15. A type-writer carriage comprising a vertical frame, a platen journaled therein, a paper-guide secured to the said frame, an operating-lever for the platen having a downwardly-curved portion, and a space-regulator above the lower edge of the paper-guide and under the said lever, which is adapted to be turned between the lever and the paper-guide to limit the downward movement of the said lever.

16. A type-writer comprising a base, a carriage carrying a feed-rack, a universal lever operating a feed-dog, the key-levers above the said universal lever, the type-bars, a spacing-lever below and out of engagement with the feed-lever, the spacing-lever pivoted inside of the outer end of the said feed-lever and having a vertical slot and a projection, which extends from the feed-lever into the said slot, whereby the feed-lever has a vertical movement independent of the spacing-lever, and the feed-lever depressed with the spacing-lever.

17. A type-writer comprising a base, a carriage carrying a rack, a universal feed-lever operating a feed-dog for the said rack, a rod or shaft below the said feed-lever or frame, a spacing-lever having its inner end loosely journaled upon the said rod, a connection between the feed and spacing levers, an upper-case lever connected at its inner end rigidly to the said rod, an inwardly-extending arm rigidly secured to the said rod, a type-bar and key-lever frame pivoted at its outer end and extending inward over the said inwardly-extending arm to be raised thereby, substantially as set forth.

18. A type-writer comprising an operating-base, a carriage carrying a platen, a printing mechanism, a feed-lever, a lever pivoted at one end and carrying a feed-dog, a rack upon the carriage, with which the dog engages, and a connection between the said feed-lever and the dog-carrying lever.

19. A type-writer comprising a base, a carriage carrying a platen and a feed-rack, a printing mechanism, a feed-lever pivoted between its ends, a horizontal dog-lever pivoted at its outer end, a dog at its inner end for engaging the said feed-rack, and a connection between the said dog-lever and the feed-lever.

20. A type-writer comprising a base, a carriage carrying a feed-rack, a universal feed-lever pivoted between its ends, a printing mechanism, a horizontal dog-lever, pivoted at one end inside of the feed-rack, a feed-dog at the inner side of the said lever, a connection between the dog-lever and the inner end of the said feed-lever, and a device for preventing the free end of the dog-lever from extending too near the feed-rack.

21. A type-writer comprising a base, a printing and feeding mechanisms, a carriage, a spring-drum for operating the carriage, a pivoted clapper, a bell, a pivoted lever, which engages the said clapper, and a trip upon the said spring-drum for operating the lever, substantially as specified.

22. A type-writer comprising a base, a printing and feeding mechanisms, a carriage, a spring-drum for operating the carriage, a bell, a pivoted clapper, a pivoted lever for operating the clapper, and an adjustable slotted trip upon the said drum for operating the said lever.

23. A type-writer comprising a feeding mechanism, a base, a carriage, a shifting frame carrying type-bars and key-levers, a standard at the rear end of the base having a vertical slot, a projection upon the inner end of the shifting frame, that engages the said slot, and the spring-drum journaled upon the said standard for operating the carriage.

24. A ribbon-feed mechanism for type-writing machines, comprising a tilting frame, a ribbon-spool, a lever pivoted at its outer end and having its inner end inside of the inner periphery of the said spool and engaging the said tilting frame, a pawl pivoted upon the lever inside of and engaging the inner periphery of the said ribbon-spool, and a stop for limiting the downward movement of the engaging end of the pawl.

25. A ribbon-feed mechanism comprising two ribbon-spools, a sliding frame or bar, a tilting frame, levers pivoted outside of the said spools and having their inner ends adapted to engage the said tilting frame alternately, stops upon the sliding bar for engaging and limiting the downward movement of the inner ends of the said levers, and pawls upon the levers inside of and engaging the inner periphery of the said spools, substantially as described.

26. A feed mechanism comprising ribbon-spools, a bar sliding transverse the spools, a tilting frame, levers pivoted outside of the spools and extending inward and adapted to engage alternately the said tilting frame, the sliding bar having a portion depending below the inner ends of the said levers, stops upon this depending portion to limit the downward movement of the inner ends of the levers, and pawls pivoted upon the lever inside of and engaging the said spools.

27. A type-bar and key-lever frame having an inner end formed of a portion of a vertical circle, which is provided with radiating slots to receive the type-bars and inner ends of the key-levers, a circular slot to receive the type-bar pivotal rod, the sides of the said frame being secured to the ends of the said inner end.

28. A type-bar and key-lever frame having an inner end formed of a block with radiating slots to receive the inner end of the type-bars and key-levers, and slots below these slots to receive the inner ends of division-plates, and division-plates which have their inner ends secured within the said slots.

29. A type-bar and key-lever frame having an inner end with radiating slots to receive the inner ends of type-bars and key-levers, and a horizontal slot to receive a pivotal rod for the type-bars, the inner end of the frame also having slots between the type-bar slots and below them for division-plates, and division-plates having their outer ends supported in an elevated position and their inner ends curved downward into the slots therefor and between the key-levers and type-bars.

30. A feed mechanism for type-writing machines, comprising a feed-rack, a universal feed-lever, a lever pivoted at one end, and dogs pivoted upon the other end of the said lever, and a connection between the free end of the said lever and the universal lever.

31. A feed mechanism for type-writing machines, comprising a universal feed-lever, a horizontal lever pivoted at one end, a feed-dog upon the free end of the said lever, a feed-rack, and a connection between the free end of the said dog-lever and the said universal feed-lever, substantially as specified.

32. A feed mechanism for type-writing machines, comprising a universal feed-lever, a horizontal lever pivoted at one end, a feed-rack, two pivoted dogs at the free end of the said horizontal lever, one above and one below the said rack, and a connection between the universal feed-lever and the free end of the horizontal pivoted lever.

33. A feed mechanism for type-writing machines, comprising a universal feed-lever, a lever pivoted at one end, a feed-rack, two dogs upon the free end of the said pivoted lever, the said dogs being pivoted at their outer ends and extending inward toward each other, stops for the said dogs, and springs for operating the dogs.

34. A feed mechanism for type-writing machines, comprising a feed-rack, a dog-carrying device which vibrates transverse the said rack, two dogs pivoted upon the said carrying device, respectively, above and below the said rack and extending inward toward each other and vibrating in a line with the travel of the said rack, stops for the said dogs to prevent them from moving with the travel of the machine, and springs for moving the said dogs in a direction opposite the travel of the said machine.

35. A type-writing machine comprising a printing mechanism, a universal feed-lever, a horizontal dog-carrying lever pivoted at one end and carrying dogs at its opposite end, a carriage, a feed-rack, ribbon spools, a ribbon tilting and guiding frame, a connection between the free end of the horizontal dog-carrying lever and the universal feed lever, and a connection between the free end of the dog-carrying lever and the said tilting frame for tilting the latter.

36. A type-bar for a type-writing machine having a type upon one side and a projection upon its opposite side, as and for the purpose specified.

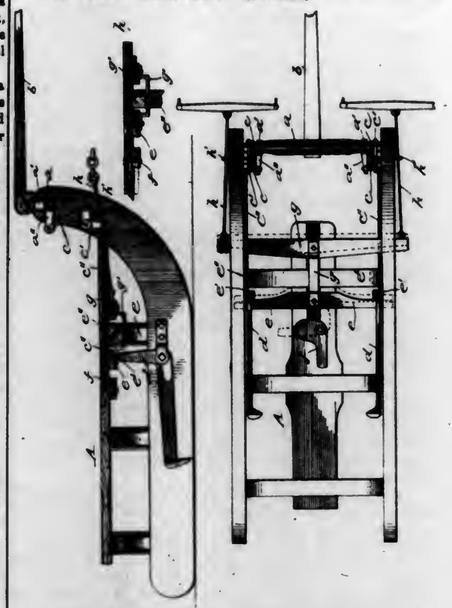
37. In a type-writer, the combination, with a series of individual pivoted type-bars carrying two or more type, of a vertically-shifting frame for sustaining said bars and suitable means for shifting said frame to bring either of the type in proper position to make an impression.

38. In a type-writer, the combination, with a series of type-bars provided with two or more type, of a vertically-shifting frame for sustaining said type-bars concentrically, a series of key-levers connected with said type-bars, and a series of keys for operating said levers.

481,478. SOLE OR HEEL PLATE. GEORGE J. DAVISON, Richmond, Va. Filed Oct. 17, 1891. Serial No. 408,087. (No model.)

Claim.—A heel or sole plate consisting of a body portion A, provided with a barbed extension a^2 bent over the body and a barbed extension a^4, projected diagonally outward from such body, said extensions being disposed in a parallel plane and at approximately an angle of forty-five degrees from the body portion of the plate, substantially as and for the purpose described.

481,479. DENTAL CLAMP. JESSE S. DEARDORFF, Canal Dover, Ohio. Filed Mar. 28, 1892. Serial No. 426,780. (No model.)

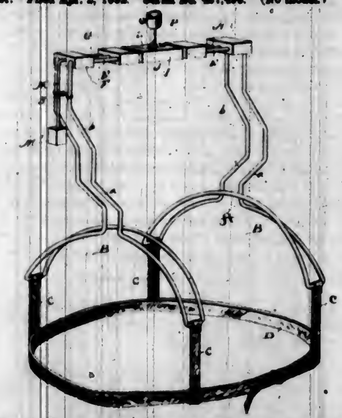


Claim.—1. In a dental clamping device, the combination, with

the pivoted arms, of the oval rims having the retaining claws or lugs, substantially as and for the purpose described.

2. In a dental clamping device, the combination, with the arms having lugs provided with a series of openings, of the oval rims having the retaining-lugs and the pivot-pins for adjustably and pivotally connecting said arms together, substantially as and for the purpose described.

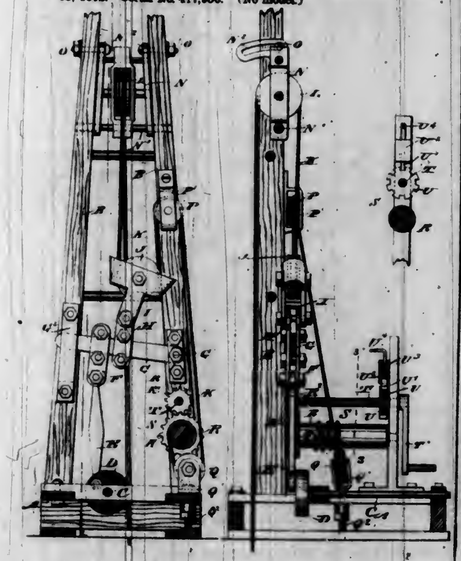
481,480. SLED-BRAKE. PRESTON T. DEMO, Hyde Park, Vt. Filed Apr. 4, 1892. Serial No. 427,701. (No model.)



Claim.—1. The combination of a sled, a rock-shaft pivoted between the upwardly-turned ends of its runners and provided with vertically and rearwardly extending arms, a pole pivoted between the vertical arms, depending rods pivoted to the rearwardly-extending arms, angle-levers pivoted on the sled-runners, rearwardly-extending rods connected to these angle-levers, and brake-dogs pivoted on the runners and having their upper arms pivotally connected to the rearwardly-extending rods, substantially as described.

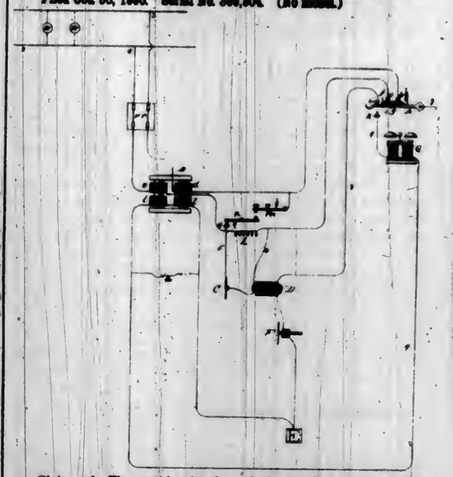
2. The combination of a sled, a rock-shaft pivoted between the forward ends of the runners and provided with two sets of arms, one set projecting upwardly and the other rearwardly, a pole pivoted between the upwardly-projecting arms, brake-dogs pivoted on the sled-runners, rods and levers pivotally connecting the upper ends of the brake dogs to the rearwardly-extending arms on the rock-shaft, a bar connecting the upper ends of the brake-dogs, a whiffletree pivotally connected about midway its ends to said bar, draft-rods connected to the whiffletree and extended forward beyond the runners, and single-trees on these draft-rods, substantially as described.

3. The combination of a sled, a pair of brake-dogs pivoted on the runners and having their upper ends connected by a movable cross-bar, means for operating these brake-dogs from the draft-pole, and a pivoted cam on the platform adapted to press the cross-bar forward and hold the brake-dogs out of engagement with the ground, substantially as described.



481,481. UMBRELLA-SUPPORTER. JOHN DEVEREAUX, Deniphan, Nebr. Filed Apr. 2, 1892. Serial No. 427,496. (No model.)

Claim.—1. In an umbrella-supporter substantially as described, the combination, with the standards, a rock-shaft having an angular arm, and a weight carried by the said arm, of a bearing-box comprising the section I, fixedly connected to the rock-shaft and having a hemispherical recess in its inner face, the section L, connected to the section I and having also a hemispherical recess in its inner face, a binding-screw taking through the section L and into the section I, and the ball seated in the spherical recess formed by the two sections and having a socket to seat an umbrella-handle, all substantially as specified.



2. In an umbrella-supporter substantially as specified, the combination, with the standards having the arch-saddles B at their lower ends and the inwardly-directed angular branches at their upper ends, a suitable means for fastening said standards in position upon the shoulders, and the bearing-blocks fixedly mounted upon the inwardly-directed branches of the standards, of the rock-shafts journaled in the said bearing-blocks, the bearing-box fixedly connected to the inner ends of said rock-shafts, a suitable means for connecting an umbrella to the bearing-box, the angular arm extending from the end of one rock-shaft, and a weight carried by said arm, all substantially as specified.

481,482. WELL-DRILLING MACHINE. JAMES W. DRAPER, FREDERICK DRAPER, and WALTER ELLSWORTH, Alden, Iowa. Filed Jan. 13, 1892. Serial No. 417,956. (No model.)

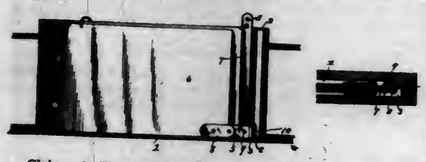
Claim.—A well-drilling machine comprising a frame or base, a derrick projecting upwardly therefrom, a drive-shaft mounted on the frame, a vertically-rocking walking-beam mounted transversely on the derrick above the inner end of the drive-shaft and operated therefrom, a pulley J, adjustably connected with the walking-beam, a frame N, pivoted in the upper end of the derrick and having slotted arms through which pass adjusting-bolts, a pulley L, mounted in said frame, a pulley P, mounted on the derrick intermediate of pulleys J L, a winding-drum on the lower part of the derrick, and a rope extending upward over pulley P, thence under pulley J, and thence upward over the adjustable pulley L, and downward for connection with a drill, substantially as set forth.

481,483. TELEPHONE SYSTEM. RICHARD N. DYER, East Orange, N. J., assignor to the American Bell Telephone Company, Boston, Mass. Filed Oct. 30, 1890. Serial No. 369,904. (No model.)

Claim.—1. The combination, in a telephone sub-station apparatus, of a telephone-transmitter, a current-supplying circuit therefor, a normally-open loop from said supply-circuit to the said transmitter, a resistance in a shunt-circuit of the said loop around the transmitter, a circuit-closer controlled by the automatic telephone-switch and acting, as the telephone is removed from or replaced on its support, to close or open the loop-circuit through the transmitter, and an electro-magnetic resistance included directly in the loop-circuit and acting as its resistance and self-induction to control the strength and steady the current flowing through said loop and transmitter, substantially as described.

2. The combination, with the telephone-transmitter, of a current-supplying circuit therefor, a loop from said supply-circuit to the transmitter and including the same, an electro-magnetic resistance in the said loop, constituting, also, the primary helix or helices of an induction-coil for sending call-signals, and a circuit-controller for alternately making and breaking the circuit of the loop at a point between the transmitter and the said electro-magnetic resistance.

3. The combination, with a telephone-transmitter, of a current-supplying circuit, a branch or loop circuit therefrom extending to said transmitter, a controlling and steadying electro-magnetic or inductive resistance in said branch circuit the helices which also constitute the primary helix or helices of an induction-coil for sending call-signals, and a determining-resistance included in a shunt of said loop-circuit around the transmitter, substantially as set forth.

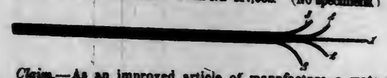


4. In combination with the mains of a constant-direction electric-light or power circuit, a telephone-transmitter, a loop from said mains to the said transmitter, a steadying and current-regulating electro-magnetic resistance included in said loop, a safety-catch interposed in said loop between the said resistance and the main-line junction, and a determining-resistance in a shunt of said loop uniting the transmitter-terminals, substantially as set forth.

5. The combination, with a telephone, of a current-supplying circuit, a branch therefrom supplying the transmitter, current-reducing magnet-coils located in said branch, secondary coils upon such magnet connected with the line through the bell-circuit, and a key closing the branch circuit through the magnet-coils and not through the transmitter, substantially as set forth.

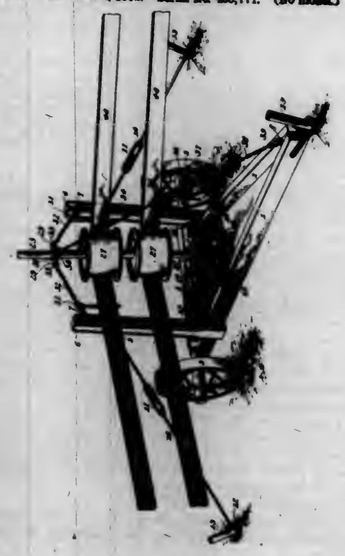
6. The combination, with a telephone, of a current-supplying circuit, a branch therefrom supplying the transmitter, current-reducing

magnet-coils located in said branch, secondary coils upon such magnet-coils, connected with the line through the bell-circuit, a key closing the branch circuit through the magnet-coils and not through the transmitter, and the telephone-switch opening and closing the branch circuit without grounding the same, substantially as set forth.



481,484. CENTER-BOARD FOR BOATS. FRANCIS M. EATON, West Tremont, Me. Filed May 24, 1892. Serial No. 434,123. (No model.)

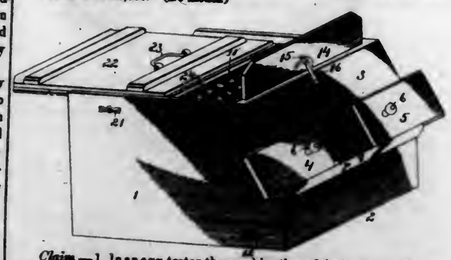
Claim.—1. The combination, with a center-well, of a vertical rod rigidly mounted at one end of the well and having its lower end secured to the same, a center-board, a hinge having one leaf connected with the center-board and having its other leaf slidingly mounted on the rod, a vertical bar secured to the slidingly-mounted leaf, and means for securing the upper end of the bar to the well, substantially as and for the purpose described.



2. The combination, with a center-well, of a vertical rod rigidly mounted at one end of the well and having its lower end secured to the same, a center-board, a hinge having one leaf provided with an eye and slidingly mounted on the rod and having its other leaf secured to the center-board, a rod secured to the leaf, having the eye and provided at its upper end with an eye and with a perforation, and a transverse pin arranged in the perforation and securing the bar to the center-well, substantially as described.

481,485. WATERPROOF FABRIC. JOSEPH R. FRANCE, New York, N. Y. Filed Jan. 9, 1892. Serial No. 417,602. (No specimens.)

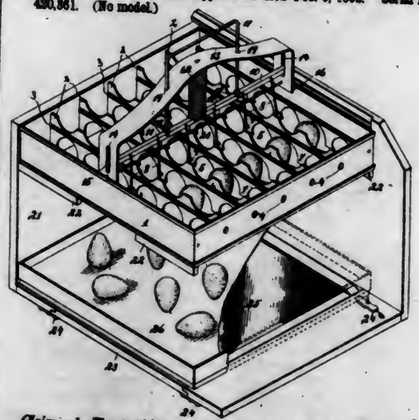
Claim.—As an improved article of manufacture, a waterproof fabric consisting of a sheet of rubber, a sheet of fibrous material—such as thin paper—attached to the sheet of rubber, and a covering of pyroxyline compound secured to the sheet of fibrous material, substantially as described.



481,486. COUNTER-SHAFT-SUPPORTING JACK. HIRAM J. GARBUTT, Lexington, Mich., assignor of one-half to George Smith, same place. Filed Mar. 4, 1892. Serial No. 423,771. (No model.)

Claim.—1. In a device of the class described, the combination, with the truck comprising the opposite sills, the transverse rods mounted on the sills, the longitudinal bar adjustably connected with the rods, and a bearing-sleeve adjustably mounted on the bar, of a counter-shaft stepped in the bearing of the sleeve and adjustable connections between the truck or frame and the upper end of the counter-shaft, substantially as specified.

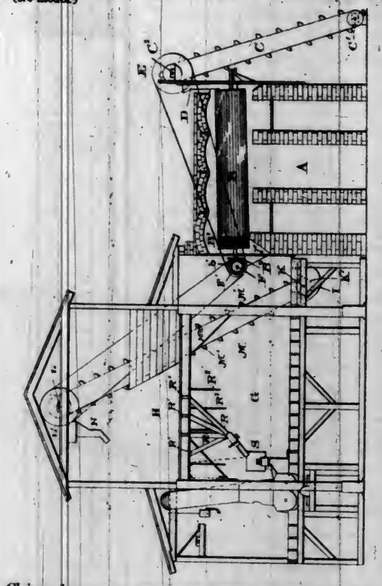
2. In a device of the class described, the combination, with the opposite side bars, the round rods mounted thereon and rigidly connected thereto, the longitudinal bar rectangular in cross-section, staples embracing the rods and passed through the bar, nuts on the staples, a rectangular sleeve mounted for movement on the bar and provided at one side with a binding-screw and upon its upper side with a tenon, a collar mounted on the tenon, a pin passed through the collar and tenon, a counter-shaft mounted in the collar, a pin passed through the collar and the lower end of the shaft, and pulleys mounted on the shaft, of means for supporting the shaft, substantially as specified.



481,487. EGG-TESTER. JEREMIAH R. GARLAND, Osage City, assignor of one-half to John H. Craig, Coyville, Kans. Filed May 16, 1891. Serial No. 393,060. (No model.)

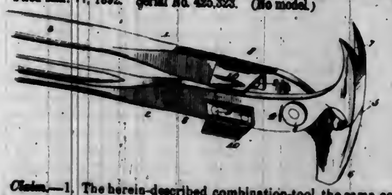
Claim.—1. In an egg-tester, the combination of the box 1, a reflector located therein, a beveled portion 3 in said box having an opening, means for the partial or entire closing of said opening, a guard 14, hinged to said box above said beveled portion, and means for securing said guard in an upright position, substantially as and for the purpose set forth.

2. In an egg-tester, the combination of the box 1, having a beveled end 3 opening therein, means for closing or partially closing said opening, means for supporting eggs in said box, a reflector 7, and a spring 13 for holding said reflector in position, substantially as described, and for the purpose set forth.



481,488. COMBINED DUMPING-TRAY AND EGG-TESTER. JEREMIAH R. GARLAND, Osage City, assignor of one-half to John H. Craig, Coyville, Kans. Original application filed May 16, 1891, Serial No. 393,060. Divided and this application filed Feb. 9, 1892. Serial No. 420,861. (No model.)

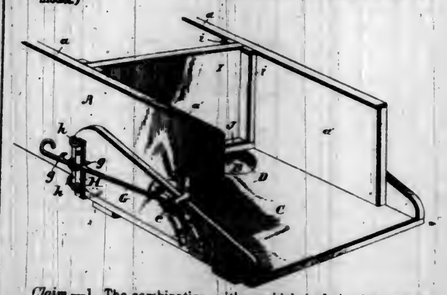
Claim.—1. The combination of the frame 1, slats 2, pivoted thereto and having openings therein for the reception of eggs, arched frame 13, having slots 14, a bar 10, having its ends working in said slots, rods 8 for connecting the bar 10 with the slats 2, and means for raising and lowering said bar in order to change the position of the slats substantially as and for the purpose set forth.



2. The combination of the frame 1, slats 2, pivoted thereto, having suitable openings for holding eggs, arched frame 13, having slots 14, bar 10, having its ends working in said slots, rods 8, connecting the bar 10 with the slats 2, brace-rod 20, a spring 12, connecting the bar 10 with the frame 13, and a bail 17, in connection with the bar 10 and extending up through the arched frame 13, substantially as and for the purpose set forth.

481,489. PLANT FOR HEATING AND CONTROLLING SAND. FRANCIS V. GREENE, New York, N. Y., assignor to the Barber Asphalt Paving Company, same place. Filed Mar. 24, 1892. Serial No. 426,315. (No model.)

Claim.—In an apparatus for heating and controlling sand in paving operations, a heating-drum arranged in a slightly-inclined position over furnaces for heating the same, provided with a hopper at its feed end and a chute at its delivery end, a conveyer arranged in close proximity to the feed end of the sand-heating drum, adapted to carry up the sand and deposit it in the feed-hopper, a main operating-platform located at one end of the sand-drum and below the same, to which the sand is conducted after leaving the heating-drum, a hot-sand platform arranged above the main platform, having its floor provided with a series of chutes leading down to the main platform and to a main or central chute, each chute being provided with an independent cut-off, and a conveyer running from the main platform to a point above the hot-sand platform, substantially as described, and for the purpose set forth.



481,490. HORSESHOER'S TOOL. OLE HANDELAND, Webster, S. D. Filed Mar. 17, 1892. Serial No. 425,323. (No model.)

Claim.—1. The herein-described combination-tool, the same consisting of the opposite levers having their inner ends shaped to form handles and near their outer ends oppositely curved, crossed, and pivoted, each of said levers terminating at its inner edge at its outer end in a pincher-jaw, the outer edge of one of the jaws shaped to form a hammer-head and the corresponding edge of the companion jaw being bifurcated to form a claw, and the oppositely-disposed L-shaped plates secured to the levers in rear of the pivot and having their inner opposing faces roughened, substantially as specified.

2. The herein-described combination-tool, the same consisting of the opposite levers having their inner ends shaped to form handles and near their outer ends oppositely curved, crossed, and pivoted, each of said levers terminating at its inner edge at its outer end in a pincher-jaw, the outer edge of one of the jaws shaped to form a hammer-head and the corresponding edge of the companion jaw being bifurcated to form a claw, the oppositely-disposed L-shaped plates secured to the levers and having their inner opposing faces roughened and the outer edges of the levers in rear of their pivot roughened to form rasps, substantially as specified.

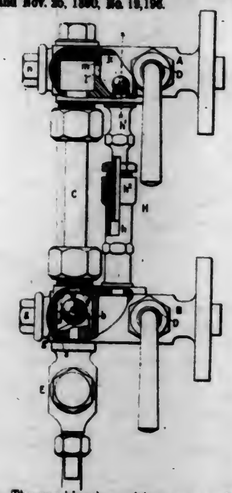
481,491. END-GATE. WALTER D. HAWK, Rock Island, and OELL S. FRENCH, Monmouth, Ill. Filed Mar. 4, 1892. Serial No. 423,759. (No model.)

Claim.—1. The combination, with a vehicle-body having an end-gate and having the sides projected a short distance in the rear of said end-gate and the vehicle-body and a scoop-board adapted to be supported at its inner end by a hinged joint to the vehicle-body about in line with the rear end of the vehicle-bottom, of a rod having connection at one end with the projected ends of said side pieces of the vehicle-body, and adapted to engage with a lateral projection on the side of and near the outer end of the scoop-board, and a plate H near the inner end of said scoop-board having projections at different levels to engage with the other end of said rod, substantially as described.

2. The combination, with a vehicle-body having its sides projected in the rear of the end-gate and the bottom of said vehicle-bottom and a scoop board adapted to be supported at its inner end by a hinged joint to the vehicle-body about in line with the rear end of the vehicle-bottom, of a rod having a series of projections at one end and connected at the other end with the side of the vehicle-body, a ring *e*, secured to the scoop-board and constructed to have the said rod pass therethrough and engage with one of the series of projections on said rod to support the scoop-board in the required position, and a plate H, secured to the said scoop-board near its inner ends, and having projections at different levels to be engaged by the said rod to support the scoop-board in a horizontal position, substantially as set forth.

3. The combination, with a vehicle body having its sides projected in the rear of the end-gate and the bottom thereof, a scoop-board, and the slotted right-angled brackets *d* and the hook-plates *b* to pivotally connect the scoop-board with the vehicle-bottom, of a strap-iron secured to the scoop board and having ring *e*, a bracket secured to the vehicle-body and having a vertical extension *f*, which is adapted to project into the said ring *e*, a notched rod connected with the said vertical extension *f*, and a plate H, attached to the inner end of the scoop-board and having lateral extensions at different levels, substantially as described, for the purpose specified.

481,492. HINGE. JOHN F. HIRST, Sabattus, Me. Filed Dec. 10, 1891. Serial No. 414,626. (No model.)



Claim.—1. A hinge, substantially as shown and described, comprising the hinged leaves, each provided on its rear face with the seats *b' c'*, one leaf having a transverse socket and the other leaf a longitudinal slot, the bail having its ends fitted in the socket and slot of the respective leaves, and the removable plates fitted in the seats of

the two leaves over the ends of the bail, as and for the purpose described.

2. The hinge herein shown and described, comprising the leaf A, having the socket *b* and the seats *b'* in rear of said socket, another leaf A', provided with the longitudinal slot and the seats *c'* in its rear side, the bail D, fitted at its ends in the socket and slot of the respective leaves, and the removable plates fitted tightly in the seats of said leaves and arranged flush with the rear faces thereof, as and for the purpose described.

481,498. WATER-GAGE. JOHN A. HOPKINSON and JOSEPH HOPKINSON, Huddersfield, England. Filed Dec. 3, 1891. Serial No. 414,421. (No model.) Patented in England Jan. 27, 1890, No. 1,435, Apr. 22, 1890, No. 6,141, and Nov. 26, 1890, No. 19,196.

Claim.—1. The combination, with a gage-cock and a spherical valve or ball for closing the water-orifice when the glass breaks, of an inclined floor for supporting said valve or ball when in its normal position and a screw-plug having an extension for maintaining the ball or valve in position on the said floor, said inclined floor being so arranged with relation to said screw-plug that upon the removal of said screw-plug the valve or ball drops out of the gage-cock, substantially as described.

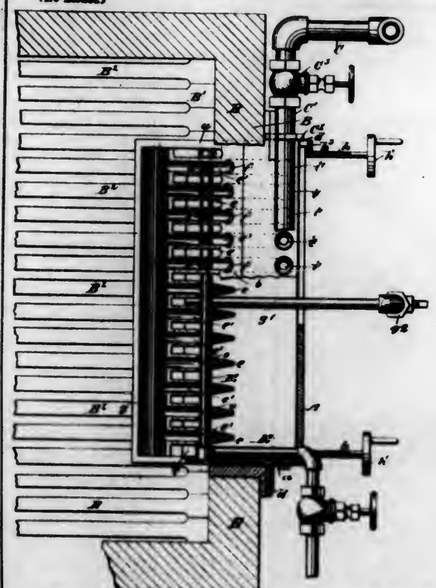
2. In a water-gage, the combination, with a water-arm, of a try-cock having a portion thereof formed with an inclined elongated hole or aperture above the ordinary passage of the try-cock, a ball which rests on the edges of the said inclined elongated opening, and a screw-plug for maintaining said ball in position, said inclined floor being so arranged with relation to said screw-plug that upon the removal of said screw-plug the ball will drop out of the gage-cock, substantially as described.

3. In a water-gage, the combination, with a ball for closing the water-orifice when the glass breaks, of a grooved or like floor whereon the said ball rests, said floor being stationary or immovable with respect to the gage, and a lateral support for maintaining the ball in position, as set forth.

4. The combination, with the lower or water arm of a water-gage, of a ball-valve for closing the water-orifice when the glass breaks, said valve being of greater weight than that of a column of water of sectional area equal to that of the seat of the said valve and of a height equal to the length of the gage, substantially as described, for the purpose specified.

5. In a water-gage, the combination, with the gage-glass and the steam and water arms, of an extensible supplementary tube connecting said arms and located at a point between the gage-glass and the gage cocks, as set forth.

6. In a water-gage, the combination, with a gage-glass and the steam and water arms, of a tube connecting the said arms supplementary to the gage-glass and a ball-valve in the steam-arm, as set forth.



7. In a water-gage, the combination, with a gage-glass and the steam and water arms, of a tube connecting the said arms supplementary to the gage-glass and a ball-valve resting in a recess on the top of the said supplementary tube, as set forth.

8. In a water-gage, the combination, with a gage-glass and a tube connecting the steam and water arms, supplementary to the gage-glass, of a ball-valve resting on a seat on the top of the said tube and so arranged that it can be taken out of the gage, as set forth.

9. In a water gage, the combination, with a gage-glass, of a tube connecting the steam and water arms supplementary to the gage-glass, said tube being constructed in two parts, one adapted to slide within the other and having a stuffing-box and gland, as set forth.

10. In a water-gage, the combination, with a gage-glass and a tube connecting the steam and water arms supplementary to the gage-glass, of a ball resting on an inclined support formed on the upper end of the said tube, as set forth.

481,494. GASEOUS-FUEL GENERATOR AND BURNER. NORBERT HOER, New York, N. Y. Filed Aug. 22, 1891. Serial No. 403,405. (No model.)

Claim.—1. A gaseous-fuel generator and burner which embrace devices contained therein adapted to produce combustible vapor and burn it as evolved and integral means for regulating the ingress of air to the combustion-chamber of boiler or furnace, which generator is adapted to be inserted and held within the usual door-opening of the combustion-chamber to close the same and removable therefrom, substantially as described.

2. A vapor-fuel producer and burner comprising a metal frame having a series of spaced ribs that incline from a vertical plane, are grooved longitudinally on one face, and are transversely intersected by a steam-jet for each rib, and have a carbonaceous-liquid supply above each steam-jet, substantially as described.

3. In a vapor-fuel producer and burner, the combination, with a frame having channeled ribs that incline from a vertical plane, of a graduating carbonaceous-liquid-feeding device for each rib connected to a supply and a steam-jet for each rib intersecting its channel, substantially as described.

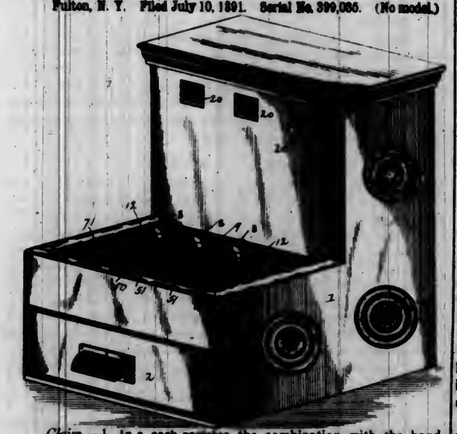
4. In a vapor-fuel producer and burner, the combination, with a frame that is insertible in the door-opening of a fire-chamber, having channeled ribs that incline from a vertical plane, each channel intersecting an inclined perforation or passage above in the frame, of a graduated carbonaceous-liquid-feeding device for each inclined passage, and a steam-conduit below on the frame, which supplies steam-jets that intersect the channels in the ribs, substantially as described.

5. In a vapor-fuel producer and burner, the combination, with a fire-chamber front wall that has a door-opening therein, of a vapor-fuel-generator frame which will enter and fill said opening, a series of spaced ribs thereon, each inclined from a horizontal plane and longitudinally channeled on its rear face, a carbonaceous-liquid-feed pipe for each rib, means to connect the feed-pipes with the channels, a transverse steam-conduit perforated at each rib to provide steam-jets therefor, a steam-supply, a carbonaceous-liquid supply, and controlling devices for said supplies, substantially as described.

6. In a vapor-fuel producer and burner, the combination, with a fire-chamber front wall provided with an opening, a boiler above, a vapor-fuel-generator frame in the front wall opening, a series of spaced channeled rib on the frame, which incline from a vertical plane and are intersected above by downwardly-inclined tubular carbonaceous-liquid passages formed in the top wall of the frame, a feed-pipe for each liquid-passage, a drip-pipe intersecting each liquid-passage below the feed-pipes, a valve for each feed-pipe, and a liquid-supply connected thereto, of a steam-conduit pipe extended from a steam-supply and entering the frame, having a transverse branch that is perforated opposite each channel in the ribs, and a valve for the steam-supply pipe, substantially as described.

7. A hydrocarbon-burner adapted to be inserted or removed from the door-opening of a furnace containing a series of open ribs and ducts thereon for conveying hydrocarbon oil from without the boiler to the point of combustion and devices for controlling the admission of air from without and through the openings in the ribs, said devices forming part of said burner, substantially as described.

8. A hydrocarbon-burner adapted to be inserted or removed from the door-opening of a furnace, a series of ribs on the furnace side of the burner, troughs on the ribs having openings between the ribs, a series of steam-jets opening into the troughs, an independent source of supply of combustible liquid, and means for connecting each troughed rib with the source of supply independently of the others, substantially as described.



9. A hydrocarbon-burner adapted to be inserted or removed from the door-opening of a furnace, a series of ribs on the furnace side of the burner, troughs on the ribs, openings between the ribs, devices for controlling the admission of air from without and through the openings in the ribs, an independent source of supply of combustible liquid, and means for connecting each troughed rib with a source of supply independently of the others, substantially as described.

10. The combination, in a burner of the class described, having integral devices for producing combustion, comprising a series of independent ducts or troughs, a source of supply of combustible material, devices for connecting said independent ducts with the source of supply, devices for regulating admission of air forming part of the burner, and means for pivotally supporting said burner, substantially as described.

11. The combination, in a burner of the class described, having integral devices for producing combustion, said burner being pivoted at 1 upon uprights O^3, with fulcra C' for pivotally supporting the uprights, the frame A, and the uprights O^3, having holes 4 and 2, respectively, at points equidistant from the pivots 1, substantially as described.

12. A hydrocarbon-burner comprising a rectangular frame, having at one side a sloping wall, which wall is provided with a series of troughed ribs *e*, having slots or openings between the ribs, means for feeding a liquid to the ribs, and devices for controlling the passage of air through said slots, comprising the hinged door-sections *a' a'*, having connected nuts A^5, a screw-threaded rod *h*, passing through said nuts, provided at one end with a crank and secured at the other end to the wall of the burner by a movable block in which said rod can turn, substantially as described.

481,495. CASH REGISTER AND INDICATOR. GEORGE M. HOWE, Fulton, N. Y. Filed July 10, 1891. Serial No. 399,086. (No model.)

Claim.—1. In a cash-register, the combination, with the hand-actuated shafts, their pointers, and the dials, of the rack-bar connected with said shafts, the indicating shafts and wheels, and the display-openings, substantially as described.

2. In a cash-register, the combination, with the hand-actuated shafts, their pinions, and the dials, of the rack-bars, the indicating shafts and wheels, the shafts having pinions meshing with said rack-bars, the shafts having pointers, the connections between said shafts and rack-bars, whereby the former are rotated, substantially as described.

3. In a cash register, the combination, with the casing, the hand-actuated shafts having pointers adapted to be rotated when a sale is made, and the pinions secured to said shafts, of the rack-bars engaging with said pinions, the indicating-shafts having indicating-wheels thereon, and pinions adapted to engage said bars, the shafts having pointers and pinions, the latter adapted to engage with teeth on said rack-bars, substantially as described.

4. In a cash register, the combination, with the casing, the hand-actuated shafts provided with pointers, and the dials, of the reciprocating rack-bars, the vertical shafts with indicating or display wheels and pinions engaging with said bars, the ratchet-disks connected with said shafts, the pawls engaging with said ratchet-disks, and means, substantially as described, for disengaging said pawls from the ratchet-disk.

5. In a cash-register, the combination, with the casing, the hand-actuated shafts provided with pointers, and the dials, of the reciprocating rack-bars, the shafts provided with indicating-wheels and pinions adapted to engage with said bars, the ratchet-disks on the lower ends of said bars, and the locking-pawls adapted to engage with said disks, substantially as described.

6. In a cash-register, the combination, with the casing, the hand-actuated shafts provided with pointers, and the dials, of the reciprocating rack-bars, the shafts provided with indicating-wheels and pinions adapted to engage with said rack-bars, the ratchet-disks on the lower ends of said shafts, the pivoted pawls engaging with said disks, and the transverse bar or shaft having arms adapted to engage with said pawls, substantially as described.

7. In a cash-register, the combination, with the casing, the hand-actuated shafts provided with pointers, and the dials, and the reciprocating rack-bars, of the shafts provided with indicating-wheels and pinions adapted to engage with said rack-bars, the ratchet-disks on the lower ends of said shafts, the pivoted spring-pawls engaging with said disks, the transverse shaft having forwardly-projecting arms adapted to engage with said pawls, the disk having a projection or stud fixed to one end of said shaft, the loosely-pivoted gravity-lever, and the cash-drawer having a plate adapted to engage with said lever, substantially as described.

8. In a cash-register, the combination, with the casing, the hand-actuated shafts having pinions and pointers, and the dials, of the reciprocating rack-bars, the shafts in line with said hand-actuated shafts, having pinions engaging with said rack-bars, the pointers on the upper ends of said shafts, and the dials, substantially as described.

9. In a cash-register, the combination, with the casing, the hand-actuated shafts provided with pinions and pointers, and the dials, of the reciprocating rack-bars, the shafts, aligned with said hand-shafts having loose pinions engaging with said rack-bars, the disks having spring-pawls secured to the loose pinions, the ratchet-wheels fixed to the shafts, and the pointers and dials, substantially as described.

10. In a cash-register, the combination, with the casing, the hand-actuated shafts provided with pinions and pointers, and the dials, of the reciprocating rack-bars, the shafts aligned with said hand-shafts, having loose pinions engaging with said rack-bars, the indicator-shafts having indicating-wheels, and pinions engaging with said rack-bars, substantially as described.

11. In a cash-register, the combination, with the casing, the hand-actuated shafts provided with pinions and pointers, and the reciprocating rack-bars, of the shafts having pointers aligned with said hand-shafts and the dials, the loose pinions on said shafts, the disks fixed to said pinions and provided with spring-pawls, the ratchet-wheels fixed to said shaft, the indicator-shafts having indicating-wheels, and pinions engaging with said rack-bars, substantially as described.

12. In a cash-register, the combination, with the casing, the hand-actuated shafts provided with pinions and pointers, the dials, and the reciprocating rack-bars provided with springs, of the shafts provided with pointers, aligned with said hand-shafts, and the dials, the loose pinions on said shafts, the disks fixed to said pinions and provided with spring-pawls, the ratchet-wheels fixed to said shafts, the indicator-shafts having indicating-wheels, the pinions on said shafts engaging with the rack-bars, the ratchet-disks on the lower ends of said shafts, the pivoted pawls engaging with said ratchets, the transverse shaft having forwardly-projecting arms, the disk fixed to said shaft and having a projection or pin, the loose gravity-lever, and the cash-drawer and plate for tripping said lever, substantially as described.

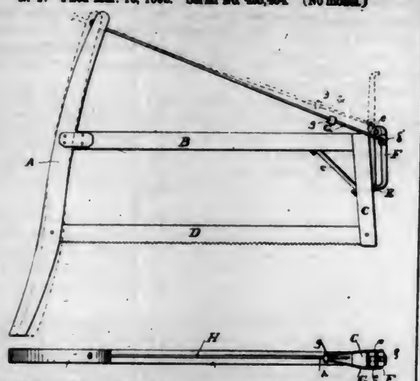
13. In a cash-register, the combination, with the casing, the hand-actuated shafts provided with pointers and pinions, the dials, and the reciprocating rack-bars, of the shafts having pointers aligned with said hand-shafts, the loose pinions on said shafts, the disks secured to said pinions and provided with spring-pawls, the projecting arms secured to said shafts, the spring-actuated reciprocating bars having hooked ends with which said arms engage, the pivoted pawls to which said bars are

connected, and the ratchets on said shafts, with which said pawls engage, substantially as described.

481,496. SAW-STRAINING DEVICE. MELVIN JINKS, Cohocton, N. Y. Filed Mar. 18, 1892. Serial No. 425,464. (No model.)

seat A, and the seat-cover C, of a vertical slide F, connected with the seat-cover, the elevated cushioning-cylinder L, the piston K, arranged in the cylinder, the piston-rod J, connections between the piston-rod and the vertical slide, the supply-valve i^3, connected with and operated by the piston-rod, the flushing-valve i^2, the lever M, connected with the flushing-valve and operated by the piston-rod, the pivoted lever O, arranged beneath and exposed to the action of the pivoted seat, the bell-crank lever P Q, having one end connected with the lever, and the dog R, engaging the other end of the bell-crank lever and adapted to engage the vertical slide, substantially as described.

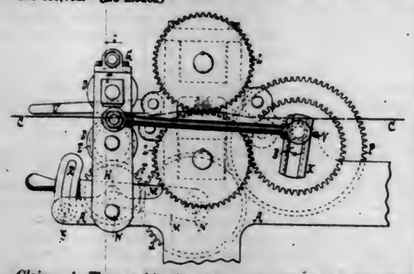
2. The combination, with a reel provided with rock-shafts carrying the teeth, of a shield over the shafts on which the teeth are supported, as set forth.



3. The combination, with a reel provided with shafts carrying the teeth, of a curved shield supported by the said shaft over the coils of the teeth, as set forth.

conductor, while the trolley moving in the opposite direction on the main line keeps the main conductor, substantially as described.

2. The combination, with the main and branch overhead conductors, of the trolley-switch consisting of the plate 5, suitably supported and provided with the stationary track-flanges, a movable piece 10, located in a slot formed in plate 5 and carrying the depending guide and track-flanges and provided with a lug projecting above the plate 5, and a spring connected at one extremity with said lug and at the opposite extremity with a suitable stationary stop secured to the top of the plate, substantially as described.



connected, and the ratchets on said shafts, with which said pawls engage, substantially as described.

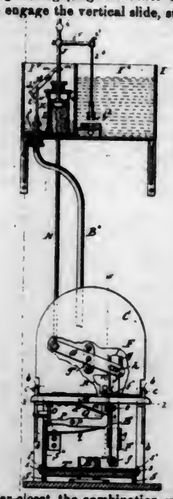
481,496. SAW-STRAINING DEVICE. MELVIN JINKS, Cohocton, N. Y. Filed Mar. 14, 1892. Serial No. 425,464. (No model.)

Claim.—The combination of the saw-frame constructed substantially as described with the strap E, having forwardly-projecting eyes, the lever F, having a rearwardly-projecting eye pivoted between those of the strap, the stirrup G, connected to said lever, and the straining-rod H, all substantially as and for the purpose set forth.

481,497. MECHANISM FOR FEEDING AND CUTTING PAPER. ROBERT T. JOHNSTON, Scotch Plains, N. J. Filed Oct. 15, 1891. Serial No. 408,782. (No model.)

Claim.—1. The combination of a rotary cutter, an oscillating frame, feed-rollers acting to feed a sheet to the rotary cutter and journaled in the oscillating frame for neutralizing the feed action of the rollers on the sheet as the frame swings backward or away from the rotary cutter, and means for rotating the cutter, oscillating the frame, and rotating the feed-rollers, substantially as described.

2. The combination, with a cutter, of rotary oscillating feed-rollers, a removable gear, as E, connected to said rollers, and an adjustable gear, as F, for driving the removable gear, substantially as described.



3. The combination, with a cutter, of rotary feed-rollers, an oscillating frame or arms for said rollers, and a pitman and crank for oscillating the arms, said pitman being adjustably connected to the crank, substantially as described.

4. The combination, with a cutter, of rotary oscillating feed-rollers, a removable gear, as E, connected to said rollers, a gear F for driving the removable gear, and an adjustable arm and set-screw for supporting the gear F, substantially as described.

481,498. WATER-CLOSET. GERTRUDE J. KREHLBAUM, New York, N. Y. Filed Nov. 13, 1891. Serial No. 411,738. (No model.)

Claim.—1. In a water-closet, the combination, with the pan, the seat, and the cover, of a cushioning-cylinder, a piston fitted into said cylinder, a piston-rod extending from said piston and constructed to actuate the water-supply valve and the flushing-valve, and means for locking the cover in its open position by the weight of the person occupying the closet and for releasing said cover when the weight is removed, substantially as described.

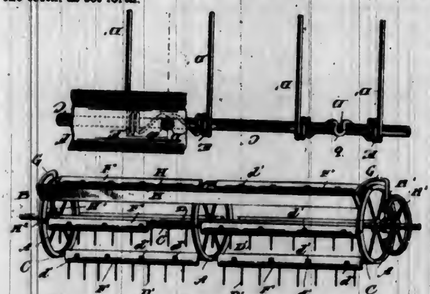
2. In a water-closet, the combination, with the pan B, the pivoted seat A, and the seat-cover C, of a vertical slide F, connected with the seat-cover, the elevated cushioning-cylinder L, the piston K, arranged in the cylinder, the piston-rod J, connections between the piston-rod and the vertical slide, the supply-valve i^3, connected with and operated by the piston-rod, the flushing-valve i^2, the lever M, connected with the flushing-valve and operated by the piston-rod, the pivoted lever O, arranged beneath and exposed to the action of the pivoted seat, the bell-crank lever P Q, having one end connected with the lever, and the dog R, engaging the other end of the bell-crank lever and adapted to engage the vertical slide, substantially as described.

3. In a water-closet, the combination, with the pan B, the seat A, and the seat-cover C, of the vertical slide F, connected with the seat-cover, the elevated cushioning-cylinder L, the piston K, arranged in the cylinder, the piston-rod J, connections between the piston-rod and the vertical slide, the supply-valve i^3, connected with and operated by the piston-rod, the flushing-valve i^2, the lever M, connected with the flushing-valve and operated by the piston-rod, the levers S, arranged below the seat and provided with a platform T, the arm S', connected to one of the levers S, the bell-crank lever P Q, adapted to engage the arm S', and the dog R, engaging the bell-crank lever and adapted to engage the vertical slide, substantially as described.

481,499. PROCESS OF TREATING SULPHIDE ORES OF ZINC AND LEAD. GEORGE T. LEWIS, Philadelphia, Pa., and CARL V. PETRASCH, Camden, N. J., assignors to the Western Patent Company, Denver, Colo. Filed July 8, 1889. Renewed Jan. 12, 1892. Serial No. 417,782. (No specimens.)

Claim.—The process of recovering lead and zinc from sulphureted lead and zinc lead ore, which consists in roasting the ore, then smelting the roasted mass and exposing the fumes or volatile matter produced by said smelting to the action of the gases which are volatilized in the roasting of said ore, together with water, and then separating the zinc solution from the insoluble lead compound and recovering the zinc and lead, substantially as described.

481,500. PROCESS OF TREATING SULPHIDE ORES. GEORGE T. LEWIS, Philadelphia, Pa., and CARL V. PETRASCH, Camden, N. J., assignors to the Western Patent Company, Denver, Colo. Filed June 27, 1889. Renewed Jan. 12, 1892. Serial No. 417,794. (No specimens.)

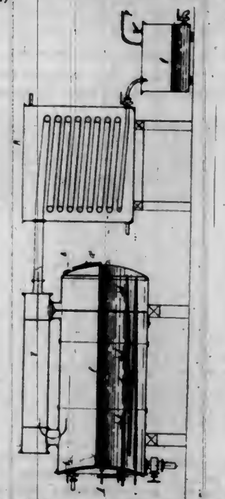


Claim.—The process of treating sulphide ores of lead and zinc, whether containing precious metals or not, which consists in driving off the volatile constituents of the ore and condensing the fumes by passing them through a stack or tower or a series of stacks or towers containing a material—such as coke—which is not acted upon by acid and upon which the fumes will condense and passing a shower of water through said stack and then separating the lead and zinc salts produced and treating each separately, substantially as and for the purpose described.

481,501. HORSE HAY-RAKE. WILLIAM R. MANN, Earlville, Ill. Filed Apr. 30, 1892. Serial No. 431,295. (No model.)

Claim.—1. The combination, with the reel having pivoted teeth and extensions, of a board arranged to the rear and above the center of the reel and forming a wind-breaker and tooth-folder fixed relatively to the said reel, as set forth.

2. The combination, with a reel provided with rock-shafts carrying the teeth, of a shield over the shafts on which the teeth are supported, as set forth.

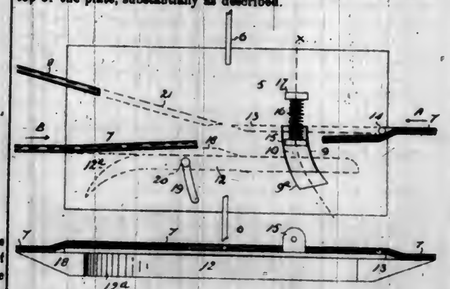


3. The combination, with a reel provided with shafts carrying the teeth, of a curved shield supported by the said shaft over the coils of the teeth, as set forth.

4. The combination, with a reel consisting of disks and shafts carrying the teeth, of a curved shield on the shaft over the coils of the teeth and held to the said shaft by the means which secures the teeth thereto, as set forth.

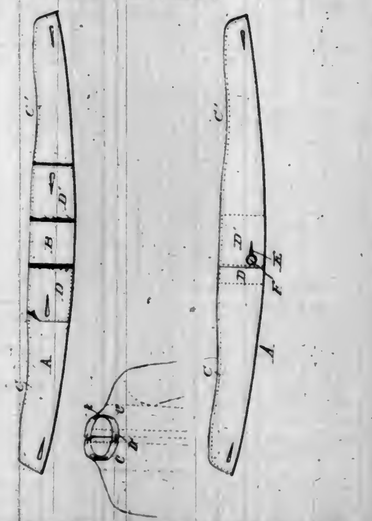
5. A reel provided with pivoted teeth, a shield over its tooth-shaft, and a board forming a combined wind-breaker and tooth-folder fixed relatively to the reel and to the rear and above the center thereof, as set forth.

481,502. PURIFICATION OF FATTY SUBSTANCES. JULES MASSENOT, Paris, France, assignor to the Société Anonyme des Parfums Naturels de Cannes, same place. Filed June 13, 1891. Serial No. 396,119. (No specimens.)



Claim.—The described process of separating volatile solvents from fatty substances by evaporating the solvent in a vacuum or rarefied medium until ebullition ceases, then injecting dry steam in jets into the body of the substance and maintaining the latter during the operation at a temperature above the boiling-point of water under the conditions present and above the temperature of the injected steam, as set forth.

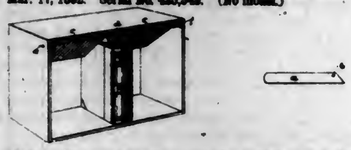
481,503. TROLLEY-SWITCH. JACOB S. MERKINS, Highlands, Colo., assignor of one-third to Emery C. Dye, same place. Filed Oct. 17, 1891. Serial No. 409,069. (No model.)



Claim.—1. The combination, with the main and branch overhead conductors, of the trolley-switch consisting of the plate 5, suitably supported and provided with two stationary track-flanges, a movable spring-actuated piece 10, located in a slot formed in plate 5 and carrying the depending guide and track-flanges rigidly secured thereto, said flanges being so arranged and connected on the plate that the trolley of a car moving in one direction passes to the side or branch conductor, while the trolley moving in the opposite direction on the main line keeps the main conductor, substantially as described.

2. The combination, with the main and branch overhead conductors, of the trolley-switch consisting of the plate 5, suitably supported and provided with the stationary track-flanges, a movable piece 10, located in a slot formed in plate 5 and carrying the depending guide and track-flanges and provided with a lug projecting above the plate 5, and a spring connected at one extremity with said lug and at the opposite extremity with a suitable stationary stop secured to the top of the plate, substantially as described.

3. The combination, with the overhead main and branch conductors, of a trolley-switch consisting of two plates 5, suitably supported and each provided with two stationary track-flanges, and a suitable spring-actuated piece located in a slot formed in each plate and carrying the depending guide and track-flanges, the flanges of each plate being so arranged and connected with each other and with the conductors that the trolley of the car moving in one direction keeps the main conductor after passing the plates, while the trolley moving in the opposite direction passes to the branch conductor after passing the first plate and back to the main conductor after passing the second plate, substantially as described.



481,504. SHIRT. ARTHUR METZER, Nashville, Tenn. Filed Jan. 4, 1892. Serial No. 416,963. (No specimens.)

Claim.—1. A shirt having the neckband provided with two independent flaps secured on the outer portion thereof, adapted to be folded back on the neckband and to form when so folded an intervening space between the flaps, the said flaps being provided with registering buttonholes and adapted to be folded one on the other in the direction of the length of said neckband, substantially as described.

2. A shirt having the neckband formed of the inner strip B and the outer strips C and C', having their inner ends D and D' left free to form overlapping flaps, the said flaps having registering buttonholes on their ends and adapted to be folded back in opposite directions, substantially as described.

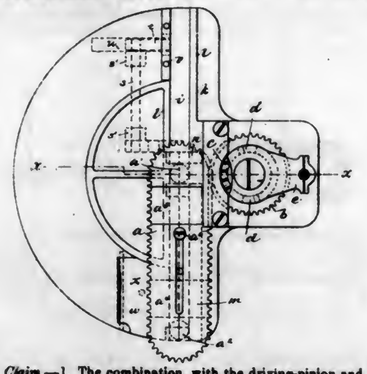
481,505. BOOK-SUPPORT. JAMES A. MUIR, Huntsville, Tex. Filed Mar. 17, 1892. Serial No. 425,249. (No model.)

Claim.—The combination, with the uprights and shelves of a book-stand, of a series of strips *a*, having beveled ends and perforations near their beveled ends, strung upon a wire between the shelves near the upper front part of the book-space, substantially as and for the purposes set forth.

481,506. WRENCH. BERNARD MCGILVRAY, Washington, D. C., assignor of one-half to Frederic W. Ritter, Jr., same place. Filed May 10, 1892. Serial No. 432,496. (No model.)

Claim.—1. The combination, with a monkey-wrench having parallel jaws, one of which is plain and the other serrated, of an interposed movable gripper-plate having parallel faces, one of which is plain and the other serrated, to correspond and coact with the respective plain and serrated faces of the parallel jaws of the monkey-wrench, substantially as and for the purposes specified.

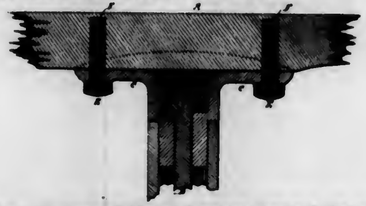
2. The combination, with a monkey-wrench having parallel jaws, one of which is plain and the other serrated, said jaws provided with lateral indentations, of a movable gripper-plate having parallel faces, one of which is plain and the other serrated, to coact with the corresponding jaws of the monkey-wrench, and a spring-plate secured to the movable gripper-plate and adapted to engage the indentations in the jaws of said monkey-wrench, substantially as and for the purposes specified.



481,507. STEAM-TRAP. JOHN MCKELLAR, San Francisco, Cal. Filed Apr. 14, 1892. Serial No. 429,174. (No model.)

Claim.—1. In a steam-trap, the combination of the main vessel A, the open-top float-vessel F, located within the main vessel, the valve-stem H, attached at its lower end to the bottom of the float-vessel, a ball-pointed valve I, carried loosely upon the upper end of the valve-stem, an inlet-pipe C and outlet-pipe D, both connected to the wall of the main vessel, a central member M' between the outlet and inlet pipes, said central member being provided with a diaphragm *m* and a nipple M^3, in which is formed a seat for the spherical-pointed valve I, while at the sides below the valve-seats are diagonal inlet-holes *c c*, and the tube or vessel Q, attached to the nipple M^3 and surrounding the valve-stem H, substantially as described.

2. In a steam-trap, the combination of the main vessel A, provided with the detachable covering plate E and lateral bosses B B, the sections of pipe or nipples N' N^3, screwed into the inner ends of said bosses, a float-vessel F within the main vessel, carrying the valve-stem H, having at its upper end the ball-pointed valve I, a central hollow member M', into which the nipples N' N^3 are screwed, said member M' being provided with jam-nuts *r* at each end and also with a diaphragm *m* and a downwardly-extending nipple M^3, in which is formed a seat for the pointed valve I, while at the sides below the valve-seat are diagonal inlet-holes *c c*, an inlet-pipe C, entering one of the bosses B, the adjacent pipe N' being provided with holes *n* on its bottom side, an outlet-pipe D, screwed into the other boss B, and the tube or vessel Q, attached to the nipple M^3 and surrounding the valve-stem H, so as to prevent any water from reaching the valve except from the bottom of the vessel F, substantially as described.



481,508. MECHANISM. ENOS PATTEN, Lynn, Mass., assignor to the Lynn Lasting Machine Company, same place. Filed Nov. 17, 1892. Serial No. 412,149. (No model.)

Claim.—1. The combination, with the driving-pinion and means for actuating the same, of an oblong gear having studs projecting therefrom adjacent to the opposite extremities thereof, a table formed with a channel in which the said studs may move lengthwise of the channel, and spring-pressed stops against which the studs act in succession to keep the channel clear, the said stops when projected into the channel passing in front of and behind one of the studs to hold the gear from further endwise movement and thereby cause it to turn upon the said stud as on a center, substantially as described.

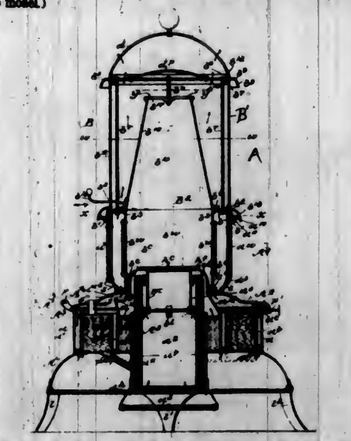
2. The combination, with the driving-pinion and means for actuating the same, of an oblong gear having studs projecting therefrom adjacent to the opposite extremities thereof, a table formed with a channel in which the studs may move lengthwise of the channel, and the spring-actuated wing *m* and arm *n*, substantially as described.

481,509. PARALLEL BARS. THEODORE PETERSON, Akron, Ohio. Filed Oct. 22, 1890. Serial No. 368,894. (No model.)

Claim.—1. The parallel bars and supports, combined with vertical bolts to unite said supports and bars and horizontal keys to retain said bolts in the bars, substantially as shown and described.

2. The combination, with the parallel bars and the supports provided with clips, of vertical bolts arranged to pass through said clips and into said bars and keys arranged to pass through said bars and bolts, substantially as shown and described.

481,510. SASH-PULLEY. FRANCIS V. PHILLIPS, Chicago, Ill., assignor to the Smith & Phillips Manufacturing Company, same place. Filed Oct. 31, 1891. Serial No. 409,439. (No model.)



Claim.—1. A sash-pulley shell provided with an opening or recess A', extending both sides of a subjacent wall or cross-bar *a*, said recess terminating at a shoulder *a'* at its inner end and forming a through-passage outside said bar *a*, whereby a nail driven through the passage into the end of the mortise in the stile may be bent to bring its head opposite the shoulder or cross-bar *a'*, substantially as and for the purpose set forth.

2. A sash-pulley shell provided with a recess A', bounded at its inner and outer ends, respectively, by the cross-bars and extending both sides of a subjacent cross-bar *a*, exterior to which said recess forms a through-passage, substantially as and for the purpose set forth.

3. The combination, with a mortised window-stile and a pulley-shell having in its face a recess A', bounded at its inner and outer ends by cross-bars *a'* and a^3 and extending both sides of a subjacent cross-bar *a*, exterior to which it forms a nail-hole a^4, of a nail entering the end of the stile-mortise through the hole a^4 and bent over the cross-bar *a*, with its head in position to encounter the cross-bar *a'* in moving or tending to move outward in the direction of the unbent portion of its shank.

481,511. CULINARY AND HEATING OIL-STOVE. VICTOR R. RANDALL, Burlington, Mich. Filed Jan. 8, 1892. Serial No. 417,886. (No model.)

Claim.—1. An oil-stove in which the wick-tube in its upper portion incloses an annular air-induction passage and which in its lower portion is itself directly encircled by an air-induction passage, which in turn is in its upper portion directly encircled by a water-containing vessel or compartment.

2. An oil-stove in which a central wick-tube in its upper portion incloses an annular air-induction passage, in which such central wick-tube is in its lower portion directly encircled by an air-induction passage around the wick-tube, in which the encircling air-induction passage is directly encircled by a water-chamber, and in which the encircling water-chamber is itself in turn directly encircled by an air-induction passage.

3. An oil-stove in which a central wick-tube incloses an air-induction passage, in which such central wick-tube is directly encircled by an air-induction passage, in which such encircling air-induction passage is directly encircled by a water-chamber, in which such encircling water-chamber is itself directly encircled by an air-induction passage, and in which the air-induction passage which encircles such encircling water-chamber is itself directly encircled by an oil-reservoir.

4. An oil-stove which has a central wick-tube which incloses an air-induction passage, and which in turn is encircled in succession by an air-induction passage, a water-chamber, an air-induction passage, an oil-reservoir, and an air-induction passage which exteriorly is inclosed by the annular outer shell of the reservoir-section of the base of such stove.

5. An oil-stove which has a central wick-tube which in its upper portion incloses a supporting-cylinder, and an annular air-induction space between such cylinder and the body of the wick-tube, an annular air-induction passage which directly incloses the wick-tube, an annular water-chamber which incloses the annular air induction passage which incloses the wick-tube, and a deflecting plate or ring which rises from the upper extremity of the outer periphery of the annular water-chamber and extends upwardly and inwardly along the upper portion of the wick-tube to a point in a plane above and near to the upper extremity of such wick-tube, the water-chamber being open at its top, whereby currents of air moistened by vapor are supplied to the outer portion or surface of the flame.

6. An oil-stove which is provided with a central wick-tube, with an annular water-chamber which encircles the wick-tube, with an annular air-induction passage between the wick-tube and the water-reservoir, which discharges into the flame-space and combustion-chamber of the stove, and with an annular air-induction passage which directly encircles the annular water-chamber and which discharges only into the air-warming chamber of the stove.

7. An oil-stove in which are combined a central wick-tube and an annular water-chamber which encircles the wick-tube and which is surmounted by an upwardly-indrawn deflecting and separating ring which overhangs the area between the outer extremity of the water-chamber and the outer periphery of the wick-tube.

8. An oil-stove in which are combined an annular oil-reservoir, an annular water-chamber, and an annular wick-tube, each of which directly encircles and each of which is directly encircled by an annular air-induction passage, the water-chamber and the oil reservoir being in the same horizontal plane.

9. An oil-stove in which are combined a central annular wick-tube which is provided interiorly with a vertically-placed deflector-bearing cylinder which extends above the plane of the wick-tube, a water-chamber which encircles the wick-tube at a short distance therefrom, and an annular deflector which rises from the outer wall of the water-chamber and is upwardly indrawn from such wall toward and along the wick-tube to a point a short distance from the deflector which is borne upon the cylinder.

10. In an oil-stove, a central oil and wick chamber, an annular water-chamber which encircles the central oil and wick chamber at a short distance therefrom, an annular oil-reservoir outside the annular water-chamber, and a conduit which extends from the lower extremity of the annular oil-reservoir to a point near the lower extremity of the central oil and wick chamber, in combination.

11. In an oil-stove, a central annular wick-tube, an annular air-casing which encircles the central and lower portions of such wick-tube, and a horizontally-arranged floor-screen suitably suspended from the stove at a short distance below the lower extremity of the central wick-tube, in combination.

12. In an oil-stove, the exterior casing provided with the interior seat *s* and the interior deflector provided with the exterior seat *s'*, combined with the closing-ring *c r*, adapted to such seats, whereby when the combustion-chamber is removed the lower section of the stove is adapted to use for culinary purposes.

13. In an oil-stove, a central annular wick-tube in which in its upper portion is supported a capped and flanged cylinder which forms with the wick-tube an annular air-passage and a flame-deflector, an annular air-casing which encircles the central and lower portions of such wick-tube, and a horizontally-arranged floor-screen suitably suspended from the stove at a short distance below the lower extremity of the central wick-tube, in combination.

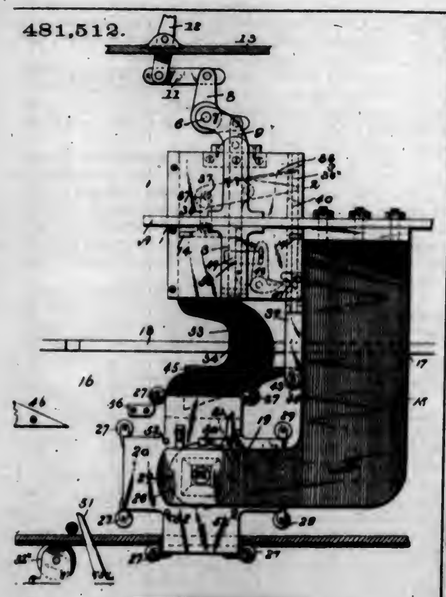
14. In an oil-stove, the exterior casing provided with the interior seat *s*, combined with the interior deflector provided with the exterior seat *s'*, substantially as set forth.

15. In an oil-stove, the exterior casing having vertical cylindrical drum, combined with the inclosed combustion-chamber having conical upper section provided with vertically-extending corrugations, for the purpose set forth.

16. In an oil-stove, the described exterior cylindrical radiating-casing, the inclosed upwardly-indrawn combustion-chamber, and the circular deflector suitably supported at a point above the combustion-chamber and in or near the horizontal plane of the upper extremity of the radiating-casing, in combination, substantially as and for the purpose specified.

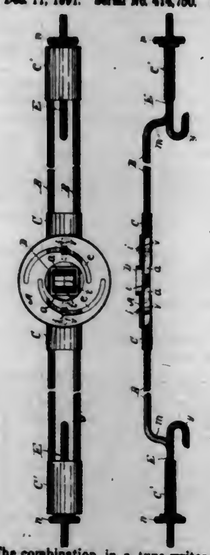
17. In an oil-stove, the non-reciprocating exterior casing having a series of windows arranged in alternation with intermediate imperforate sections, combined with the interior reciprocating combustion-chamber which is provided with a series of windows which, like those in the outer casing, are arranged in alternation with intermediate imperforate sections, whereby the stove is made illuminating or non-illuminating, as may be desired.

481,512. GRIP FOR CABLE RAILWAYS. GEORGE SCHORFF and LOUIS SCHORFF, Philadelphia, Pa., assignors of one-third to Christian F. Mertz, same place. Filed Feb. 25, 1892. Serial No. 423,776. (No model.)



Claim.—1. The combination, with the truck, of a sliding box supported thereby, a vertically-movable wedge-bar, a revoluble grip provided with projecting pins, an arm to strike said pins, a shifting-rod, and cam-blocks arranged within the conduit to contact with said shifting-rod, substantially as described.

2. The combination, with the contact-blocks and rigid arm within the conduit, of a revoluble grip provided with pins to strike said arm, a shifting-rod to engage said blocks, a wedge-bar, and locking mechanism between the wedge-bar and shifting-rod, whereby the wedge-bar is raised as the shifting-rod is lowered, and vice versa, substantially as described.

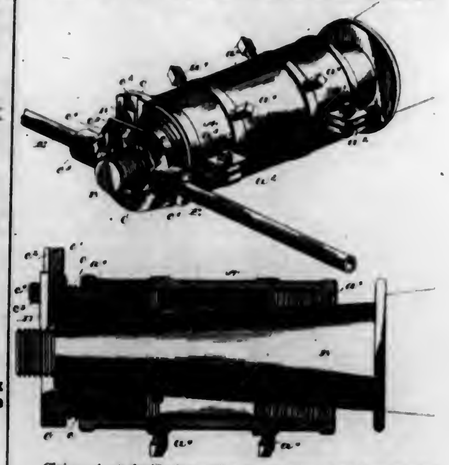


3. The combination, with the two-part revolving grip provided with projecting pins, of the rigid arm adapted to strike said pins, and pulleys or rollers arranged upon the grip sections oppositely in pairs to support the cable, substantially as described.

4. The combination, with the truck and sliding box, of a movable wedge-bar arranged in said box, a sliding shifting-rod arranged in said box, locking devices between the wedge-bar and shifting-rod, a frame depending from the truck and supporting a revolvable grip, and means, substantially as described, for automatically revolving said grip a partial revolution at cable-crossings, substantially as described.

481,512.

481,513. ALIGNER FOR TYPE-WRITING MACHINES. FRANK M. SPAULDING, Kalamazoo, Mich., assignor to Edward S. Mayfield, same place. Filed Dec. 11, 1891. Serial No. 414,760. (No model.)



Claim.—1. The combination, in a type-writer aligner, of a plurality of clamp-plungers connected with the same cam or slotted disk, and by which they are given a movement away from or toward each other when the cam or slotted disk is operated, substantially as set forth.

2. The combination, in a type-writer aligner, of a plurality of clamp-plungers connected with the same cam or slotted disk, and by which they are given a movement away from or toward each other when the cam or slotted disk is operated, and means, substantially as described, whereby the clamp-plungers are guided back and forth, for the purpose set forth.

3. The combination, in a type-writer aligner, of a plurality of clamp-plungers connected with the same cam or disk, with two screws or pins by which they are given a movement away from or toward each other when the cam or slotted disk is operated, and means, substantially as set forth, whereby the clamp-plungers are guided back and forth and held in position, for the purpose set forth.

4. The combination, in a type-writer aligner, of clamp-plungers, a cam or slotted disk, guide and housing for the clamp-plungers, two rods or wires passing through the housing to form a frame and support for the device, and two hooked rods having knurled nuts for the purpose of fastening the frame and device to the type-writer, substantially as set forth.

481,514. TOOL FOR THREADING AXLES. JOHN C. STOCKEL, Indiana, Pa. Filed Nov. 12, 1891. Serial No. 411,762. (No model.)

Claim.—1. A device for cutting a screw-thread on the end of a vehicle axle or skein, consisting of a box or case having a sleeve movable in and out of its end and internally screw-threaded at its ends respectively, right and left, said sleeve carrying a cutting-die and having means for working or rotating it, and said box or case having means to secure it rigidly in position upon the axle, substantially as set forth.

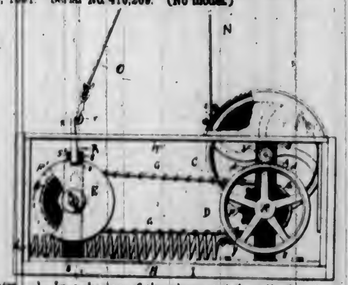
2. A case or box A, split lengthwise at *a*, provided with means for closing this aperture and having center bolts a^4 at various points through its periphery, and screw-threaded internally at its ends, respectively, right and left, combined with the sleeve C, screw-threaded on the inner end and having in its front end an adjustable cutting-die, and means for rotation in or out of the sleeve.

3. The sleeve C, having attached to it suitable handles to move it and provided with a cutting-die D, adjustably fixed in its forward edge by means of the clamp and screw-threaded on the inner end of its periphery, and combined with the box A, screw-threaded inside at each end to receive a sleeve, all substantially as described.

481,515. MARKING-GAGE. JOSIAH A. TRAUT, New Britain, Conn., assignor to the Stanley Rule and Level Company, same place. Filed Dec. 22, 1891. Serial No. 415,867. (No model.)

Claim.—1. In a marking-gage, the combination, with the gage-bar having one laterally-projecting head fixed thereon and with a second head adjustable on said bar, of a cutter-carrier independent of the gage-bar and adjustable and movable longitudinally of the gage-bar to carry the marking-point to positions on either side of the fixed head, substantially as described.

2. In a marking-gage, the combination, with the gage-bar having the fixed laterally-projecting butt-gage head at one end and on one side thereof, of the sliding cutter-carrier having two points projecting in different directions and movable to positions on either side of said fixed head, substantially as described.



3. In a marking-gage, the combination, with the hollow gage-bar having the laterally-projecting butt-gage head at one end thereof and having the slots 20 and 22, of the cutter-carrier fitted to slide within the gage-bar and having two oppositely-disposed cutters fitted to slide within said slots, respectively, and means for sliding the carrier to carry said cutters within or beyond said head, substantially as described.

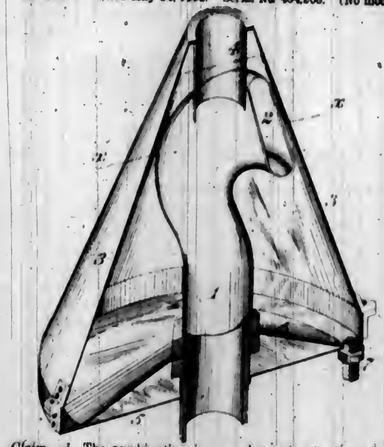
4. In a marking-gage, the combination, with a hollow gage-bar longitudinally slotted at one end thereof, of the head fixed in the slotted end of the bar and projecting on one side thereof, the cutter-carrier sliding in the bar and carrying cutters in the same transverse plane, and one projecting in the direction of said head and the other in an opposite direction thereto, said cutters being adapted to enter said slots, and means for sliding the cutter-carrier, whereby the gage is adapted for setting off distances varying by the thickness of said head, substantially as described.

481,516. COMPOSITION FOR SOFTENING ENAMELED LEATHER. ROBERT L. TUDOR, Cincinnati, Ohio, assignor of one-half to Geo. A. Springmeier, same place. Filed Dec. 18, 1891. Serial No. 415,638. (No specimens.)

Claim.—The herein-described composition of matter for softening enameled and patent leather or cloth, consisting of pure white soap, washing-powder, vinegar, and pure water combined in the proportions herein specified.

481,517. TROLLEY-PROTECTOR. JOHN WALSH, Cleveland, Ohio, assignor of one-half to Jacob Frederick Grether, same place. Filed Dec 23, 1891. Serial No. 416,269. (No model.)

Claim.—1. In a device of the character described, a drum and a sprocket mounted upon separate shafts, driving connection between said drum and sprocket, a sprocket and a disk having a notch cut in its periphery mounted upon another shaft, a link-chain around said sprockets, a spring having one end attached to said chain and the opposite end fixed to an immovable object, and a catch adapted to engage the notch in the disk, substantially as shown and described.

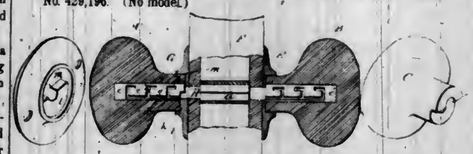


2. In a device of the character described, a support having a drum and a sprocket journaled therein, driving connection between said drum and sprocket, a support having journaled therein a shaft carrying a sprocket, and a disk having a notch in its periphery, driving connection between said sprockets, a spring having one end attached to the driving connection between the sprockets and its opposite end fixed to an immovable object, a catch, which normally engages the notch in the disk, and means for disengaging the catch from said notch, substantially as shown and described.

3. The combination, in a device of the character described, of a trolley, a winding drum or reel, flexible connection between the trolley and winding drum or reel, with means for turning the drum or reel to wind said flexible connection thereon, which means consists in a disk having a notch in its periphery, a catch, which normally engages said notch, an auxiliary check connection O between the catch and the trolley, driving connection between the disk and winding drum or reel, and a spring to actuate said driving mechanism when the catch is disengaged from the notch in the disk, substantially as shown and described.

4. The combination, in a device of the character described, of a winding drum or reel, a disk having a notch in its periphery, driving connection between the winding drum or reel and the disk, and an auxiliary check connection O, a catch to engage the notch in the disk, the catch being adapted to be disengaged from said notch by the action of the trolley and the check connection O, and a spring adapted to actuate the driving mechanism between the disk and the drum or reel when the catch shall have been disengaged from the notch in the disk, substantially as shown and described.

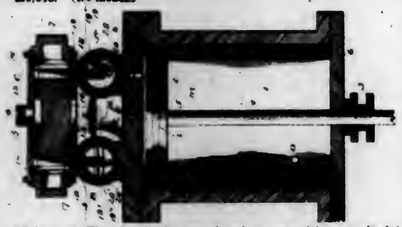
5. In a device for automatically lowering a disengaged trolley-wheel, the combination of a suitable support, as I, standards, as B and B', shafts A and A^3, journaled in the support B, and a shaft A', journaled in standard B', the shaft A, carrying a drum C, and a pinion V, shaft A^3, carrying a sprocket F and gear-wheel D, and the shaft A', carrying a notched disk E and sprocket F', a suitable driving mechanism between the sprocket-wheels F and F' for operating the drum C and the disk E, a catch R, connected with the trolley and adapted to be lowered into the notch in the disk E and prevent the disk from turning while the trolley is engaged with the wire, but which will become automatically disengaged therefrom the moment the trolley leaves the wire, and a spring, as H, connected to the drum in such a manner as to automatically wind up the operating-trolley rope onto the drum, and thereby lower the trolley, substantially as and for the purpose described.



481,518. CONDENSER-HEAD. SAMUEL H. WOODBRIDGE, Boston, Mass., assignor to the Westinghouse, Church, Kerr & Company, New York, N. Y. Filed May 24, 1892. Serial No. 434,208. (No model.)

Claim.—1. The combination, in a condenser-head, of an exhaust-nozzle of approximately spiral form at and adjacent to its discharge end and having an inclined and elongated discharge-outlet thereat, truncated-cone casing inclosing the major portion of the nozzle with its smaller end above and adjacent to the discharge-outlet thereof, a steam-outlet pipe extending into the casing from its smaller end to a point below the adjacent end of the exhaust-nozzle discharge-outlet, a base-plate closing the larger end of the casing, and a drip-pipe leading out of the casing at or near its larger end, substantially as set forth.

2. The combination, in a condenser-head, of an exhaust-nozzle having a main body of substantially cylindrical form at and adjacent to a receiving end adapted to be connected to a steam-exhaust pipe and which is thereafter turned into approximately spiral form at and adjacent to an elongated discharge-outlet inclined relatively to the axis of the main body, a truncated-cone inclosing casing concentric with said main body and having its smaller end above and adjacent to the discharge-outlet of the nozzle, a steam-outlet pipe extending into the casing from its smaller end to a point below the adjacent end of the exhaust-nozzle discharge-outlet, a base-plate closing the larger end of the casing, and a drip-pipe leading out of the casing at or near its larger end, substantially as set forth.



481,519. KNOB ATTACHMENT. WILLIAM A. G. ASHLEY, New Bedford, Mass., assignor of two-thirds to James M. Lawton, Jr., and Austin T. Howland, both of same place. Filed Apr. 14, 1892. Serial No. 429,196. (No model.)

Claim.—1. The knob-spindle having a stud or lug near opposite ends, in combination with knobs having the interior of their shanks provided with a longitudinal slot and a series of transverse slots communicating therewith, and the transverse slots each terminating in an offset, substantially as specified.

2. A knob-spindle provided with a stud or lug on one side, in combination with knobs having the interior of their shanks provided with a longitudinal slot and a series of transverse slots communicating therewith and each terminating in an offset, one of the said knobs having the end of its shank provided with a shoulder, and a rose provided with a shoulder adapted to engage the shoulder of the knob-shank, substantially as and for the purpose specified.

481,520. STEAM-ACTUATED VALVE. ELLIS BARTHOLOMEW, Lima, Ohio, assignor of four-fifths to Oscar W. Bell, same place, and Oliver Jay and Daniel W. Jay, St. Mary's, Ohio. Filed Apr. 18, 1892. Serial No. 429,613. (No model.)

Claim.—1. The herein-described valve, comprising a cylindrical casing having a supply-opening in its top, an exit-opening opposite thereto leading to the exhaust, and openings at the sides of the exit-openings, and a valve within said casing having near its ends heads provided with packing-rings and at its center a three-way shank, in combination with cylinders to which said side openings lead, reciprocating pistons in said cylinders, and connections, substantially as described, between said pistons and the valve for oscillating the latter, as set forth.

2. The herein-described valve, comprising a cylindrical casing having near its ends transverse slots and at its center a supply-opening in its top, an exit-opening opposite thereto leading to the exhaust, and openings at the sides of the exit-opening, and a valve within said casing having near its ends heads provided with packing-rings, at its ends depending arms passing through said slots, and at its center a three way shank, in combination with cylinders having longitudinally-slotted tops registering with the slots in said casing, passages connecting said side openings with the opposite ends of the two cylinders, openings leading from the other ends of the two cylinders, cylindrical pistons within said cylinders and having slots in their tops registering with those in the cylinders, said arms projecting through the three registering slots into the pistons, and transverse pins in said pistons at opposite sides of the two arms, as and for the purposes set forth.

3. The herein-described valve, comprising a cylindrical casing having near its ends transverse slots and at its center a supply-opening in its top, an exit-opening opposite thereto leading to the exhaust, and openings at the sides of the exit-opening, and a valve within said casing having near its ends heads provided with packing-rings, at its ends depending arms passing through said slots, and at its center a three-way shank, in combination with cylinders having longitudinally-slotted tops registering with the slots in said casing, passages connecting said side openings with the opposite ends of the two cylinders, reciprocating pistons within said cylinders, and pins on the pistons at opposite sides of said arms, as and for the purposes set forth.

4. The herein-described valve, comprising a cylindrical casing having near its ends transverse slots, and at its center a supply-opening in its top, an exit-opening opposite thereto, and openings at the sides of the exit-opening, and a valve within said casing having near its ends heads provided with packing-rings, at its ends depending arms passing through said slots, and at its center a three-way shank, in combination with cylinders standing beneath the ends of the casing at right angles thereto and having longitudinally-slotted tops registering with the slots in said casing, passages connecting said side openings with the opposite ends of the two cylinders, reciprocating pistons within said cylinders, pins on the pistons at opposite sides of said arms, a box between the cylinders communicating with said exit-opening, and an exhaust-pipe leading from said box, as and for the purpose set forth.

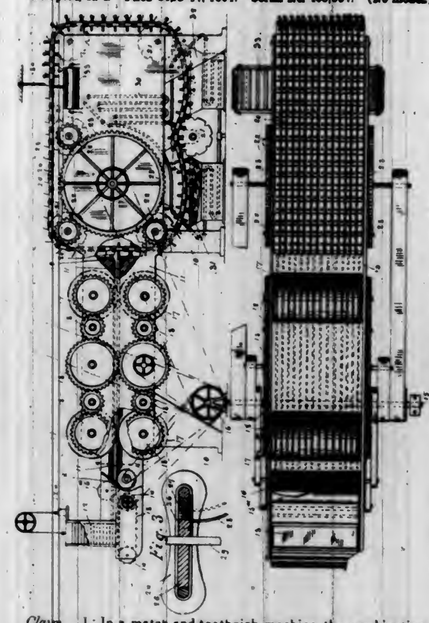
5. The combination, with a valve comprising a cylindrical casing having a supply-opening in its top, an exit-opening leading to the exhaust, and openings at the sides of the exit-opening, a valve within said casing having near its ends heads provided with packing-rings and at its center a three-way shank, auxiliary cylinders to which said side openings lead, reciprocating pistons in these cylinders, and connections, substantially as described, between said pistons, and the valve for operating the latter, of a main cylinder, a piston-head therein, and passages connecting this cylinder with the auxiliary cylinders, as and for the purpose set forth.

6. The combination, with a valve comprising a cylindrical casing having near its ends transverse slots and at its center a supply-opening in its top, an exit-opening opposite thereto leading to the exhaust, and openings at the sides of the exit-opening, a valve within said casing having near its ends heads provided with packing-rings, at its ends depending arms passing through said slots, and at its center a three-way shank, two auxiliary cylinders having longitudinal slots in their tops registering with those in the casing, passages connecting said side openings with the right end of the first and the left end of the second auxiliary cylinder, reciprocating pistons within these cylinders, and pins on the pistons at opposite sides of the arms, of a main cylinder, a piston-head therein, an upper end passage leading from near the right end of the first auxiliary cylinder to the top of the main cylinder, an upper side passage leading from the left end of the first auxiliary cylinder to the side of the main cylinder just below the upper limit of movement of the piston-head therein, a lower end passage leading from near the left end of the second auxiliary cylinder to the lower end of the main cylinder, and a lower side passage leading from the right end of the second auxiliary cylinder to the side of the main cylinder just above the lower limit of movement of the piston-head therein, as and for the purpose set forth.

7. The combination, with a valve comprising a cylindrical casing having a supply and exit openings and openings at the sides of the exit-opening, a valve within said casing having a three-way shank, two auxiliary cylinders to which said side openings lead, pistons in these cylinders, and connections, substantially as described, between said pistons and the valve for oscillating the latter, of a main cylinder, a piston-head therein, and passages connecting this cylinder with the auxiliary cylinders, as and for the purpose set forth.

8. The combination, with a valve comprising a casing having supply and exit openings and openings at the sides of the exit-openings, a valve within said casing having a three-way shank, two auxiliary cylinders to which said side openings lead, pistons in these cylinders, and connections, substantially as described, between said pistons and the valve for oscillating the latter, of a main cylinder, a piston-head therein, an upper end passage leading from near the right end of the first auxiliary cylinder to the top of the main cylinder, an upper side passage leading from the left end of the first auxiliary cylinder to the side of the main cylinder just below the upper limit of the movement of the piston-head therein, a lower end passage leading from near the left end of the second auxiliary cylinder to the lower end of the main cylinder, and a lower side passage leading from the right end of the second auxiliary cylinder to the side of the main cylinder just above the lower limit of movement of the piston-head therein, as and for the purpose set forth.

9. The combination, with a casing having a three-way valve therein, two auxiliary cylinders, passages for supplying steam from the casing alternately to opposite ends of these cylinders, pistons in the latter, and means, substantially as described, for shifting said valve, of a main cylinder, a piston-head therein, an upper end passage leading from near the right end of the first auxiliary cylinder to the top of the main cylinder, an upper side passage leading from the left end of the first auxiliary cylinder to the side of the main cylinder just below the upper limit of movement of the piston head therein, a lower end passage leading from near the left end of the second auxiliary cylinder to the lower end of the main cylinder, and a lower side passage leading from the right end of the second auxiliary cylinder to the side of the main cylinder just above the lower limit of movement of the piston-head therein, as and for the purpose set forth.



481,521. PACKAGE FOR PULVERIZED SUBSTANCES. JULIUS BINA, Furth, Germany. Filed Apr. 1, 1892. Serial No. 427,313. (No model.)

Claim.—1. A package for snuff or other pulverulent material, composed of a pyramidal body having a slotted opening at the apex, a spring-key inserted into the slotted apex, a base placed on the wider end of the body, and a wrapper of corresponding shape extending over the body, base, and key, substantially as set forth.

2. A package for snuff or other pulverulent articles, composed of a body of pyramidal shape having a slot in its apex, a spring-key inserted into the slot of the apex for closing the same, a base applied to the larger end of the body, and a wrapper made of a shape corresponding to the body and extending over the base-body and a spring-key, said wrapper being provided at some distance from its apex near the point where the spring-key is located with perforations for permitting the convenient detaching of the apex of the wrapper when opening the package, substantially as set forth.

481,522. MATCH AND TOOTHPICK MACHINE. JOSEPH BOULARD, Newport, R. I. Filed Sept. 17, 1891. Serial No. 406,087. (No model.)

Claim.—1. In a match and toothpick machine, the combination, with a series of saws and a carrier, of a printing mechanism between the saws and carrier, substantially as and for the purpose set forth.

2. In a match and toothpick machine, the combination, with a series of saws, of a printing mechanism in rear of the saws and a carrier in rear of the printing mechanism and provided with automatically-operated grippers for seizing the splints, substantially as described.

3. In a match and toothpick machine, the combination, with a series of saws and a feed mechanism for delivering the material to the saws, of printing-rollers in rear of the saws and an endless carrier in rear of the printing-rollers and provided with automatically-operated grippers for seizing the splints, substantially as described.

4. In a match and toothpick machine, the combination, with a series of saws and a printing mechanism in rear of the saws, of an endless carrier provided with automatically-operated grippers for seizing the splints as they are delivered from the printing mechanism and a heater within the frame, around which the endless carrier travels, substantially as described.

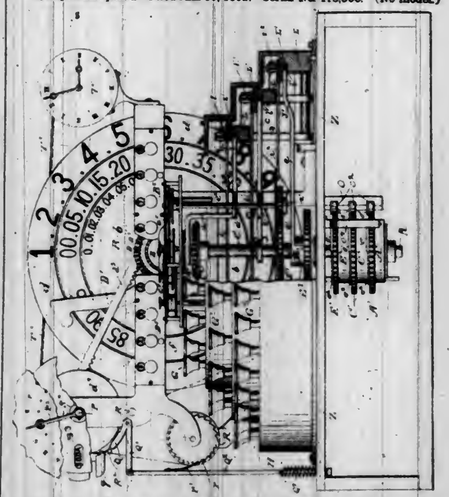
5. A match and toothpick machine comprising a bench, a feed mechanism arranged to deliver upon the bench, a series of saws arranged to project through the bench-top, a carrier held to move opposite the rear end of the bench, a series of catches carried by the carrier and adapted to receive articles from the bench, automatic means for operating the catches, and baths arranged beneath the carrier and adjacent thereto, substantially as described.

6. A match and toothpick machine comprising a bench, a feed mechanism adapted to deliver upon the bench, a series of saws mounted in the bench and projecting through the bench-top, a series of revoluble printing-rollers mounted upon the bench, a carrier adapted to move opposite the rear end of the bench, said carrier having a series of spring-catches therein, a carrier arranged beneath the top surface of the main carrier and adapted to deliver into a receptacle, and automatic means for operating the catches, substantially as described.

7. A match and toothpick machine comprising a bench, a feed-belt arranged to deliver upon the bench, a feed-box mounted above the feed-belt, a series of saws held to revolve in the bench-top, a series of printing-rollers mounted on the bench, a carrier held to move opposite the rear end of the bench, said carrier having a series of spring-catches therein adapted to receive articles from the bench, a laterally extending carrier arranged beneath the main carrier and adapted to receive articles therefrom, and means for operating the carrier-catches, substantially as described.

8. In a match and toothpick machine, the combination, with the bench and the mechanism for feeding articles longitudinally thereon, of a main carrier held to move opposite the end of the bench, said carrier having a series of spring-catches thereon, baths arranged in the path of the carrier, a laterally-extending carrier arranged beneath the main carrier, and means for operating the main carrier-catches, substantially as described.

9. In a match and toothpick machine, the combination, with the spring-pressed carrier-catches consisting of sliding spring-pressed jaws having projecting fingers, of tripping flanges and arms arranged in the paths of the catch-fingers, substantially as described.



10. In a match and toothpick machine, an endless carrier formed of links provided with spring-pressed jaws, said jaws having curved fingers, substantially as described.

481,523. POCKET COIN-RECEPTACLE. FRED. H. BROWN, Chicago, Ill., assignor of one-half to Sidney F. Andrews, same place. Filed Mar. 26, 1891. Serial No. 386,486. (No model.)

Claim.—In a pocket coin-receptacle, the combination, with a series of tubes secured together longitudinally of each other by means of a strip of solder, each tube being open at one end and provided with an inwardly-projecting retaining-flange, of a spring-actuated follower in each tube, and a name-plate secured to the tubes at substantially right angles to their axes, whereby the tubes are firmly secured together and a means is afforded for marking or identifying the carrier, substantially as set forth.

481,524. CASH REGISTER, INDICATOR, AND RECORDER. CHARLES F. BROWN, Yonkers, N. Y., assignor to the Royal Machine Company, same place. Filed Jan. 19, 1892. Serial No. 418,560. (No model.)

Claim.—1. The combination of a vertical shaft, a gear and ratchet thereon, a sliding rack-bar meshing with said gear, a pawl engaging said ratchet, and a movable stud adapted to push said rack-bar in one direction, and mechanism for automatically disengaging the pawl and ratchet before the stud moves the rack-bar, substantially as specified.

2. The combination of a shaft, a gear and ratchet thereon, a sliding rack meshing with said gear, and a pawl engaging said ratchet with a strip connected to and movable with said rack-bar and laterally movable thereon, whereby when the strip and rack-bar are pushed inward the pawl is disengaged from the ratchet, substantially as described.

3. The combination of a spring-controlled shaft, a ratchet and gear thereon, a sliding rack-bar meshing with said gear, and a bell-crank pawl adapted to engage said ratchet with a spring-controlled strip loosely connected to said rack-bar and sliding therewith, but lat-

erally movable thereon, adapted to disengage said pawl from the ratchet when it and the rack-bar are pushed inward, and a sliding drawer having a stud adapted to engage and move the rack-bar and strip in one direction, substantially as specified.

4. The combination of a slotted key-stem, and an angularly-slotted pull-strap extending past the key-stem, and a pin in the slot of the stem engaging the slot in the strap, substantially as set forth.

5. The combination of a semicircular series of slotted key stems, and an angularly-slotted curved pull-strap extending along the series of key-stems, and pins in the slots of the stems engaging the slots in the straps, with a movable drawer, a locking device therefor, and connections between said locking device and pull-strap, substantially as and for the purpose set forth.

6. The combination of a slotted key-stem, and an angularly-slotted pull-strap extending through the key-stem, and a pin on the stem engaging a slot in the strap, with a movable drawer a locking device therefor, and connections between said locking device and pull-strap, whereby when the drawer is closed the pull-strap is brought back to normal position, substantially as described.

7. The combination of a drawer, vertically-movable bolt, a key-stem, and a pull-strap operated from said stem with a pivoted bell-crank lever interposed between the bolt and pull-strap for operating said bolt from said strap, substantially as specified.

8. The combination of the drawer and a pull-strap, a bolt, a hinged bar connected thereto, a bell-crank lever having one end underlying said bar and its other end connected to the pull-strap, and a depressing-spring, substantially as described.

9. The combination of a bolt, a hinged bar connected thereto, a bell-crank lever for lifting said bar, and a depressing-spring, and a dogging device for locking said lever when the bolt is raised, substantially as described.

10. The combination of a drawer-bolt, a key-stem, and a pull-strap operated from said stem with a bell-crank lever interposed between the bolt and pull-strap for operating said bolt from said strap and a sliding dogging-plate arranged to lock said lever when the bolt is lifted, substantially as set forth.

11. In a cash-register, the combination of a drawer, a locking-bolt therefor, a series of key-stems, mechanism for raising and locking said bolt upon the depression of a key-stem, and thereby releasing the drawer and locking the depressed key, and mechanism whereby the bolt and stem are released when the drawer is closed, substantially as described.

12. The combination of the drawer, a locking-bolt therefor, a bell-crank lever and connections for operating said bolt, and key-stems and connections for shifting said lever with a spring-controlled latch-plate adapted to lock said lever when the bolt is raised and mechanism operated by the drawer in closing for disengaging said latch-plate and lever, substantially as set forth.

13. The combination of a bolt, a hinged bar connected thereto a bell-crank lever for lifting said bar, and a depressing-spring and a dogging device for locking said lever when the bolt is raised, a pivoted arm for disengaging said dogging device, and a movable drawer adapted to shift said arm in closing, substantially as specified.

14. The combination of a drawer-bolt, a key-stem, and a pull-strap operated from said stem with a bell-crank lever interposed between the bolt and pull-strap for operating said bolt from said strap, and a sliding dogging-plate arranged to lock said lever when the bolt is lifted, and a swinging arm engaging said plate and connected to a crank-arm in the drawer space, arranged to be shifted by the drawer in closing, substantially as and for the purpose described.

15. In a cash-register, the combination of a drawer-bolt, a hinged presser-bar connected thereto, a pivoted bell-crank lever having an arm underlying said bar, the series of key-stems and connections between the same and upstanding arm of the bar, and a latch-plate underlying said bar and end of lever, and the spring and swinging arm for shifting said plate, substantially as described.

16. In a cash-register, the combination of a drawer, its locking-bolt, and a hinged presser-bar connected thereto with a series of key-stems, a pull-strap operated thereby, a pivoted bell-crank lever having one end linked to the end of the strap and the other underlying the bar, the latch-plate underlying said lever, the spring and swinging arm for shifting said plate, and the rock shaft and crank-arm therein adapted to be struck and shifted by a lug on the drawer, substantially as set forth.

17. In a cash-register, the combination of the drawer-bolt, a hinged bar connected thereto, a series of bell-crank levers adapted to independently lift said bar, and the row of key-stems, and connections between the respective rows of stems and levers, and the independent locking-plates for locking the levers when the bar is shifted so as to disengage the bolt, substantially as set forth.

18. The combination of the presser-bar, the series of bell-crank levers pivoted beside and adapted to lift the same when shifted, the rows of key-stems, the pull-straps operated therefrom, and the connections between the upper ends of the levers and the pull-straps with the dogging-plates for the levers and the springs and swinging arm for shifting said plates, substantially as and for the purpose specified.

19. The combination of the revoluble shaft, the arm connected thereto, and the bolt for locking said arm in normal position, and key-stems, pull-straps, and connected mechanism for shifting said bolt to release the arm, substantially as described.

20. The combination of a revoluble shaft, its stop-arm, and the bolt for locking said arm in normal position with the key-stems and mechanism operated therefrom, whereby the bolt is disengaged from the arm when a key is depressed, substantially as set forth.

21. The combination of the revoluble shaft, its stop-arm, and a locking-bolt therefor with a pivoted lever and connections for shifting said bolt and a key-stem and connections for shifting said lever, substantially as and for the purpose specified.

22. The combination of a movable drawer, a revoluble shaft, its arm, and a locking device engaging said arm to hold it in normal position with mechanism for releasing the arm and devices for keeping said bolt retracted while the drawer is open and for projecting it to lock the arm when the drawer closes, substantially as described.

23. The combination of the revoluble shaft, its stop-arm, and a locking-bolt therefor with a pivoted lever and connections for shifting said bolt, and a key-stem and connections for shifting said lever to release the bolt, a dogging device for locking said lever when shifted from the key-stem, and a movable drawer and mechanism whereby upon the closing of the drawer the lever is thrown back to normal position, substantially as described.

24. The combination of the vertical shaft, its locking-arm, the indicating-dial operated by said shaft, the bolt for locking said arm, and thereby the dial and shaft, in normal position, a series of key-stems and connections for shifting said bolt to release the arm, a movable drawer, and mechanism operated by said drawer whereby upon the closing of the drawer the shaft and dial and arm are brought back to normal position and the bolt caused to lock the arm, substantially as set forth.

25. The combination of a series of parallel key-stems arranged in a semicircular row, a curved pull-strap engaged by said stems, and a centrally-pivoted bar uniting the ends of said strap with a drawer-locking device connected to one end of said strap, substantially as described.

26. The combination of a movable drawer, a locking device therefor, an indicating-dial, a vertical shaft and gear for operating the same, a radial arm attached to said shaft, a series of key-stems adapted to arrest the movement of said arm, a locking device for holding said arm in normal position, a curved pull-strap engaged by said keys adapted to shift the said locking devices when a key is depressed to release the drawer and locking-arm, and a bar fulcrumed on said shaft and connecting the extremities of said pull-strap, substantially as and for the purpose specified.

27. The combination of a vertical shaft or sleeve, an indicating-dial driven therefrom, a horizontal set of registering-wheels above said shaft, a second vertical shaft connected to the first registering-wheel, and the pinion on the lower end of said shaft engaging a gear on the first shaft, substantially as described.

28. The combination, in a cash register, indicator, and recorder, of an indicating-dial, a type-wheel loosely journaled on a shaft beside the dial and driven by gearing therefrom, and a type-wheel fixed to said shaft, means for revolving said shaft by hand to shift said wheel, a sliding drawer and paper-feed devices, and a platen and a push-rod operated by the drawer for taking a record from the type on both wheels, substantially as described.

29. In a cash register, indicator, and recorder, the combination of an indicating mechanism, a shaft journaled beside the same, a type-wheel fixed thereon, and means for revolving said shaft by hand with a type-wheel loosely journaled on said shaft and operated from the indicating mechanism, and an endless belt running over a pulley loosely journaled on said shaft, driven by clockwork, and bearing a series of type time characters, and mechanism, substantially as described, for taking an impression from the type on the wheels and belt upon a record, substantially as described.

30. In a cash register, indicator, and recorder, the combination of mechanism for recording the amount of each sale with independent hand-operated devices, substantially as described, for simultaneously indicating on the record the person by whom the sale is made, and a type-bearing belt driven by a clock mechanism for recording the time of such sale, and means for recording also the kind of goods sold, substantially as and for the purpose set forth.

31. In a cash register, indicator, and recorder, the combination of indicating mechanism and type wheels driven therefrom by racks and pinions for recording the amount of each sale, independently-operated type-wheels for recording the number of the person making the sale and the kind of goods sold, and the type belt driven by clockwork for recording the time of each sale with a sliding drawer and mechanism, substantially as described, operated thereby for simultaneously producing an impression from the type on the several wheels and belt upon a record-strip, substantially as described.

32. In a cash-register, the combination of a pair of independent indicators, and independent rows of keys, and a pull-strap for each row of keys operated thereby and respectively connected to one of the indicators, and means, substantially as described, whereby when one pull-strap is shifted the other will be locked unless simultaneously moved, substantially as described.

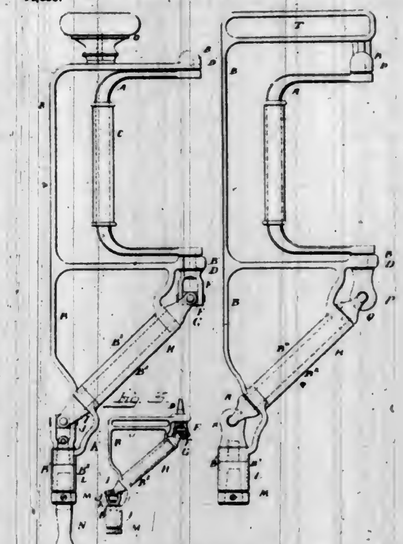
33. In a cash-register, the combination of independent rows of keys, a pull-strap for each row, and the levers respectively connected to the straps, each adapted to release one of the indicating mechanisms when shifted, with a locking device operated by either lever, whereby when one pull-strap is shifted the other will be locked, yet is so arranged that both may be shifted together, substantially as specified.

34. The combination of the pull-straps and the key-stems for shifting them with the locking-rod, its arms underlying the ends of pull-straps and adapted to engage and lock the straps, and means for shifting said rods from the straps, so that when either pull-strap is shifted by the depression of one of its actuating-keys the other strap will be locked unless one of its keys be simultaneously depressed, substantially as described.

35. In a cash-register, the combination of a drawer-bolt, a hinged bar connected thereto, a series of bell-crank levers, each having one end underlying and adapted to independently lift said bar, the pull-straps connected thereto and to the rows of key-stems, and independent connections between the respective pull-straps and the respective levers, substantially as described.

36. The combination of a series of parallel key-stems arranged in a curved row with a slotted curved pull-strap set edgewise and having a series of upwardly-inclined slots respectively engaged by the several keys and its ends connected by a cross-bar, substantially as and for the purposes specified.

481,525. CAR-COUPLING. JAMES C. CARRICK, Spivey, Kans., assignor of one-third to E. R. Smalley, same place. Filed Apr. 20, 1892. Serial No. 429,893. (No model.)



Claim.—1. In a car-coupling, the combination, with the draw-head A, having the longitudinally-extending slot *a* in its top, bottom, and rear walls, of the link-engaging hook mounted in said slot and comprising the body *d*, pivotally connected to the draw-head, the shank *e*, with head *f*, extending above and below the shank and having its forward edge convexly curved, and the bridge-bar *g*, spanning the slot *a* to limit the movement of said hook, substantially as and for the purposes specified.

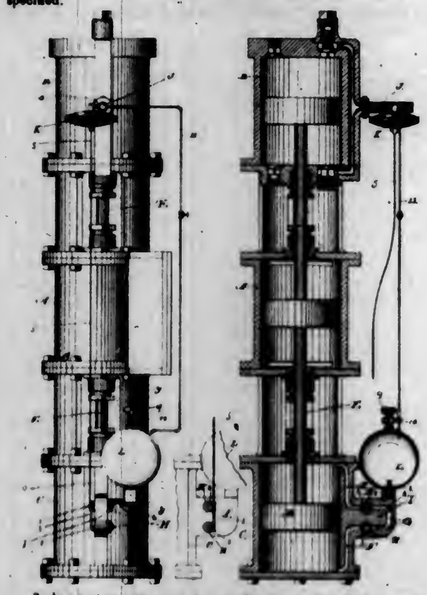
2. In a car-coupler, substantially as described, the combination, with the draw-head, the transverse shaft *b*, taking through the draw-head and having the angular branch *c* at one end, and the link-engaging hook pivotally connected to said shaft, of the keeper C, connected to the draw-head and adapted to engage the branch *c* of the shaft *b*, so as to prevent a casual displacement of the same, substantially as and for the purpose set forth.

3. In a car-coupler, substantially as specified, the combination, with the draw-head and the link-engaging hook pivotally mounted therein, of the longitudinally-extending lever E, a link connecting the forward end of said lever with the link-engaging hook, the transverse rocking lever F, the angular arm connecting the inner portions of the levers E F, the upwardly-extending handle H, pivotally connected to the lever F adjacent to the free end thereof, and the laterally and downwardly extending handle also connected to the lever F adjacent to the free end thereof, substantially as specified.

481,526. UNIVERSAL-JOINTED BRACE. ARTHUR C. DERLOS, Paris, France, assignor, by mesne assignments, to the National Manufacturing Company, of Pennsylvania. Filed Jan. 18, 1892. Serial No. 418,520. (No model.) Patented in France Feb. 1, 1890, No. 203,484; in Belgium June 30, 1890, No. 91,065, and in England Sept. 20, 1889, No. 14,833.

Claim.—1. A brace consisting of a frame having a suitable holding and bearing handle, a continuously-revoluble crank-handle mounted in an offset in said frame, a spindle mounted at an angle in said frame and connected by means of a universal joint with said crank-handle, and the bit or drill receiving spindle mounted beneath the holding and bearing handle, with its axis parallel to that of the crank-handle and connected by a universal joint with the other end of the angularly-arranged spindle, substantially as hereinbefore described.

2. The combination, with a suitable frame having at one end a revoluble spindle adapted by a suitable socket to receive a bit or tool and at the other end a stationary holding and bearing handle, of an offset on the frame, a driving-spindle having means for rotating it mounted on said offset, with its axis parallel with the axis of the bit-spindle, and the angularly-arranged spindle located between the driving and bit spindles and having universal-joint connection therewith, substantially as and for the purpose set forth.



3. In a brace, the combination of a frame consisting of a longitudinal back, arms extending laterally from said back, a handle on one end of the frame, a longitudinal bit-spindle bearing on the other end of said frame, and an obliquely-arranged bearing supported by one end of the frame and the adjacent lateral arm, a crank-handle journaled in the respective ends of the lateral arms, a bit-spindle journaled in the bearing in the end of the frame, and a spindle in the obliquely-arranged bearing, having universal-joint connection at its respective ends with the crank-handle and the bit-spindle, all substantially as shown and described.

481,527. SPEED-REGULATOR FOR AIR-COMPRESSOR PISTONS. ERNEST C. FASOLDT, Albany, N. Y., assignor of one-half to John Boyd Thacher, same place. Filed Dec. 29, 1891. Serial No. 416,441. (No model.)

Claim.—1. In a steam-actuated air-compressor, and in combination therewith, a liquid-containing cylinder provided with a reciprocating piston which is connected with the air-compressing mechanism, a passage which forms a free communication between the opposite ends of the interior of said cylinder, a pair of retarding-cocks arranged transversely of said passage and fitted to partially rotate therein, and a diaphragm operated by compressed air and connected to said retarding-cocks for automatically operating the latter to vary the area of said passage, as and for the purpose herein specified.

2. In an air-compressor, the combination of a cylinder which is approximately filled with liquid, a piston fitted to reciprocate in said cylinder in such manner that the liquid will be alternately transferred to opposite ends of said cylinder, the latter having a passage which forms a communication between said opposite ends, retarding-cocks arranged in said passage for the purpose of regulating the area of the

opening therethrough, and mechanism, substantially as set forth, whereby said retarding-cock will be automatically controlled by the varying pressure of the compressed air, as and for the purpose herein specified.

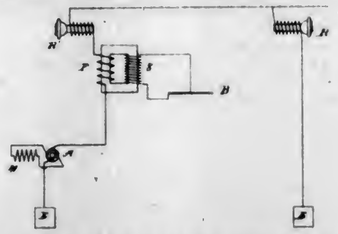
3. In an air-compressor, the combination of a cylinder approximately or entirely filled with liquid and provided with a piston fitted to reciprocate therein, as herein described, a replenishing-chamber containing liquid and connected to said cylinder by a pipe connection, whereby the loss of liquid from said cylinder by reason of leakage therefrom will be compensated for, and a pipe for conveying compressed air from the eduction-pipe into said replenishing-chamber, substantially as specified.

481,528. PARER AND CORER. PHILEMON T. GATES, Brooklyn, N. Y. Filed Oct. 30, 1891. Serial No. 410,327. (No model.)

Claim.—1. A parer having, in combination with a stock composed of the metal tube, the raised knife-blade, which is bent to a concavo-convex shape in cross-section and with its convexity reverse to that of said tube for stiffening the blade and adapting it to conform with the outline of a vegetable, substantially as shown and described.

2. A parer and corer having a stock composed of the metal tube, which is of a tapering form cut obliquely at its smaller end to form the corer, cylindrical at such end, and elliptical at its larger end for producing an oblong core-escape way, in combination with the knife-blade joined to said tube, substantially as shown and described.

481,529. TELEPHONY. JOHN W. GIBBONEY, Lynn, Mass. Filed Feb. 8, 1892. Serial No. 420,626. (No model.)



Claim.—1. The method of transmitting speech, consisting in passing over the line-waves of alternating current or varying current of slight audibility in the receivers and superposing thereon waves of current corresponding to vocal waves, substantially as described.

2. The method of transmitting speech, consisting in putting upon the line alternating or pulsating waves of current inaudible, or nearly so, in receivers and inductively superposing waves of current corresponding to the vocal waves received by a transmitter.

3. The method of transmitting speech, consisting in passing over a line or circuit, including the receivers and transmitting devices, waves of electric current incapable or nearly incapable of producing audible tones in the receivers, and modifying the induction between the line transmitter-coil and a local coil in inductive relation thereto through the agency of voice-waves.

4. The method of transmitting speech along a line having receivers and transmitters, consisting in producing induction between a pulsating or alternating current in the line of such rate as not to produce strongly-audible tones or sounds in the receiver and a local circuit in inductive relation to a coil in the line and modifying the resistance, capacity, or self-induction of such local circuit by the vocal waves received by the transmitter.

5. In combination with a telephone-line having receivers thereon of means for producing in said line varying or alternating current impulses of such period as not to produce strongly-audible tones or sounds in receivers, and means, such as a local coil in inductive relation to a coil in the line, for superimposing undulations inductively transferred from the local coil to the line-coil, the local coil being provided with a telephone-transmitter in its circuit, whereby the capacity or the resistance of its circuit may be varied by the waves of the voice communicated to said transmitter.

6. In a telephone system in which alternating or varying impulses are passed over the line, an induction-coil the primary of which is in the line and the secondary of which is local to the transmitter and connected to the said transmitter, whereby the variations of resistance, capacity, or self-induction set up in the transmitter by the voice-waves are inductively transferred to the primary coil in the line to vary its current or superimpose the vocal undulatory current on the alternating or varying line-current.

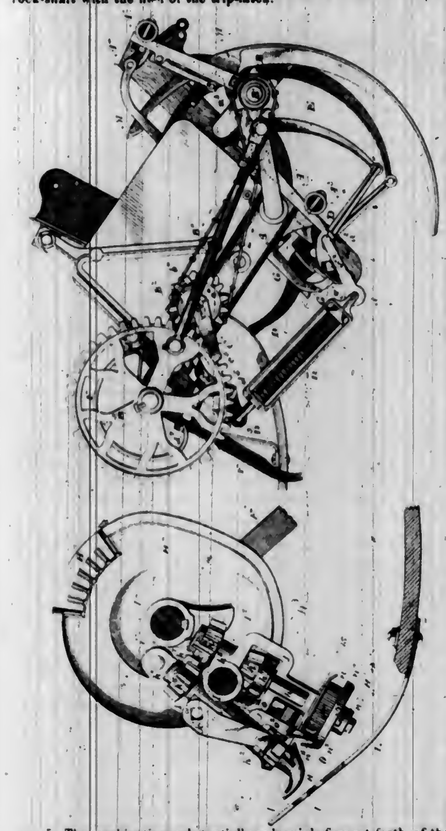
7. The combination, in a telephone system, of an induction-coil provided with a primary coil of many turns traversed by alternating or varying impulses of current, and also provided with a secondary coil of few turns locally connected through a transmitter, whereby the resistance of said local coil-circuit is varied, as described, and for the purpose specified.

8. The combination, in a telephone apparatus, of a source of alternating or varying electric current, a line-circuit connected to said current source, a transformer or inductorium the primary coil of which is in said line-circuit or inductively related thereto, and a secondary circuit for said transformer, whose resistance, capacity, or self-induction is adapted to be modified by sound waves, as set forth.

9. The method of telephoning, consisting in passing over a circuit an alternating current or a current periodically changing in value and inductively modifying said current in correspondence with sound vibrations.

10. The method of telephoning, consisting in passing over a circuit an alternating current or a current of changing value, passing said current through a coil of an inductorium, and varying the counter-induction of said inductorium by the agency of sound-vibrations.

11. The method of telephoning, consisting in feeding the line with an electric current of periodically rising and falling potential, passing said current through a counter-inductive device included in the line-circuit, and varying the counter-induction of said device by the agency of sound-vibrations, whereby the said current is made to flow over said line in impulses or waves corresponding to the sound-vibrations.



481,530. GRAIN-BINDER. HENRY R. PRIDMORE, Chicago, Ill. Filed Sept. 1, 1887. Serial No. 248,506. (No model.) Patented in England Aug. 10, 1886, No. 10,212.

Claim.—1. The combination, substantially as hereinbefore set forth, of the main gear, a sprocket-wheel on the constantly-driven packer-shaft, an opposing sprocket-wheel on a stub-axle adjacent to the main gear, a loose pinion mounted on said stub-axle and meshing with the main gear, a trip-clutch between said loose pinion and the adjacent sprocket-wheel, a trip-latch operating to hold the trip-dog out of engagement, the outside tripping and compressing finger mounted on a rock-shaft, and a link directly connecting a crank from said rock-shaft with the heel of the trip latch.

2. The combination, substantially as hereinbefore set forth, with the trip-clutch, of the pivoted trip-latch, the tripping and compressing finger closing the passage from the grain-receptacle, the rock-shaft on which it is mounted, and the yielding link connecting an arm from said rock-shaft with the heel of the trip-latch.

3. The combination, substantially as hereinbefore set forth, with a pinion meshing directly with the main gear, of a trip-dog carried by said pinion, a pivoted trip latch to disengage said trip-dog, an outside tripping and compressing finger mounted on a rock-shaft, and a yielding pitman connection between an arm of said rock-shaft and the heel of the trip-latch.

4. The combination, substantially as hereinbefore set forth, of the main gear, a pinion meshing therewith, a trip-dog carried by said pinion and engaging with lugs from a constantly-driven part of the gearing, a lever pivoted to the frame and vibrated by a cam on said main gear, a trip-latch pivoted to the outer end of said lever, a trip-finger mounted on a rock-shaft, and a pitman connecting an arm from this rock-shaft with the heel of the trip-latch.

5. The combination, substantially as hereinbefore set forth, of the main gear, a pinion meshing therewith and carrying a trip-dog, constantly-driven mechanism with which said dog engages, a lever pivoted to the frame and vibrated by a cam on said main gear, a trip-latch pivoted to the free end of said lever, a spring interposed between the trip-latch and the lever to press the nose of the trip-latch down into the path of the trip-dog, a trip-finger mounted on a rock-shaft, and a pitman connecting an arm from said rock-shaft with the heel of the trip-latch.

6. The combination, substantially as hereinbefore set forth, of the main gear, a pinion meshing therewith and carrying a trip-dog, a constantly-driven wheel having lugs with which said trip-dog engages, a lever pivoted to the frame and vibrated by a cam on the main gear, a trip-latch pivoted to the outer end of said lever, a spring to press said trip-latch down to bring its nose into the path of the trip-dog, and a stop on the lever to limit its downward movement, a trip-finger mounted on a rock-shaft, and an elastically-yielding link connecting an arm from said rock-shaft with the heel of the trip-latch.

7. The combination, substantially as hereinbefore set forth, with the main gear and its driving-pinion and the trip-dog carried by said pinion, of the lever pivoted to the frame and vibrated by a cam on said main gear, the trip-latch pivoted to the outer end of the lever and extending inward past the center of said lever, the spring pressing said trip latch down and the stop which limits its movement, the trip-finger and its rock-shaft and the spring-link connecting an arm from said rock-shaft with the heel of the trip-lever.

8. The combination, substantially as hereinbefore set forth, with the trip-finger and its rock-shaft and the arm from said rock-shaft, of the stop on the frame to limit the inward movement of the trip-finger, the trip-latch, the lever to which it is pivoted, the cam which vibrates said lever, having a slow upward incline or eccentric to lift the lever gradually until the close of the binding operation, and the spring-link connecting the arm from the compressor-shaft with the heel of the trip-latch, whereby the compressing-finger is first carried inward against the gavel until stopped by the contact of its arm with said stop and then the stress of the spring-pitman constantly increased to increase the resistance of the compressor.

9. The combination, substantially as hereinbefore set forth, of the trip-latch, the lever to which it is pivoted, the cam which actuates said lever, having first a concentric reach that the machine may start without moving the lever, then a quick outward incline, then a slow outward or eccentric reach, the tripping and compressing finger, the rock-shaft on which it is mounted, the arm from said rock-shaft, the stop on the frame, and the spring-link connecting the heel of the trip-latch with said arm, for the purpose described.

10. The combination, substantially as hereinbefore set forth, of the trip-latch, the lever to which it is pivoted, the cam which vibrates said lever, having, practically, the outline shown and described, the lug from said lever and the tappet revolving with the shaft which supports said cam, the tripping and compressing finger, the rock-shaft on which it is mounted, and the spring-link connecting an arm from said rock-shaft with the heel of the trip-finger.

11. The combination, substantially as hereinbefore set forth, with the trip-finger and its rock-shaft and the cam at the base of the trip-finger, of the table trip extended to rest on said cam and means for rocking said shaft to carry the trip-finger inward after the binder starts, whereby the table-trip is lifted against the gavel to serve as an under compressor.

12. The combination, substantially as hereinbefore set forth, with the outside trip-finger and its rock-shaft and the cam at the base of said finger, of the table trip extended to rest on said cam, the trip-latch link connected to an arm from said rock-shaft, and means whereby said trip-latch is raised after the binder starts to carry the trip finger inward, thereby lifting the table-trip to cause it to serve as an under compressor.

13. The combination, substantially as hereinbefore set forth, with the outside trip-finger and the rock shaft on which it is mounted, of the cam at the base of said finger, the table-trip extended to rest on said cam, the arm from said rock-shaft, and the stop on the frame against which said arm is carried, the spring-link connecting said arm with the heel of the trip-latch, and means whereby said trip-latch is lifted after the binder starts to carry the trip-finger forward to operate the table-trip to serve as an under compressor.

14. The combination, substantially as hereinbefore set forth, with the outside trip-finger, the rock-shaft on which it is mounted, and the cam at the base of the trip-finger, of the table trip extended to rest on said cam, the arm from the rock-shaft, the stop against which said arm is carried, the trip-latch, the lever to which it is pivoted, the cam which vibrates said lever upward after the binder starts, and the spring-link connecting the heel of the trip-latch with the rock-shaft.

15. The combination, substantially as hereinbefore set forth, of the tyer-cam having a segment-rack and delay-surface, the holder-spindle having a pinion and delay-shoe engaging with said rack and delay-surface, and the knotter-spindle engaged with said holder-spindle by intermeshing gears and driven therefrom.

16. The combination, substantially as hereinbefore set forth, of the tyer-cam having a segment-rack and delay-surface, the holder-spindle having a driving-pinion and delay-shoe engaging with said rack and delay surface, the knotter-spiodle arranged obliquely to the holder-spindle, the intermeshing bevel-gears at the head of each spindle and the binder-arm arranged to pass between the knotter-spindle and holder-spindle.

17. The combination, substantially as hereinbefore set forth, of the holder-spindle having a crown-disk holder at its foot and arranged on one side of the plane of movement of the binder-arm and the knotter-spindle having a tying-bill at its foot and arranged on the other side of said plane of movement.

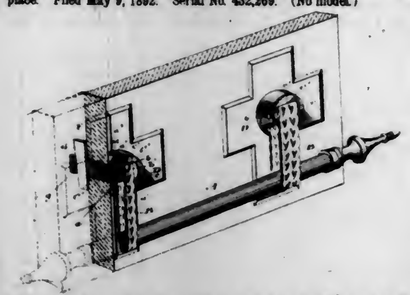
18. The combination, substantially as hereinbefore set forth, to form a holder, of the crown-disk having a serrated peripheral flange, the shoe pressing against the serrated face of said flange, a notch at its rear to stop the cord from passing beneath, and the spring arranged to press said shoe against the flange.

19. The combination, substantially as hereinbefore set forth, with the crown-disk and its shoe pressing against the exterior of the flange, of the inclined ledge or shoulder at the rear of the advancing notch in said disk.

20. The combination, substantially as hereinbefore set forth, with the crown-disk and the shoe which presses against its periphery, of the web projecting out from the bottom of said disk and upturned into a concentric flange to prevent the strands of cord from falling below the proper level or from being displaced.

21. The combination, substantially as hereinbefore set forth, with the crown-disk and the shoe which presses upon its flange, of the knife revolving with said crown-disk exterior to the shoe.

22. The combination, substantially as hereinbefore set forth, with the crown-disk and its shoe, of the web extending out from the bottom of the disk and having an upturned concentric flange exteading up to about the level of the bottom of the notches in said crown-disk and cut away opposite and beneath the advancing notch to permit the fag ends to drop out.



23. The combination, substantially as hereinbefore set forth, with the crown-disk and its shoe, of the plate attached to the bottom of said crown-disk and having an exterior concentric flange, the knife on said plate, and means whereby said plate may be adjusted axially about said disk to advance or retard the action of the knife.

24. The combination, substantially as hereinbefore set forth, with the crown-disk having two notches and a broad belay-tooth between them, of the shoe pressing upon the exterior of the flange and means for giving said crown-disk a complete revolution in each knotting operation.

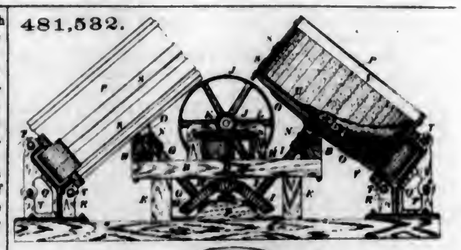
25. The combination, substantially as hereinbefore set forth, with the crown-disk and its shoe, of the cap covering said crown-disk and slotted to direct the cord-strands into the proper notch, while preventing them from falling into the notch at any other place.

26. The combination, substantially as hereinbefore set forth, of the tyer-cam, the supporting-stock for the holder and knotter spindle pivoted upon the frame eccentrically to the tyer-shaft, means for giving the tying-bill a complete revolution and stopping it with its jaws pointing inward, the cam-groove in the face of the tyer-cam, and a roller from the heel of the swinging stock extended into said cam-groove, whereby the knotter and holder are swung outward after the knot has been laid to strip and tighten it.

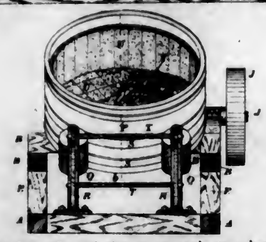
481,531. CASKET-HANDLE. JOHN D. RIPSON, Thoroid, Canada, assignor of one half to John Joseph Franklin and Joseph Battle, same place. Filed May 9, 1892. Serial No. 432,269. (No model.)

Claim.—1. In combination with a casket, a handle having its shank passing through the wall of the casket and provided with an annular flange bearing against said wall and a thin plate of sheet metal having an opening to receive the flange and having its edges bent down a distance corresponding to the thickness of the flange, the said shank having an enlarged head overlapping the edge of the opening in the plate and adapted to rest against the face thereof, substantially as described.

2. In combination with a casket, a shank for supporting the link and handle, a thin plate of sheet metal having an opening therein with a notch in the edge thereof, and an annular flange on the shank adapted to fit the opening in the plate and provided with a projection adapted to engage the notch, substantially as and for the purpose set forth.



3. As a new article of manufacture, and in combination with the shank C, provided with jaws *c* and secured in position, as specified, the links B, made of braided endless woven wire formed rigid and having trunnions in the upper ends, as and for the purpose specified.

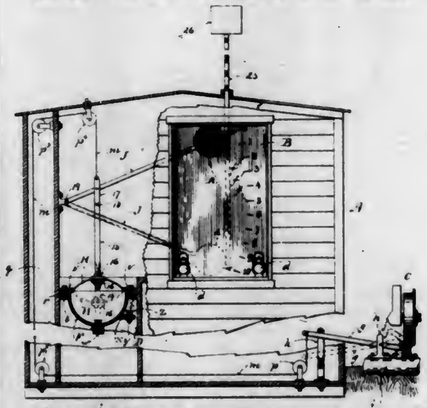


481,532. PULVERIZER. GEORGE H. SMITH, Chicago, Ill. Filed July 17, 1891. Serial No. 399,829. (No model.)

Claim.—1. In a pulverizer for reducing metals and minerals, a central motor, a multiple of vessels arranged around the motor and adapted to be operated thereby, each of said vessels having its plane of revolution at an angle to a horizontal and adapted to receive material to be operated upon and to carry it part way up the inclination formed by the sides and bottom of the vessel, substantially as set forth.

2. In a pulverizer for reducing metals and minerals, a base-frame, a rectangular frame mounted thereon, a support at each end of the base-frame, provided with rollers, two vessels mounted in the frames,

481,532.



each having its plane of revolution at an angle to a horizontal and adapted to bear against the rollers of the support at its respective end of the frame, and a central motor for operating said vessels, substantially as set forth.

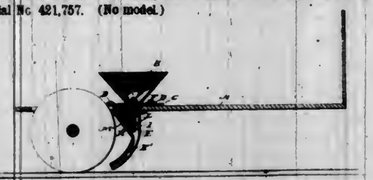
3. In a pulverizer for reducing metals and minerals, a base-frame, a rectangular frame mounted thereon, a block at the center of the base-frame, provided with three step-bearings, a shaft journaled in each bearing and in bearings upon the rectangular frame, a motor for the central shaft, and a vessel upon the upper end of each of the other shafts, the plane of revolution of which is at an angle to a horizontal, and a support for each vessel, substantially as set forth.

481,533. RAILWAY TIME-SIGNAL. SAMUEL SMITH, Lawrence, Mass., assignor of two-thirds to John T. McKone and Charles E. Hill same place. Filed Mar. 14, 1892. Serial No. 424,765. (No model.)

Claim.—1. A time-signal for railways, comprising a pivoted index, a spaced rod attached near the end thereof, a drum provided with valves, a diaphragm closing the mouth of said drum, a rod connected to said diaphragm and pivoted index, a lever actuated by the car-wheels, and mechanism connecting said rod and lever.

2. A time-signal for railways, comprising a drum provided with valves, a diaphragm in said drum, a rod connected to said diaphragm, provided with a pivoted extension, a lever actuated by the car-wheels, mechanism connecting said pivoted extension and lever, and a pivoted index connected to said pivoted extension.

3. A time signal for railways, comprising a closed dial, a pivoted index, a spaced rod attached thereto, a drum provided with valves, a diaphragm in said drum, a rod provided with a pivoted extension, connected to said diaphragm and to said pivoted index, a lever actuated by the car-wheels, and mechanism connecting said rod and pivoted extension.



4. In a time-signal for railways, the closed dial B and pivoted index J, in combination with the drum F, provided with the valves *w y*, the diaphragm H, closing the mouth of said drum, the rod 15, connecting said diaphragm and index, the lever *g*, actuated by contact with the car-wheels, and a connection between said rod and lever, all being arranged to operate substantially as described.

481,534. PEN OR PENCIL HOLDER AND ART OF MAKING THE SAME. HENRY T. SMITH, Pawtucket, R. I. Filed May 10, 1892. Serial No. 432,510. (No model.)

Claim.—1. A tubular metallic pen or pencil holder having a tapered stem or shank and consisting of a single jointless piece of stock as described.

2. The art of forming pen or pencil holders, consisting in taking a piece of tubular stock, forming the bowl *b* in one end thereof, and subjecting the opposite end and stem portion to tapered hammering-dies, as set forth.

481,535. SANDING DEVICE FOR STREET-CARS. JOHN H. VOGAN and GEORGE L. VOGAN, New Castle, Pa. Filed Feb. 16, 1892. Serial No. 421,757. (No model.)

Claim.—1. The combination, with a main hopper provided at its lower end with a short tube, of an auxiliary hopper arranged below the main hopper and surrounding the lower end of the tube attached thereto, a valve arranged in the main hopper, a rock-shaft journaled in the walls of the auxiliary hopper and connected with the valve in the main hopper and with an operating-lever, a discharge-pipe connected to the auxiliary hopper, and means for holding the valve normally closed, substantially as described.

2. The combination, with a main hopper, of an auxiliary hopper arranged below and communicating with the main hopper, a discharge-pipe leading from the auxiliary hopper, a rock-shaft journaled in the walls of the auxiliary hopper and connected to an operating-lever, a valve arranged within the main hopper and having its stem extending into the auxiliary hopper and connected to the rock-shaft therein, and means for normally keeping said valve closed, substantially as described.

3. The combination, with a main hopper, of an auxiliary hopper arranged below and communicating with the main hopper, a rock-shaft journaled in the auxiliary hopper and connected with an operating-lever at one end, a valve arranged in the main hopper and having its stem extending into the auxiliary hopper and connected to an arm on the rock-shaft, a discharge-pipe connected to the lower end of the auxiliary hopper, and a flat spring-arm having one end secured in position and its free end bifurcated and bearing against an arm on the rock-shaft, substantially as described.

481,536. BICYCLE. ALEXANDER WINTON, Cleveland, Ohio. Filed Nov. 27, 1891. Serial No. 413,215. (No model.)

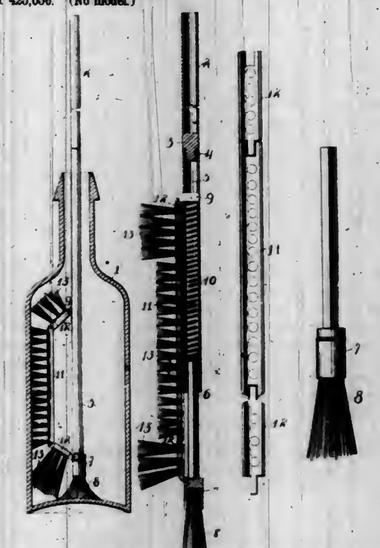
Claim.—1. An arm for supporting a wheel of a bicycle, pivoted on the fork and provided with a head having springs inclosed therein, substantially as described.

2. The fork of a bicycle, wheel-supporting arms pivoted on the said fork, and inclosed springs about said pivot-point, substantially as described.

3. In a bicycle, the fork having a spindle fixed on its lower end and lateral projections about the spindle, an arm having a hub adapted to turn on said spindle, the hub having lateral webs, and springs between the said webs and the projections about the spindle, substantially as described.

4. In a bicycle, the fork having a disk with lateral projections and a spindle rigid with its lower end, in combination with an arm pivoted on said spindle, having a rim and webbing within the rim about said spindle, and springs between the opposed parts of the arm and the fork, substantially as described.

5. In a bicycle, a fork having a spindle and a disk with lateral projections on opposite sides of the spindle, in combination with an arm having a head with a hub on said spindle and webs radiating from said hub, and rubber springs interposed between the said lateral projections on the fork and the webs of the said head, substantially as described.



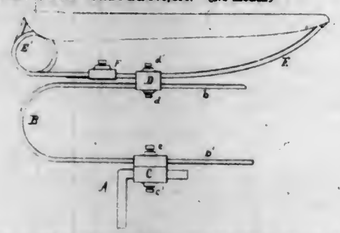
6. The fork with a lateral spindle and cone-bearings thereon, in combination with an arm having a hub adapted to said bearings and springs about said hub between parts of said head and parts of the said fork, substantially as described.

7. The fork having a disk with lateral projections and a spindle central with the disk at its lower end, in combination with an arm having a head pivoted on said spindle and provided with webbing-springs of different tension interposed between said webbing and the said lateral projections on opposite sides of the said webbing, substantially as described.

8. In a bicycle, a carrying-wheel, a shaft for said wheel, and arms rigidly connected with the ends of said shaft, in combination with the fork of the bicycle, on which said arms are pivoted, and inclosed springs at the pivot-points connecting said parts, substantially as described.

9. In a bicycle, the cone-bearings for the wheel, having flanges, and the axle on which said cones are adjustable, in combination with the arms fixed to the axle and locking mechanism between said arms and said cone flanges, substantially as described.

481,537. DEVICE FOR CLEANING BOTTLES OR SIMILAR RECEPTACLES. CHARLES F. WOERNER, St. Louis, Mo., assignor of one-half to Adelbert Schneider, same place. Filed Mar. 15, 1892. Serial No. 425,056. (No model.)



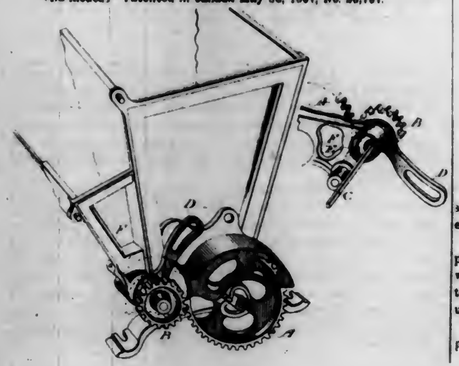
Claim.—1. In a bottle-washer, the combination, with a tubular standard and an outwardly-yielding shank movable longitudinally in said standard, but fixed against independent lateral movement, of a plate carrying tufts and consisting of three sections pivotally connected together, the free ends of said plate being respectively pivotally connected with the standard and shank, substantially as and for the purpose set forth.

2. A bottle-washer consisting of a tube, such as 5, adapted to be movably attached to a rotating tube or pipe 2, a shank, such as 6, adapted to be moved within said tube 5, a tuft carried by the lower end of the said shank and adapted to be brought in contact with the bottom of the bottle, a sectionalized plate, the sections of which are hinged together, one end of which is attached to the tube 5 and the other end attached to the socket carried by the shank 6, whereby the tufts carried by the said plates are brought in contact with the sides of the bottle when pressure is applied to the said tuft 8, substantially as described.

3. A bottle-washer consisting of a tube, such as 5, a plate 9, carried thereby, a square opening formed in the said tube, a square shank, such as 6, adapted to be located within said opening, a socket, such as 7, attached to one end of the said shank, a tuft secured within said socket, a sectionalized concave plate the sections of which are hinged together, one end of which is movably attached to the projecting end of the plate 9 and the opposite end movably attached to the said socket 7, and tufts carried by the said sectionalized plate and adapted to be brought in contact with the sides of the bottle when pressure is applied by the bottle to the said tuft 8, substantially as described.

4. A bottle-washer comprising a tube, such as 5, a plate, such as 9, attached thereto, a shank 6, adapted to be located within said tube, a tuft carried by the said shank, a coil-spring located between said plate and the upper end of the said shank, and a sectionalized plate, such as 11, the ends of which are movably attached to the plate 9 and the shank 6, respectively, whereby the tufts carried by the said sectionalized plate are brought in contact with the sides of the bottle when pressure is applied to the tuft carried by the said shank, substantially as described.

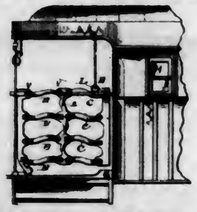
481,538. BICYCLE-SADDLE. ARTHUR L. GARFORD, Elyria, Ohio. Filed Jan. 2, 1891. Serial No. 376,461. (No model.)



Claim.—1. The combination of a substantially-U-shaped spring B and a clip for adjustably securing the lower leg thereof to the saddle-support, a front seat-support, a rear seat-support, said supports being adjustably secured to the upper leg of said spring B, with the front seat-support adjacent to the bent part of said spring, substantially as and for the purpose specified.

2. The combination of a substantially-U-shaped spring B, a clip for adjustably securing the lower leg thereof to the saddle-support, a front seat-support, a rear seat-support, a clip adapted to be adjustably secured to the upper leg of said spring B, and means for adjustably securing the seat-supports to the said clip, with the front seat support adjacent to the bent part of the spring B, substantially as and for the purpose specified.

3. The combination of a bent spring B and a clip C for adjustably securing it to the saddle-support, a clip D, adjustably secured to the upper leg of said spring, a front seat-support and a rear seat-support, one of which is curved, and means for adjustably securing said curved support to the clip D, with the front seat-support adjacent to the bent part of the spring B, substantially as and for the purpose specified.



4. In a saddle for bicycles and like vehicles, the combination, with the seat-supporting spring E E' and clips D C, of the spring B, adjustable back and forth in said clips, substantially as shown, and for the purpose set forth.

481,539. DRIVING-GEAR FOR SEEDING-MACHINES. THOMAS H. NOXON, Ingersoll, Canada. Filed May 4, 1892. Serial No. 431,836. (No model.) Patented in Canada May 30, 1887, No. 26,767.

Claim.—A grain-seed feed-rod C, connected to the center of a gear-pinion, in combination with a handle having an eccentric hole for the rod and journaled in the frame F of the machine and the driving-gear A, whereby the pinion may be moved out of engagement with its driver by bending the rod, substantially as set forth.

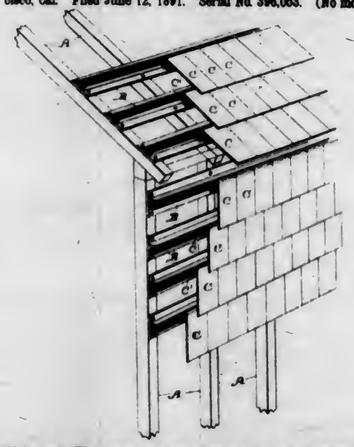
481,540. RAILWAY-CAR GATE. LYNDON ARNOLD, St. Johnsbury, Vt. Filed May 1, 1891. Serial No. 391,290. (No model.)

Claim.—1. A railway-car gate comprising a stationary side piece and a horizontally-sliding side piece, each pivotally connected to a vertically-movable central piece, and means for raising and lowering the central piece to open and close the gate, substantially as specified.

2. In a car-gate, the combination of the vertically-movable center piece A, connected by parallel bars B and C to side pieces D and E, substantially as described.

3. The parallel bars B and C, hinged by joints V to center piece A and at the other end to side pieces D and E, as shown.

4. The combination, in a car-gate, of the starting-block G, grooved track, and flanged carrying-roller F, substantially as described.



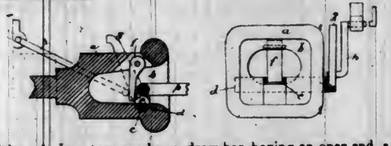
5. The lock-lever J, pivoted by joints V to center piece A and side piece D and engaging catch H at one end and catch I at the other, for the purpose specified.

6. The combination, in a car-gate, of the rollers N, cord M, loop L, eccentric-loop O, and lock-lever J, substantially as shown, and for the purpose specified.

7. Sliding sleeve R, movable vertically on rod Q and connected by eccentric P, loop O, cord M, and loop L to lock lever J, substantially described.

8. In a car-gate, the combination of eccentric P with sliding sleeve R, handle T, grip-lever S, connected by cord M to lock-lever J, all substantially as described, and for the purpose specified.

481,541. ROOFING AND SIDING. JAMES WINSLOW, San Francisco, Cal. Filed June 12, 1891. Serial No. 396,053. (No model.)



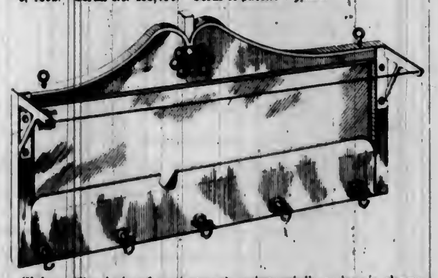
Claim.—1. The improvement in covering for walls and roofs, consisting of plates having flanges formed with double beads at their upper ends to form a lock for the plates, substantially as herein described.

2. The improvement in covering for walls and roofs, consisting of plates having flanges at their upper ends bent to form the double beads, which form a lock for the plates, said plates having raised portions on the faces, whereby they are stiffened and their overlapping edges fitted upon each other, substantially as herein described.

3. The improvement in covering for walls or roofs, consisting of plates or shingles of concavo-convex form having double bent flanges at their upper ends adapted to form a lock for the plates, said plates having raised portions at their overlapping edges, horizontal stripe having edges formed for engagement with the double bent portions and secured to the studding to lock the plates in position, substantially as herein described.

REISSUES.

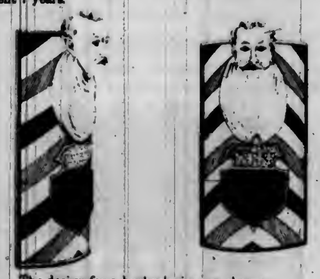
11,265. CAR-COUPLING. CHARLES DESAURES, Portland, Me., assignor to Henry Soule, David W. Schwarz, and Charles S. Cook, same place. Filed Apr. 15, 1892. Serial No. 429,371. Original No. 466,713, dated Jan. 5, 1892.



Claim.—1. In a car-coupler, a draw-bar having an open end, a cross-bar journaled in oval-shaped holes in the sides of the draw-bar and having a recess therein, said oval openings having cogs at the side and said cross-bar having cogs to mesh therewith, and a link-pin pivoted in the top of the draw-bar, substantially as and for the purposes set forth.

2. In a car-coupler, a draw-bar having an open end, a cross-bar having a recess therein journaled in holes in the sides of the draw-bar, and a link-pin pivoted in a slot in the top of the draw-bar, said pin having a dog projecting forward and having its point resting in a recess in the draw-bar, substantially as and for the purposes set forth.

3. In a car-coupler, a draw-bar having an open end, a cross-bar journaled in oval-shaped or vertically-elongated holes in the sides of said draw-bar, said oval holes having cogs at the side and said cross-bar having cogs to mesh therewith, and a link-pin pivoted at the top of said draw-bar, substantially as described.



DESIGNS.

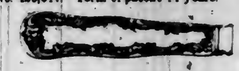
21,781. HAT-RACK. JOHN HONECKER, Cleveland, Ohio. Filed June 6, 1892. Serial No. 435,756. Term of patent 7 years.

Claim.—The design for a hat-rack, substantially as herein shown and described.

21,782. BARBER'S SIGN. FERDINAND SVOBODA and CHARLES HOFMANN, Chicago, Ill. Filed June 24, 1892. Serial No. 437,912. Term of patent 7 years.

Claim.—The design for a barber's sign, as shown.

21,783. SPOON. JOSEPH A. HUGHES, Corpus Christi, Tex. Filed May 2, 1892. Serial No. 431,572. Term of patent 3½ years.



Claim.—The design for a spoon, herein shown and described.

21,784. CANE-HANDLE. FRENCH S EVANS, Washington, D. C. Filed July 25, 1892. Serial No. 441,208. Term of patent 3½ years.

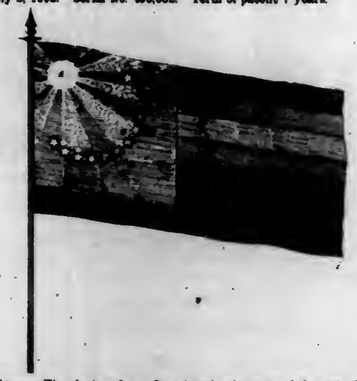
Claim.—The design for a cane-handle, substantially as herein shown and described.

21,785. HANDLE FOR KNIVES. HENRY A. WEHMAN, Philadelphia, Pa., assignor to Simons Bro. & Co., same place. Filed Feb. 1, 1892. Serial No. 420,017. Term of patent 14 years.

Claim.—The design for handles of knives, substantially as shown and described.

21,786. CASING FOR COIN-ACTUATED VENDING-MACHINES. ROBERT H. LITTLE, Chicago, Ill., assignor to Everell D. Stiles, same place. Filed June 6, 1892. Serial No. 435,757. Term of patent 7 years.

Claim.—The design herein shown and described for a casing of a coin-actuated vending-machine.



21,787. STATUE. CHARLES HOLLOWAY, Chicago, assignor to Louis H. Aymé, La Grange, Ill. Filed July 11, 1892. Serial No. 439,704. Term of patent 14 years.

Claim.—The design for the statue, herein shown and described.

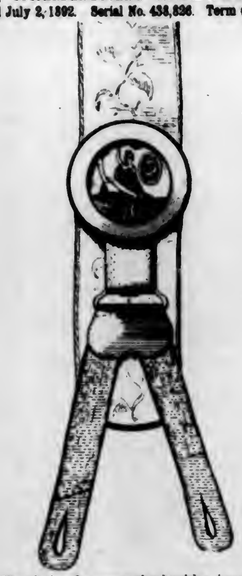
21,787.

21,788. FLAG. JAMES W. MACNAMARA, Blairsville, Pa. Filed July 2, 1892. Serial No. 438,832. Term of patent 7 years.

Claim.—The design for a flag, herein shown and described.

21,789. CAMPAIGN HORN. HENRY L. MILLIS, Millis, Mass. Filed July 22, 1892. Serial No. 440,961. Term of patent 14 years.

Claim.—The design for a campaign horn, as herein shown and described.



21,790. BADGE. GEORGE B. RAND, Dubuque, Iowa. Filed June 7, 1892. Serial No. 436,900. Term of patent 3½ years.

21,790.

Claim.—The design for a badge, as herein shown and described.

21,791. SUSPENDER-BUCKLE. CHARLES R. HARRIS, Williamsport, Pa. Filed July 2, 1892. Serial No. 438,836. Term of patent 14 years.

Claim.—The design for suspender-buckles, herein shown and described.

21,792. BUTTON-HOOK. CHARLES WEBSTER, New York, N. Y. Filed July 14, 1892. Serial No. 440,077. Term of patent 7 years.

Claim.—The design for a button-hook, herein shown and described.

21,793. TRIMMING. ADOLPH S. ELLISON, New York, N. Y. Filed July 14, 1892. Serial No. 440,076. Term of patent 3½ years.

Claim.—The design for trimmming, substantially as herein shown and described.

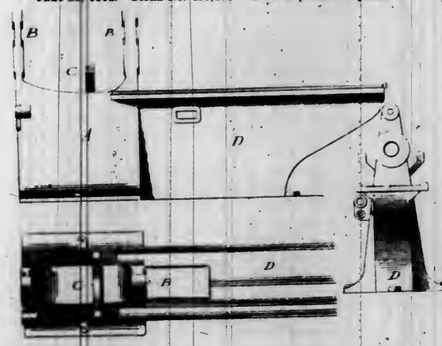
21,794. DRESS-TRIMMING. HENRY W. SCHLOSS, New York, N. Y. Filed Apr. 28, 1892. Serial No. 431,080. Term of patent 3½ years.

Claim.—The design for dress-trimming, substantially as described, and as shown in the accompanying drawing.

21,795. ORNAMENTATION OF FABRICS. HENRY STURM, Arlington, N. J. Filed June 21, 1892. Serial No. 437,523. Term of patent 3½ years.

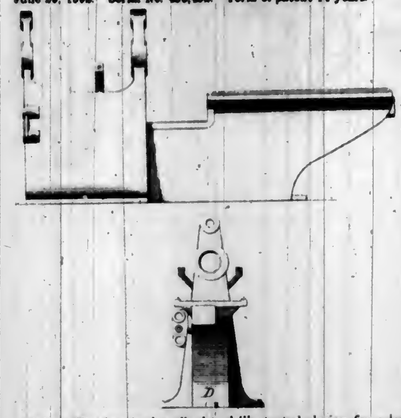
Claim.—The design for the ornamentation of fabric, herein shown and described.

21,796. BOX. EUGENE L. BUTTON, Brooklyn, N. Y. Filed June 22, 1892. Serial No. 437,655. Term of patent 7 years.



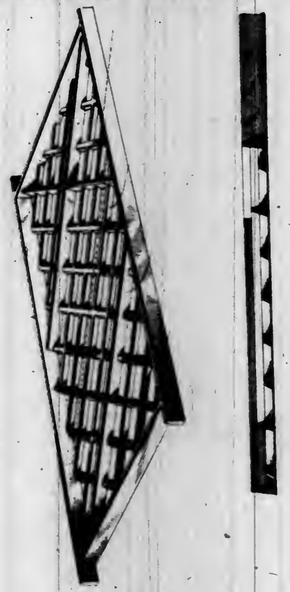
Claim.—The design for a box, as herein shown and described.

21,797. WATCH-CASE. JOHN C. DUEBER, Canton, Ohio. Filed July 28, 1892. Serial No. 441,536. Term of patent 14 years.



Claim.—The design for a watch-case, as herein described and shown.

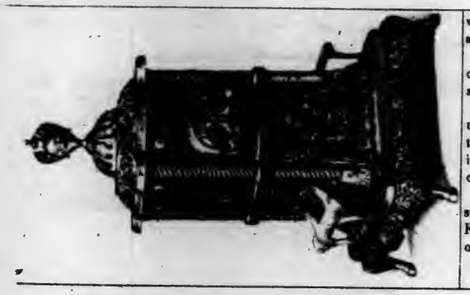
21,798. LATHE-BED. CONRAD M. CONRADSON, Madison, Wis. Filed June 22, 1892. Serial No. 438,451. Term of patent 14 years.



Claim.—The herein described and illustrated design for a lathe bed.

21,799. LATHE-BED. CONRAD M. CONRADSON, Madison, Wis. Filed June 29, 1892. Serial No. 438,452. Term of patent 14 years.

Claim.—The herein described and illustrated design for a lathe bed.



21,800. VENTILATOR-GRATE. GEORGE N. JOSS, Indianapolis, Ind., assignor to the Eagle Machine Company, Lancaster, Ohio. Filed July 19, 1892. Serial No. 440,532. Term of patent 7 years.

Claim.—The design for a ventilator-grate, substantially as shown and described.

21,801. HEATING-STOVE. WILLIAM N. MOORE, Joliet, Ill. Filed July 9, 1892. Serial No. 439,551. Term of patent 14 years.

Claim.—1. In a design for a heating-stove, the design for the lower section between the central belt F and the base G, embracing the three rosettes *a c c*, arranged in a horizontal line with each other in the central part of the panel, and the volutes *r*, springing from the sides of the central rosette *a* and extending both above and below the same and turned toward each other, and the volutes S, springing from the

volutes r and extending horizontally both above and below the rosettes c and turned toward the corners of the panel, as set forth.

2. In a design for a heating-stove, the design for the base-section, comprising the ornamentation of the lanceolate leaves pointed upward and arranged contiguous to each other, as set forth.

3. In a design for a heating-stove, the design for the upper section, comprising the rope molded margin having the arched top and the vertical central bar having the volutes springing from its sides near its upper part and turned downward at each side of said bar and incorporated with other vertical bars, as set forth.

4. In a design for a heating-stove, the design for the body of the stove, comprising the spiral columns H and the molded horizontal belt F and the ornamented panels between said columns and at either side of said belt, as set forth.

5. The design for a heating-stove, as herein shown and described.

TRADE-MARKS

REGISTERED AUGUST 23, 1892.

21,650. SEWING-MACHINES. CASH BUYERS' UNION, Chicago, Ill. Filed July 27, 1892.

KENWOOD

Essential feature.—The word "KENWOOD." Used since June 1, 1892.

21,651. HAND-POWER WASHING-MACHINES. BOSS WASHING MACHINE COMPANY, Cincinnati, Ohio. Filed July 16, 1892.

BOSS

Essential feature.—The word "BOSS." Used since March 15, 1890.

21,652. PILLS. W. T. HANSON COMPANY, Schenectady, N. Y. Filed July 25, 1892.

PINK-IRON

Essential feature.—The word "PINK-IRON." Used since June 15, 1892.

21,653. CORN-FLOUR. ONTARIO ORIENTAL FLOUR COMPANY, St. Thomas, Canada, and Chicago, Ill. Filed July 18, 1892.

Essential feature.—The representation of a shield bearing upon its face a crescent and the three letters "H O F." Used since February 7, 1890.

21,654. SCALP-WASH. LEN A. SMITH, New York, N. Y. Filed July 19, 1892.

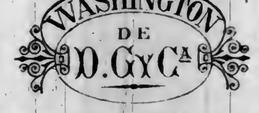
Essential feature.—The script signature "DR. L. A. SMITH & Co.," and the words "ANTI-DANDRUFF," all in white letters on a dark background. Used since December 15, 1891.

21,655. LUBRICATING COMPOUNDS, OILS, AND GREASE. LEWIS E. ATKINSON, Boston, Mass. Filed July 28, 1892.

Essential feature.—The words "WE LUBRICATE THE WORLD" in connection with the representation of a globe surrounded by brownies in the act of lubricating the same with lubricating devices. Used since June 2, 1892.

21,656. TIN AND ROOFING PLATES. CLEVELAND TIN PLATE CO., Cleveland, Ohio. Filed May 14, 1892.

BUCKEYE



Essential feature.—The word "BUCKEYE," within a diamond border. Used since January 1, 1892.

21,657. WORM-SIRUP. DR. DAVID KENNEDY CORPORATION, Kingston, N. Y. Filed July 19, 1892.

WORM SYRUP

Essential feature.—The words "WORM SYRUP" and the facsimile signature "D. KENNEDY, M. D." Used since 1870.

21,658. CIGARS. DIAZ Y HERMANO, Havana, Cuba. Filed July 27, 1892.

Essential feature.—The name "WASHINGTON" and the letters "DE D. G. Y CA." Used since July 6, 1888

21,659. TOILET PREPARATIONS FOR BEAUTIFYING THE COMPLEXION. JOSEPH C. FLOWERS and CLEMENT S. WITWER, Joliet, Ill. Filed July 5, 1892.

DIAMOND DEW

Essential feature.—The words "DIAMOND DEW." Used since June 1, 1892

21,660. CONDENSED MILK. WILLIS JOHNSTON, Washington, D. C. Filed July 5, 1892.

Essential feature.—The words "BABY BRAND," with a full-length representation or figure of an infant clothed in a short slip only, sitting in an angle of a couch or sofa, having the right leg extended, the right hand resting upon the right leg. The left leg is bent inwardly

and upwardly and its great toe is held by the fingers of the left hand. Used since July 1, 1891.

21,661. CIGARS. RAMÓN LÓPEZ, Havana, Cuba. Filed July 27, 1892.

CELIA.

Essential feature.—The word "CELIA." Used since December 23, 1885.

21,662. WHISKY. REINAULD & NIEDERSTADT, New York, N. Y. Filed July 27, 1892.

Essential feature.—The representation of the head of a unicorn. Used since May 17, 1892.

21,663. WHISKY. REINAULD & NIEDERSTADT, New York, N. Y. Filed July 27, 1892.

UNICORN

Essential feature.—The word "UNICORN." Used since May 17, 1892.

21,664. THREAD OF COTTON, SILK, FLAX, AND OTHER FIBROUS MATERIALS FOR MACHINE AND HAND SEWING. THE KERR THREAD COMPANY, East Newark, N. J. Filed July 27, 1892.

HYDRA

Essential feature.—The word "HYDRA." Used since July 9, 1892.

21,665. THREAD OF COTTON, SILK, FLAX, AND OTHER FIBROUS MATERIALS FOR MACHINE AND HAND SEWING. THE KERR THREAD COMPANY, East Newark, N. J. Filed July 27, 1892.

LEADER

Essential feature.—The word "LEADER." Used since July 9, 1892

21,666. THREAD OF COTTON, SILK, FLAX, AND OTHER FIBROUS MATERIALS FOR MACHINE AND HAND SEWING. THE KERR THREAD COMPANY, East Newark, N. J. Filed July 27, 1892.

DIADEM

Essential feature.—The word "DIADEM." Used since July 9, 1892.

21,667. THREAD OF COTTON, SILK, FLAX, AND OTHER FIBROUS MATERIALS FOR MACHINE AND HAND SEWING. THE KERR THREAD COMPANY, East Newark, N. J. Filed July 27, 1892.

Essential feature.—The word "EYE" and the representation of a human eye. Used since July 9, 1892.

21,668. WHITE LEAD. MOSES L. WIRDER, St. Louis, Mo. Filed July 6, 1892.

21,668.

Essential feature.—The words "THE IVORY BRAND WHITE LEAD & METAL" and the pictorial representation of two tusks crossing each other and arranged within a circular border. Used since March, 1892.

21,669. LUBRICATING AND MACHINE OIL AND GREASE. CHARLES H. BEELY, Chicago, Ill. Filed Nov. 5, 1891.

Essential feature.—The representation of a helmet. Used since September 10, 1885.

21,670. POWDER FOR CAUSING THE SMOKING OUT OF RATS, RABBITS, &c. LOUIS BOEHLE, Philadelphia, Pa. Filed July 14, 1892.

BOLTING

Essential feature.—The word "BOLTING" and the representation of a man in the act of dropping powder into a burrow. Used since July 6, 1892.

21,671. LAUNDRY SOAP. BENJAMIN BROOKE AND COMPANY, Philadelphia, Pa. Filed July 6, 1892.

WORTH IT S WEIGHT IN GOLD

Essential feature.—The words "WORTH ITS WEIGHT IN GOLD." Used since May 15, 1892.

21,672. TOILET PREPARATIONS, NOT INCLUDING FACE-POWDER. MARGUERITE V. BOTTS, Philadelphia, Pa. Filed June 10, 1892.

MARGUERITE

Essential feature.—The word "MARGUERITE." Used since March 1, 1891.

21,673. METAL POLISH. SAMUEL KIDDER, Boston, Mass. Filed July 11, 1892.

STARINE

Essential feature.—The word "STARINE." Used since December, 1891.

21,674. SUPPORTER FOR LADIES' UNDERWEAR. LUTHER P. SIMMER, Ayer, Mass. Filed Nov. 3, 1891.

G. M. S.

Essential feature.—The letters "G. M. S." Used since 1888.

21,675. LARD AND ITS SUBSTITUTES. THE W. J. WILCOX LARD AND REFINING COMPANY, Guttenberg, N. J., and New York, N. Y. Filed July 30, 1892.

LA PUERTORIQUENA

Essential feature.—The words "LA PUERTORIQUEÑA." Used since July 1, 1892.

21,676. LAUNDRY SOAP. BENJAMIN BROOKE AND COMPANY, Philadelphia, Pa. Filed July 6, 1892.

NUGGET

Essential feature.—The word "NUGGET." Used since May 15, 1892.

21,677. COATS, PANTALOONS, OVERALLS, SHIRTS, AND GENTLEMEN'S FURNISHING GOODS. BEAN, LA DUE & CLAWSON, Buffalo, N. Y. Filed July 18, 1892.

Essential feature.—The representation of a buffalo. Used since December, 1888.

21,678. FLUID REMEDY FOR CONSTIPATION, DISEASES OF THE LIVER, KIDNEYS, BOWELS, SKIN, AND BLOOD. WILLIAM F. HARRIS, Adrian, Ill. Filed Mar. 24, 1892.

Essential feature.—The words "ELIXIR OF BANANAS," arranged on a curve, and the representation of a banana partly encompassed by said words. Used since July 10, 1891.

21,679. PILLS USED IN KIDNEY COMPLAINTS. JOHN ARNOLD McKAY, Toronto, Canada. Filed July 14, 1892.

Essential feature.—The words "DODD'S KIDNEY PILLS." Used since May 15, 1892.

21,680. LAGER-BEER. THE LONG ISLAND BREWERY, Brooklyn, N. Y. Filed Oct. 26, 1891.

Essential feature.—A design having the outline of a lozenge-shaped figure applied in white and with the letters "P. G. M." in the field of said design upon a black ground. Used since March 1, 1891.

21,681. LAGER-BEER. THE LONG ISLAND BREWERY, Brooklyn, N. Y. Filed Oct. 26, 1891.

Essential feature.—A black parallelogram having thereon the outline of a lozenge-shaped figure formed by white lines. Used since March 1, 1891.

21,682. PLASTIC MATERIAL COMPOSED IN PART OF PYROXYLINE. THE CELLULOID COMPANY, Newark, N. J. Filed July 12, 1892.

LITHOID

Essential feature.—The word "LITHOID." Used since August 8, 1888.

21,683. PLASTIC MATERIAL COMPOSED IN PART OF PYROXYLINE. THE CELLULOID COMPANY, Newark, N. J. Filed July 12, 1892.

SOLID FIBRE

Essential feature.—The words "SOLID FIBRE." Used since March, 1887.

21,684. TIME-KEEPING AND TIME-RECORDING INSTRUMENTS. SETH E. THOMAS, New York, N. Y. Filed July 2, 1892.

Essential feature.—The initials "S. E. T." inclosed within a circle. Used since May 26, 1892.

21,685. MEN'S PANTALOONS AND OVERALLS. COWAN, MAGILL & CO., Knoxville, Tenn. Filed Aug. 1, 1892.

21,685. MASTIFF

Essential feature.—The word "MASTIFF." Used since April 1, 1892.

21,686. HARNESS, SOLE, AND BELTING LEATHER. J. GROSTEIGER & Co., Allegheny, Pa. Filed July 30, 1892.

LA BELLE

Essential feature.—The words "LA BELLE." Used since 1882.

21,687. PHOSPHATED BEVERAGE. ROSE BROS., Camden, Me. Filed May 27, 1892.

Essential feature.—The representation of a cylindrical casket and the words "SYRUP OATMEAL PHOSPHATE" or "SYRUP OATMEAL" arranged upon the same. Used since June 10, 1891.

21,688. SAWS. SHURLY & DIETRICH, Galt, Canada. Filed Aug. 2, 1892.

SECRET

Essential feature.—The word "SECRET." Used since September 1, 1876.

21,689. SAWS. SHURLY & DIETRICH, Galt, Canada. Filed Aug. 2, 1892.

RAZOR

Essential feature.—The word "RAZOR." Used since June 1, 1889.

21,690. MEATS, SMOKED AND UNSMOKED, AND ALL KINDS USED FOR HUMAN FOOD. VOLUNTEER CHICAGO BEEF CO., New York, N. Y. Filed Feb. 12, 1892.

VOLUNTEER

Essential feature.—The word "VOLUNTEER." Used since July 1, 1889.

21,691. CIGARS. CASIMIRO ALVAREZ, Havana, Cuba. Filed July 27, 1892.

Essential feature.—The name "CARMENCITA" and the portrait of her. Used since January 26, 1892.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

SANCHE *v.* ELECTROLIBRATION COMPANY.

TRADE-MARK—WHERE TITLE VESTS IN CERTAIN CASES.

Where one who claims to have invented or discovered a new means for treating disease transfers for a consideration all his rights therein to a corporation and afterward acquiesces in the use of a certain Trade-Mark thereon by the corporation, *Held* in a subsequent contest between himself and the corporation over title to the Trade-Mark that an absolute right is vested in the corporation.

Decided July 20, 1892.

APPEAL from Examiner of Interferences.

TRADE-MARK FOR CLINICAL INSTRUMENTS.

Trade-Mark of Hercules Sanche registered April 22, 1890, No 17,810. Application of Electrolibration Company filed November 16, 1889.

Mr. James L. Norris for Sanche.

Mr. R. G. Dyrenforth for Electrolibration Company.

SIMONDS, *Commissioner:*

This is an appeal from the decision of the Examiner of Interferences awarding the right to the Electrolibration Company to the word "Electropoise" as a Trade-Mark for instruments and appliances for the cure of disease. The status of the contestants is that of applicants for registration, with the burden of proof upon Sanche.

The oral testimony is contradictory to that degree that it is hardly possible that any trier basing his decision mainly thereupon could arrive at a decision wholly satisfactory to himself. It is a case where any settled landmark is of high value and where the ordinary laws governing human action must be taken into full account.

On the 14th day of July, 1887, Sanche entered into the following written agreement:

NEW ORLEANS, LA., *July* 14, 1887.

Whereas I, Hercules Sanche, M. D., of Port Gibson, county of Claiborne, State of Mississippi, having discovered a new means of preventing and curing diseases of human beings, animals, and plants, for which I have applied for Letters Patent in the United States; and

Whereas, it is desirable to form a stock company to patent in this and in foreign countries, and manufacture and sell the instruments and devices relating to said new means, and to push investigation to its further development, now

Therefore, in consideration of the premises and for the further consideration of twenty-five (25%) per centum of the capital stock of said company I hereby transfer all my right, title, and interest in and to all my patents pending and to be applied for, all manuscripts and drawings relating to said new means; and for the further consideration of twelve and a half (12½%) per centum of the net income from the operations of said company I bind myself, heirs, and executors to transfer to John N. Webb, Birmingham, Ala., Timothy Moroney, New Orleans, La., and Cornelius Doremus, New Orleans, La., as trustees for this proposed company, and to devote my time and attention to the investigation and improvement of said discovery; and for the further consideration of two thousand dollars, ($2,000.00,) to be paid to me during the first year and annually thereafter, until the said company pays a dividend of thirty per centum per annum, and thence such sum as the board of directors may deem proper, not exceeding five thousand dollars per annum. This assignment is conditional upon the opinion of Munn & Co. as to the patentability of the said new means. A favorable report from the said Munn & Co. shall be followed by an organization of a company within sixty days from the date of the receipt of said Munn & Co.'s report. The capital stock of said company shall be sufficient to secure and operate all desirable patents in this and other countries.

In testimony whereof I have hereunto set my hand and affixed my seal this 14th day of July, A. D. 1887.

HERCULES SANCHE, M. D.

Witness in presence of—
ISAAC GILLESPIE,
FERDINAND JOHNSON.

Messrs. Munn & Co. made two reports upon the matter, and within sixty days from the date of the receipt of said Munn & Co.'s report a corporation was organized under the laws of the State of Alabama, and the trustees named in the foregoing paper, on the 6th day of October, 1887, made the following written conveyance to that corporation:

In the State of Alabama, Jefferson county, *ss:*

This deed of conveyance made this 6th day of October, 1887, by and between Cornelius Doremus, Timothy Moroney, and John N. Webb, trustees for Dr. Hercules Sanche, and the subscribers to the electrolibration fund of the first part, and the Electrolibration Company, a corporation chartered under the general incorporation laws of the State of Alabama, party of the second part, witnesseth: That, whereas the said Dr. Hercules Sanche, a citizen of the State of Mississippi, has discovered a new means for the treatment of nervous and other diseases, is desirous to secure patents on the same in this and foreign countries, in order to secure the necessary means to carry out his purpose, has made a deed of conveyance to the said Cornelius Doremus, Timothy Moroney, and John N. Webb, as trustees, in trust for himself and the subscribers to the fund known as the electrolibration fund, of all his rights and interests in and to said patent pending and to be applied for, and all manuscripts, drawings, designs, of whatever nature relating to his new discovery, which deed is dated July the 14th, 1887, and is hereby expressly referred to and its conditions and contracts are to be ratified and renewed. Now, therefore, in consideration of the premises and the further consideration of 10,000 shares of the capital stock of said Electrolibration Company, fully paid up and non-assessable, and in order to carry out the expressed trust reposed in us, we, Cornelius Doremus, Timothy Moroney, and John N. Webb, trustees, do hereby sell, convey, assign, and transfer, and by these presents have hereby sold, conveyed, assigned, and transferred all our right, title, and interest in and to all patents pending and to be applied for, all manuscripts and drawings relating to the discoveries of Dr. Hercules Sanche and conveyed by him to us, as trustees, to the said Electrolibration Company, party of the second part, and its assigns forever.

Provided, however, in case of dissolution of this company and sale of its assets, such sale shall reserve to Dr. Sanche his fourth interest in such assets, and the purchaser of the company's assets shall be liable to Dr. Sanche to the same extent as this company is liable under its contract with him; the purpose of this proviso being to perpetuate Dr. Sanche's rights in his discoveries and patents the same as these rights exist in the company.

Witness our hands and seals this sixth day of October, 1887.

JOHN N. WEBB. [Seal.]
C. DOREMUS. [Seal.]
TIMOTHY MORONEY. [Seal.]

Witness:
JNO. MCNEESE,
WILL C. HAWLEY.

This corporation proceeded to—

manufacture and sell the instruments and devices—

referred to in the paper of July 14, 1887, and at first

called them "Electrolibrators." Then Sanche wrote this letter to the president of the company:

155 CALLIOPE STREET, NEW ORLEANS, LA.,
December 28, A. D. 1887.

JOHN N. WEBB, Esq.,
Birmingham, Ala.:

DEAR FRIEND: Pondering over what you said about the name "Electrolibrator," that it was too long, which I have often felt myself, wishing for a shorter word-equivalent, the word "Electropoise" suggests itself to my mind as still more appropriate for the instrument with which we are immediately concerned, while the former would be still desirable for some appliances to be brought out in the future. "Electropoise," under the fourth definition of Webster's Unabridged of "Poise," would make the latter much more significant. Messrs. Munn & Co. several times stated while we were in Washington that devices under the first application by me affected "electrolibration," but that those covered by the second did not, but were aimed at something more, which is strictly true, and hence the word in the latter case was not clearly expressive. The name of the company to remain the same, because of other devices named above for future, it is right. If you approve and advise the change, write me at once; and also advise Messrs. Munn & Co. that if necessary they *change the name* in our applications before too late. Believing that you and all concerned will approve, I begin to write using the new appellation until it is rejected. Our aim in treatment is to restore the normal electrical condition expressed by Mr. Byrn as fixing the molecular polarity of the body, which facts show to be a negative preponderant; yet equilibration is sometimes a necessary process and must in each case be first effected. The word Electropoise will express both, while the old name can express but one, and it will at the same time have the advantages of being shorter and of adding diversity and contradistinction to our nomenclature. Consult directors with you and I will see those here. Hoping this will overtake you I remain,

Yours respectfully, H. SANCHE.

P. S.—If you indorse, it will also be necessary to instruct the manufacturer to stamp accordingly. If a still greater improvement can be had on the name, I would be happy to accept it.

H. S.

Thereupon the instruments were afterward marked with and known by the name "Electropoise." On the 10th day of June, 1889, Sanche wrote a letter to Webb, president of the corporation, parts of which are as follows:

ROOM 221, WAYNE HOTEL, DETROIT, MICH.,
Monday, 6 P. M., June 10th, 1889.

J. N. WEBB, Esq.,
610 *E street, N. W., Washington, D. C.:*

DEAR FRIEND: I wrote you last night all I could find time to. Having ventured to go ahead, victory lies in undaunted and vigorous action, without repentance or looking back. * * * Several of the rich here want their houses furnished with electropoise, branching in every sleeping room. * * * I will also supply the houses mentioned at $100 for Poise, with Twigs at $20 to $30 each per annum. Also a refrigerating polarizer for high city buildings as before mentioned which is already on the way; and a portable Poise for Drs. which they will demand faster than we can furnish them. * * * We must take every step to secure everything the best we can, leaving no gap open for opposition. Therefore have Trade-Mark registered, and every new design and print copyrighted as it is produced. If it cannot be done in our corporate name, have it done in my name, and send me assignments to sign. * * *

It thus appears that at one time the Electrolibration Company enjoyed the exclusive possession of the word "Electropoise" as a Trade-Mark for instruments and appliances for the cure of disease, and that it enjoyed this possession with the assent and co-operation of Sanche. Upon such a state of facts the burden of proof is upon Sanche to divest the company of the right. He contends that before the company was formed he furnished to his patients some seven instruments, and that in thus furnishing some of these seven he wrapped them up in paper and wrote thereupon the word "Electropoise," not, however, upon all of the seven. Sanche and Doremus both testify that by verbal arrangement Sanche, in co-operating in the organization of the corporation, reserved as his personal property such Trade-Marks and Labels as might be used upon the instruments sold by the company.

There are certain things to be said in answer to these contentions: first, that Sanche's letter of December 28, 1887, speaks of the word "Electropoise" as a result-suggestion and makes no mention of any previous use thereof; second, that Sanche's letter of June 10, 1889, recognizes the company's ownership of Trade-Marks and in that connection specifies "assignments" and not licenses; third, that it would not be in accordance with ordinary human action for the company to establish and develop a Trade-Mark with the knowledge that Sanche might take it to himself at his will; fourth, that the reservation of certain rights to Sanche in the trustee's deed of October 6, 1887, excludes by inference the alleged reservation as to Trade-Marks, and, fifth, Webb, the president of the company, denies the existence of such reservation.

In view of these considerations the testimony of Sanche and Doremus does not suffice to establish the existence of the reservation as to Trade-Marks or to divest the company of the exclusive possession of the Trade-Mark.

It is contended by Sanche that the case of *Kidd* v. *Johnson* (100 U. S., 617) is determinative of Sanche's right here. In that case the Supreme Court says this:

It is admitted that Pike was the owner of the Trade-Mark when he took two of his clerks into partnership and formed the firm of S. N. Pike & Co. He did not place his interest in the Trade-Mark in the concern as a part of its capital stock. He allowed the use of it on packages containing the whisky manufactured by them; but it no more became partnership property from that fact than did the reality itself, which he also owned, and on which their business was conducted. He was engaged in the same business before the partnership as afterward, and taking his clerks into partnership changed in no respect, beyond its terms, their relation to his individual property. Their subsequent conduct, moreover, plainly showed that they claimed no interest in the Trade-Mark. They knew of his conveyance of its uses to Mills, Johnson & Co., on the 1st of October, 1868, when they removed their own business to New York, and made no objection to the transfer. Their subsequent correspondence discloses beyond question their knowledge of the transfer and recognition of his power to make it. That transfer was plainly designed to confer whatever right Pike possessed.

And this:

The claim of Kidd to the Trade-Mark as survivor of the partners in the firm of S. N. Pike & Co. is without any merit. Pike, in his life-time, repudiated any ownership in the Trade-Mark after his sale, and Kidd knew that fact, and never even pretended that the firm had any such right until after Pike's death.

The finding of the Supreme Court is practically to the effect that the partnership in question simply enjoyed a license from Pike to use the Trade-Mark while the partnership existed.

And, again, in that case Pike, as a member of the partnership, continued to use the Trade-Mark regularly and continuously, which is not the fact here. Grant that Sanche used the word "Electropoise" in the limited way claimed by him before the Electrolibration Company was formed, he ceased to use it personally while he was friendly to that corporation, and that corporation used it exclusively with his assent. There are broad distinctions between corporations and partnerships. A mere stockholder in a corporation can, as a rule, do nothing in its name and behalf that a stranger cannot do, while a member of a partnership can, as a rule, do anything that the entire partnership can do. That which is true of a partnership as to ownership and devolution of Trade-Mark property is not necessarily true of a corporation. And, as has already been remarked, the finding of the Supreme Court is practically to the effect that the partnership enjoyed a license from Pike to use his Trade-Mark while that partnership was in existence, and that finding is based not only upon what occurred during the existence of the partnership, but on subsequent acquiescence in Pike's doings after the partnership was terminated by those who had been Pike's partners.

The decision of the Examiner of Interferences awarding right to the Electrolibration Company is affirmed.

EX PARTE WEEDEN.

Decided June 18, 1892.

PRACTICE—INTERFERENCE.

Where an applicant appealed from the refusal of an Examiner to inform him of the subject-matter of the issue in a proposed interference in order that he might amend so as to include the issue in his claims, *Held* that it is not the practice of the Office to suggest claims to an applicant in order to create possible interferences.

ON petition.

HIGH-PRESSURE BALL-COCK.

Application of Henry C. Weeden filed June 26, 1890, No. 356,888.

Mr. Alexander P. Browne for the applicant.

FROTHINGHAM, *Assistant Commissioner:*

This is a petition taken from the action of the Examiner amounting in substance to a refusal to inform the applicant of the subject-matter of the issue in a proposed interference, in order that he might amend so as to include it in his claims.

The petitioner requests that the Examiner be instructed to withdraw the other case from issue and that applicant be furnished with such information as will enable him to put his case into condition for an interference with it.

In the case of *McNeil* v. *Borton and Wilcox* (50 MS. Dec., 178) the converse of the present case arose In that case an appeal was taken from the action of the Examiner denying a motion brought on behalf of Borton and Wilcox to dismiss a motion to dissolve brought by McNeil, the principal object in taking the appeal having been to bring to the attention of the Commissioner the action of the Examiner in communicating to McNeil a certain claim that had been held allowable in Borton and Wilcox's application, and which might be made in McNeil's application.

The following language, found in said decision upon this point, is decisive of the present petition:

The only question now remaining for consideration is whether or not as a matter of practice the action of the Examiner was regular in suggesting the claim to McNeil, as above stated It is not the present practice of the Office to suggest claims to applicants in order to create an interference between the application of one person and that of another.

It is stated by the Examiner that he had the right and it was his duty to communicate the claim to McNeil in order that he might secure a patent for whatever patentable subject-matter was embraced in his application, and he relies upon the case of *ex parte Donovan* (44 O. G., 607) to sustain this position.

While it is undoubtedly true that it is the duty of the Office to place itself in the attitude of a friend, and not that of a litigant with the applicant, and while this doctrine is one that ought to be followed in cases similar to that of *ex parte Donovan*, *supra*, yet there is no such practice of the Office as warrants the extension of the doctrine for the purpose of creating interferences.

In the present case it need only be added that after the patent issues on the other application an interference may probably be instituted between the patent and the present application, provided a proper claim is made.

The petition is denied.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of Ohio, Western Division.

STILWELL & BIERCE MANUFACTURING COMPANY *v.* S. N. BROWN & Co.

Decided March 12, 1892.

1. PATENT—INFRINGEMENT—FEED-WATER HEATERS AND PURIFIERS.

Letters Patent No. 274,048, to Edwin R. Stilwell, dated March 18, 1883, for a feed-water heater and purifier, sustained and *Held* infringed by purifiers made under Letters Patent No. 318,112 to John J. Hoppes, dated May 19, 1885.

2. FACTS RATHER THAN THEORIES CONTROL IN THE CONSTRUCTION OF PATENTS.

In an action for infringing a patent demonstrable facts are the decisive factor in determining the actual bearing upon each other of the patents under consideration, and a defense which rests upon a mere theory as to the philosophy of operation of the complainant's device will not be considered by the court when this theory is negatived by the history of the art and by the practical working of the device in question.

ON feed-water heater and purifier patent.

Messrs. Wood & Boyd for the complainant.

Messrs. Staley & Shepherd for the defendants.

STATEMENT OF THE CASE.

This suit is brought to restrain the infringement of Letters Patent No. 274,048, granted March 18, 1883, to Edwin R. Stilwell, for feed-water heater and purifier, and by him assigned to the complainant company.

The patent relates to what is called a "live-steam purifier."

The object of the invention is to heat and purify the feed-water in a vessel separate from the boiler and so connected to it by pipes that live steam will enter the purifier from the boiler and heat the feed-water, removing its impurities and passing it into the boilers in a pure state.

The patent contains two claims, as follows:

1. A live steam feed-water purifying or heating apparatus D, connected to the boiler by means of water-pipe K, steam-feed pipes L, and gas escape pipe M, substantially as herein set forth.

2. A live steam heater or feed water purifier having a series of pans vertically above the filter, and a space or chamber above the pans, and water-inlet connected to the steam-dome by a pipe, so as to discharge the gases from the top of the purifier directly into the boiler, substantially as herein set forth.

The bill also charges the infringement of Letters Patent No. 434,324, granted August 12, 1890, to Ralph B. Day, for live-steam purifier, and assigned by him to the complainant; but this charge has been withdrawn and the bill as to this patent dismissed.

The patentee of No. 274,048 sets forth in the specification that the principal feature of this invention (which consists in connecting by a pipe the top of the heater with the steam-dome of the boiler and with the steam-space of the boiler) can be employed with a combined heater and purifier or with either a heater or purifier. This connection is by means of what is termed in the claim "gas-escape pipe M," passing from near the top of the purifier into the steam-dome of the boiler. The object of this pipe is to allow the direct escape of gases generated in the heater. The shell of the heater, which is circular, is constructed of boiler-iron adapted to resist the same pressure as the boiler. It is placed vertically at the side of the boiler and contains in its upper part a series of shelves or pans, over which the cold water, admitted at the top through a pipe, passes in the operation of heating and purification. The water is first admitted into an overflow-pan. This pan is placed opposite the upper steam-pipe L', which is supplied by live steam direct from the boiler, so that a current of steam will strike against the water as it passes from the overflow-pan onto the series of shelves or pans immediately below. At or

near the bottom of the series of shelves or pans a branch steam-pipe L from the boiler admits steam, which passes up over the pans as the water passes down. By employing steam-pipes from two to four inches in diameter the water in the purifier is kept at or near the same temperature as that in the boiler, and the space above the overflow-pan forms, in fact, a part of the steam-dome of the boiler. As a consequence, the inventor states, deleterious gases escaping from the water as it is being freed from impurities rise into that space and pass through the gas-escape pipe into the steam-dome of the boiler without passing through the boiler itself.

The inventor sets forth that another very important result is that by thus highly heating the water in the purifier a much more perfect purification is obtained than in purifiers which do not, in fact, form a part of the boiler by employing live-steam-pipe connections to heat and purify the feed-water. In the complainant's purifier the water, having been heated in passing over a series of shelves or pans, where the mineral impurities are mostly removed, is passed down through a passage on one side of the filter-chamber into a mud-well. This chamber and the mud-well, with a filtering-chamber, constitute the lower portion of the purifier, where the heavier substances settle and may be blown off from time to time through a pipe at the bottom of the purifier. The water passes from the mud-well into the filtering-chamber, thence up through any suitable filtering medium and through pipe K into the mud-drum, located immediately below the boiler, or pipe K may connect with the boiler direct.

The defendants' purifier was manufactured by the Hoppes Manufacturing Company, of Springfield, Ohio, which manufactures and sells the Hoppes feed-water heater and purifier under Letters Patent No. 318,112, granted May 19, 1885, to John J. Hoppes, of Springfield, Ohio. The defendants' purifier, as made and sent out by the manufacturers, was provided with but one flange for steam connection and the usual openings for the other pipe connections. The defendants' purifier was first connected up by a single pipe to the boiler-drum. Afterward two pipes were put in near one end of the purifier, and these not accomplishing the desired result, as there was no deposit on the rear end of the purifier, the defendant made a second pipe connection from the rear end of the purifier to the steam-pipe, and in this instance the steam-pipe ran the feed-pump. The purifier itself is placed longitudinally instead of vertically. It is a metallic cylinder constructed of boiler-iron and provided at each end with suitable covers or heads, which are removable. Extending longitudinally through the cylinder is a series of troughs arranged one above another and closed at each end by suitable end pieces, which extend above the side of the trough, each being provided at either side with a projection adapted to rest on supporting rods or ways, which extend longitudinally along each side of the interior of the cylinder and are secured to supporting-brackets, which are in turn secured to the cylinder. The troughs are adapted to slide on these rods or ways, and when one or both the heads of the cylinder are removed may be readily withdrawn from or slipped into the cylinder. Immediately above the upper trough is a perforated supply-pipe provided with a perforated bottom and extending longitudinally within the cylinder and near its top almost the entire length of the upper trough. This pipe is connected by a suitable inlet-pipe to the pump or other source of water-supply. Immediately under the lower trough is a removable horizontal plate, the edges of which are turned up, so as to form flanges, which rest on the lower curve of the cylinder, said plate thus forming, with the bottom of the cylinder, a compartment which closes at each end by vertical perforated plates. The removable horizontal plate is extended at its rear end beyond the troughs and is provided with a head or flange projecting upward beyond the bottom of the lower trough, the flange being considerably shorter than the trough. Its forward end does not extend out to the end of the troughs, but rests on the perforated vertical plate, thus forming a pocket or chamber in the forward part of the bottom of the cylinder. The vertical perforated plate which closes the rear end of the compartment in which the filtering material is placed extends back some distance, so as to form a chamber to the rear of the filtering-chamber and under the plate. From this chamber leads the water-exit pipe, which extends downward and out from some distance above the bottom of the chamber. When this heater is used as a live-steam heater, a connection from the steam-reservoir of the boiler is established by a pipe which leads into the top of the cylinder of the heater, the exit-pipe above described being connected to the water-inlet of the boiler. There is also a blow-off or discharge pipe which leads from the chamber above described, which is in front of the filtering-compartment. The plates above described are made removable for the purpose of removing or replacing the filtering substance and that they may be easily cleaned. When used as a live-steam heater, the bottom of the casing or cylinder is so placed as to be above the water-line of the boiler.

The operation is as follows: The water is pumped or otherwise forced into the supply-pipe and falls into the top trough. When that trough is filled, the water falls over the sides thereof and, following the outer surface of the bottom, which is curved, flows in a uniform sheet thereunder until it reaches the center, when it drops into the trough below, and so on through each successive trough until it falls on the horizontal plate and flows along the same into chamber C below. From that chamber it passes through the filtering-chamber into the exit-chamber, and thence through the exit-pipe into the boiler. As the water passes through the troughs it is brought into direct contact with the steam and becomes thoroughly heated. As each trough remains filled with water, the sediment or impurities fall to the bottom and are retained. The water, flowing in a uniform sheet under the bottom of the troughs and subjected to the direct action of the steam, parts with the lime or other incrustating substances which it contains, and these are deposited on the under side of the troughs. There are some other details of construction to which it is not necessary to refer. It is obvious from this description that the change from the vertical position of the purifier to the longitudinal is not material, and it is conceded that the purifier as it came from the manufacturer and as it was first set up for use by the defendants was not an infringement of the complainant's.

SAGE, *J.*, (after stating the case as above:)

It is conceded that the only real difference between the complainant's purifier and that patented to Edwin R. Stilwell July 23, 1867, No. 66,098, is by the addition of the gas-escape pipe M, as shown in the complainant's purifier. The purifier patented July 23, 1867, had but one pipe connecting with the boiler and supplying steam and one pipe connecting the water-well of the purifier to the boiler for supplying the boiler. That purifier was designed to do its work, so it is stated in the specification, by the action of live steam direct from the boiler. Prior to that is shown Patent No. 41,374, January 26, 1864, to A. M. Granger, wherein the steam-supply pipe connects with the main steam-pipe which supplied the engine, or, it is stated, may be connected to receive steam directly from the boiler.

On September 18, 1866, Patent No. 58,099 was issued to Hasecoster and Stephens, for a feed-water heater with an inlet and outlet steam-pipe corresponding to steam-pipes L′ and L″ in complainant's purifier. Steam was introduced into that heater from the exhaust-pipe of the engine through the lower steam-

pipe, and the upper pipe was provided for its escape at or near the upper end of the vertical sheet-iron cylinder or shell of the heater, which was intended to be also a purifier.

Patent No. 169,302, to Tellier, November 2, 1875, for water filter and purifier, shows at the top of the cover a gas-escape pipe provided with an automatic valve—a common instance of the use of valves or pipes to permit the escape of air or gas, in order that the live steam may enter, as in steam-radiators for heating purposes.

In Hayes, Jeffery, and Schlack's heater and purifier (Patent No. 226,068, March 30, 1880) the feed-water enters at the top of the dome of a steam-boiler and passes down through filtering material, and thence directly to the boiler. Two tubes, each two inches or more in diameter and extending from the boiler into the upper part of the dome, constitute the passage-way for live steam to heat the water and assist in the purification.

French's purifier, patented December 6, 1881, No. 250,519, upon an application filed August 23, 1880, has an outer drum or jacket surrounding the purifier and supplied with live steam from the boiler above the water-line, the object being to keep the inner drum, which is the purifier, hot. The bottom of this outer drum is connected by a pipe with the boiler, so that the steam which by condensation in the space between the two drums becomes water will run into the boiler by gravity. French subsequently made an improvement on this purifier, for which he obtained Patent No. 250,520, applied for September 5, 1881, and granted December 6, 1881. This improvement shows a pump in the dome of the boiler, which by pipe connection forces steam from the boiler through the purifier also, and this is suggested as an alternative device—a pump for exhausting the steam through the connecting-pipe from the purifier to the boiler. For this last pump, it is stated in the specification, an injector or siphon may be substituted. By changing the connection the operation of the first pump may be reversed—that is to say, it will exhaust the steam through the apparatus instead of forcing it into the apparatus, either way causing the desired circulation.

The above are the anticipating devices offered on behalf of the defendant. Without entering upon a detailed examination of them, it will be sufficient to say that if the earlier patent to Stilwell (No. 66,098, July 23, 1867) does not anticipate the complainant's patent none of the others do. The radical difference between that and the complainant's purifier is that the complainant's is provided with the gas-escape pipe M. The supply-pipes being of large capacity, the temperature of the water in the purifier and in the boiler is nearly the same. As a consequence deleterious gases and air are set free. These rise to the top of the purifier, where but for the escape-pipe M they would accumulate and prevent the contact of the steam with the cold water as it is introduced into the heater and retard the condensation of the steam, and thereby the heating of the water to be purified. The escape-pipe M, connecting the purifier with the dome of the boiler, causes a constant discharge of the gas and also a free and constant circulation, greatly facilitating the heating of the water in the purifier and increasing the deposit of impurities. This very desirable result had not been so well accomplished by any one of the previous devices. There is a conflict of views and theories, as it is disclosed by the testimony, with reference as to how and why the result is accomplished. I shall not stop to consider them.

I do not care to go into the discussion of the philosophy of the operation of the complainant's device. It is urged on behalf of the defendants that the escape-pipe is not necessary for the production of the desired result of circulation, and that the steam-pipe connecting with the boiler will, if made large enough, accomplish the same result by passing the steam in through the under part of the pipe and the gases out through the upper part of the pipe. That may be true, and that method was and is free to the defendants. If it would effect the purpose, they were and are at liberty to use it. The difficulty with theories is that they can be used to support either side of the case, and that is peculiarly true of this case. But what we have to deal with is facts, and, whatever may be said in support of this or that or the other theory, the record shows that the complainant's device is the result of a long-continued course of experiments, and that, in fact, it has proven to be more effective than any which preceded it. Even the defendants' record establishes that the escape-pipe which was attached to their purifier and connected it with the steam-pipe was applied because without it the operation of their purifier was not satisfactory and that it remedied the defects. It is contended for the defendants that the defect resulted from the faulty construction of the boiler and was not in the purifier or its connection; but the fact remains that the only thing that was found that would remedy it was the escape-pipe, and that did completely remedy it, and did at the same time conclusively prove the practical utility and value of the complainant's device. The testimony for the complainant proves that its purifier does its work successfully and keeps the boilers in good condition. The evidence satisfactorily establishes not only its utility, but its superiority. That it is novel is, I think, equally clear, and I am satisfied that it is an invention. Perhaps it might also be termed a "discovery," because it was the result of experiments which finally led to the construction that was patented. That the defendants infringed is, I think, also clear. It is true that the escape-pipe of its purifier is connected to the steam-pipe which supplied the steam to run the feed-pump and is not connected to the dome of the boiler; but the variation is not material and does not make the defendant any less an infringer.

The decree will be for the complainant for an injunction and account, with costs.

U. S. Circuit Court of Appeals—Second Circuit.

DEDERICK *v.* SEIGMUND.

Decided July 20, 1892.

1. PATENT-INFRINGEMENT—BALING-PRESSES.

The second claim of the Gehrt patent, No. 232,400, September 21, 1880, for improvement in baling-presses, covers, broadly, the application of a friction-brake to retard the backward movement of the plunger of the press. *Held* that the claim must be limited to the means shown and described in the patent—to wit, a set-screw for adjusting one side of the baling-chamber—and is not infringed by an eccentric upon the top of the press and upright rods which are connected to the eccentric and which bear against small hinged brakes.

2. GENERIC INVENTIONS.

A patent for a primary invention will not receive a liberal or broad construction where the invention is of a very low order.

3. SAME.

It is true that when the invention is of a primary character a larger latitude is given to the equivalents which the patent includes than if the invention was a modification of a well-explored art; but this doctrine cannot be applied to primary invention of low order.

4. PIONEER INVENTORS.

The patentee conceived the idea of gradually stopping the backward movement of the plunger in a rebound baling-press by applying a friction-brake. *Held* that as friction-brakes are very old it was a low order of invention to apply such a brake to a baling-press, and a patent which with difficulty maintains its right to patentability must receive a narrow construction.

APPEAL from the Circuit Court of the United States for the Northern District of New York.

Mr. Melville Church for the complainant.

Mr. George H. Knight for the defendant.

SHIPMAN, *J.*:

This is an appeal from the decree of the Circuit Court for the Northern District of New York, which dismissed the complainant's bill in equity, founded upon the alleged infringement of Letters Patent No. 232,400, dated September 21, 1880, to Albert A. Gehrt, for an improvement in presses for baling hay.

The portion of the patented improvement which is involved in the record of the case consists in the means which the patentee provided for resisting the backward movement of the traverser, so as to prevent a shock to the frame or other part of the machinery. The description of this portion of the invention which the patentee gave in his specification is as follows:

In presses of this class the traverser is reversed by the reaction or back expansion of the pressed material, and ordinarily with such force as to cause a severe shock to the frame and power connections. To remedy this defect I apply more or less friction to the traverser during its backward movement, and thus stop its motion gradually.

Various instrumentalities may be employed in carrying out this idea; but I prefer to adjust the lining or planking E by means of an adjusting screw or screws, S, so as to cause it to bear upon the top of the upper rear extension of the traverser, as shown in Fig. 1. By operating the screw the lining or planking can be made to bear more or less tightly, as will be readily understood. The lining or planking may be made permanently contracted, if desired, and the same result be produced.

The second and third claims relate to this portion of the device and are as follows:

2 In a baling-press in which the traverser is reversed in whole or in part by the reaction or back expansion of the pressed material, a friction plate or pressure contrivance for applying friction to the traverser to retard its backward movement and prevent shock, substantially as described.

3. The combination, with the traverser having the rearward extension, of the lining or planking and the set-screw for adjusting the same, substantially as described, for the purpose specified.

The second claim is the only one which is alleged to have been infringed.

The idea which the patentee wished to embody in wood and iron was the gradual stoppage of the motion of the traverser during its backward movement by means of the application of friction. The instrumentalities which he selected were, first, a brake, which consisted of a portion of the top planking of the press-box, made adjustable by means of a set-screw, so as to cause the planking to bear upon the top of the rear extension of the traverser during its backward movement. This combination is described and claimed in the third claim. The second instrumentality was the combination, with the traverser, of the press-planking made permanently contracted or narrowed, so that the same kind and amount of friction shall always be brought to bear upon the traverser.

The second claim can properly be construed to include, in a baling-press of the rebounding-traverser type, the described pressure contrivance consisting of the adjustable planking of the press-box or the permanently-contracted planking.

In the defendant's device an eccentric upon the top of the press regulates rods extending from the eccentric to upright rods on the sides of the press, which bear upon the ends of small brakes, which are hinged to the end of each side of the press.

Inasmuch as in this device friction is not applied by the use of the planking of the press-box as a brake, but by a contrivance of eccentric and rods, which rods bear upon brakes which are hinged to the sides of the press, the defendant does not infringe the second claim unless it should be considered so broad as to include a friction-plate or pressure contrivance, for the purpose named, in a baling-press of the described type, in which a part of the planking is not used as the instrumentality by which friction is applied. It is virtually claimed that any adjustable or non-adjustable pressure contrivance for applying friction to the traverser to retard its backward movement and prevent shock is an equivalent of the means specified in the patent. The complainant bases his contention that the claim should have a broad construction upon the fact that the patentee was a pioneer inventor of this part of a baling-press.

It is true that when the invention is of a primary character a larger latitude is given to the equivalents which the patent includes than if the invention was a modification of a well-explored art. In the former case devices which operate upon the same principle and perform the same functions by analogous means are held to be infringements, (*McCormick* v. *Talcott*, 20 How., 402,) and it is also true that when mechanical means are for the first time invented which enable a law of science or a force of nature to be used so as to accomplish a practical and beneficial result, such as the Bell telephone, or when an inventor invents mechanical means for carrying into effect a newly-discovered and useful principle of operation, like the double carbon of Brush, the inventor's properly-drawn patent will include a very wide scope of analogous mechanical means which accomplish the same result. But this invention, though it may be called a primary one, is not of the character to which any such latitude can be given.

The patentee sought to check the backward motion of the traverser. It naturally occurred to him that it could be done by applying some sort of a brake which would slowly and gradually arrest motion. A brake is an old and familiar mechanical appliance and is often applied in a very simple way. The patentee applied it with like simplicity by causing the top press-planking to be inwardly adjustable, so as to impinge upon the traverser and gradually check its motion. He also suggested the primitive idea of permanently narrowing the planking. The patentability of either of these devices is of a very low order. Having made this improvement, he broadly claims in his patent any friction-plate or pressure contrivance, and desires to include all the more elaborate and ingenious methods of constructing a brake which may be introduced. Such a construction is inadmissible, because a patented invention of this character, which with difficulty maintains its right to patentability, belongs to a different class from the one to which the doctrine in *McCormick* v. *Talcott*, *supra*, and kindred cases applies, and is to receive a narrow construction.

The decree of the circuit court is affirmed.

Names of Applicants.

When the full first name of the applicant does not appear either in his signature or in the preamble to the specification, the Examiner will, in his first official letter, require an amendment supplying the omission, and he will not pass the application to issue until the omission has been supplied, unless an affidavit shall have been filed setting forth that the full first name of the applicant is the one originally given by him.

World's Columbian Exposition—Protection of Foreign Exhibitors.

DEPARTMENT OF STATE,
Washington, D. C., July 30, 1892.

To the Diplomatic and Consular Officers of the United States:

GENTLEMEN: I subjoin a transcript of the act of Congress approved April 6, 1892, Public No. 29, entitled "An act to protect foreign exhibitors from prosecution for exhibiting wares protected by American patents and trade-marks," which reads as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That no citizen of any other country shall be held liable for the infringement of any patent granted by the United States, or of any trade-mark or label registered in the United States, where the act complained of is or shall be performed in connection with the exhibition of any article or thing at the World's Columbian Exposition at Chicago.

You will transmit copies of this circular to the government of the country to which you are accredited, and ask that it be given the widest possible circulation for the information of those directly concerned.

I am, gentlemen, your obedient servant,

JOHN W. FOSTER,
Secretary of State.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., August 4, 1892.

Official copy to the Commissioner of Patents for his information and guidance.

E. M. DAWSON,
Chief Clerk.

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1890, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Vol. 7. Appendix No. 7, July 1, 1887, to June 30, 1888. One volume, 68 pages. In paper covers, $1.50.

Vol. 8. Appendix No. 8, July 1, 1888, to June 30, 1889. One volume, 72 pages. In paper covers, $1.50.

Vol. 9. Appendix No. 9, July 1, 1889, to June 30, 1890. One volume, 84 pages. In paper covers, $1.50.

Vol. 10. Appendix No. 10, July 1, 1890, to June 30, 1891. One volume, 98 pages. In paper covers, $1.50.

Indexes to Foreign Patents.

The following indexes to foreign patents have been translated, compiled, and published under the authority of the Commissioner of Patents, and may be obtained as a Patent Office publication at the prices given below:

INDEX TO FRENCH PATENTS, 1791 to 1879, inclusive, (subject-matter,) one volume, 935 pages, bound in cloth $10 00

INDEX TO ITALIAN PATENTS, 1848 to May 1, 1882, (subject-matter,) one volume, 120 pages—

Bound half-turkey	2 50
Bound in cloth	1 25
Paper covers	1 00

Withdrawal of Cases from Issue.

Hereafter all amendments proposed to allowed applications which involve a withdrawal from issue, and all petitions and requests relating thereto, shall be filed with the docket clerk, Mr. J. M. Emory, and transmitted by him to the Primary Examiner for report. If the Examiner shall report favorably to the admission of such amendment, the matter will be laid before the Commissioner for immediate determination. If the Examiner shall report unfavorably, the case will be docketed and will be heard and decided by the Commissioner in regular course, unless good reasons shall appear for immediate action.

Notice.

All solicitors, agents, or attorneys who, in circulars or advertisements or otherwise, refer to the Commissioner of Patents, or to any other official of the Patent Office, for evidence of their professional standing, do so without authority.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Issue of August 30, 1892.

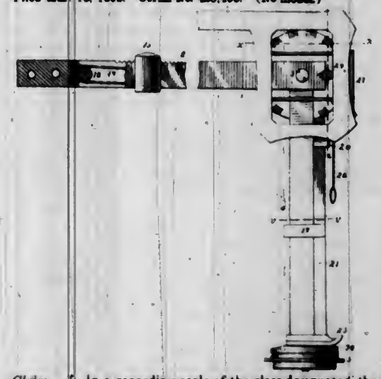
PATENTS

GRANTED AUGUST 30, 1892.

481,542. CHURN. GEORGE S. AGEE, Willow Springs, Mo. Filed Oct. 1, 1891. Serial No. 407,381. (No model.)



Claim.—1. In a churn, the combination, with a support, of an angular rocking frame pivoted at its angle to said support, a foot-treadle at the lower end of the vertical member of said rocking frame, and a dasher-shaft clamp on the outer end of the horizontal member, substantially as set forth.

2. In a churn, the combination, with the parallel uprights, of an angular frame pivoted at its angle between said supports, a dasher-shaft clamp suspended by a link H from the outer end of the horizontal member of said frame, the vertical member of the rocking frame being formed of parallel bars provided with a treadle or foot-piece between their lower ends, substantially as set forth.

3. A churn comprising the base A, vertical uprights B B, the angular rocking frame pivoted at its angle in the upper ends of said uprights, with its horizontal arm G overhanging the base and provided with a depending pivoted link carrying at its lower end the clamping-jaws I I', the vertical member of the rocking frame being formed of two parallel bars having a foot-piece pivoted between their lower ends, and a churn-body having a dasher provided with a shaft held between said clamping-jaws, substantially as set forth.

481,543. RECORDING-BALANCE. CLARENCE F. AMES, Akron, Ohio. Filed Mar. 18, 1892. Serial No. 425,408. (No model.)

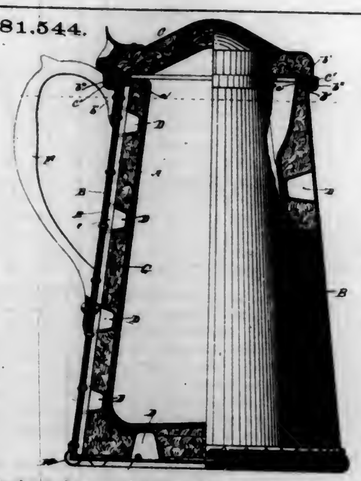
Claim.—1. In a recording-scale of the class designated, the bifurcated scale-beam and the pendant pivotally connected with its free end and the two type-disks loosely mounted on a pivot in said free end, one having a toothed hub and a single lateral and the other having a series of lateral teeth, and a spur-wheel interposed between said type-disks arranged to be engaged by the single tooth of one disk at each revolution thereof and cause a partial revolution of the opposite disk, combined with an endless chain running on the hub of said single-toothed disk and a pulley at the opposite end of the scale-beam and attached to and arranged to move with a sliding weight on said beam, substantially as shown and described.

2. In a scale of the class designated, the combination, with the bifurcated scale-beam and the sliding weight, of the two parallel disks bearing radial type, one whereof has a toothed hub, and the intermediate spur-wheel, and the endless chain running on said hub, and a pulley at the opposite end of said beam and attached to and moved by said weight to cause revolutions of one disk and through said spur-wheel a partial revolution of the other and the rocking platen to force a paper against the type of said disks, substantially as shown and described.

3. In a scale of the class designated, the scale-beam bearing at its free end a pendant having a disk at its lower end and a disk bearing radial type and having a toothed hub loosely mounted on a pivot in the free end of said beam, combined with a bar arranged to slide lengthwise of said pendant, having a rack arranged to mesh in said toothed hub, and a shoe adjacent to the disk of said pendant, arranged to be raised by the interposition of weights between said shoe and disk, and cause a partial rotation of the type-bearing disk as each weight is interposed, substantially as shown and described.

4. The combination, with the scale-beam 2 and pendant 4, of the disks 10 11 12, each having the radial type, the first and last having toothed hubs, and the spur-wheel 14, arranged to engage lateral teeth in the disks 11 and 12, and the chain 17, roller 18, weight 15, attached to said chain, and the sliding bar 21, having the rack 22, meshing in the toothed hub of the disk 10 and arranged to be raised by the interposition of a weight beneath its lower end, all constructed and arranged substantially as shown and described, and for the purpose specified.

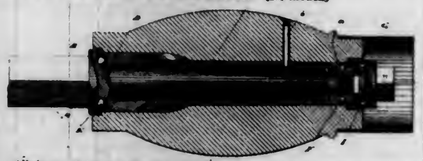
5. In a scale of the class designated, the scale-beam bearing at its free end a series of type-disks arranged to present radial type to indicate the load on the scale, combined with an ink-ribbon mounted on rollers opposite said disks, and a platen arranged to be rocked and force said ribbon against said type and to bear a paper to secure the impression therefrom, substantially as shown and described.



6. In a scale of the class designated, the scale-beam bearing at its free end a series of type-disks arranged to present figures to indicate the load on the scale and a device, as an ink-ribbon, to ink said figures, combined with a platen pivotally mounted in the beam-frame, arranged to bear a paper and to be rocked against said type-disks, and a projection connected with said platen and arranged to enter a recess or notch in the end of said scale-beam to retain it from movement during the contact of the platen and type-disks, substantially as shown and described.

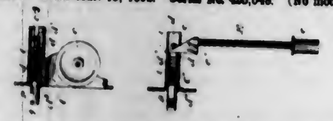
481,544. ICE-PITCHER. RAWDON ARNOLD, Sacramento, Cal. Filed Sept. 4, 1891. Serial No. 404,755. (No model.)

Claim.—1. The combination, with an inner shell of porcelain or analogous material and an outer shell of papier-maché, to which the inner shell is flanged at the top, of a continuous space between said shells at sides and bottom, non-conducting projections or lugs on the outer shell, extending to the inner shell across the space at bottom and sides, and a packing of mineral wool filling the continuous space between the shells, as set forth.



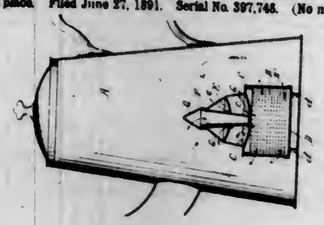
2. The combination of an interior shell or case, A, having an outwardly-projecting horizontal flange *a* at the top, with an outer shell B, having an inwardly-projecting horizontal double flange at the top, between the parts of which the flange *a* is held, and provided with a trough *b*° around its top, and a lid or cover hinged to the outward

481,544.



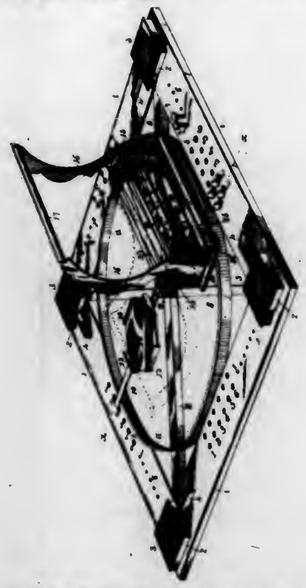
shell having a downward-projecting lip or edge C, fitting into the trough b^6, as set forth.

481,545. AXLE-BEARING. SAMUEL S. ARNOLD, Toronto, Canada. Filed Nov. 23, 1891. Serial No. 412,821. (No model.)



Claim.—A journal-box having its end cut, a nut screwed onto the axle of the said journal-box and cut to form with the cupped end of the journal-box an annular recess for the reception of hard balls by which the end of the journal-box is supported, a washer fitting onto the screwed end of the axle, so that it cannot revolve thereon, and a nut or cap designed to jam the washer against the inner cupped nut, substantially as and for the purpose specified.

481,546. SASH-FASTENER. CHARLES O. BIRNEY, Kansas City, Mo., assignor of nine-sixteenths to John Birney and Frank M. Bressler, same place. Filed Mar. 15, 1892. Serial No. 426,048. (No model.)

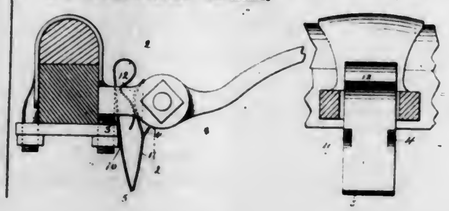


Claim.—In combination with a sash lock and fastener, the locking-bolt D, the slot D^x, the metallic locking-plate G, the coil-spring d^x, the casing C, the slot c', connected with the pulley c, the operating-key E, its beveled end e', its operating end e, secured in the keeper H by a flange, and the removable keeper H and its corresponding plate securely bolted or screwed to the jamb, substantially as set forth.

481,547. SEDIMENT-GATHERER FOR COFFEE-POTS, &c. JOSEPH C. W. BOICK, Bates City, Mo., assignor of one-third to William W. Bailey, same place. Filed June 27, 1891. Serial No. 397,746. (No model.)

Claim.—In combination with a perforated and cloth-covered cylinder, the concave open cover C, the supplemental concave cover E, funnel F, and the handle G G G, substantially as set forth.

481,548. GAME APPARATUS. JULIUS W. BOCK, Greenville, Pa., assignor of one-half to William R. Field, same place. Filed Apr. 14, 1892. Serial No. 429,118. (No model.)

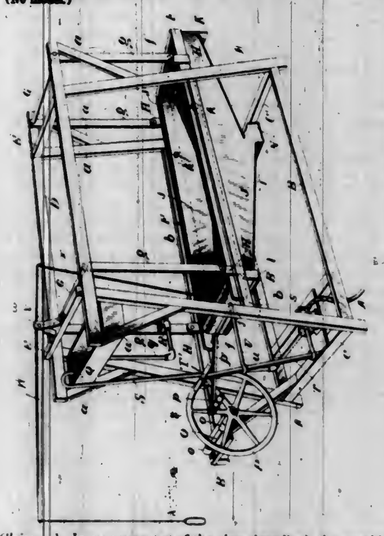


Claim.—1. In a game apparatus, the combination of a frame with openings therein and a horizontally-arranged rotatable carriage mounted in said frame, having a lamp-rest at one end thereof, a counting-board with openings therein at the other end of the same, and playing-pieces adapted to be used in connection with said frame and said counting-board, substantially as described.

2. In a game apparatus, the combination of a frame with openings therein, a carriage within said frame supporting the counting or working board with openings therein, and an arm or hand rest pivotally secured to said carriage, substantially as described.

3. In a game apparatus, the combination of a frame with openings therein, a carriage rotatably mounted in said frame and supporting a counting or working board with openings therein, guards arranged on opposite sides of said counting or working board, and arms pivotally connected to the carriage and supporting a hand or arm rest at their upper ends, substantially as described.

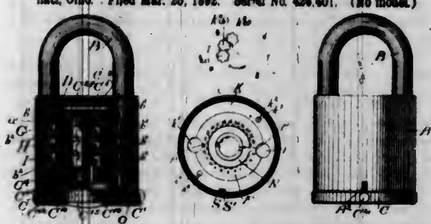
4. In a game apparatus, the combination of a frame, a carriage rotatably mounted in said frame, consisting of a bar supporting a lamp-rest at one end and a base at the other, to which is secured a counting or working board having a trough below the same, an arm or hand rest pivotally connected to the supports of said counting or working board, guards on opposite sides of said counting or working board, a circular track on which said carriage moves, a large playing ball or piece, and smaller balls or pieces, and game-tallying pegs, substantially as described.



481,549. ANTI-RATTLER FOR THILL-COUPLINGS. CLARENCE A. CARMAN, Paterson, N. J. Filed June 11, 1891. Renewed June 8, 1892. Serial No. 435,924. (No model.)

Claim.—1. An anti-rattler for thill-couplings, formed with a body 10, a main spring-arm 11, there being a V-bend at the point where the arm leaves the body, an auxiliary or reinforcing spring arm which bears against the main arm, all parts being made from a single strip of metal, substantially as described.

2. An anti-rattler for thill-couplings, formed from a single strip of metal and with main and auxiliary spring-arms and with retaining-tongues, the upper end of the main spring-arm being bent outward, as and for the purpose stated.



481,550. ORE WASHER AND CONCENTRATOR. ARTHUR L. DANA, Colorado Springs, Colo. Filed Dec. 28, 1891. Serial No. 416,286. (No model.)

Claim.—1. In an apparatus of the class described, the combination, with a swinging shoe having its bottom inclined from each end inwardly, but at different degrees of inclination, whereby a rearwardly-directed opening *m* is formed, of a trap N, encircling said opening, substantially as and for the purpose set forth.

2. In an apparatus of the class described, the combination, with an oscillating shoe having its bottom inclined from each end inwardly, but at different degrees of inclination, whereby a rearwardly-directed opening *m* is formed, of a trap N, inclosing said opening, and a false perforated bottom disposed in said shoe, substantially as and for the purpose set forth.

481,551. COMBINATION-PADLOCK. HENRY H. DANIELS, Cincinnati, Ohio. Filed Mar. 26, 1892. Serial No. 426,401. (No model.)

Claim.—1. In a combination-lock, the combination of two or more tumblers, each tumbler consisting of tumbler-disk N, tumbler-ring F, and tumbler-support K, united together substantially as described, the tumbler-support being provided with the pinion k^9, arranged to mesh with the notches or teeth f^2 of the tumbler, and the rod C^{16}, provided with the projecting teeth C^{20}, and mechanism, substantially as described, for enabling the rod C^{16} to be longitudinally reciprocated for bringing said teeth C^{20} into contact with their respective pinions k^9 and for rotating the rod C^{16}, substantially as and for the purposes specified.

2. In a combination-lock, the combination of two or more tumblers, each tumbler consisting of tumbler-disk N, tumbler-ring F, and tumbler-support K, united together substantially as described, and a tumbler-operating column having rod C^{16}, carrying teeth C^{20}, and the finger-disk C^{18}, arranged to move to and from the tumblers provided with mechanism for enabling the rotation of the said disk when at one end of its reciprocal movement to rotate a given tumbler, substantially as and for the purposes specified.

3. In a combination-lock, the combination of two or more tumblers, each tumbler consisting of tumbler-disk N, tumbler-ring F, and tumbler-support K, united together substantially as described, and tumbler-operating column having rod C^{16}, carrying teeth C^{20}, and the finger-disk C^{18}, arranged to move to and from the tumblers provided with mechanism for enabling the rotation of the said disk when at one end of its reciprocal movement to rotate a given tumbler and provided with means, substantially as described, for elastically returning the disk after a given tumbler has been returned to its first position, substantially as and for the purposes specified.

4. In a combination-lock, the combination of two or more tumblers, each tumbler consisting of tumbler-disk N, tumbler-ring F, and tumbler-support K, united together substantially as described, and a tumbler-operating column having rod C^{16}, carrying teeth C^{20}, and the finger-disk C^{18}, arranged to move to and from the tumblers provided with mechanism for enabling the rotation of the said disk when at one end of its reciprocal movement to rotate a given tumbler and provided with springs C^{30}, embracing the rod C^{16}, fastened substantially as described, substantially as and for the purposes specified.

5. In a combination-lock, the combination of two or more tumblers, each tumbler consisting of tumbler-disk N, tumbler-ring F, and tumbler-support K, united together substantially as described, and the rod C^{16}, provided with teeth C^{20}, engaging the pinions k^9, the rod C^{16}, reciprocating through the said shank and the disk C^{14}, connected to the rod, the disk C^{18} being capable of reciprocal movement to and from the tumblers, substantially as described, and spring for elastically returning finger-disk C^{18} to its first position, substantially as and for the purposes specified.

6. In a combination-lock, the combination of two or more tumblers, each tumbler consisting of tumbler-disk N, tumbler-ring F, and tumbler-support K, united together substantially as described, and rod C^{16}, provided with teeth C^{20}, engaging their respective adjacent pinions k^9, the rod C^{16}, reciprocating through the shank and the reciprocating disk C^{18}, and means, substantially as described, for enabling the reciprocatory movement of the disk to rotate the rod, substantially as and for the purposes specified.

7. In a combination-lock, the combination of two or more tumblers, each tumbler consisting of tumbler-disk N, tumbler-ring F, and tumbler-support K, united together substantially as described, and rod C^{16}, provided with teeth C^{20}, engaging their respective adjacent pinions k^9, the rod C^{16}, reciprocating in the shank C^4, and finger-disk C^{18}, located in the recess C^{14} at the end of the bed-foundation portion of the tumbler-operating column connected to the rod by mechanism, substantially as described, for enabling the said finger-disk C^{18}, when reciprocated and turned, to rotate the rod and move the teeth C^{20}, substantially as and for the purposes specified.

8. In a combination-lock, the combination of two or more tumblers, each tumbler consisting of tumbler-disk N, tumbler-ring F, and tumbler-support K, united together substantially as described, and rod C^{16}, provided with teeth engaging their respective adjacent pinions k^9, the rod C^{16}, reciprocating in the shank C^4, and the disk C^{18}, located in the recess C^{14} and rigidly connected to the said rod C^{16}, and provided with spring C^{30}, substantially as and for the purposes specified.

9. The series of tumblers having central openings through which passes an operating rotatable reciprocating shaft having projections, in combination with pinions for successively operating the tumblers, one of the said projections when the shaft has been reciprocated in one direction and rotated a given distance engaging with one of the said pinions, the said projections when the shaft has been reciprocated in the opposite direction being out of engagement with the said pinions, substantially as and for the purposes specified.

10. The combination of the catch C^{31}, and the disk C, and tumbler-operating column having shank C^4, having two or more projections C^5, and the tumblers having projections *n'*, and the shell having notches, as A^3 A^4 A^5, substantially as and for the purposes specified.

11. The combination of the catch C^{31}, and the disk C, and tumbler-operating column having shank C^4, having two or more projections C^5, and the tumblers having projections *n'*, and the shell having notches, as A^3 A^4 A^5, and the reciprocating rod C^{16}, having teeth C^{20}, and finger-disk C^{18}, and elastic mechanism for returning the spring to its first position after being operated, and pinions, as k^9, located substantially as described, substantially as and for the purposes specified.

12. The combination of the catch C^{31}, and the disk C, and tumbler-operating column, having shank C^4, having two or more projections C^5, and the tumblers having projections *n'*, and the shell having notches, as A^3 A^4 A^5, and the reciprocating rod C^{16}, having teeth C^{20},

and finger-disk C^{15}, and spring C^{20}, located in connection with rod C^{16} and pinions, as k^2, located substantially as described, substantially as and for the purposes set forth.

13. The combination of the tumbler-supports and the tumblers, each tumbler made thicker than the depth of its seat in the tumbler-support, and the envelope or shell in which said tumblers and their supports are contained, and the spring C^{16}, bearing against a fixed portion of the lock and against the bottom of the end tumbler-support, substantially as and for the purposes set forth.

14. The combination of the tumbler-supports and the tumblers, each tumbler made thicker than the depth of its seat in the tumbler-support, and the envelope or shell in which said tumblers and their supports are contained, and the spring C^{16}, compressed between a fixed portion of the shell and a part of the tumbler mechanism for creating frictional contact between the tumblers, substantially as and for the purposes set forth.

15. The combination of the tumbler-supports and the tumblers, each tumbler made thicker than the depth of its seat in the tumbler-support, and the envelope or shell in which said tumblers and their supports are contained, and the spring C^{16}, one end bearing against the end C of the shell and the other end of the spring pressing up the bottom side of the lower tumbler-support, substantially as and for the purposes set forth.

16. The combination of the tumbler-supports and the tumblers, each tumbler made thicker than the depth of its seat in the tumbler-support, and the envelope or shell in which said tumblers and their supports are contained, and the spring C^{16}, one end located in a depression C^{16} in the end C of the shell and pressing the tumbler devices together, substantially as and for the purposes set forth.

17. The combination of the tumbler-supports and the tumblers, each tumbler made thicker than the depth of its seat in the tumbler-support, and the envelope or shell in which said tumblers and their supports are contained, and the spring C^{16}, one end located in a depression C^{16} in the end C of the shell, and the washer O, against which the other end of the spring bears, this washer being below the lower tumbler-support, substantially as and for the purposes specified.

18. The combination of the tumbler-supports and the tumblers, each tumbler made thicker than the depth of its seat in the tumbler-support, and the envelope or shell in which said tumblers and their supports are contained, and the spring C^{16}, bearing against a fixed portion of the lock and against the bottom of the end tumbler-support, each tumbler having projections, as n', and the shank C^4, having projections C^9 for respectively engaging the projections, as n', of the tumblers, and the rotatable disk C, connected to the shank and having catch C^{21}, engaging a fixed portion of the lock, and mechanism for rotating each tumbler to a given number, substantially as and for the purposes specified.

19. The combination of the tumbler-supports and the tumblers, each tumbler made thicker than the depth of its seat in the tumbler-support, and the envelope or shell in which said tumblers and their supports are contained, and the spring C^{16}, bearing against a fixed portion of the lock and against the bottom of the end tumbler-support, each tumbler having projections, as n', and the shank C^4, having projections C^9 for respectively engaging the projections, as n', of the tumblers, and the rotatable disk C, connected to the shank and having catch C^{21}, and a fixed portion of the lock having as many notches as there are tumblers, the notches being adapted to receive the said catch, and mechanism for rotating each tumbler to a given number, substantially as and for the purposes specified.

20. The combination of the tumbler-supports and the tumblers, each tumbler made thicker than the thickness of its tumbler-support, and the envelope or shell in which said tumblers and their supports are contained, and the spring C^{16}, bearing against a fixed portion of the lock and against the bottom of the end tumbler-support, each tumbler having projections, as n', and the shank C^4, having projections C^9 for respectively engaging the projections, as n', of the tumblers, and the rotatable disk C, connected to the shank and having catch C^{21}, and a fixed portion of the lock having as many notches as there are tumblers, the notches being adapted to receive the said catch, and rod C^{14}, having teeth C^{21} and connected to finger-disk and reciprocating with the length of the shank, and mechanism for enabling the movement of the teeth of the rod C^{14} to rotate the tumblers, substantially as and for the purposes specified.

21. The combination of the tumbler-supports and the tumblers, each tumbler made thicker than the thickness of its tumbler-support, and the envelope or shell in which said tumblers and their supports are contained, and the spring C^{16}, bearing against a fixed portion of the lock and against the bottom of the end tumbler support, each tumbler having projections, as n', and the shank C^4, having projections C^9 for respectively engaging the projections, as n', of the tumblers, and the rotatable disk C, connected to the shank and having catch C^{21}, and a fixed portion of the lock having as many notches as there are tumblers, the notches being adapted to receive the said catch, and rod C^{14}, having teeth C^{21}, and connected to finger-disk and reciprocating with the length of the shank, and pinions, as k^2, for respectively operating the tumblers and for engagement with the teeth of rod C^{14}, substantially as and for the purposes specified.

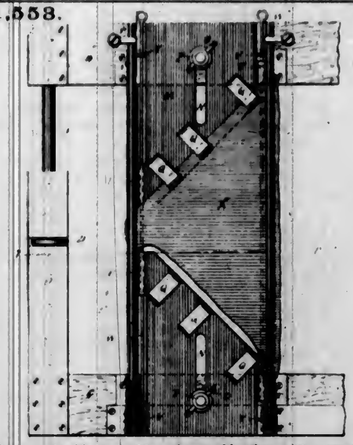
22. The combination of the tumbler-supports and the tumblers, each tumbler made thicker than the thickness of its tumbler-support, and the envelope or shell in which said tumblers and their supports are contained, and the spring C^{16}, bearing against a fixed portion of the lock and against the bottom of the end tumbler-support, each tumbler having projections, as n', and the shank C^4, having projections C^9 for respectively engaging the projections, as n', of the tumblers, and the rotatable disk C, connected to the shank and having catch C^{21}, and a fixed portion of the lock having as many notches as there are tumblers, the notches being adapted to receive the said catch, and rod C^{14}, having teeth C^{21}, and connected to finger-disk and reciprocating with the length of the shank, and pinions, as k^2, for respectively operating the tumblers and for engagement with the teeth of rod C^{14}, substantially as and for the purposes specified, and mechanism for retracting the rod to its original position, substantially as and for the purposes specified.

23. The combination of the shank C^4, fixed to the rotatable disk C, and having notch or recess C^{24} and teeth C^8, and tumblers having projections, as n', for respective engagement with said teeth C^8 and rod C^{14}, reciprocating in the shank and having teeth C^{20} on blade C^{19}, and mechanism for enabling the said teeth C^{20} as rod C^{14} is turned to rotate the tumblers, substantially as and for the purposes specified.

24. The combination of the shank C^4, fixed to the rotatable disk C, and having notch or recess C^{24}, and teeth C^8, and tumblers having projections, as n', for respective engagement with said teeth C^8, and rod C^{14}, reciprocating in the shank and having teeth C^{20} on blade C^{19}, and pinions, as k^2, for engaging said tumblers, and also said teeth C^{20}, as rod C^{14} is rotated, the sides of notch C^{24} limiting the rotation of the blade C^{19}, and thereby limiting the rotation of the said teeth C^{20}, substantially as and for the purposes specified.

25. The combination of the tumbler-supports and the tumblers, each tumbler made thicker than the depth of its seat in the tumbler-support, and the envelope or shell in which said tumblers and their supports are contained, and elastic mechanism bearing against one portion of the lock, and arranged to press the tumbler devices against each other, substantially as and for the purposes specified.

481,552. SPECTACLES. MASON W. DAVIS, Southbridge, Mass. Filed May 17, 1892. Serial No. 433,379. (No model.)



Claim.—In a spectacle-frame, the combination, with the glass rims or frames, of lugs formed with and extending at right angles across the inner central portions thereof and having recesses in their upper sides to form limiting-walls and also provided with vertical screw-openings extending centrally therethrough, a nose or bridge piece having the ends thereof bent back upon themselves to form laterally-extending depending guards and terminating in rearwardly-projecting horizontal arms at right angles to the said nose or bridge piece and formed with flattened ends with openings therethrough to fit the said lugs, and screws for connecting said parts, substantially as described.

481,553. FABRIC-HOLDER FOR EMBROIDERING-MACHINES. THEODOR D. EISNER, Boston, Mass. Filed Mar. 27, 1891. Serial No. 386,593. (No model.)

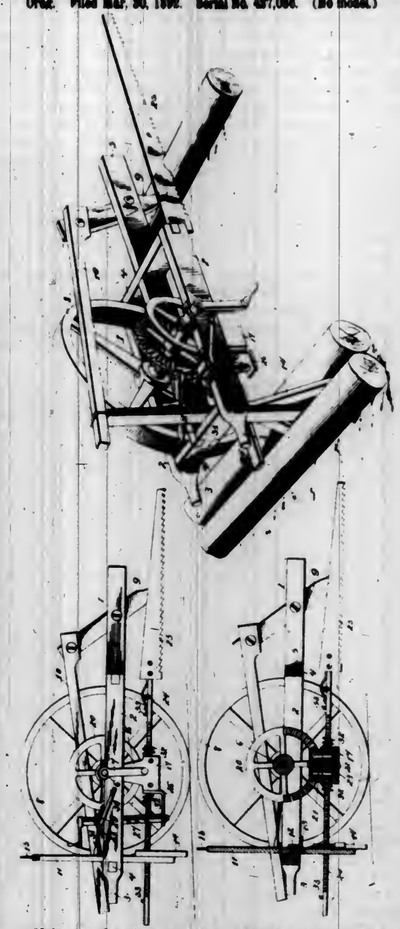
Claim.—1. In an embroidery-machine, the combination, with a tambour-frame, of rails fitting in the openings of the frame and means for moving them toward or from each other, U-shaped bars connecting the rails, clamping-bars fitting in said U-shaped bars, means for locking the free ends of the clamping-bars to one of the rails, and spring-clamps for holding part of the fabrics held between the clamping-bars, substantially as set forth.

481,553.

2. In an embroidery-machine, the combination, with a tambour-frame having openings, of two rails fitting in said openings, hollow arms projecting from the ends of one of the rails, a nut in each hollow arm, screw-rods projecting from the other rail into the said hollow arms and passing through the nuts, U-shaped bars connecting the rails, hinged clamping-bars adapted to be pressed into said bars, means for locking the free ends of the clamping-bars to one of the rails, and spring-clamps for holding part of the fabric held between the clamping-bars, substantially as set forth.

3. In an embroidery-machine, the combination, with a tambour-frame having openings, of rails fitting in said openings, means for adjusting the rails toward or from each other, U-shaped bars secured to the rails, hinged clamping bars adapted to be pressed into the U-shaped bars, adjustable plates held on the rails between the clamping-bars, which plates have their inner ends cut off diagonally, and spring-clamps on said plates at the diagonal edges thereof, substantially as set forth.

481,554. ROVING-CAN. ALVAN B. FISHER, Rutland, Mass. Filed Apr. 29, 1892. Serial No. 430,479. (No model.)



Claim.—1. A roving-can provided with a cylindrical body made of double cross-laid wood veneers and having a metal joint-connection overlying and binding the adjacent edges along the sides of the cylinder, with its outer edges riveted through the veneer fabric, its top end reinforced by an edge-protecting metal top border and its lower end protected by an underflanged metal foot-supporting rim, substantially as herein set forth.

2. The method of making double-ply wood veneer cylinders for roving-cans, which consists in gluing together a wet veneer and a dry veneer with their grain cross-laid, applying pressure to the same in substantially flat position until the glue has become set, and then removing the pressure and drying the product without confining it, and in a manner to facilitate the curling up of the edges, substantially as set forth.

3. The side-joint connection composed of a metal plate having its edges folded over upon itself, turned inward at their meeting line between the abutting edges of the cylinder and there bent back in opposite directions and pressed down upon the inner face of the respective edges of the cylindrical fabric, the outer folded parts of said joint-plate extending laterally beyond the width of its inner downpressed edges for supporting the cylindrical curve of the fabric, and connected through said fabric by rivets along the folded edges of the plate, in combination with the body-cylinder, substantially as shown and described.

4. The roving-can constructed as herein-described, its cylindrical body *a* formed of cross-laid plies of wood veneer, having their abutting edges 5 connected and protected by a joint-plate that embraces and compresses said edges and reinforced at the top by a metal border that covers and protects the edge of the wood to prevent slivering of the same, the bottom disk *i*, the reinforce-band *f*, and the metal foot-supporting rim A, surrounding the base of the body and extending beneath the same, all substantially as shown and described.

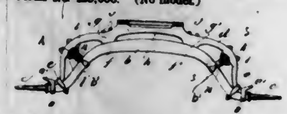
481,555. DRAG-SAWING MACHINE. LEONARD FOREMAN, Albion, Orez. Filed Mar. 30, 1892. Serial No. 427,086. (No model.)

Claim.—1. In a drag-sawing machine, the combination of a saw-blade secured to a rack-bar, double pinions, one of which engages said rack-bar, and oppositely-situated mutilated gears adapted to engage one of said pinions to impart reverse reciprocating movements to said rack-bar and the saw-blade carried thereby, substantially as described.

2. In a drag-sawing machine, the combination of a frame, a transverse shaft arranged thereon, a large wheel carried by said shaft, mutilated gears keyed to said shaft, pinions below said gears, and a rack-bar engaging one of said pinions and carrying a saw-blade, said large wheel being adapted to be thrown into and out of connection with the mutilated gears, the other of said pinions being in engagement alternately with said mutilated gears, substantially as described.

3. In a drag-sawing machine, the combination of a frame, a transverse shaft mounted thereon, hangers depending from said shaft, a box-frame connected to the lower portion of said hangers and having a rearward extension, pinions carried in said box-frame, a rack-bar extending through one side of said box-frame and having a saw-blade connected thereto, and a vertically-disposed screw-shaft connected to the said rearward extension of the box-frame and having a spring-actuated wedge engaging the same, substantially as described.

4. In a drag-sawing machine, the combination of a frame, a shaft transversely mounted thereon, mutilated gears on said shaft having the teeth thereof arranged opposite to the untoothed portion of each other, a pinion engaged by said mutilated gears alternately, another pinion below the first-named pinion, a rack-bar, and a saw-blade carried by said rack-bar, substantially as described.



5. In a drag-sawing machine, the combination of a frame having the rear ends of the side bars thereof formed into handles and pro-

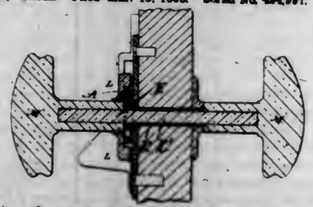
vided with an extension at the front end thereof, a dog pivotally connected to said extension, a lever attached to said dog and extending to the rear of the machine, an upright at the rear of the machine having legs at the lower end thereof and its upper end in engagement with the end of said lever, an adjustable saw carried by said frame, and an enlarged wheel secured to the frame and having a clutch mechanism in engagement therewith, whereby the same may be transported from one position to another, substantially as described.

6. In a drag-sawing machine, the combination of the frame, a shaft transversely mounted on said frame, mutilated gears on said shaft, a box frame suspended from said shaft and having an opening in the top thereof, and a slot extending longitudinally therethrough, a pinion mounted to project through the top opening of said frame and engaged by the mutilated gears, a second pinion in line with the longitudinal slot in said frame, a rack-bar movably mounted in said longitudinal slot, and a saw carried by said rack-bar, substantially as described.

7. In a drag-sawing machine, the combination of a frame, a shaft transversely extending across the same, a frame suspended from said shaft having a longitudinal opening therethrough, springs surrounding opposite sides of said opening, a rack-bar having stops to engage said spring and carrying a saw-blade, and means for operating said rack-bar, substantially as described.

481,556. SULKY. Edward S. Frasier, Aurora, Ill. Filed Mar. 19, 1892. Serial No. 425,633. (No model.)

Claim.—1. The combination, with a high-curved axle *b*, having the rising portions *b'*, of a truss-bar *d*, elevated above the axle and having projections *g g* on its under side which rest upon the upper side of the axle, said truss-bar having its ends connected with the axle adjacent to the spindles thereof and between the latter, and the said projections formed with a degree of curvature greater than that of the said rising portions of the axle, a seat-supporting frame *i*, mounted on the truss-bar, and the shaft *k*, secured to the truss bar above the axle, substantially as described.

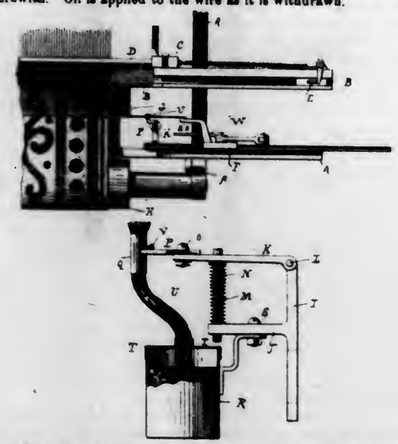


2. The combination, with an axle *b*, of a bent truss-bar *d*, secured to the axle near the ends thereof and rising over and resting upon the upper portion of said axle, and shaft *k*, extending between the rising portions of the truss-bar and the axle and secured to the truss-bar above the axle, substantially as described.

3. The combination, with a high curved axle *b*, having the rising portions *b'*, of the truss-bar *d*, mounted upon the upper side of the axle and extending over but elevated above the rising portions thereof, the degree of curvature of the truss-bar being greater than that of the said rising portions of the axle, the shafts *k*, secured to the said elevated portions of the truss-bar above the rising portions of the axle, and braces *m n*, connecting the shafts with the rising portions of the axle, substantially as described.

4. The combination, with an axle *b*, of a tie-bar *d*, resting upon said axle, the lower ends of the tie-bar being secured upon the lower ends of the axle, shafts *k*, secured to said tie-bar, and braces *m* and *n*, substantially as described.

5. The combination, with a curved axle *b*, of a tie-bar *d*, the ends of which are secured to the opposite ends of the axle *b* and the upper portion of which rests upon the axle, of tongues *p*, formed on the lower ends of said tie-bar, grooves *p'* in said axle, adapted to receive said tongues, and clips for securing the ends of said tie-bar upon the axle, substantially as described.



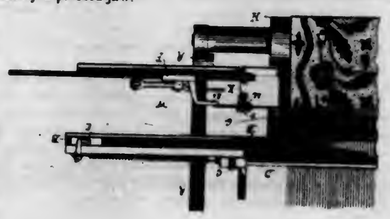
481,557. LATCH. Cyrille Gagnon and Louis Lefebvre, Montreal, Canada. Filed Mar. 15, 1892. Serial No. 424,991. (No model.)

Claim.—In combination, the plate B, the latch having an opening therein, the cam arranged entirely within the said opening and in the same plane with the latch, the cover-plate extending over the latch at its opening to cover the same and the cam, the said latch projecting at one side of the cover-plate to engage with the keeper and projecting on the other side of said plate, the latter projecting end being pivoted to the plate B, substantially as described.

481,558. OILING DEVICE FOR LOOMS. Joseph S. Gilbe, Worcester, Mass., assignor to Matthew J. Whittall, same place. Filed Mar. 14, 1892. Serial No. 424,754. (No model.)

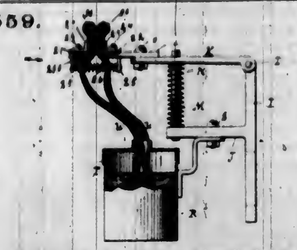
Brief.—The wicking is carried by a hinged arm K and is moved from the path of the withdrawing-hook by a cam W mounted to move therewith. Oil is applied to the wire as it is withdrawn.

Claim.—1. The combination, in a loom, of the wires, the hook for catching and withdrawing the same, a wick interposed in the path traveled by said wires, means for supplying oil to said wicking, and means for moving the wick out of its normal position, so that the same will clear said hooks, substantially as described.



2. The combination, in a loom, of the wires, the hook for catching and withdrawing the same, the arm K, carrying at one end thereof the wicking and normally holding the wicking in the path traveled by the wires, so as to oil the same, and the cam moving with the hook and adapted to strike the arm K and move the wicking, so that the same will clear said hook, substantially as described.

3. The combination, in a loom, of the wires, the hook for catching the same and withdrawing the wires out of the fabric, the pivoted arm K, the screw M, the head of which limits the upward movement of the arm K, the spring N, holding said arm in its raised position, of a wicking carried by the end of said arm and interposed in the path traveled by the wires, and the cam moving with the hook, adapted to strike the arm K and depress the wicking, so that the same will clear the hook, substantially as described.

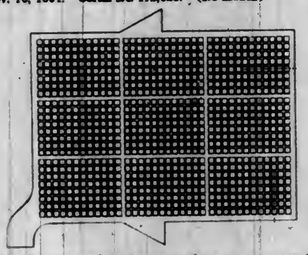


4. The combination, in a loom, of the wires, the hook for catching and withdrawing the same, the frame I, fastened to the loom-frame and having the extending arm J, the arm K, pivoted to the frame I, the tube Q, carried at the end thereof, means for adjusting the tube relatively to the arm K, the spring for holding the arm K normally elevated, the cam W, carried by the carriage of the loom, adapted to depress the arm K, the oil-cup R, and the wicking extending from the oil-cup to the tube Q, substantially as described.

481,559. OILING DEVICE FOR LOOMS. Joseph S. Gilbe, Worcester, Mass., assignor to Matthew J. Whittall, same place. Filed Mar. 14, 1892. Serial No. 424,755. (No model.)

Brief.—The wires are oiled or wiped by being passed between two opposed wicks. One of said wicks is fixed and the other is carried by a pivoted jaw.

481,559.



Claim.—1. In a loom of the character described, the combination of the wires, means for withdrawing and inserting the same, and two opposed wicks arranged in the path traveled by the wires and between which said wires are moved, substantially as described.

2. In a loom of the character described, the combination, with the wires, the hook for catching and withdrawing said wires, and two oppositely-disposed wicks normally arranged in the path traveled by said wires and through which the same are drawn, of means for moving said wicks out of this position, so that the wicks will clear the hook, substantially as described.

3. In a loom of the character described, the combination, with the wires and means for withdrawing and inserting the same, of the rigid jaw and the pivoted jaw, the spring acting to force the end of the pivoted jaw against the end of the rigid jaw, each jaw holding or having a facing of suitable material, and between which said wires are drawn, substantially as described.

4. In a loom of the character described, the combination, with the wires and means for withdrawing and inserting the same, of the two opposed plates 30, having holes 31, 32, and 33, the wicks passing through said holes, as described, and so arranged that the wires will be drawn between the said wicks, substantially as described.

481,560. SECONDARY BATTERY. William W. Gibbon, Haverford College, assignor to the Accumulator Company, Philadelphia, Pa. Filed Nov. 16, 1891. Serial No. 412,023. (No model.)

Claim.—1. In a secondary battery, plates or supports having a series of holes or perforations extending therethrough, each of said perforations having two opposite walls only concave, substantially as described.

2. In a secondary battery, plates or supports for the active material, having a series of holes or perforations extending therethrough, each of said perforations having its opposite walls only concave, the two complementary opposite walls having a suitable holding-surface, substantially as described.

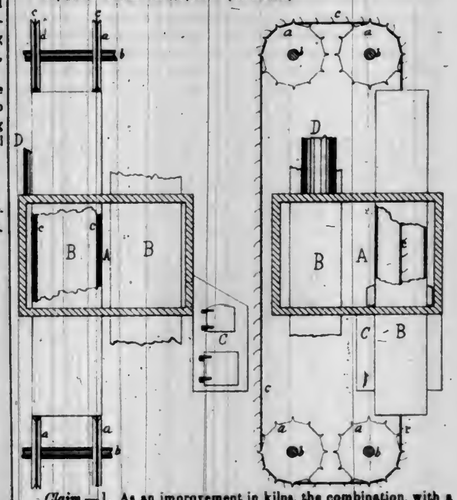
3. A plate for use in a secondary battery, having a series of holes or perforations extending therethrough, said perforations having two opposite walls concave and two opposite walls substantially plane surfaces, with an inwardly-projecting rib, substantially as described.

4. A plate for use in a secondary battery, composed of lead and having a series of substantially equidistant uniformly arranged perforations, said perforations having four sides or walls, two opposite walls being concave and two opposite walls being substantially plane surfaces, with a diagonal inwardly-projecting rib or projection, substantially as described.

5. A plate for use in a secondary battery, having a series of holes or perforations extending therethrough, said perforations having two opposite walls concave and two opposite walls substantially plane surfaces, with an inwardly-projecting rib or extension, and finely-divided absorptive material packed in said perforations, substantially as and for the purpose set forth.

481,561. PUZZLE. James W. Hale, Newburyport, Mass. Filed May 27, 1892. Serial No. 434,628. (No model.)

481,561.



Claim.—1. A puzzle apparatus comprising a base, two rigid posts, as B B', extending from said base, and a strap adapted to be wound around said posts, substantially as described.

2. A puzzle apparatus comprising a base, two rigid posts, as B B', extending from said base, one of said posts being provided with a designating-mark, as *b'*, whereby it may be distinguished from the other, and a strap adapted to be wound around said posts, substantially as set forth.

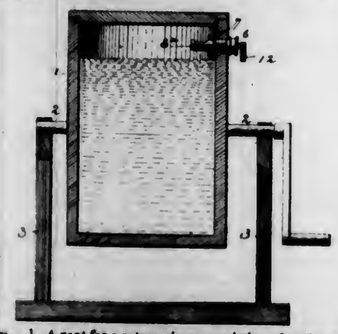
3. A puzzle apparatus comprising a base, two rigid tubular posts, as B B', extending from said base, a pin, as C, of shape to be inserted in the opening of one of said posts, and a strap adapted to be wound around said posts, substantially as described.

481,562. KILN. Philip J. Handel, Meriden, Conn. Filed Nov. 18, 1891. Serial No. 412,277. (No model.)

Claim.—1. As an improvement in kilns, the combination, with a heating-chamber, of one or more vertical flues passing through said chamber and extended both above and below the same, for the purpose specified, said flues having no communication with the chamber, substantially as set forth.

2. As an improvement in kilns, the combination, with a heating-chamber, a fire box or boxes, and a stack communicating with the chamber, of one or more uninterrupted vertical flues passing through the chamber and extended above and below the same, forming a burning-passage, having its greatest temperature essentially at or near its center, and a continuous carrier adapted to pass entirely through said flue or flues, substantially as and for the purpose set forth.

481,563. CALENDAR. Charles H. Hoyt, Brooklyn, N. Y. Filed Jan. 27, 1892. Serial No. 419,434. (No model.)



Claim.—1. A monthly calendar having the numbers of the days of the month in conspicuous numerals arranged in seven columns and forming cross rows reading from left to right and having, also, cross-rows *a* of time divisions in less-conspicuous characters extending across the calendar and alternating with the rows of conspicuous numerals of the monthly calendar, substantially as and for the purposes set forth.

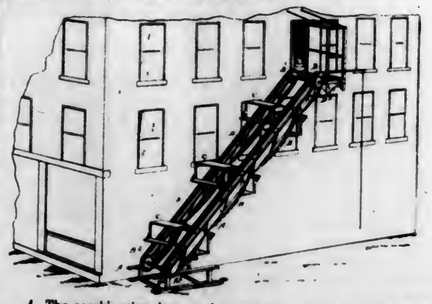
2. A monthly calendar having the numbers of the days of the month in conspicuous numerals arranged in seven columns and forming cross-rows reading from left to right and having cross rows *a* of time divisions in less-conspicuous characters extending across the calendar and alternating with the rows of conspicuous numerals of the monthly calendar, and having, also, a column *c*, containing the number of the current year of the calendar, and the names of the months arranged opposite the respective rows *a*, substantially as and for the purposes set forth.

3. A monthly calendar consisting of the names of the current month and year, the names of the days of the week arranged in a row, and the numbers of the days of the month in conspicuous numerals arranged in columns and forming cross-rows, as set forth, said monthly calendar having cross-rows *a* alternating with the rows of day-of-the-month numerals of the calendar and consisting of groups, each comprising the name of a week-day and the name of one or more months, and having, also, printed in the blank spaces of the calendar the numbers of the years of the century arranged in groups, substantially as and for the purposes set forth.

4. A monthly calendar consisting of the names of the current month and year, the names of the days of the week arranged in a row, and the numbers of the days of the month in conspicuous numerals arranged in vertical columns and forming cross-rows, as set forth, said calendar having rows *a* alternating with the rows of conspicuous numerals of the monthly calendar, the rows *a* being composed of groups comprising each the name of a day of the week and the name of a month, and having, also, printed in the blank spaces of the monthly calendar the numbers of the years of the century arranged in their proper order and each having an index-number, substantially as and for the purposes set forth.

481,564. CHURN-VENT. FREDERICK E. HUGGINS, Clinton, Iowa, assignor to Edgar W. Conable, same place. Filed Nov. 9, 1891. Serial No. 411,396. (No model.)

Claim.—1. A vent for a rotary churn, consisting of a tube adapted to be inserted into a churn-body, provided at its inner end with a slot or opening, a tube fitting and rotatable within said tube, provided with a corresponding slot, and a weight connected with said last-mentioned tube and adapted to operate the same during rotation of the churn to prevent the discharge of the cream therefrom when the vent is below the surface of the fluid, substantially as described.



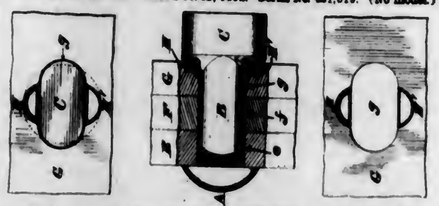
2. In a vent for churns, the combination, with the outer tube 3^a, closed at one end and provided with a slot 4 and having a flange 5 at its outer end, with screw-threads 4^a and 6 at each side of said flange, of the nut 7, adapted to engage with the screw-threads 4^a, the inner tube 8, having slot 9 and collar 14, the cross-piece 10, and pivoted weighted arm 12, substantially as described.

481,565. FIRE-ESCAPE. JOHN A. HUNT, Indianapolis, Ind. Filed Feb. 9, 1892. Serial No. 420,869. (No model.)

Claim.—1. The combination of traveling chains, angle-frames pivoted thereto and pivoted together, and seats or steps on said angle-frames, whereby a carrier is provided, and an appropriate device for checking and regulating the speed of said carrier, substantially as set foth.

2. The combination, in a chain-carrier, of frames composed of parts C' C^2, pivoted to the chains and pivoted together, and seats or steps C, secured to said frames, whereby the necessary movement is secured to permit the continuous motion of the carrier, substantially as shown and described

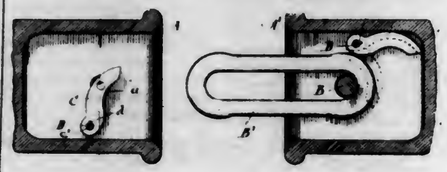
3. The combination, in a carrier, of a framework set at an angle, bearings on said framework, shafts carrying wheels mounted in said bearings, adjusting-screws A^4, whereby said bearings and the wheels carried thereby are adjusted to the proper position, chains running over said wheels, and seats or steps secured to said chains, whereby a safe gradual descent from an upper to a lower elevation may be secured, substantially as shown and described.



4. The combination, in a carrier, of a framework set at an angle, a traveling chain-carrier mounted thereon having seats or steps secured thereto extending out therefrom in a substantially horizontal direction, thus producing a substantially level platform for carrying the passengers.

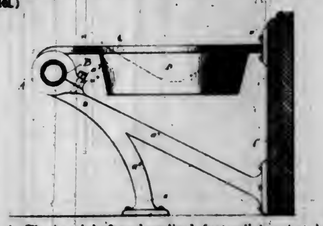
5. The combination, in a carrier, of a framework set at an angle and frames secured thereto in such a position that the upper member thereof will be at substantially a level with a seat or step portion secured thereto, substantially as shown and described.

6. The combination, in a carrier, of traveling chains, frames pivoted thereto having two portions which extend out in a horizontal direction or on a level but at an angle with the chain and its direction of travel, the upper portion of which carries a seat part and the lower portion a foot-rest part, substantially as shown and described.



481,566. FASTENING FOR METAL PLATES. WILLIAM C. HUNTER, Newport, Ky. Filed Feb. 15, 1892. Serial No. 421,619. (No model.)

Claim.—1. As a new article of manufacture, a fastening device consisting of a shank B, having a head A at one end, an oblong butt C at its other end, and a pair of diametrically-opposite beveled shoulders D D′, which shoulders slope downward and inward from the extremities of said butt and connect it with said shank B, said parts A B C D D′ being formed of a single integral piece of metal, as herein described.



2. A fastening device consisting of the head A, shank B, butt C, and beveled shoulders D D′, all formed of a single integral piece of metal, in combination with the bar or plate G, to which said fastener is directly applied, said plate being slotted at *g* and having a socket, as H, on each side of said slot to admit said shoulders D D′, in the manner described, and for the purpose stated.

481,567. CAR-COUPLING. JACOB S. HUFFER, Dickerson, Kans. Filed Feb. 26, 1892. Serial No. 423,090. (No model.)

Claim.—1. The combination, with the draw-head having an opening to receive the coupling-link and a pin-hole, of a laterally-swinging curved gate C, said gate having formed upon its outer face a curved recess c^3 and an overhanging shoulder c^4, whereby said gate may partially encircle and overlap the end of the link, a shaft D, extending outside the draw-head, and a handle d^2 for operating said shaft and swinging gate, substantially as described.

481,568. COMBINED COUNTER-RAIL, FOOT-BRACKET, AND CUSPIDOR. WILLIAM C. HUSS, Cincinnati, Ohio, assignor to the Huss Brothers Company, same place. Filed May 6, 1892. Serial No. 431,960. (No model.)

Claim.—1. The hereinbefore-described foot-rail bracket having the boss A for the reception of the foot-rail, the arm *a*, and branches a' a^2 for securing the bracket in place, and the ring to receive and hold a cuspidor, as a new article of manufacture.

2. The combination, substantially as hereinbefore set forth, of the bracket having perforated boss A, ring A′, and attaching-supports, and the foot-rail B.

481,569. BICYCLE. FRANK JEWETT, New Haven, Conn. Filed Nov. 2, 1891. Serial No. 410,698. (No model.)

Claim.—1. The combination, with a sprocket having internal gear-teeth, of a pedal-shaft carrying a pinion having a less number of teeth than the sprocket, a movable box which carries the pedal-shaft, a clutch-gear adapted to engage the sprocket, and suitable mechanism for moving the clutch-gear into and out of operative position and for moving the box and pedal-shaft laterally to engage and disengage the pinion and sprocket, so that when the cam gear is disengaged and the pinion engaged with the sprocket a relatively slow speed is produced with corresponding increase of power and when neither clutch-gear nor pinion is engaged with the sprocket the latter is left wholly disconnected from the pedal-shaft.

2. The combination, with a sprocket having internal gear-teeth, of a pedal-shaft carrying a pinion having a less number of teeth than the sprocket, a movable box carrying the pedal-shaft, and suitable mechanism for moving the box and pedal-shaft laterally to engage and disengage the sprocket.

3. The combination, with a sprocket having internal gear-teeth, of a pedal-shaft carrying a pinion and having a square portion outside of the pinion, said square portion having a slot 31, a clutch-gear having an opening to receive said square portion, and a slot 31^a, a rod 33, and a cross-piece lying in slots 31 and 31^a and rigidly secured to the cross-piece and clutch-gear.

4. The combination, with the sprocket having internal gear-teeth and the pedal-shaft having a longitudinal recess, a square portion 30, and a slot 31, of clutch-gear 32, having an opening to receive the square portion of the shaft, and a slot 31^a, a cross-piece lying in said slot, said cross-piece and the ends of slot 31^a having threaded half-sockets, screws engaging said half-sockets, which connect the cross-piece and clutch-gear, and rod 33, lying in the recess in the pedal-shaft and engaging the cross-piece, by which the clutch-gear is moved into and out of operative position.

5. The sprocket, having internal gear-teeth and the pedal shaft, in combination with a clutch-gear adapted to engage the internal teeth of the sprocket, a sliding sleeve 39 on the pedal-shaft, having an internal groove 42 and rod 33, one end of which is attached to the clutch-gear and the other provided with a curved plate 43, engaging the groove, so that longitudinal movement of said sleeve will move the clutch-gear into and out of engagement with the sprocket.

6. The combination, with the sprocket having internal gear-teeth, the pedal-shaft, the clutch-gear, and rod 33, by which the clutch-gear is engaged and which is provided with a curved plate 43, of a sliding sleeve on the pedal-shaft, having an arm 40 and an internal groove 42, which receives the curved plate, and a cam which engages arm 40 to move the sleeve longitudinally on the pedal-shaft.

7. The combination, with the sprocket having internal gear-teeth and the pedal-shaft having a pinion with a less number of teeth than the sprocket, of a box by which the pedal-shaft is carried, arms 67, extending outward from the box and carrying studs 66, and cams engaging said studs, by which the box and pedal-shaft are moved laterally to engage and disengage the pinion and sprocket.

8. The combination, with the sprocket having internal gear-teeth, the pedal-shaft carrying pinion 29, the clutch-gear, rod 33, by which it is carried, sliding sleeve 39, which is engaged by rod 33 and is provided with an arm 40, a box carrying the pedal-shaft and sleeve and provided with arms 67, and a rock-shaft carrying cams 60 and 63, by which the sliding sleeve is moved on the pedal-shaft to engage and disengage the clutch-gear and sprocket and the box and pedal-shaft are moved laterally to engage and disengage the pinion and sprocket.

9. The combination, with the case having arms 48 and slot 41, of the pedal-shaft, sliding sleeve 39, having arm 40, the box having arm 67, carrying studs 66, a rock-shaft journaled in arms 48 and carrying cams 60 and 63, operating-arm 53, keyed to the rock-shaft, and rod 57, pivoted to the operating-arm by which the pedal-shaft is oscillated.

10. The combination, with the frame of a bicycle having a plate 59, the case, box, pedal-shaft, pinion, clutch-gear, rod 33, and sliding sleeve, substantially as described and shown, of a rock-shaft carrying cams 60 and 63 and arm 53, rod 57, pivoted to said arm and having notches 58, and intermediate connections, substantially as described and shown, between the cams and the sliding sleeve and box, so that when the lower notch is engaged with plate 59 the clutch-gear will be placed in engagement with the sprocket and when the upper notch is engaged with said plate the pinion will be placed in engagement with the sprocket and when the intermediate notch is engaged with said plate the pedal-shaft and sprocket will be wholly disconnected.

11. The combination, with the case, the pedal shaft, and the box, of suitable means for moving the box and pedal-shaft laterally in the case, and a key 46, engaging both case and box, whereby the latter is held against endwise movement but left free to be moved laterally.

12. The combination, with the case having disk 19, provided with flange 18, surface 17, and screw-threads 22, of the sprocket having V-shaped groove 16, ring 21, having surface 20, and screw-threads engaging threads 22, and balls between said surfaces.

13. The combination, with the case and disk 19, having slot 26 and threaded flange 18, and the sprocket having V-shaped groove 16, of ring 21, threaded to engage the flange and having teeth 24 and holes 25 for the purpose of adjustment, balls between said flange, ring, and sprocket, and a plate lying in slot 26 and engaging teeth 24, by which the ring is locked in place after the bearing has been adjusted.

14. The combination, with the case, the box, the pedal-shaft, and the sprocket, of cap 37, secured to the sprocket and having an opening through it, spring-washer 38, carried by the pedal-shaft and covering the opening, nut 8, engaging the pedal-shaft, and plate 10, through which the nut passes and which slides in ways in the case.

481,570. BAND-CUTTER AND FEEDER. MONROE R. JOHNSON, Pittsburg, Kans., and ARMITE M. PHILLIPS, Nashville, Mo. Filed Jan. 18, 1892. Serial No. 418,476. (No model.)

Claim.—1. In a band-cutter and feeder, the combination, with the feeder-box and the revolving cutter-cylinder, of a series of cutter or knife rollers journaled in opposite ends of said cylinder and carrying cutting-knives, means for turning said rollers in their bearings to adjust the knives, and operating mechanism, substantially as set forth.

2. The combination of the knife-cylinder having the opposite heads, knife or cutter rollers loosely mounted in said heads and provided with a series of curved cutting-knives, retaining-bands encircling opposite ends of the cylinder around said rollers, and adjusting-arms secured to the ends of said knife-rollers and circumferentially adjustable upon the opposite heads of said cylinder, substantially as set forth.

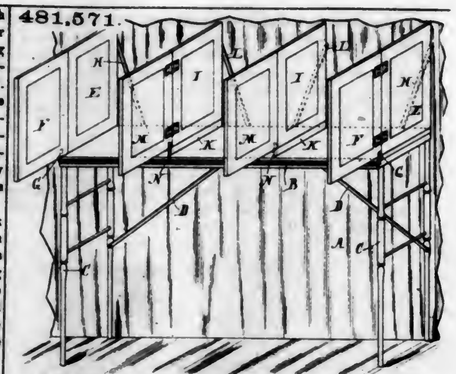
3. In a band-cutter and feeder, the combination of the feeder-box having opposite curved bearing and guide-slots at one end and at an intermediate point the revolving cutter-cylinder journaled in said slots and free to move in an arc therein, the main drive-shaft, swinging arms engaging over opposite ends of the drive-shaft and the opposite ends of the cylinder-shaft, a toothed feeder-roller journaled in the end slots and free to move therein, and suitable gearing connecting the cutter-cylinder and roller, so that the latter revolves slower than the former, substantially as set forth.

4. In a band-cutter and feeder, the combination, with the feeder-box and the knife-cylinder and feeder-roller journaled in said box, of the main drive-shaft K, journaled in said box, a speeding-shaft N, journaled in said box adjacent to said drive-shaft, reversely-arranged cone-pulleys keyed upon adjacent ends of said drive and speeding shafts, a belt connecting said pulleys, the top shaft O, a belt connecting the shafts N and O, and belting connecting the knife-cylinder with the drive-shaft and the feeder-roller with said top shaft, respectively, substantially as set forth.

5. In a band cutter and feeder, the combination, with the feeder-box, the knife-cylinder, and feeder roller, of the endless-apron rollers journaled at opposite ends of said box, one of said rollers carrying an operating-pinion *n'*, a main drive-shaft, a speeding-shaft adjacent to said drive-shaft N and provided with a pinion *n*, meshing with said roller-pinion, reversely-arranged cone-pulleys keyed upon adjacent ends of the speeding-shaft and drive shaft, a normally-loose belt *m*, connecting said cone-pulleys, an adjustable belt-tightener arranged over said belt, the top shaft O, a belt connecting the shafts N and O, and belting connecting the knife-cylinder with the drive-shaft and the feeder-roller with said top shaft, respectively, substantially as set forth.

6. In a band-cutter and feeder, the combination, with the endless-apron feeder-box and the knife cylinder and feeder-roller movably journaled in said box, of the main drive-shaft K, a speed-shaft N, adjacent to said drive-shaft, belting connecting the knife-cylinder with said drive-shaft, reversely-arranged cone-pulleys keyed upon adjacent ends of the drive-shaft and speed-shaft, a normally-loose belt *m*, connecting said cone pulleys, a vertical ratchet-bar supported from the ends of said feeding and drive shafts and between the same, an adjustable hinged belt-tightener hinged to the side of the feeder-box and adjustably engaging said ratchet-bar and said normally-loose belt, the top shaft O, a belt connecting the shafts N and O, and belting connecting said top shaft with the feeder-roller, substantially as set forth.

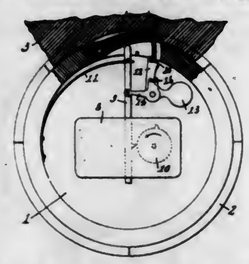
7. In a band-cutter and feeder, the combination, with the endless-apron feeder-box and the knife-cylinder and feeder-roller movably journaled in said box, of the main drive-shaft, a speeding-shaft N, adjacent to said drive-shaft below said feeder-box, belting connecting the cylinder with said drive-shaft, reversely-arranged cone-pulleys keyed upon adjacent ends of the drive and speeding shafts, a belt connecting said pulleys, a supplemental top shaft O, journaled upon said feeder-box, and belting connecting the speeding-shaft with said top shaft and the latter with the feeder-roller, substantially as set forth.



481,571. ELECTION-BOOTH. JACKSON JONES, Jefferson, Wis. Filed Sept. 28, 1891. Serial No. 407,020. (No model.)

Claim.—1. The portable compartment device for election purposes, consisting of a suitably-supported shelf or table, walls hinged thereto capable of being unfolded upright thereon, wings hinged to the walls capable of being swung forwardly and projecting therefrom in a plane therewith, and means for securing the wings in place and the end walls upright temporarily, substantially as described.

2. In a compartment device for election purposes, the combination, with a shelf, of walls hinged to the upper portion of the shelf, so as to fold thereon and to open uprightly, wings hinged to the walls, so as to swing forwardly therefrom to the plane of the walls, and detachable braces adapted to engage temporarily the rear edges of the walls and the rear edge of the table or shelf, substantially as described.

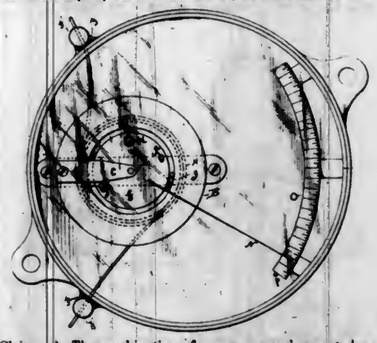


3. The combination, with a shelf or table and folding walls hinged thereto at distances apart and capable of being folded thereon and opened uprightly thereto, of folding legs hinged to the under part of the table or shelf and braces adapted to be temporarily secured to the legs and to the table, substantially as described.

481,571.

4. The combination, with a table or shelf having folding walls hinged to the upper surface thereof at a distance apart and means for securing the walls in position when unfolded from the table, of a wall or curtain at the rear of the table, the folding walls when opened forming with the table and rear wall or curtain a compartment hidden from observation, substantially as described.

481,572. TIME-LOCK ATTACHMENT. JOHN X. KAISER, Newport, Ky., assignor to the Mosler Safe and Lock Company, Cincinnati, Ohio. Filed Apr. 21, 1892. Serial No. 430,015. (No model.)

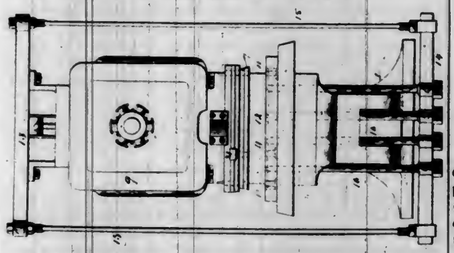


Claim.—1. In a time-lock attachment, the combination, substantially as set forth, with a safe-door, a latch therefor arranged to fall to unlatched position by gravity, a spring to force the latch to latched position, and a time-lock arranged to retract the spring and again to permit it to act at proper times, respectively, of a movable support arranged to normally engage below said latch and support it in latched position, a connection between said movable support and time-lock to cause the support to be moved to inactive position when the time-lock retracts said spring, and a weight connected with said movable support and tending to hold it in active position when the door is in position corresponding to the latched position and to move the support to inactive position when the door is reversed.

2. In a time-lock attachment, the combination, substantially as set forth, of a jamb-thread having a notch, a door having a thread to fit the jamb-thread, a pawl pivoted in said door and adapted to engage said notch when the door is screwed home, a spring to force said pawl into the notch, a time-lock arranged to retract said spring at proper time, a movable rigid support under said pawl, a weight connected with said movable support and tending to hold it in active position and to move it to inactive position as the door is turned, and connections between said spring and movable support and time-lock to cause the time-lock to retract said spring and lift said weight and move said support to inactive position.

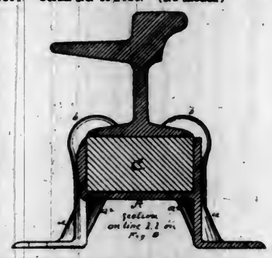
3. In a time-lock attachment, the combination, substantially as set forth, of a threaded door-jamb having a notch, a circular-threaded door, a pawl pivoted to the door and adapted to engage the notch, a spring tending to force the pawl outwardly into the notch and permitting the pawl to yield inwardly, a pivoted lever with its end under and supporting the pawl in locked position, a weight on said lever to hold it in active position, a second lever engaging said supporting-lever by a fly connection and adapted when the second lever is rocked sufficiently to rock the first lever into inactive position, a bolt engaging said spring and second lever and serving when moved to retract the spring and move the support to inactive position, and a time-lock arranged to operate upon said bolt and move it at proper times.

481,573. VOLT-AMMETER. FREDERICK A. LA ROCHE, Philadelphia, Pa. Filed Sept. 1, 1891. Serial No. 404,463. (No model.)



Claim.—1. The combination of a case, a spool mounted on said case, a scale secured to the sides of said case on a level with the top of the spool, a coil around said spool, a rod of magnetizable material secured to said spool in a direction transverse to said coil, a spindle held rotatably in the center of said coil and supports secured thereto, whereon is placed a rod of magnetizable material parallel to and in the neighborhood of said fixed plate, and a pointer extending over the top of said spool and scale, and means for moving said movable bar of magnetizable material toward the other, substantially as described.

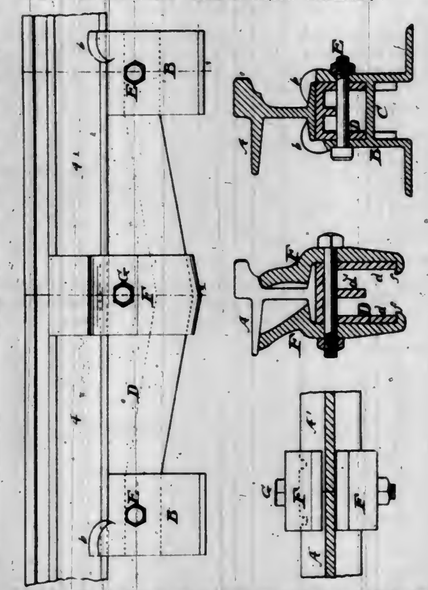
2. The combination of the case, a spool secured to a piece of non-magnetizable material secured to the back plate of said case and having therein a bearing for a spindle, a support secured to the top of said spool and containing an adjustable bearing for said spindle, a coil surrounding said spool, a rotatable spindle mounted centrally in said spool between said bearings, a piece of magnetizable material secured transversely to said coil in the interior of said spool, supports attached to and revoluble with said spindle, a rod of magnetizable material placed parallel to and in the neighborhood of said fixed rod and supported from said supports, a pointer supported from said supports, devices for bringing said pieces of magnetizable metal toward each other, and a scale, all substantially as described.



3. The combination of a circular casing, a bracket-supported scale at one side thereof, a spool holding a coil mounted on the back plate of said casing-supports containing bearings, between which is mounted a revoluble spindle, a rod of magnetizable material supported by and secured to the interior of said spool in a direction transverse to the direction of the wires of the coil thereon, a rod of magnetizable material supported substantially at its middle point parallel to said fixed piece of magnetizable material by supports connected to said spindle, a weight, and the curved pointer N, all substantially as described.

481,574. PUNCHING-MACHINE. JAMES LONG, Packerton, Pa. Filed Jan. 16, 1892. Serial No. 418,265. (No model.)

Claim.—The combination, with the supporting-frame having upper and lower jaws, of the punch-block having discharge-apertures for the wads, the cutting-plate provided with apertures registering with the apertures in the punch-block, the punch-die, and punches, the lifting plate and the movable bars 16, supporting the lifting-plate, the cross-bar 14, supporting the vertically-movable bars, and the cross-bar 13, secured to the reciprocating plunger, the connecting-bars between the cross-bars, and the weighted lever engaging the upper cross-bar, whereby the plate is operated to strip the article from the punches and the working parts of the machine restored to normal position, substantially as specified.

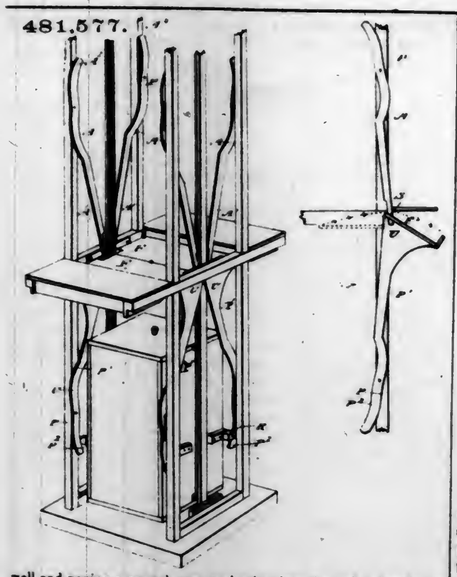


481,575. RAIL-CHAIR. CHARLES R. MARK, Cleveland, Ohio. Filed Aug. 31, 1891. Serial No. 404,180. (No model.)

Claim.—1. A rail-chair embodying in a single element a rectangular-chambered body having two opposite sides extended downward to form legs with flanges and exterior and interior strengthening-lugs and at diagonally-opposite upper corners lips *b*, joining the adjacent exterior lugs, substantially as shown and described.

2. The combination, with the rail-chair in the form of a rectangular box and having feet, lugs, and diagonally-oppositely-arranged lips at the upper corners, of the wood filling in said box, with its upper surface raised slightly above the top edges of the box, and a rail supported on said filling and held by its flanges, substantially as shown and described.

481,576. RAILWAY-RAIL JOINT. CHARLES R. MARK, Cleveland, Ohio. Filed Nov. 9, 1891. Serial No. 411,397. (No model.)

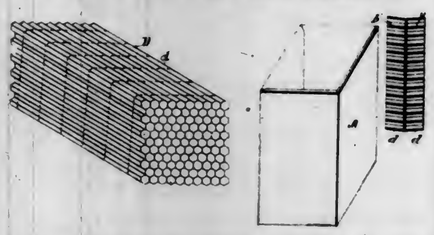


Claim.—In a rail-joint, the combination, with chairs B B, having diagonal lips *b b*, of the bridge-bar D, secured in said chairs, clamp-plates F F, embracing the middle part, said bridge-bar and abutting ends of the rails with their upper edges bearing under the upper flanges of the rails, and bolts G for securing said plates to the bridge-bar and the rails, substantially as described.

481,577. ELEVATOR. THOMAS MASON, Topeka, Kans. Filed July 17, 1891. Serial No. 399,587. (No model.)

Claim.—1. The combination of a lever pivoted to the side of an elevator-well and having a curved arm projecting into said well, a hatchway door rigidly secured to the lever and adapted to swing therewith in an arc of a circle, and an elevator-car provided with a projection adapted to engage the curved arm of the lever to rock the same and to swing the door out of the path of the car, all substantially as described.

2. The combination of a lever pivoted to the side of an elevator-

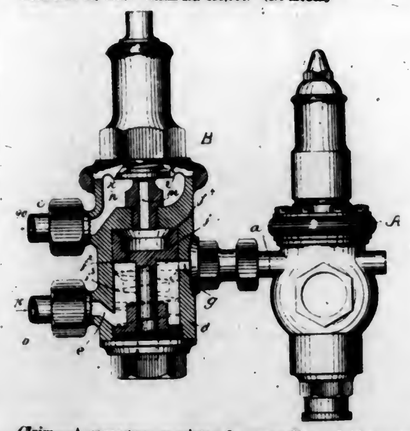


481,577.

well and having a curved arm projecting into the well, a hatchway-door rigidly secured to the lever, a lever located above the door and having its upper end projecting into the well and its lower end loosely connected to the door, and an elevator-car provided, with a projection to engage the levers to operate the door, all substantially as described.

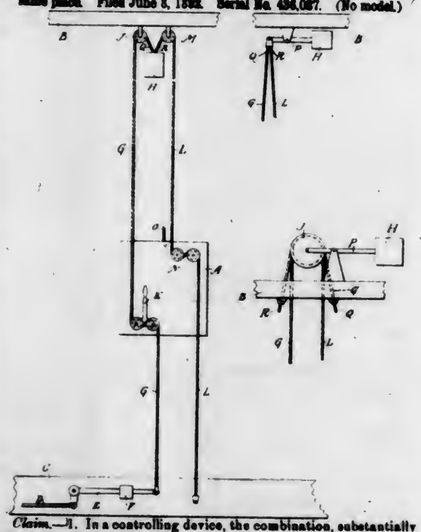
3. The combination of two pairs of levers U, pivoted to the sides of an elevator-well and having their lower ends projecting into the well, doors F, rigidly secured to the top of each pair of levers, two pairs of levers A, pivoted above the doors and having their upper ends projecting into the well and their lower ends loosely connected to said doors, and an elevator-car provided with projections adapted to engage the levers to rock the same and to swing the doors out of the path of the car, all substantially as described.

481,578. ART OF MAKING ARTIFICIAL HONEY CELLS AND COMBS. EDGAR T. MASON and MAXIMILIAN H. MOSKOVITS, Kansas City, Mo. Filed Oct. 30, 1891. Serial No. 410,336. (No model.)



Claim.—1. The improved method of making sections for artificial honeycombs, consisting in molding wax into a cellular mass of the desired length and width and then separating the artificial cellular mass transversely into parts of the required thickness.

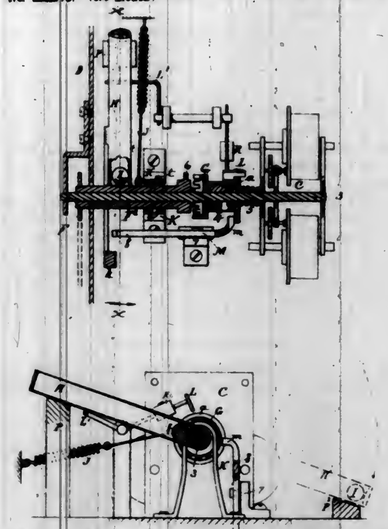
2. The improved method of making sections of artificial honeycombs, consisting in molding wax into a cellular mass of the desired length and width and then separating the artificial cellular mass transversely into parts or sections upon a line at an angle of inclination to the sides of said mass, for the purpose described.



3. The improved method of making artificial honeycombs, consisting in molding wax into a cellular mass of the desired length and width and then separating the cellular mass transversely into parts of the requisite thickness, then making the edges of the cells on one side of one of said parts adhesive and spreading in a thin sheet plastic wax over said side and cells and then taking another part of the cellular mass and making the edges of the cells on one side of said part adhesive and uniting them to the other part of the cellular mass and to the side of said part over which the plastic wax is spread.

481,579. FLUID-PRESSURE REGULATOR. WILLIAM B. MASON, Boston, Mass., assignor to the Mason Regulator Company, same place. Filed Nov. 14, 1891. Serial No. 411,900. (No model.)

Claim.—A secondary regulator for controlling a fluid-pressure-regulating instrument, said secondary regulator comprising a valve-shell having passages communicating with different sources of fluid-pressure, and a main valve governing the communication between said passages, respectively, and the pressure-inlet to the main regulator, combined with a pressure-chamber and secondary valve therein controlled by pressure from one of said inlets and governing the operation of the said main valve, substantially as described.



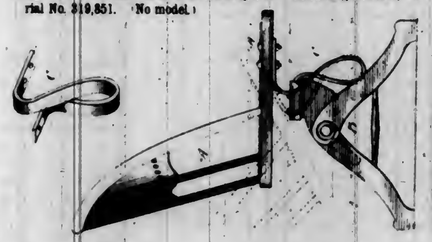
481,580. ELEVATOR-CONTROLLING MECHANISM. EDWIN S. MATTHEWS, Cincinnati, Ohio, assignor of one-half to James L. Haven, same place. Filed June 8, 1892. Serial No. 436,027. (No model.)

Claim.—1. In a controlling device, the combination, substantially as set forth, of a single standing control-rope, a take-up on the car, a separate weight connected to each end of and straining said rope, a control piece connected with one of said weights, and a check-rope secured to a fixed point and attached to the other weight and joining the control-rope in the support of that weight.

2. In a controlling device, the combination, substantially as set forth, of a single standing control-rope, a take up on the car involving sheaves engaging bends in said control-rope, a separate weight connected to each end of and straining said control-rope, a control-piece connected with one of said weights, a check-rope secured to a fixed point and attached to the other weight and joining the control-rope in the support of that weight, and a pair of sheaves in fixed relation to each other on the car and engaging bends in said check-rope.

481,581. RAILWAY TIME-SIGNAL. DANIEL W. MITCHELL and ELMER L. MITCHELL, Southborough, Mass. Filed Mar. 12, 1892. Serial No. 424,673. (No model.)

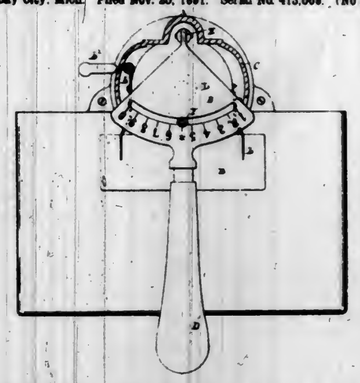
Claim.—1. The combination, with the graduated dial, index-hand, index arbor, and return-spring, of the radial arm or tube H, fixed at one end to said arbor, and the self-shifting-weight ball carried by said arm and movable from one end to the other thereof, substantially as and for the purposes set forth.



2. The combination of the graduated dial, the index and index-arbor, the radial tube fixed to said arbor and carrying the self-shifting weight, the clock or motor train, its time-shaft, a clutch connecting said index-arbor and time-shaft, the return-spring, and means for disengaging said clutch to effect the return of the index to zero, substantially as set forth.

3. The combination of the dial, the clock-operated time-shaft, the index and index-arbor, the sliding spring-pressed clutch connecting said arbor and time shaft, the radial tube carrying the shifting-weight, the return-spring, the throw-off guide, the clutch-holding dog, the tripping-lever having the arms that engage said clutch and tube, and the operating-slide having an incline for working said lever, all substantially as and for the purpose set forth.

4. A time-signal apparatus comprising, in combination, a graduated figured dial, an index or hand, a clock-train or time-regulated motor, clutch mechanism connecting the motor and index-arbors to advance the index over the dial, and a lever that disengages said clutch, having connections for its actuation by the passing of a railway-train, and means, substantially as described, that automatically return said index to normal or zero position, for the purpose set forth.



5. In a time-signal apparatus having an index and index-operating mechanism, the combination, with the operating-slides and the lever whereby the index-arbor clutch is disengaged, of the yielding relief-plate connected by a hinge to said lever and extending upward along the incline of said operating-slide, the curved arm fixed to said plate and passing through the lever, and an expanding-spring between said plate and said lever, substantially as and for the purpose set forth.

481,582. CHAIR. JAMES W. MCDONOUGH, New York, N. Y., assignor to Blackmer Bros. & Co., Chicago, Ill. Filed Aug. 5, 1889. Serial No. 319,851. (No model.)

Claim.—In an oscillating or tilting chair or like article of furniture, the combination, with a base and movable seat, of a pair of springs connecting the base and seat, said springs being substantially S shape in form and having their upper portions flattened and attached to the seat, and their lower portions bent to a plane parallel to but inside of the upper portion and attached to the base, whereby is provided a hanging loop, whose width is less than the height thereof, substantially as and for the purpose described

481,583. PERFORATING-PUNCH. HENRY H. NORRINGTON, West Bay City, Mich. Filed Nov. 25, 1891. Serial No. 413,069. (No model.)

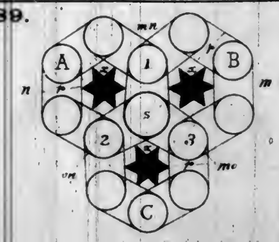
Claim.—1. In a perforating-machine, the combination, with a bed-plate provided with a casing, of feeding mechanism within the bed-plate, and a post journaled in the casing, a broad flat dial-plate pivotally secured at one edge to the post and provided upon its opposite edge with a handle, a male and a female die plate, each rigidly secured to the post within the casing, vertically movable dies in the male-die plate, a spring-actuated plunger within the casing, the upper end of which is engaged by the dial and the lower end engages with the dies in the male die-plate, and means intermediate the post and the plunger for engaging with the dial and the feeding mechanism, whereby the feed is operated by the dial in any of its lateral positions, substantially as set forth.

2. In a perforating-machine, the combination, with a bed-plate provided with a casing, of a post journaled therein, a dial plate pivotally secured to the post at one end and provided with a handle at its opposite end and having a slot intermediate the ends and a male and a female die plate each rigidly secured to the post within the casing, vertically-movable dies in the male-die plate, and a vertically-movable spring-actuated plunger within the top of the casing, the upper end of which is shouldered and projects through the slot in the dial-plate and the lower end engages with the dies in the male-die plate, said dial-plate being provided with characters along the slot to correspond with the characters of the die-plates, substantially as set forth.

3. In a perforating-machine, the combination of a bed-plate provided with a casing, feeding mechanism within the bed-plate and post journaled in the casing, a dial hinged to the post above the casing, and a slotted male and a female die plate, each rigidly secured to the post within the casing, vertically-movable dies in the male-die plate, a plunger within the casing, the upper end of which is loosely secured in the top of the casing and the lower end passes through the slot in the die-plate and engages with the feeding mechanism, and means intermediate the dial and the male dies for operating said dies by means of the dial, substantially as set forth.

481,584. TRUSS. JOHN M. OAKEY, Salem, Va. Filed Feb. 3, 1892. Serial No. 420,191. (No model.)

Claim.—A truss for the purpose set forth, comprising a scrotum-bag having a central opening, a rear or back strap fastened to the bag from the opening to its rear edge, acting as a stay therefor and extending rearward from the stride up around the belly, through guide-stays on the body-belt, said back-strap being of elastic material on its belly portion, a body-belt supporting a compression-pad and scrotum-bag, and provided with an elastic rear portion and an unyielding front portion acting as a compression-bandage for the groins, and a rigid pad secured to the body-belt above the scrotum-bag and so shaped as to fit upon and bear on the sides of the pubic bone, substantially as described.



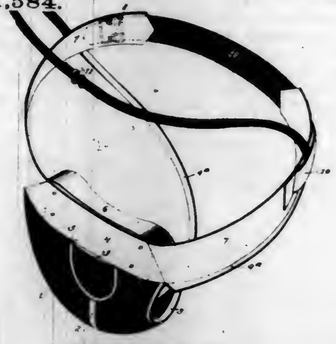
481,584.

with their outer points resting against the plates and depending bars, respectively, and a round shaft interposed between these cam-faces, and means, as a hand-wheel, for rotating said shaft, substantially as shown and described.

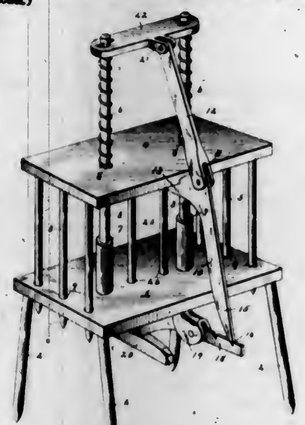
2. The combination, with a cabinet having an opening for inserting the press-book, of an inverted bed, with its lower face even with the top of that opening supported by depending bars attached to the inner opposite sides of said cabinet, a platen below and arranged to approach said bed, and four segmental cams arranged in pairs, with their outer points resting against the platen and depending bars, respectively, and a round shaft interposed between their cam-faces, extending outside of said cabinet and provided with a hand-wheel for revolving it, substantially as shown and described, and for the purpose specified.

3. The combination, with the cabinet having an opening [illegible]

481,589.



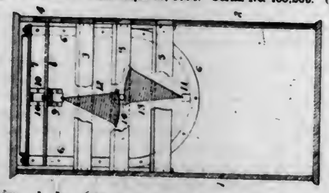
481,591. PROCESS OF DYEING WITH ALIZARIN. HENRI M. F. SCHAEFFER, Lowell, Mass. Filed Jan. 5, 1891. Renewed June 25, 1892. Serial No. 437,953. (No specimens.)



Claim.—The herein-described method of dyeing or producing colors or lakes with alizarin, which consists in first treating the cloth or fiber with a soluble modification of alizarin, consisting of a soluble salt of boracic acid and alizarin and then with a mordant, substantially as described.

481,592. MINING CAGE OR CAR. ERNEST SCHILLO, McDonald, Pa. Filed May 17, 1892. Serial No. 433,301. (No model.)

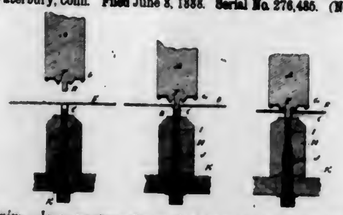
481,584.



481,585. MOLE-TRAP. CHARLES OERTHER and JAMES W. DILLINGHAM, Blue Springs, Mo. Filed May 21, 1892. Serial No. 433,893. (No model.)

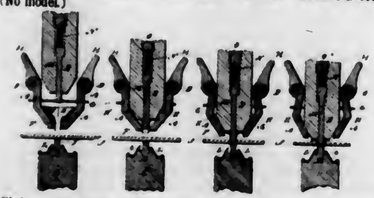
Claim.—In a mole-trap, the combination of a horizontal plate 1, provided with perforations and having depending legs with pointed ends adapted to anchor the trap, parallel standards rising from the plate, a cross-bar connecting the upper ends of the standards, a vertically-movable plate arranged on the standards and provided with depending impalers passing through the perforations of the horizontal plate 1, spiral springs interposed between the cross-bar and the vertically-movable plate, a connecting-link having its upper end pivoted to the cross-bar, a bell-crank lever fulcrumed at its angle to the lower end of the link and having a short arm to support the vertically-movable plate, and a trigger pivoted beneath the horizontal plate 1 and provided at its inner end with a foot and having its outer end adapted to engage the bell-crank lever, substantially as described.

481,586. LETTER-PRESS AND CABINET. GEORGE PAUL, Cuyahoga Falls, Ohio. Filed Sept. 10, 1891. Serial No. 405,266. (No model.)



Claim.—1. In a letter-press, an inverted bed supported and retained by depending bars, and a platen below and arranged to approach said bed, combined with four segmental cams arranged in pairs, with their outer points resting against the platen and depending bars, respectively, and a round shaft interposed between these cam-faces, and means, as a hand-wheel, for rotating said shaft, substantially as shown and described.

2. The combination, with a cabinet having an opening for inserting the press-book, of an inverted bed, with its lower face even with the top of that opening supported by depending bars attached to the inner opposite sides of said cabinet, a platen below and arranged to approach said bed, and four segmental cams arranged in pairs, with their outer points resting against the platen and depending bars, respectively, and a round shaft interposed between their cam-faces, extending outside of said cabinet and provided with a hand-wheel for revolving it, substantially as shown and described, and for the purpose specified.

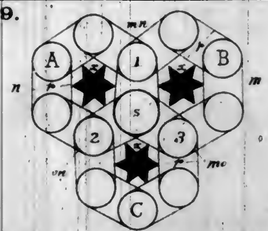


3. The combination, with the cabinet having on its inner opposite sides the U-shaped bars and platen-guides and on its outside the forked shaft-bearings, of the inverted bed attached to the upper end of the U-shaped bars, the platen having slides fitting said guides, the segmental segments resting against said slides and the U-shaped bar, and the shaft interposed between the faces of opposite pairs of segments, resting in the forked bearings and provided with a hand-wheel outside of said cabinet, substantially as shown and described

481,587. BUTTON-ATTACHING MACHINE. CLARK M. PLATT, Waterbury, Conn. Filed June 8, 1888. Serial No. 276,485. (No model.)

Claim.—In a machine for setting buttons, having a perforated center, the combination, with a die of such shape as to firmly hold a button thereon and having formed thereon a rigid pin or lug of smaller diameter than that of said perforation for extending through or partially through the same, said holder or die being also provided with a recess encircling the base of said pin to be partially overlapped by the edge of said perforation, of a second die adapted to hold an open rivet or eyelet and provided with a central yielding pin adapted to enter said eyelet, the several parts being constructed and arranged to operate in the manner and for the purpose substantially as described.

481,588. MACHINE FOR ATTACHING BUTTONS. CLARK M PLATT, Waterbury, Conn. Filed Sept. 10, 1888. Serial No. 285,016. (No model.)

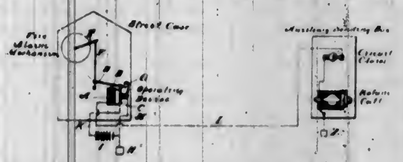


Claim.—In a machine for setting buttons, the combination, with spring-actuated jaws or fingers for holding a hollow rivet or eyelet, of an upper movable holder provided with a central yielding pin for entering said eyelet and a lower holder or die for supporting a centrally-perforated button provided with a rigid pin adapted to extend through said perforation and register with said eyelet, and also provided with an annular recess encircling the base of said rigid pin to lie partially overlapped by the edge of said perforation, substantially as set forth

481,589. PUZZLE. ABNER C. PROCTOR, Washington, D. C. Filed June 8, 1892. Serial No. 436,015. (No model.)

Claim.—1. The game or puzzle board described, having marked thereon three sections with six terminal positions to each section, the sections overlapping, so that the terminals constitute thirteen positions in all, substantially as described.

2. The game or puzzle board described, having thirteen positions arranged with one central position and three sections of six positions, each overlapping about the central position, so that two positions of each section are common to other sections and the central position is common to all, substantially as described.



481,589.

3 The puzzle or game board described, having thirteen positions arranged substantially as described, in combination with the pieces described, three of which are designated by letters, three by numbers, and the others blanks, all substantially as stated.

4. The game-board described, having thirteen positions arranged substantially as shown, in combination with the twelve pieces, three of which are designated by letters, three by numbers, and the others not so designated, all substantially as described.

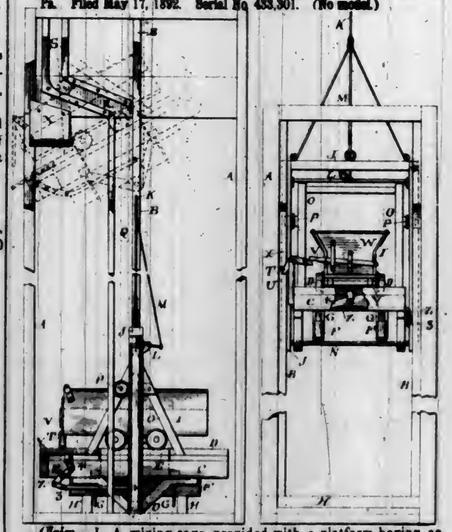
481,590. AUXILIARY FIRE-ALARM SYSTEM. JOSEPH SACHS, New York, N. Y. Filed Mar. 29, 1892. Serial No. 426,960. (No model.)

Claim.—1. A fire-alarm system consisting of a fire-alarm mechanism and a separate and independent electro-magnetic tripping device for said fire-alarm mechanism, a circuit-controlling device directly connected with said tripping device, and an auxiliary operating device at the other end of the circuit, consisting of a circuit-closer and a return-call.

2. A fire-alarm system consisting of the fire-alarm mechanism, a separate electro-magnetic tripping device for said fire-alarm mechanism, a circuit-controlling device connected with said tripping device, and an auxiliary operating device composed of a circuit-closer and return-call in the same circuit as the tripping device and circuit-controller in the fire-alarm box, but remote from said box, substantially as set forth.

3. A fire-alarm system consisting of fire-alarm mechanism, a separate electro-magnetic tripping device for said fire-alarm mechanism, a circuit-breaking device connected with said tripping device, a circuit-closing device remote from said box, a return-call adjacent to said circuit-closer, and a single electric circuit connecting said tripping device, said circuit-breaking device, said circuit-closer, and said return-call.

4. A fire alarm system consisting of a fire-alarm mechanism, a separate electro-magnetic tripping device for said fire-alarm mechanism, a circuit controlling device connected with said tripping device, and any number of circuit-closers and return-calls remote from said fire-alarm mechanism and in one and the same circuit with each other and with said tripping device and said circuit-controlling device.



5. A fire-alarm system consisting of a fire-alarm mechanism, a separate electro magnetic tripping device for said fire-alarm mechanism, a circuit-controller directly connected with said tripping device, a number of circuit-closers and return-calls remote from said fire-alarm mechanism and in the same circuit with each other, and a single generative battery in the circuit with said circuit-closers and return-calls.

6. A fire-alarm system consisting of a fire-alarm mechanism, an electro-magnetic tripping device for said alarm mechanism, a circuit-controlling device on said tripping device, a circuit-closer remote from said alarm mechanism, and a return-call adjacent to said circuit-closer and comprising a movable guard normally held by a latch and a magnet having an armature to engage with said latch, said magnet, circuit-closer, tripping device, and circuit-controlling device being in one and the same electric circuit, whereby when the circuit-closer is operated the tripping device will be actuated and simultaneously the said magnet will be energized, thereby tripping the said latch, allowing the movable guard to fall upon the armature of the said magnet, and whereby the said circuit-controlling device will be operated simultaneously with the movement of the tripping device, thereby breaking the circuit, so as to allow the armature of the said magnet to retract, allowing the movable guard to drop to its limit of movement.

481,591. PROCESS OF DYEING WITH ALIZARIN. HENRI H. F. SCHAEFFER, Lowell, Mass. Filed Jan. 5, 1891. Renewed June 25, 1892. Serial No. 437,953. (No specimens.)

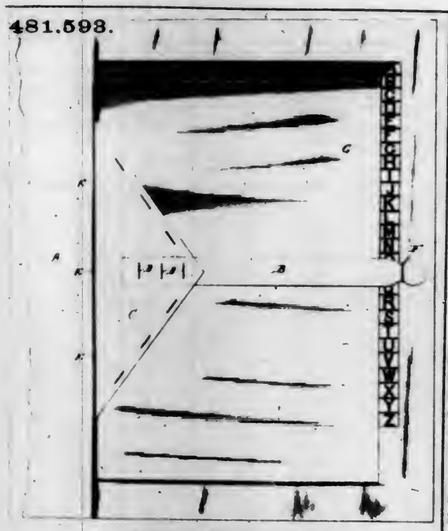
Claim.—The herein-described method of dyeing or producing colors or lakes with alizarin, which consists in first treating the cloth or fiber with a soluble modification of alizarin, consisting of a soluble salt of boracic acid and alizarin and then with a mordant, substantially as described.

481,592. MINING CAGE OR CAR. ERNEST SCHILLO, McDonald, Pa. Filed May 17, 1892. Serial No. 433,301. (No model.)

Claim.—1. A mining-cage provided with a platform having an intermediate sectional track, tracks upon both sides of said sectional track in line therewith, the inner ends of which form abutment-stops for the car-wheels when the cage is elevated, a frame carrying the sectional track, having a limited movement up and down with respect to the platform, and a support at the bottom of the shaft for arresting the downward movement of the sectional track, whereby the latter is thrown into alignment with the track on the platform when the cage is at the bottom of the shaft.

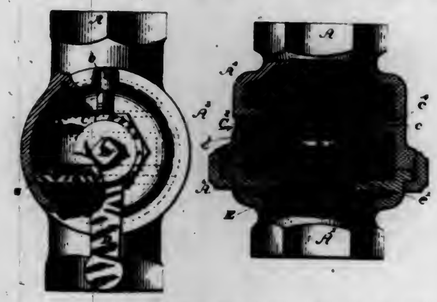
2. The mining-cage provided with a platform having a coal-chute arranged beneath and within the area of the same, so as not to interfere with the sides of the shaft, and a link mechanism connected to the car and to the chute for reciprocating the latter outwardly at the top of the shaft and for withdrawing the same upon the descent of the platform.

3. The combination of a shaft, a stationary piece arranged alongside thereof, a cage adapted to travel in the shaft, and a standard secured to the platform, provided with a pivotal lever having oppositely-projecting arms, one of which is adapted to come in contact with said piece on the side of the shaft and cause an upward movement of the opposite arm of the lever, thereby unlatching the gate of the car on the platform at a predetermined point.



4. The combination of a mining-cage, a platform, a sectional track upon the platform, adapted to be depressed with respect thereto when the cage is elevated, a chute beneath and within the platform, a link mechanism connected to the chute and to the cage for projecting and withdrawing the same, a supplementary frame pivotally connected to the cage, having a guide pulley or pulleys thereon, and a guide way or ways upon the sides of the shaft for guiding and deflecting the supplementary frame.

481,593. DOCUMENT-FILE. EDWARD A. SHARP, Rogers Park, Ill. Filed June 24, 1892. Serial No. 437,863. (No model.)

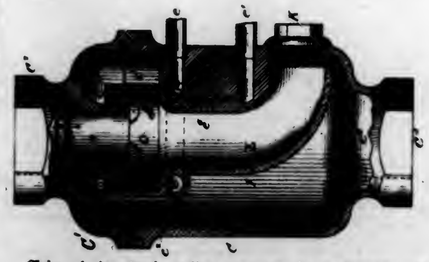


Claim.—1. The improved file comprising a folded cover, clamps, as B B', and a flap C, forming a connection by which the clamps B B' are hinged to the cover, and a fastening, as F, for the outer ends of said clamps, substantially as described.

2. The combination, in a paper-file, of an outer cover A, clamps B B' within said cover, a flap C, forming an attachment between the clamps B B' and the cover A, an index G, included within said clamps and likewise secured to said flap, and a fastening, as F, for the outer ends of said clamps, substantially as described.

481,593.

481,594. TRACK-SANDING APPARATUS. CHARLES W. SHERBURNE, Boston, Mass. Filed July 5, 1892. Serial No. 438,869. (No model.)



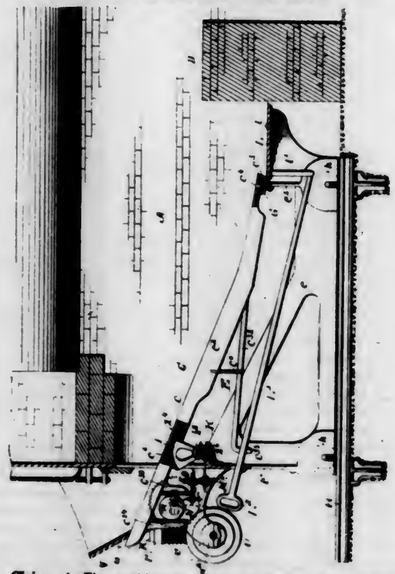
Claim.—1. In a locomotive track-sanding apparatus, the combination of a hollow body having two necks, one for attachment to the sand-pipe leading from the sand-box and the other for attachment to the sand-pipe leading in front of the driving-wheels, and an interior dome with depending walls, outside of which dome and within the cavity of the body is a sand-channel, and with a stage E, provided with a lip upon its inner edge, which lip does not exteod above the lower edge of the depending wall of the dome and is of less diameter than the wall of the dome, and with an air-pipe within the dome connected with a source of air-supply under pressure, said air-pipe C being perforated with holes for the passage of air upon its under side, as and for the purposes described.

2. In a locomotive track-sanding apparatus, the combination of a body having the interior form of a solid of revolution, which body is provided with two necks, one for connection with the sand-pipe leading from the sand-box of a locomotive and the other for connection with the sand-pipe leading in froet of the driving-wheels, with the shaft B, hollow journal C^3, perforated air-pipe C, and dome provided with depending walls C', the whole being adapted to be adjustable to and clamped at any angle with the axis of the necks A A', substantially as described.

3. In a locomotive track-sanding apparatus, the combination of a body having the interior form of a solid of revolution and provided with two necks, one for attachment to the sand pipe leading from the sand-box and the other for attachment to the sand-pipe leading in froet of the driving-wheels, and an interior stage-dome, perforated air pipe delivering air to the interior of the dome, and a shaft B, and a hollow journal C^3, adapted to be connected with a source of air-supply under pressure, and the whole being adjustable within the interior of the body and to be clamped in any position therein by means substantially as described

481,595. TRACK-SANDING APPARATUS. CHARLES W. SHERBURNE, Boston, Mass. Filed July 5, 1892. Serial No. 438,884. (No model.)

Claim.—1. In a track-sanding apparatus, the combination, with the sand-supplying apparatus, of two independent conduits for compressed air, both under control of the engineer, one of them being the pipe *e*, and the other being the pipe *d*, the pipe *d* furnishing only a small quantity of air to propel the sand, the other pipe *e* furnishing a much larger quantity of air to propel the sand, substantially as and for the purposes described.



2. In a track-sanding apparatus, the combination, with the train-line and engineer's valve, of the reservoir E, the automatic valve F, air-pipe *e*, and sand-distributing barrel C, substantially as and for the purposes described.

3. The combination of the Westinghouse air-brake apparatus having an automatic valve and its air-reservoir, with an air-actuated sand-distributing barrel and sand-delivery pipe, substantially as described.

4. In a track-sanding apparatus, the combination of a sand-chamber O, a wall M, surrounding said basin, a sand-delivery channel *c*, and two air-pipes, one of which furnishes a very much larger quantity of air than the other, substantially as and for the purposes described.

5. The combination, with a railway-train and with the vehicles thereof and with the air brake apparatus of such a train, of two or more sets of automatic track-sanding apparatus actuated by compressed air of the air-brake apparatus, one of which automatic track-sanding apparatus is located on a vehicle at or near the head of the train and the other one on a vehicle behind the vehicle at or near the head of the train which carries the track-sanding apparatus hereinbefore referred to, substantially as and for the purposes described.

481,596. FURNACE-GRATE. EPHRAIM C. SOOT, Kansas City, Mo. Filed Nov. 23, 1891. Serial No. 412,780. (No model.)

Claim.—1. The combination, in furnace-grates with a grate-bar having separate longitudinal openings in its fire-surface and transverse

ribs between adjoining openings and opposing sides to said openings provided with inwardly-beveled edges, of interchangeable perforate and imperforate plates in said openings, having the edge of each plate beveled and fitted to the respective sides of the openings in said bar, substantially as described.

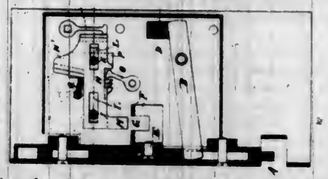
2. In a furnace-grate, a grate-bar having longitudinal downwardly-extended flanges upon its sides and longitudinal openings in the fire-surface of said bar, and sectional grates in said openings, and transverse ribs on the flanges of said bar between said grates having lateral bolt-receiving flanges, substantially as and for the purpose described.

3. In a furnace-grate having longitudinal grate-bars, the combination, with one of said bars having longitudinal downwardly-extended flanges upon its outer edges and grooves parallel with each other in the inner sides of said flanges, and longitudinal openings in the fire-surface of said bar, of sectional grates in the openings in said bar, transverse compartment-forming ribs connected with the inner side of said longitudinal flanges of said bar between said sectional grates and extending downwardly and serially below the line of adjoining ribs to the line of the respective grooves beneath the several compartments formed by said ribs, and sliding plates in said grooves linked together in a telescopic position, and means for operating said plates, substantially as and for the purpose described.

4. In a furnace-grate having longitudinal grate-bars, the combination, with one of said bars having downwardly-extended flanges upon its outer edges and grooves parallel with each other in the inner sides of said flanges, and longitudinal openings in the fire-surface of said bar, of sectional grates in the openings of said bar, transverse compartment-forming ribs connected with the inner sides of said longitudinal flanges of said bar between said sectional grates and extending downwardly and serially below the line of adjoining ribs to the line of the respective grooves beneath the several compartments formed by said adjoining ribs, and telescopic sliding plates on said grooves having longitudinal grooves, and pins in said grooves linking one plate with another, and an operating-rod hinged at one end to one of said sliding plates, for the purpose described.

5. In a furnace-grate having longitudinal reciprocating grate-bars and suitable transverse supporting-plates for the ends of said bars, the combination, with said supporting-plates, of one of said grate-bars provided with an aperture in the end of said bars directly over said supporting-plate, and a cavity in the under side of said grate-bar communicating with the said aperture, substantially as and for the purpose described.

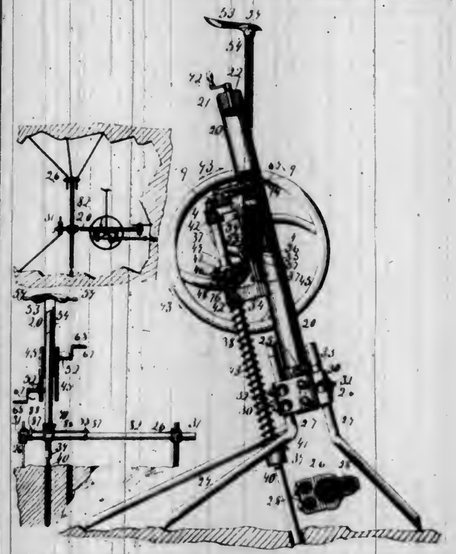
6. In a furnace-grate having longitudinal reciprocating grate-bars and a suitable transverse supporting-plate for said bars, the combination, with one of said bars having a longitudinal V-shaped groove in the inner surface of said bar at the bearing end and an aperture in said end of said bar communicating with said groove, of serrated ribs in the upper surface of one of said transverse supporting-plates within the groove in the said grate-bar, substantially as and for the purpose described.



7. In a furnace having suitable side walls, the combination therewith of a grate having longitudinal reciprocating grate-bars, a transverse plate in said walls supporting the rear end of the said grate-bars, a transverse shaft beneath the front ends of the said grate-bars, and a transverse plate beneath and supporting the ends of said shaft, a rocking shoe on said shaft, having its bearing-surface in the arc of a circle supporting the forward end of one of said grate-bars, and lugs on said rocking shoe on each side of said shaft adapted to contact with the said transverse plate, substantially as and for the purpose described.

8. In antifriction grate-bar supports, a rocking shoe or plate consisting of a sector having its bearing-surface in the arc of a circle, and lateral flanges having their outer bearing-surfaces inclined in opposite directions, substantially as and for the purpose described.

9. The combination, with a longitudinal grate-bar having longitudinal downwardly-extending flanges upon its outer edges and a tread-plate on the inner side of each flange, having its lower surface inclined from said flange in an upward direction, of an antifriction support consisting of a rocking shoe or plate, each plate consisting of a sector having its bearing-surface in the arc of a circle, and lateral flanges on the sides of said shoe, having the upper bearing-surface of said flanges inclined in downward and opposite directions and adapted to fit the tread upon the said grate-bar, substantially as and for the purpose described.



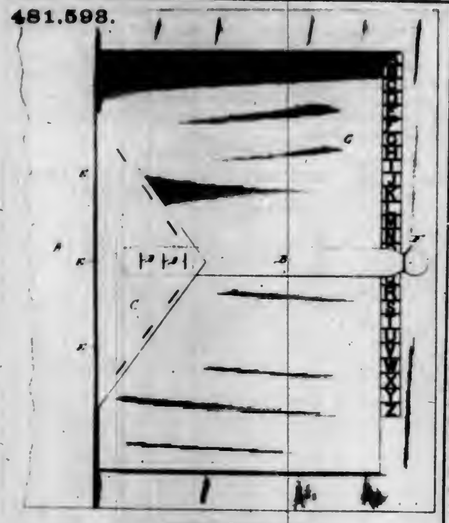
10. In a furnace-grate having suitable upper and lower transverse supports for the upper and lower ends of the grate-bars and rocking shoes upon said upper support, having a bearing-surface describing an arc of a circle, the combination of an inclined grate-bar having a plate extending the length of the fire-surface of said bar and the lower end of said plate bent upwardly at an angle to the upper portion of said plate, and means for reciprocating said bar, substantially as and for the purpose described.

481,597. LOCK. NILS G. SORENSEN, Stockholm, Sweden. Filed Nov. 5, 1891. Serial No. 410,981. (No model.)

Claim.—In a lock, the combination, with a vertically-movable bolt provided with a plate projecting therefrom and having holes therein, of tumblers moving in an angular direction to the bolt, angle-pieces projecting from the under side of the tumblers and substantially parallel to the bolt, whereby when the lock is unbolted said angle-pieces will be in a position directly above the said holes, a tripper beneath said tumblers and reaching up into notches in the edges thereof, and a knob on said tripper, whereby they may be actuated from the outside of the door.

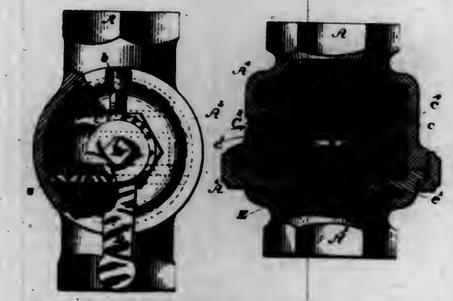
481,598. ROCK-DRILLING MACHINE. WILLIAM X. STEVENS, Washington, D. C. Filed Oct. 3, 1891. Serial No. 408,094. (No model.)

Claim.—1. The combination, in a rock-drilling machine, of a column and a receiver perforated to fit thereon, the receiver having other perforations parallel therewith to receive legs and having yet other perforations transverse thereto to receive similar legs, substantially as described.



2. The combination, in a rock-drilling machine, of a column, a receiver therefor having perforations both parallel therewith and transverse thereto to receive legs, the said leg perforations intersecting each other in pairs, and a set-screw fitted in the receiver at each intersection, adapted to engage a leg in either of the intersecting perforations, substantially as described.

3. The combination of a rock-drilling-machine column, a slideway of the same form and diameter as the column, and a receiver interchangeably fitted to both column and slideway, substantially as described.

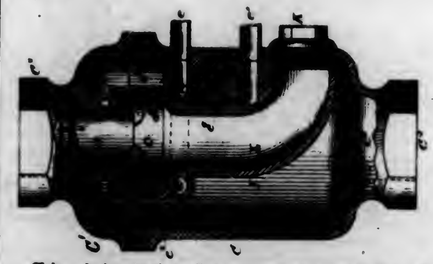


4. The combination, in a rock-drilling machine, of a column, a slideway of the same form and diameter as the column, and a receiver perforated to fit upon either the column or slideway and further perforated to receive legs, substantially as described.

5. The combination, in a rock-drilling machine, of a drill-carriage, a slideway therefor, a drill-plunger fitted to reciprocate in the carriage and provided with a series of radial arms, a sentinel located in the path of rotation of the said arms, and a drive-wheel provided with cams adapted to engage the said arms and lift them over the sentinel, substantially as described

481,593.

481,594. TRACK-SANDING APPARATUS. CHARLES W. SHERBURNE, Boston, Mass. Filed July 5, 1892. Serial No. 438,869. (No model.)



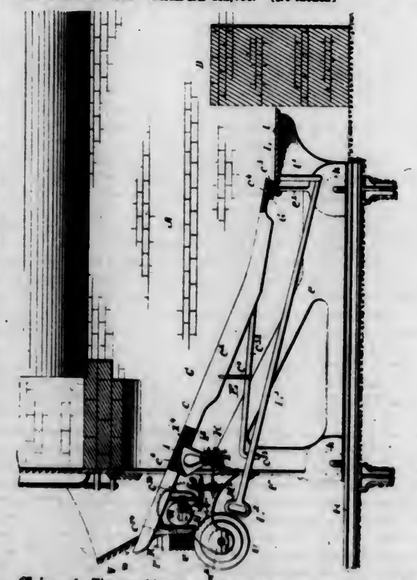
Claim.—1. In a locomotive track-sanding apparatus, the combination of a hollow body having two necks, one for attachment to the sand-pipe leading from the sand-box and the other for attachment to the sand-pipe leading in front of the driving-wheels, and an interior dome with depending walls, outside of which dome and within the cavity of the body is a sand-channel, and with a stage E, provided with a lip upon its inner edge, which lip does not extend above the lower edge of the depending wall of the dome and is of less diameter than the wall of the dome, and with an air-pipe within the dome connected with a source of air-supply under pressure, said air-pipe C being perforated with holes for the passage of air upon its under side, as and for the purposes described.

2. In a locomotive track-sanding apparatus, the combination of a body having the interior form of a solid of revolution, which body is provided with two necks, one for connection with the sand-pipe leading from the sand-box of a locomotive and the other for connection with the sand-pipe leading in front of the driving-wheels, with the shaft B, hollow journal C^3, perforated air-pipe C, and dome provided with depending walls C', the whole being adapted to be adjustable to and clamped at any angle with the axis of the necks A A', substantially as described.

3. In a locomotive track-sanding apparatus, the combination of a body having the interior form of a solid of revolution and provided with two necks, one for attachment to the sand pipe leading from the sand-box and the other for attachment to the sand-pipe leading in front of the driving-wheels, and an interior stage-dome, perforated air pipe delivering air to the interior of the dome, and a shaft B, and a hollow journal C^3, adapted to be connected with a source of air-supply under pressure, and the whole being adjustable within the interior of the body and to be clamped in any position therein by means substantially as described.

481,595. TRACK-SANDING APPARATUS. CHARLES W. SHERBURNE, Boston, Mass. Filed July 5, 1892. Serial No. 438,864. (No model.)

Claim.—1. In a track-sanding apparatus, the combination, with the sand-supplying apparatus, of two independent conduits for compressed air, both under control of the engineer, one of them being the pipe *c*, and the other being the pipe *d*, the pipe *d* furnishing only a small quantity of air to propel the sand, the other pipe *c* furnishing a much larger quantity of air to propel the sand, substantially as and for the purposes described.



2. In a track-sanding apparatus, the combination, with the train-line and engineer's valve, of the reservoir E, the automatic valve F, air-pipe *c*, and sand-distributing barrel C, substantially as and for the purposes described.

3. The combination of the Westinghouse air-brake apparatus having an automatic valve and its air-reservoir, with an air-actuated sand-distributing barrel and sand-delivery pipe, substantially as described.

4. In a track-sanding apparatus, the combination of a sand-chamber O, a wall M, surrounding said basin, a sand-delivery channel *c*, and two air-pipes, one of which furnishes a very much larger quantity of air than the other, substantially as and for the purposes described.

5. The combination, with a railway-train and with the vehicles thereof and with the air brake apparatus of such a train, of two or more sets of automatic track-sanding apparatus actuated by compressed air of the air-brake apparatus, one of which automatic track-sanding apparatus is located on a vehicle at or near the head of the train and the other one on a vehicle behind the vehicle at or near the head of the train which carries the track-sanding apparatus hereinbefore referred to, substantially as and for the purposes described.

481,596. FURNACE-GRATE. EPHRAIM C. SOOT, Kansas City, Mo. Filed Nov. 23, 1891. Serial No. 412,780. (No model.)

Claim.—1. The combination, in furnace-grates with a grate-bar having separate longitudinal openings in its fire-surface and transverse

ribs between adjoining openings and opposing sides to said openings provided with inwardly-beveled edges, of interchangeable perforate and imperforate plates in said openings, having the edge of each plate beveled and fitted to the respective sides of the openings in said bar, substantially as described.

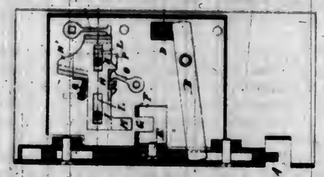
2. In a furnace-grate, a grate-bar having longitudinal downwardly-extended flanges upon its sides and longitudinal openings in the fire-surface of said bar, and sectional grates in said openings, and transverse ribs on the flanges of said bar between said grates having lateral bolt-receiving flanges, substantially as and for the purpose described.

3. In a furnace-grate having longitudinal grate-bars, the combination, with one of said bars having longitudinal downwardly-extended flanges upon its outer edges and grooves parallel with each other in the inner sides of said flanges, and longitudinal openings in the fire-surface of said bar, of sectional grates in the openings in said bar, transverse compartment-forming ribs connected with the inner side of said longitudinal flanges of said bar between said sectional grates and extending downwardly and serially below the line of adjoining ribs to the line of the respective grooves beneath the several compartments formed by said ribs, and sliding plates in said grooves linked together in a telescopic position, and means for operating said plates, substantially as and for the purpose described.

4. In a furnace-grate having longitudinal grate-bars, the combination, with one of said bars having downwardly-extended flanges upon its outer edges and grooves parallel with each other in the inner sides of said flanges, and longitudinal openings in the fire-surface of said bar, of sectional grates in the openings of said bar, transverse compartment-forming ribs connected with the inner sides of said longitudinal flanges of said bar between said sectional grates and extending downwardly and serially below the line of adjoining ribs to the line of the respective grooves beneath the several compartments formed by said adjoining ribs, and telescopic sliding plates on said grooves having longitudinal grooves, and pins in said grooves linking one plate with another, and an operating-rod hinged at one end to one of said sliding plates, for the purpose described.

5. In a furnace-grate having longitudinal reciprocating grate-bars and suitable transverse supporting-plates for the ends of said bars, the combination, with said supporting-plates, of one of said grate-bars provided with an aperture in the end of said bars directly over said supporting-plate, and a cavity in the under side of said grate-bar communicating with the said aperture, substantially as and for the purpose described.

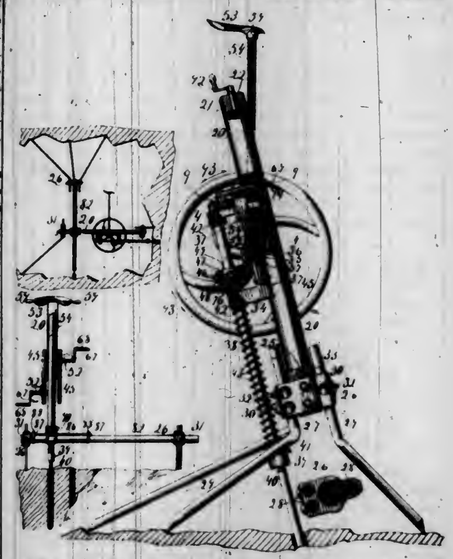
6. In a furnace-grate having longitudinal reciprocating grate-bars and a suitable transverse supporting-plate for said bars, the combination, with one of said bars having a longitudinal V-shaped groove in the inner surface of said bar at the bearing end and an aperture in said end of said bar communicating with said groove, of serrated ribs in the upper surface of one of said transverse supporting-plates within the groove in the said grate-bar, substantially as and for the purpose described.



7. In a furnace having suitable side walls, the combination therewith of a grate having longitudinal reciprocating grate-bars, a transverse plate in said walls supporting the rear end of the said grate-bars, a transverse shaft beneath the front ends of the said grate-bars, and a transverse plate beneath and supporting the ends of said shaft, a rocking shoe on said shaft, having its bearing-surface in the arc of a circle supporting the forward end of one of said grate-bars, and lugs on said rocking shoe on each side of said shaft adapted to contact with the said transverse plate, substantially as and for the purpose described.

8. In antifriction grate-bar supports, a rocking shoe or plate consisting of a sector having its bearing-surface in the arc of a circle, and lateral flanges having their outer bearing-surfaces inclined in opposite directions, substantially as and for the purpose described.

9. The combination, with a longitudinal grate-bar having longitudinal downwardly-extending flanges upon its outer edges and a tread-plate on the inner side of each flange, having its lower surface inclined from said flange in an upward direction, of an antifriction support consisting of a rocking shoe or plate, each plate consisting of a sector having its bearing-surface in the arc of a circle, and lateral flanges on the sides of said shoe, having the upper bearing-surface of said flanges inclined in downward and opposite directions and adapted to fit the tread upon the said grate-bar, substantially as and for the purpose described.



10. In a furnace-grate having suitable upper and lower transverse supports for the upper and lower ends of the grate-bars and rocking shoes upon said upper support, having a bearing-surface describing an arc of a circle, the combination of an inclined grate-bar having a plate extending the length of the fire-surface of said bar and the lower end of said plate bent upwardly at an angle to the upper portion of said plate, and means for reciprocating said bar, substantially as and for the purpose described.

481,597. LOCK. NILS G. BOLINDER, Stockholm, Sweden. Filed Nov. 5, 1891. Serial No. 410,981. (No model.)

Claim.—In a lock, the combination, with a vertically-movable bolt provided with a plate projecting therefrom and having holes therein, of tumblers moving in an angular direction to the bolt, angle-pieces projecting from the under side of the tumblers and substantially parallel to the bolt, whereby when the lock is unbolted said angle-pieces will be in a position directly above the said holes, a tripper beneath said tumblers and reaching up into notches in the edges thereof, and a knob on said tripper, whereby they may be actuated from the outside of the door.

481,598. ROCK-DRILLING MACHINE. WILLIAM X. STEVENS, Washington, D. C. Filed Oct. 8, 1891. Serial No. 408,094. (No model.)

Claim.—1. The combination, in a rock-drilling machine, of a column and a receiver perforated to fit thereon, the receiver having other perforations parallel therewith to receive legs and having yet other perforations transverse thereto to receive similar legs, substantially as described.

2. The combination, in a rock-drilling machine, of a column, a receiver therefor having perforations both parallel therewith and transverse thereto to receive legs, the said leg perforations intersecting each other in pairs, and a set-screw fitted in the receiver at each intersection, adapted to engage a leg in either of the intersecting perforations, substantially as described.

3. The combination of a rock-drilling-machine column, a slideway of the same form and diameter as the column, and a receiver interchangeably fitted to both column and slideway, substantially as described.

4. The combination, in a rock-drilling machine, of a column, a slideway of the same form and diameter as the column, and a receiver perforated to fit upon either the column or slideway and further perforated to receive legs, substantially as described.

5. The combination, in a rock-drilling machine, of a drill-carriage, a slideway therefor, a drill-plunger fitted to reciprocate in the carriage and provided with a series of radial arms, a sentinel located in the path of rotation of the said arms, and a drive-wheel provided with cams adapted to engage the said arms and lift them over the sentinel, substantially as described.

6. The combination of a drill-plunger fitted to reciprocate and to rotate in a carriage and having radial arms, means for lifting and rotating the said arms, and a sentinel located in their path of rotation and made adjustable longitudinally of the carriage, substantially as described.

7. The combination, in a rock-drilling machine, of a sliding carriage, a plunger fitted to reciprocate therein, a wheel journaled in the carriage and adapted to retract the plunger, pedal-cranks upon the wheel, and a saddle supported on the carriage, whereby the driver's relation to the cranks will be maintained throughout the movement of the carriage, substantially as described.

8. The combination of a rock-drilling machine drive-wheel journaled in bearings and provided with pedal-cranks and a saddle having supports journaled upon the said bearings, substantially as described.

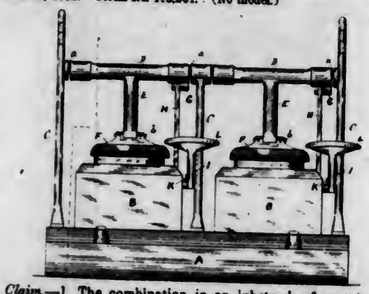
9. The combination of a rock-drilling-machine carriage, a drive-wheel journaled therein and provided with pedal-cranks adapted for direct application of the driver's feet and having arms extending from their outer ends, and manual cranks formed on the extended arms, substantially as described.

10. The combination, in a rock-drilling machine, of a carriage, a feed-screw journaled in a frame parallel therewith, a ratchet-wheel threaded upon the screw between end bearings of the carriage, a lever pivoted to the carriage and having a pawl to engage the ratchet-wheel, and a drill-plunger fitted to reciprocate in the carriage, the said plunger communicating motion to the said lever by means of a parallel slide-way with an offset at its end over which the coacting part may pass, substantially as described.

11. The combination, in a rock-drilling machine, of a reciprocating drill-plunger and a feeding-lever, one of them having a parallel slideway with an offset at its end and the other having a coacting part to slide upon the said way and offset, substantially as described, whereby, first, the said lever is held out of action during the descent of the plunger until the advance of the drill into the rock requires more feed, and, secondly, the lever is actuated to give a positive feed motion by the receding plunger when thus required.

12. The combination of a reciprocating drill-plunger having a shoulder near its end, and a feed-lever fitted to bear against one side of the plunger and to pass over the said shoulder into the path of the plunger, substantially as described.

481,599. TUCK-CREASER FOR SEWING-MACHINES. HIRAM P. STEWARD, Elizabeth, N. J., assignor to The Singer Manufacturing Company of New Jersey. Filed Jan. 29, 1892. Serial No. 419,671. (No model.)



Claim.—1. In a sewing-machine tuck-creaser, the combination, with a plate over which the material is to pass and which is provided with an arm or portion having a creasing-lip, of a creasing-arm co-operating with said lip, means for operating said creasing-arm, and a presser-plate arranged to press upon the material passing over the first-named plate, said presser-plate being provided with a finger *f*, which is in a different vertical plane from the said plate over which the material is to pass, said finger being forward of the needle or the needle-hole in the presser-foot and extending toward the needle and in the direction in which the work is to be moved.

2. In a sewing-machine tuck-creaser, the combination, with a presser-foot adapted to be attached to the presser-bar of a sewing-machine, of a plate B, rigid with said foot and provided with ears, one of which is adapted to be compressed, and is thus a clamping-ear, a set-screw for compressing said clamping-ear, a plate D, provided with a creasing-lip and also with a rod adapted to pass through said ears, and a rocking bar G, having arms journaled on said rod and one of which co-operates with said lip as a creasing-arm, and a yielding operating-lever H to form an elastic connection between said rocking bar and the machine needle-bar or part by which it is operated and thereby yieldingly press the said creasing-arm against said creasing-lip.

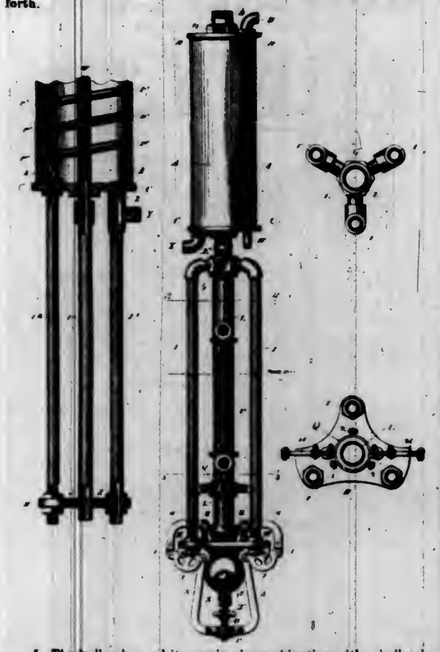
3. In a sewing-machine tuck-creaser, the combination, with the presser-foot A, having a shank *a*, of a plate B, rigid with said foot and provided with the ears *b* and *b'*, the plate D, provided with a creasing-lip, the rod E, attached at one end to a standard on said plate and passing through said ears, a set-screw for compressing one of said ears around said rod, the rocking bar G, provided with the arms *g* and *g'*, journaled on said rod, and an operating-lever H, one portion of which is coiled around said rod, said lever having a longer arm to be engaged by the operating device and a shorter arm to depress the said bar G and a spring a^3 for lifting said bar.

4. In a sewing-machine tuck-creaser, the combination, with a presser-foot adapted to be attached to the presser-bar of a sewing-machine, of a plate B, rigid with said foot and provided with ears, a plate D, provided with a creasing-lip and with a rod adapted to pass through said ears, a set-screw for securing said rod and the plate D, with which said rod is connected, in a fixed position relative to said plate B, the rocking bar G, having arms by which it is journaled on said rod, and one of which serves as a creasing-arm, and means for vibrating said bar to operate the creasing arm.

481,600. INKSTAND. CHARLES R. STRAUGHN, Fernwood, Pa. Filed Jan. 16, 1892. Serial No. 418,261. (No model.)

Claim.—1. The combination, in an inkstand, of an ink-well, a base, standards carried by said base and extending above the top of said ink-well, a shaft pivoted to said standards and extending across the top of said ink-well, an arm depending from and integral with said shaft, a cap pivotally connected at its rear end to lower end of said arm and closing the top of ink-well, a crank on said shaft, a lever pivoted to the front part of said standards and carrying an operating-button on its front end, and a connecting-link connecting the rear end of said lever and crank, all substantially as and for the purposes set forth.

2. The combination, in an inkstand, of an ink-well, a base, standards carried by said base and extending above the top of said ink-well, a shaft pivoted to said standards and extending across the top of the ink-well, an arm depending from and integral with said shaft, a cap pivotally connected to lower end of said arm and adapted to close the top of the ink-well, a crank on said shaft, a lever pivoted to the front part of said standards and furnished at its front end with an operating-button, a link connecting the rear end of said lever and the crank, and a stop carried by the standard to which said lever is pivoted and adapted to limit the movement of said lever and its connected parts, all substantially as described.



481,601. STEAM-TRAP. CYRUS TAYLOR, Buffalo, N. Y., assignor to the Excelsior Specialty Company, of New York. Filed July 20, 1891. Serial No. 400,128. (No model.)

Claim.—1. The thermo-expansible tube of a steam-trap having a valve-seat, in combination with a valve carrier connected with said tube so as to move simultaneously with and oppositely to said valve-seat, and a ball-valve loosely held and carried by said carrier and co-operating with said valve seat, substantially as set forth.

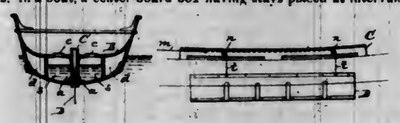
2. The thermo-expansible tube of a steam-trap having a valve-seat, the fixed plate H, and the valve-casing J, supported by said plate, into which valve-casing the free end of said thermo-expansible tube extends, in combination with a valve-carrier below said plate H, and extending within said casing J, and multiplying and reversing connections between said tube and said valve-carrier, said multiplying and reversing connections consisting of the links *c c*, connected with the thermo-expansible tube, the multiplying levers *u u*, pivoted at their inner ends to said plate H above the same and eccentrically connected with said links *c c*, the multiplying and reversing levers *l l*, eccentrically pivoted to said plate H below the same, said levers *u u* and *l l* being connected together at their outer ends beyond said plate H, and links *s s*, connecting the inner ends of said levers *l l* with the valve-carrier, substantially as set forth.

3. The thermo-expansible tube L of a steam-trap, having a valve-seat, the fixed plate H, and the valve-casing J, supported by said plate, into which valve-casing the lower free end of said thermo-expansible tube extends, the valve-carrier K below said plate H, and extending within said casing J, and the cross bar or yoke *r*, by which the said valve-carrier is carried, in combination with collar Q, fixed to said tube L, the links *c c*, pivoted at their upper ends to said collar Q, the levers *u u*, pivoted at their inner ends to and above said plate H and eccentrically connected with the lower ends of said links *c c*, the reversing-levers *l l*, eccentrically pivoted to and below said plate H, links *l l* beyond said plate H, connecting the outer ends of said levers *u u* to the outer ends of said levers *l l*, and links *s s*, connecting the inner ends of said levers *l l* with said cross-bar *r*, substantially as set forth.

4. The valve-seat, the ball-valve, and its carrier, said ball-valve and carrier moving to and from said valve-seat, in combination with a ball-valve rotator carried by said valve-carrier, substantially as set forth.

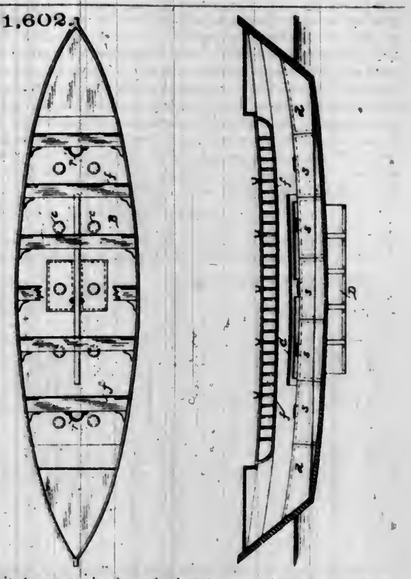
5. The ball-valve and its carrier, in combination with a ball-valve rotator consisting of a spring-actuated plunger which comes in contact with said ball-valve at one side of its vertical axis, substantially as set forth.

6. The ball-valve and its carrier, in combination with the centrally-located spring-actuated plunger o and the eccentrically-located spring-actuated plunger V, substantially as set forth.



7. In a steam-trap having a thermo-expansible tube which is fixed at one end to a suitable support and the other end of which moves (responsively to changes in temperature) in a valve-casing, ties connecting said support and said casing, said ties being tubular and adapted to serve as conduits for cold water and steam, substantially as set forth.

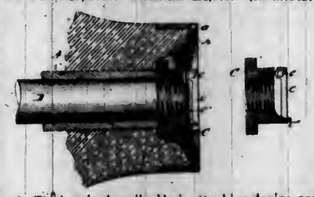
8. In a steam-trap having a condenser and a thermo-expansible tube which is fixed at one end to a suitable support and the other end of which moves (responsively to changes in temperature) in a valve-casing, ties connecting said support and valve-casing, said ties being tubular, a portion of said ties serving as conduits for water, and one at least of said ties communicating with the interior of said condenser and serving as a conduit for steam, substantially as set forth.



481,602. LIFE-BOAT. WILLIAM H. TAYLOR, Narragansett Pier, R. I. Filed Jan. 25, 1892. Serial No. 419,228. (No model.)

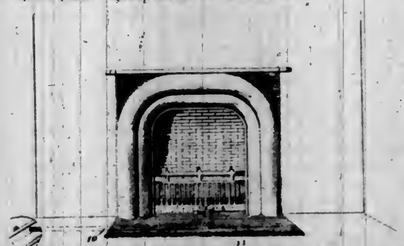
Claim.—1. In a life-boat having a second water-tight floor, as described, a center-board box extending up from the bottom of the boat through said floor, forming two water-tight compartments between the bottom of the boat and the second floor, said center-board box having valves in its sides level with the top of the second floor and opening inward into the box, in combination with removable air-tight tanks for provisions and water, fitted into said two water-tight compartments on each side of the center-board box, substantially as set forth.

2. In a boat, a center-board box having stays placed at intervals



481,602.

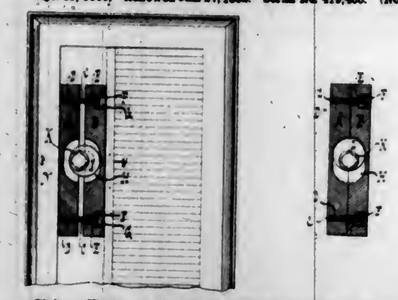
across its lower opening its entire length, connecting its two sides together for strength, in combination with a center-board having slots made through it corresponding with said stays, substantially as described.



481,603. HUB-ATTACHING DEVICE. ISAAC VAN WINKLE, Dysart, Iowa. Filed Feb. 13, 1892. Serial No. 421,385. (No model.)

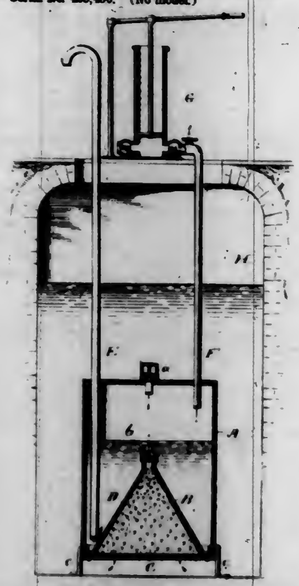
Claim.—1. The herein-described hub-attaching device, consisting, essentially, of a burr provided with a lever hinged thereto, the said lever when in normal position not extending beyond the square of the burr laterally and being wholly external to the axle, an axle to which the said burr is attached, and a hub having a notch or shoulder to engage the lever when folded outwardly.

2. In a hub-attaching device, the combination of a notched hub, an axle adapted to receive a burr, a burr provided with a hinged lever adapted when folded outwardly to engage with the notch in the hub and when in normal position lying within the square of said burr, but external to the axle, and a spring to hold the lever in position and prevent rattle.



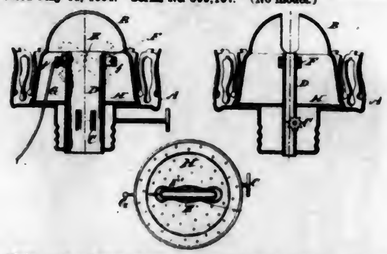
481,604. GAS-MIXER. SAMUEL K. WAGNER, Latrobe, Pa. Filed Nov. 20, 1889. Serial No. 330,955. (No model.)

Claim.—In a system of natural-gas supply, the combination, with a combustion-grate, of a mixing-chamber located underneath and in



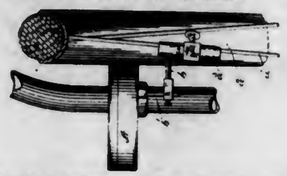
proximity to said grate and comprising a vertical and horizontal arm mutually and integrally connected by a curved elbow, a horizontal gas-supply pipe terminating in said mixing-chamber in a vertical tapered nozzle having its discharge-orifice at a point slightly above the line of the horizontal tube or arm, a manually-adjustable damper pivoted transversely across the air-passage of said horizontal arm, and an air-supply pipe connected to the horizontal arm beyond the chamber and communicating at its other extremity with the exterior air, the whole being so arranged that the gas and air come in contact with each other under pressure in substantially a vertical plane from opposite converging planes, substantially as set forth.

481,605. QUOIN. CHARLES W. WALDRON, Lewiston, Me. Filed Apr. 15, 1886, Renewed Jan. 27, 1892. Serial No. 419,406. (No model.)



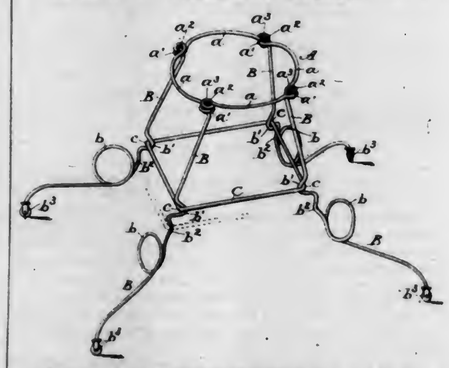
Claim.—The herein-described adjustable printer's quoin, composed of the section A, recessed on its inner side, as shown, the section B, also recessed on its inner side, as shown, and provided at its ends with the holes E and countersinks G, the cam having bearings in the upper and lower sides of said sections and adapted to work in the recess H, formed by the recessed inner faces of the sections, and the guide-pins C at one end screw-threaded into the section A and at the other end provided with a smooth portion, and a stop-head adapted, respectively, to work loosely in the holes E and countersinks G of the section B, substantially as described.

481,606. FILTER. JAMES M. WASSON, Peoria, Ill. Filed Mar. 18, 1892. Serial No. 425,436. (No model.)



Claim.—In a submerged water-filter, a tank having a closed top with a valved opening therein and a perforated bottom plate, a filter-case packed with filtering material resting on said bottom plate and having a valved opening in its top, an air-compressor, an air-pipe connected with the compressor and extending into the tank, and a discharge-pipe in communication with the tank.

481,607. LAMP-BURNER. RICHMOND A. WENTWORTH, Hope, Me. Filed July 11, 1891. Serial No. 399,167. (No model.)

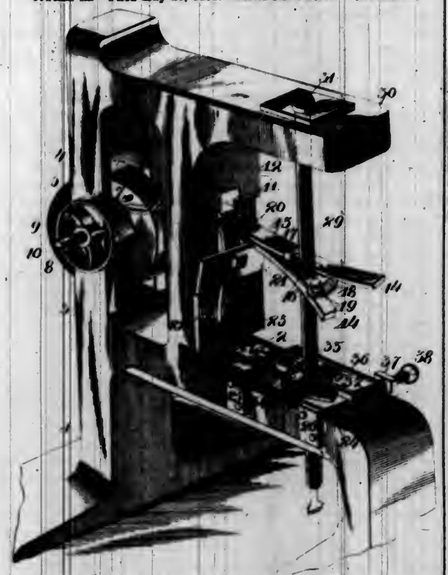


Claim.—In a lamp-burner, the combination, with the flat wick-tube D, of the regulator pivoted to said tube, consisting of a sheet-metal sleeve the sides of which are bent outwardly at their centers, forming convex friction-bearings F, and cut away or recessed at the upper edges of the ends, which project some distance beyond the wick-tube, and the depending adjusting-wire, substantially as described.

481,608. CYCLOMETER. FRANK C. WESTON, Bangor, Me. Filed Apr. 15, 1891. Serial No. 388,993. (No model.)

Claim.—In a cyclometer, the combination, with the case A, adapted to be attached to the fork of a bicycle or tricycle, of the shaft b', provided with the arm b and with the oscillating plate b^4, having a flattened side, the spring m, bearing against said flattened side, the spring-pressed pawl b^5, carried by said plate, the ratchet-wheel engaged by said pawl, a registering-train operated by said ratchet-wheel, and the adjustable and removable tappet a, clamped to a spoke of the machine-wheel and arranged to engage the said arm b to operate the cyclometer positively, substantially as set forth.

481,609. BABY-WALKER. PETER WIBERG, New York, N. Y. Filed Nov. 23, 1891. Serial No. 412,753. (No model.)



Claim.—1. In a baby-walker for infants, the combination of a waist-ring, spreading legs secured to said ring, a brace-ring encircling said legs, and means to retain said brace-ring at different points on said legs, substantially as shown and described.

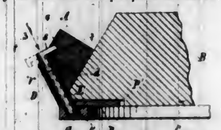
2. In a baby-walker for infants, the combination of a waist ring, yielding and spreading legs secured to said ring and formed each with loops or bends projecting at different distances toward the vertical

axis of the chair, and a brace-ring loosely encircling said legs, substantially as shown and described.

3. A baby-walker for infants, composed of a series of legs having each a horizontal member bent to form a section of a waist-ring, the extremity of the horizontal member of each leg being secured to the other end of the horizontal member of the next leg, substantially as shown and described.

481,610. ROCK-DRILLING MACHINE. NICHOLAS WIDMAN, Mascoutah, Ill. Filed May 21, 1892. Serial No. 433,807. (No model.)

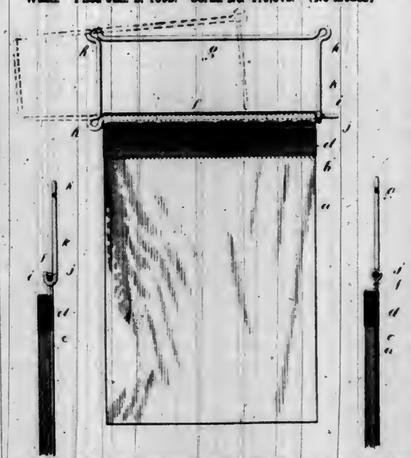
Claim.—1. A rock-drilling machine having a gripper composed of two members pivotally united, a wheel having one of its surfaces provided with a cam or cams for actuating said gripper in one direction, and a pin or pins fixed to the opposite surface of said wheel for depressing one end of the gripper and elevating the opposite end of the same, substantially as set forth.



2. A rock-drilling machine consisting of a gripper movably attached to the frame of the machine, a wheel having cam-surfaces for operating the said gripper in one direction, pins carried by the said wheel for elevating one end of the gripper, a reciprocating plate or bar fixed to the bed of the machine, a lever movably attached to the said plate or bar and adapted to be actuated by the movement of the gripper in one direction, and a serrated plate adjustably secured to the said reciprocating plate or bar and adapted to be brought in contact with the drill-shaft for partially rotating the same, substantially as described.

3. A rock-drilling machine consisting of a gripper and means for operating the same, a lever 23, movably attached to the frame of the machine and adapted to be actuated by the said gripper, a reciprocating plate or bar 24, movably attached to one arm of the said lever, a serrated plate 32, adjustably secured to the said plate or bar and adapted to be brought in contact with the drill-shaft 29, an oil-basin 36, movably attached to the bed of the machine, and means for adjusting the same in relation to the said drill-shaft, substantially as set forth.

4. A rock-drilling machine comprising a gripper and means for operating the same, a plate 16, movably attached to one of the members of the said gripper, a slot 18, formed in the said plate, and a screw 19 for holding said plate in its proper adjustment in relation to the drill-shaft of the machine, substantially as set forth.

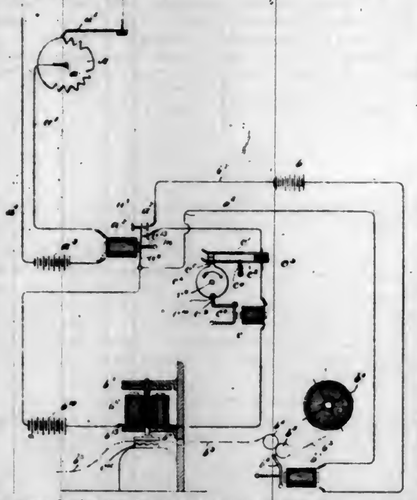


481,611. TOE-WEIGHT FOR HORSES. HARRY ARMSTRONG, Fidelity, Ill. Filed Apr. 5, 1892. Serial No. 427,940. (No model.)

Claim.—1. In a toe-weight for horses, said weight having a tongue adapted for insertion in a channel in the bottom of the hoof, a fastening mechanism comprising a pin D, adapted to pass downward through the weight into the front of the shoe, said pin having a notch r in the side thereof for the reception of the side of a transverse locking or retaining bolt E, having a similar notch g, adapted, when said bolt is pushed inward to the limit of its travel, to allow the withdrawal of the fastening-pin, a spiral spring F, located in a cavity at the end of said locking-bolt, adapted to push the latter back after being pushed in, a pin d inserted in the weight at right angles to the locking-bolt, in the side of which is a recess of such length and breadth as to limit the travel of the locking-bolt and prevent the latter turning round, all of said parts constructed, combined, and adapted to operate substantially as and for the purpose set forth.

2. A toe-weight for horses, having combined with the body thereof a fastening mechanism comprising a fastening-pin and locking-bolt constructed and adapted to each other as described, the bevel b upon the lower end of the pin D, adapted, when the pin is turned half round and in that position thrust into the shoe, to draw the weight snugly up to the hoof, the said fastening-pin D being provided with a bent head and dowel t to facilitate its withdrawal and turning round, as and for the purpose set forth.

481,612. TOILET-PAPER HOLDER. MARTIN A. BROWN, Seattle, Wash. Filed Jan. 2, 1892. Serial No. 416,870. (No model.)

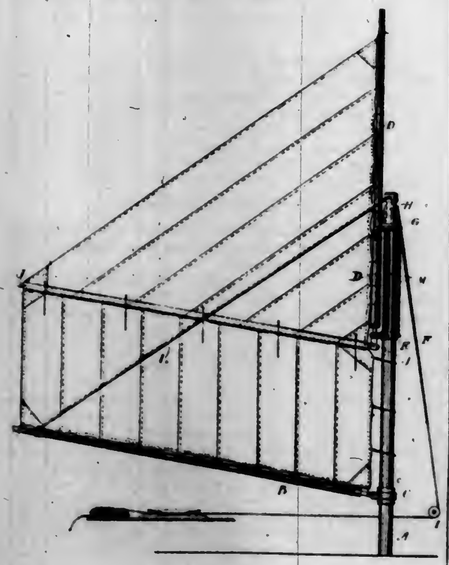


Claim.—The combination, in a toilet paper holder, of a back continued to form a loop, a rectangular wire frame composed of a single integral piece of wire, loops bent out of the wire at the upper corners of the frame and lying in the same plane therewith, and a spring-arm formed by the lower side of the frame, said arm adapted to pass through said loop, and a hook on the lower end of the right vertical side of the frame, adapted to be engaged by the free end of said spring-arm, all arranged and adapted to operate in the manner set forth.

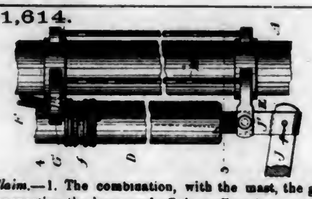
481,613. SIGNAL-TIMING APPARATUS. HENRY A. CRASE, Boston, Mass., assignor to Albert Watts, same place. Filed May 11, 1892. Serial No. 432,615. (No model.)

Claim.—1. In a signaling system, the combination of the following instrumentalities, viz: a main electric circuit, a signal-transmitting mechanism included therein, a relay or receiving mechanism a^2 in said circuit, a local circuit controlled by said relay, a register in said local circuit, a time-stamp provided with an electro-magnet, a second local circuit controlled by the relay a^2 and independent of the register local circuit and in which the electro-magnet of the time-stamp is located, two sets of circuit-terminals for the local circuit of the time-stamp, one set of circuit-terminals being controlled by the relay, a rotary mechanical circuit-controller to govern the operation of the second set of circuit-terminals, and an electro-magnet to govern the operation of the said mechanical circuit-controller, substantially as described.

2. In a signaling system, the combination of the following instrumentalities, viz: a main electric circuit, a signal-transmitting mechanism included therein, a relay or receiving mechanism in said circuit, a local circuit controlled by said relay, a registering mechanism in said local circuit, a second local circuit controlled by the relay, a



481,618.

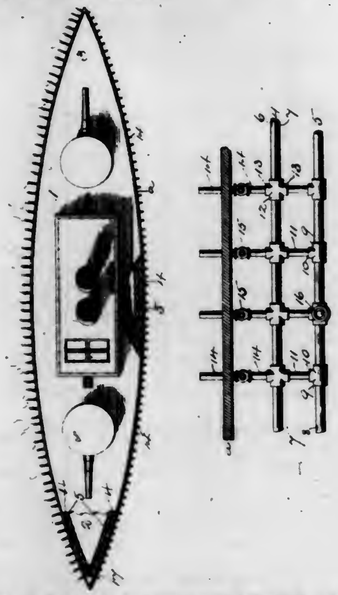


time-stamp having its electro-magnet included in said second local circuit, circuit-terminals for said local circuit, a circuit-controller to operate said circuit-terminals, and an electro-magnet in the local circuit of the time-stamp magnets to govern the operation of the said circuit-controller, substantially as described.

3. In a signaling system, the combination of the following instrumentalities, viz: a main electric circuit, a signal-transmitting mechanism included therein, a relay or receiving mechanism in said circuit, a local circuit containing a register-operating magnet *b'*, a recording strip or tape upon which the signal transmitted is received, a second local circuit controlled by the said relay, time-operating magnets located in said local circuit, normally-closed circuit-terminals in said local circuit, a circuit-controller co-operating with the said circuit-terminals to hold the same normally closed, and an electro-magnet in the local circuit of the time-operating magnets governing the operation of the circuit-controller, substantially as described.

481,614. SAIL. ALPHONSO S. CORSTOCK, Evanston, Ill. Filed Apr. 18, 1892. Serial No. 429,617. (No model.)

481,614.



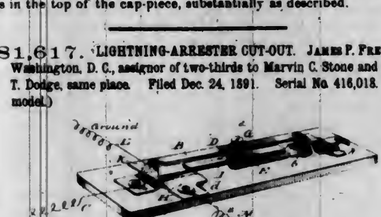
Claim.—1. The combination, with the mast, the gaff, a goose-neck connecting the lower end of the gaff to the mast, and the halyard, of a block mounted to slide on the mast above the goose-neck and means connecting said goose-neck and block, so that they move together and prevent each other from canting, substantially as set forth.

2. The combination, with the mast, the gaff, the goose neck E, connecting the lower end of the gaff to the mast, and the halyard, of a block G, mounted to slide upon the mast above the goose-neck, and spring-rods having their upper ends secured to said block and their lower ends secured to said goose neck, substantially as set forth.

3. The combination, with the mast, the gaff, and the goose-neck E, connecting the lower end of the gaff to the mast, of the block G, means connecting the goose-neck and block, and the jaws G', carried by the block and adapted to receive the gaff between them, substantially as set forth.

4. The combination, with the mast, the gaff, and the goose-neck E, connecting the lower end of the gaff to the mast, of the block G, having jaws G' and eyes *g*, the spring-rods M, connecting the goose-neck and block, and the halyard made fast to the yard and rove through the eyes *g*, substantially as set forth.

481,615. APPARATUS FOR REPELLING BOARDERS AND DISTRIBUTING OIL. FRED BYLE, New Orleans, La. Filed May 11, 1891. Serial No. 392,385. (No model.)



Claim.—1. In combination with a navigable vessel, a plurality of steam and oil pipes extending in an inner and an outer horizontal line circumferentially around the bow, sides, and stern of said vessel, and having registering discharge-openings in their sides, tubular-valved couplings connecting said pipes at said openings, valve-guarded nozzles extending horizontally outward from the outer circumferential pipe, and oil and steam supplies connected to said pipes, respectively, at the bow of the vessel, substantially as and for the purpose set forth.

2. In combination with the navigable vessel, a plurality of steam and oil pipes extending in an inner and an outer horizontal line circumferentially around the bow, sides, and stern of said vessel, and having registering discharge-openings in their sides, tubular couplings connecting said pipes at said openings, valve-guarded nozzles extending horizontally outward from the outer circumferential pipe, and oil and steam supplies connected to said pipes, respectively, at the bow of the vessel, substantially as and for the purpose set forth.

3. A navigable vessel, a pipe extending horizontally around the same and having a plurality of outboard-extending valve-guarded nozzles, and an oil-supply connected to the bow portion of said pipe, whereby oil may be supplied to said pipe and ejected from said nozzles, substantially as and for the purpose set forth.

481,616. BOTTLE-STOPPER. WILLIAM J. FERRIS, Louisville, Ky. Filed May 3, 1892. Serial No. 431,646. (No model.)

Claim.—1. A stopper for bottles, flasks, and like receptacles, consisting of a valve seated upon a discharge-opening of the receptacles, and a retaining device so arranged in proximity to the valve as to permit the latter to have a limited movement from said seat when in a vertical position, but preventing such movement when in any other position, substantially as described.

2. A stopper for bottles, flasks, and like receptacles, consisting of an elongated valve spherical at its lower end and seated upon a spherical seat surrounding the discharge-opening of the receptacle, and a perforated retaining-disk located above the valve and in close proximity thereto, so as to permit the valve to leave its seat only when in a vertical position, substantially as described.

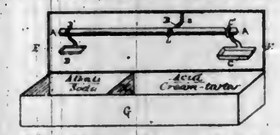
3. A stopper for bottles, flasks, and the like, consisting of a cross-partition located in the discharge-neck and having an aperture, a valve-seat of spherical contour upon the upper end of said aperture, a valve upon said seat, said valve being spherical at one end and flat at the other, and a perforated retaining-disk above the valve in proximity thereto, so as to prevent the valve from leaving its seat except when in a vertical position, substantially as described.

4. In a stopper for bottles, flasks, and the like, a device for preventing the refilling by vacuum apparatus, consisting of a valve located in proximity to the entrance-opening of the bottle and within the same, said valve being adapted to be drawn or sucked across said opening when the vacuum apparatus is set in operation, substantially as described.

5. In a stopper for bottles, flasks, and the like, a device for preventing the refilling by vacuum apparatus, consisting of a valve located in proximity to the entrance-opening of the bottle and within the same, said valve being adapted to be drawn or sucked across said opening when the vacuum apparatus is set in operation, and the bottle-opening being zigzag, so as to prevent interference with said valve, substantially as described.

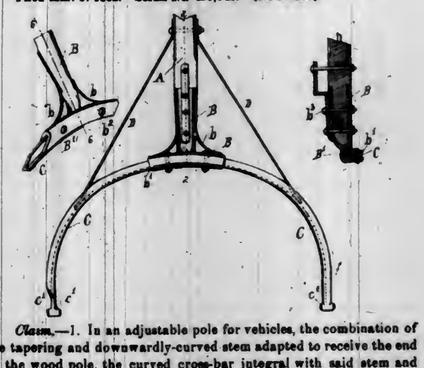
6. In a stopper for bottles, flasks, and the like, a device for preventing the refilling by vacuum apparatus, consisting of a perforated disk, a cap-piece above said disk and forming therewith an interior chamber, a float-valve located within such chamber, and zigzag openings in the top of the cap-piece, substantially as described.

481,617. LIGHTNING-ARRESTER CUT-OUT. JAMES P. FREEMAN, Washington, D. C., assignor of two-thirds to Marvin C. Stone and Philip T. Dodge, same place. Filed Dec. 24, 1891. Serial No. 416,018. (No model.)



Claim.—1. In a lightning-arrester, the combination of a magnetic needle, means for directing the current lengthwise of the needle, and main-line and ground connections opened and closed alternately by the vibration of the needle.

2. The base, the arched conductor, and the needle, in combination with the line and the ground contacts at opposite sides of the needle.

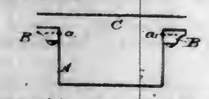


3. In combination with the needle, the line and the ground contacts, through which the current is directed by the needle, the auxiliary magnet, and means for directing the current lengthwise of the needle, substantially as described.

481,618. PROPORTIONAL BALANCE. ORLANDO H. JADWIN, Brooklyn, N. Y. Filed Apr. 20, 1891. Serial No. 389,734. (No model.)

Claim.—The herein-described box, scale-beam, and scale-pans, constructed in such a manner that the smaller of the two compartments of the box, the shorter arm of the scale-beam, and the lesser of the two scale-pans shall bear, respectively, to the larger of the two compartments of the box, longer arm of the scale-beam, and greater of the two scale-pans the same proportions that the component parts of the chemical compound to be contained in the box sustain one to the other.

481,619. VEHICLE-POLE. JAMES P. JOHNSON, Springfield, Ill. Filed Mar. 5, 1892. Serial No. 423,948. (No model.)



Claim.—1. In an adjustable pole for vehicles, the combination of the tapering and downwardly-curved stem adapted to receive the end of the wood pole, the curved cross-bar integral with said stem and having a longitudinal L-shaped channel adapted to receive a circle-bar of either angle-iron or flat bar-iron, and provided with horizontally-transverse holes to receive bolts connecting said circle-bar with said cross-bar, the integral braces connecting said stem with said cross-bar, and the circle-bar of angle-iron having slots, whereby the upper ends of the segments of said circle-bar may be adjusted longitudinally within said cross-bar, said segments having at their lower ends eyes, as set forth, and for the purpose stated.

2. In an adjustable pole for vehicles, a circle-bar consisting of two segments of angle-iron so formed that the edge of one member of the angle-bar from which said segments are made forms the outer convex edge of said circle-bar and the flat surface of the other member of the angle-bar forms the inner concave surface of said circle-bar, in combination with a stem adapted to receive the wood pole, a cross-bar adapted to adjustably support the upper ends of the segments forming said circle-bar, the integral eyes at the lower ends of said segments, formed by making a quarter-turn in said angle-bar, said eyes having externally-rounded ends and being rimmed out internally, and the braces connecting the wood pole with the circle-bar and adapted to fit in the angle of said circle-bar, as set forth, and for the purpose stated.

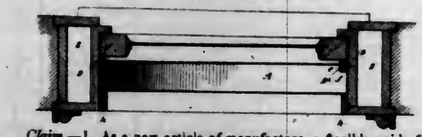
3. In an adjustable vehicle-pole, the combination of a circle-bar consisting of two segments adapted to longitudinal adjustment in the cross-bar by means of bolts passing horizontally through holes in said cross-bar and through longitudinal slots in said segment, the downwardly-curved stem adapted to receive a wood pole, the cross-bar supporting the circle-bar, and the braces connecting said circle-bar with said wood pole, as set forth, and for the purpose stated.

4. In an adjustable vehicle-pole, the combination of the stem, the cross-bar, and the braces integral with said stem, the L-shaped longitudinal channel in said cross-bar, the wood pole fitting in said stem, the hammer-strap, the bolts passing through the hammer-strap, the stem, and the wood pole, and connecting all together, the circle-bar consisting of two segments, having their upper ends longitudinally adjustable within the opening in said cross-bar and having at their lower ends eyes, the ends of said eyes being externally conical and rimmed out internally, and the braces connecting said segments with said wood pole, as set forth, and for the purpose stated.

481,620. SHEET-METAL AIR-DUCT. JUDSON H. LAKE, Elmira, N. Y., assignor to T. C. Northcott, same place. Filed May 26, 1892. Serial No. 434,435. (No model.)

Claim.—1. A sheet-metal duct composed of the part A, bent to the form necessary to form the body of the duct, (of any preferred form in cross-section,) and the plain sheet C, with the stripe B, all combined substantially as shown and described.

2. The improvement in the construction of air-ducts, which consists in forming the body of the duct of a sheet of metal bent into a trough-like form, closing its open side by a flat sheet of metal, and securing the whole in place by means of the side stripe B, substantially as herein set forth.



481,621. MAIL-BOX. GEORGE S. LIGHT, Covington, Ky. Filed Nov. 7, 1891. Serial No. 411,332. (No model.)

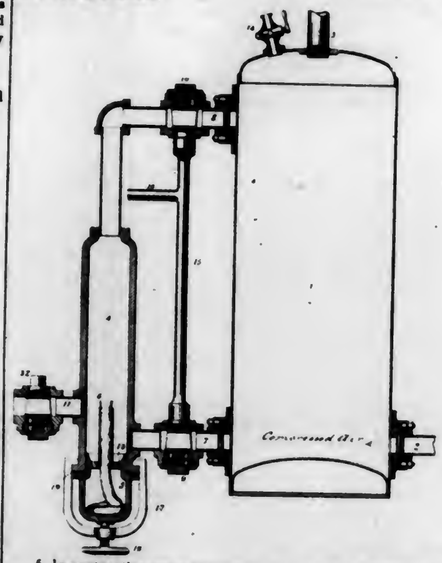
Claim.—1. A mail-box having a series of drawers therein closed at one end and open at the other, a mail-compartment above said drawers, and hinged doors with hasps and locks over the ends of said drawers, substantially as described.

2. A mail-box having a series of drawers therein open at one end and closed at the other and extending therethrough from end to end, a mail-compartment above said drawers, hinged doors adapted to close over the end of the drawers entire, hasps and locks for securing said doors, rings on the box, and a chain to engage said rings and support the box in proper position, substantially as described.

481,622. SASH-HOLDER. STEPHEN B. MORSE, Rahway, N. J. Filed May 28, 1891. Serial No. 394,386. (No model.)

Claim.—1. As a new article of manufacture, a flexible guide for window-sashes, screens, and the like, consisting of a base *d*, ribs or webs *e*, extending outwardly from the base and having a space between them, and webs *f f*, extending from the webs *e* outwardly and backwardly at an angle to webs *e*, said guide being adapted to fit between sashes and its opposite webs *f* to bear on the opposite sashes.

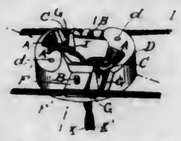
2. A flexible guide composed of a base *d*, ribs *e*, extending outwardly from the base and having a space between them and ribs *f*, extending backwardly from the ribs *e*, the corresponding ribs *e* and *f* forming an angle between their sides, combined with a strip D^4 fitting between the ribs *e e*.



481,623. APPARATUS FOR HEATING COMPRESSED AIR. ROBERT A. PARKE, New York, N. Y. Filed July 10, 1891. Serial No. 399,052. (No model.)

Claim.—1. In combination with a source of compressed-air supply and a motor, an interposed reservoir, and a separate combustion-chamber communicating with the reservoir for the purpose of heating the air contained therein, substantially as described.

2. In combination with a source of compressed air supply and a motor, an interposed reservoir, and a separate combustion-chamber communicating with the reservoir and maintaining a circulation of air therethrough, substantially as and for the purposes described.



3. A reservoir or chamber having a source of compressed-air supply and an exit leading to a motor, which reservoir communicates at its upper and lower ends with the upper and lower ends, respectively, of a separate combustion-chamber, in combination with a burner producing continuous combustion in compressed air within said combustion-chamber, substantially as and for the purposes set forth.

4. In combination with a reservoir having a source of compressed-air supply and an exit leading to a motor, a separate combustion-chamber, and tubes connecting the reservoir and combustion-chamber at their upper and lower ends, cocks or valves in said tubes, by which communication may be effected or cut off between the reservoir and combustion-chamber, and a cock or valve connected with the combustion-chamber, by means of which the combustion-chamber may communicate with the atmosphere, substantially as and for the purposes described.

5. In combination with a reservoir having a source of compressed-air supply and an exit leading to a motor, a separate combustion-chamber, circulating tubes or passages connecting the reservoir and combustion-chamber, and cocks or valves in said tubes or passages, by which communication may be effected or cut off between the reservoir and combustion-chamber, substantially as and for the purposes described.

481,624. CEILING-ROSETTE CUT-OUT. JAMES FAIS and ALBERT P. SEYMOUR, Syracuse, N. Y. Filed Mar. 21, 1892. Serial No. 425,671. (No model.)

Claim.—1. In an electric-wiring fixture, the combination, with a block of porcelain or similar insulating material adapted to be clamped against the surface of a wall, ceiling, or other support, of fuse-clamps mounted in the face of said block next the surface against which the block is secured and clamp-screws passing through said block from the outer or lower surface thereof and operating to bind or fasten the fuse-wire, as and for the purpose described.

2. In a branch or rosette cut-out or similar electric-wiring device, the combination, with a block of porcelain or similar insulating material adapted to be fastened down upon the surface of any suitable support, such as a ceiling or wall, of fuse-clamps mounted in cavities or depressions on the inner surface of said block, one at or near the rim and the other within the rim, but connected with the rim by an opening adapted to receive the fuse-wire, and screws for operating on said clamps, said screws passing through the block from the outer surface and having their heads on the outside, as and for the purposes described.

3. In an electric-wiring fixture having a cut-out, a porcelain or similar block or plate adapted to be fastened to the surface of a wall

or ceiling and having the metal-work forming the clamping devices mounted on the inner side next such surface, in combination with screws passing through the block from the outer surface and serving the double function of holding the metal-work in place and operating the clamp jaws or plates.

4. In an electric-wiring fixture, the combination, with the block or plate of insulating material D, adapted to be fastened to the surface of a wall or ceiling, of a metal plate I, seated in a cavity or depression on the face of said plate next the support to which the block or plate D is secured, the clamping-screw A, passing through the block from the outer face thereof and entering the clamp-plate I, and an opening or passage connecting the cavity holding said plate I with the rim of the block to form a passage for the fuse-wire, clamped beneath said plate I.

5. In an electric-wiring fixture, the combination, substantially as described, with the block D, of insulating material, such as porcelain, adapted to be fastened to the surface of a wall, ceiling, or other support, of a clamping-plate I, seated in a depression or cavity in the face of the block next the surface to which it is secured and within the rim of said block, a passage connecting said cavity with the outer rim and adapted to receive a fuse wire clamped beneath said plate, a screw passing through said plate from the outer surface thereof for the purpose of holding said plate down and at the same time clamping the fuse-wire, and a second screw A^1, tapped into said plate for the purpose of making electrical connection with a branch or other conductor.

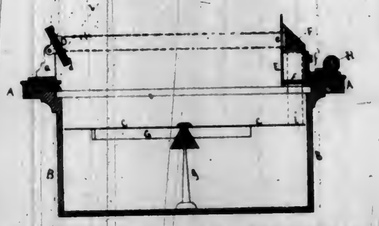
6. In an electric-wiring fixture, the combination, substantially as described, with the block or plate of insulating material D, adapted to be secured to the surface of a ceiling, wall, or other support, of a line-wire clamp consisting of two plates F F', mounted in a cavity or recess on the inside of said block and provided with a fastening or clamping screw passing through from the outer surface, a line-wire held between said plates, and a fuse-wire clamp beneath the lower plate F', as and for the purpose described.

7. The combination, in an electric-wiring fixture, of a combined conductor and fuse-clamp consisting of the two plates F F', mounted in a cavity or depression on one surface of the block or plate of insulating material, the clamping-plate F being mounted or supported at one end free from the surface of the opposite plate, and a fastening and clamping screw passing through said plates from the opposite surface or face of the insulating-block, and a rest or support for the fuse-wire beneath the lower of the two plates.

8. In a ceiling-rosette cut-out, a block or plate of insulating material adapted to be secured to the surface of a wall or ceiling, a line-wire clamp mounted on the face next the surface to which the said block is secured, and a fastening-screw passing through the block of insulating material from the outer surface and serving the combined purpose of holding the brasswork of the clamping devices in place and of operating the clamping-plate or metal piece which fastens the wire.

9. In a branch or rosette cut-out or similar electric-wiring device, the combination, substantially as described, with a block or plate of insulating material, such as porcelain, of clamping metal-work mounted in a depression or cavity in the face of said block next the surface to which the said block is secured and a fastening-screw passing through said block from the outer or lower surface thereof and performing the three functions of holding the metal-work, clamping the conductor-wire, and fastening the fuse.

10. In a ceiling-rosette cut-out, the combination, substantially as described, of a block of insulating material, such as porcelain, adapted to be fastened directly to a supporting-surface, a fuse-holding metal-work mounted in the side of said block next the surface to which it is fastened, and an operating-screw passing through the block from the under or outer side into said metal-work and serving the double purpose of holding the metal-work and clamping the fuse-wire.

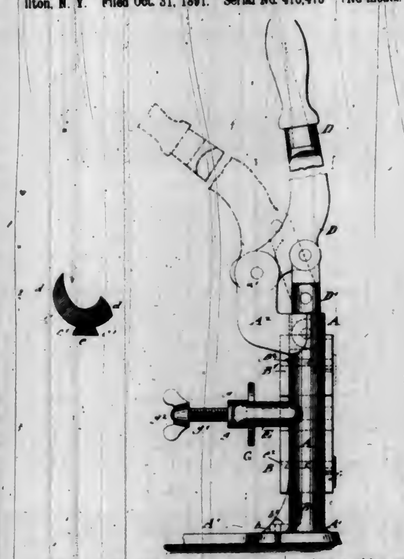


11. In an electric wiring fixture, the combination, substantially as described, with a block D of insulating material, of a pair of clamp-plates F, mounted in a depression on the inner side of said block and at the edge thereof, and a fastening-screw passing through the block of insulating material from the outer surface thereof and tapped into the upper one of said clamp-plates, the said latter plate being supported at one end free from the surface of the opposite clamp-plate, as and for the purpose described.

12. The combination, substantially as described, in an electric-wiring fixture, of a block of insulating material B, a pair of clamp-plates mounted in a depression or cavity on one surface thereof, a clamp-screw passing through the block from the opposite side or surface, and a shoulder or offset *d*, forming a rest for one end of the plate, into which said fastening-screw is tapped, as and for the purpose described.

13. In a ceiling-rosette cut-out, the combination, substantially as described, with a block or plate of insulating material adapted to be secured directly to the surface of a ceiling or wall and having its clamping metal-work mounted in depressions or cavities in the side of said plate next the surface to which it is secured, of a fuse-wire way exposed for inspection and renewal of the fuses at the edge of the block or plate, and clamping-screws passing through said block from the outer surface into the metal-work against which said fuse is fastened.

14. A ceiling or rosette cut-out comprising, in combination, the following parts: a block of insulating material D, having suitable cavities or depressions in the face or side thereof opposite the surface to which said rosette is secured, two pairs of clamp-plates F F', and corresponding fastening-screws passing through the block from the outer surface, clamp-plates I, clamp-screws A, passing through the block from the outer surface thereof and tapped into said plates, and clamp-screws A^2, tapped into the plates I from the inside of the block, and fuse-wire ways or passages accessible from the edge of the block for the renewal of fuses without detaching the insulating-block, as and for the purpose described.

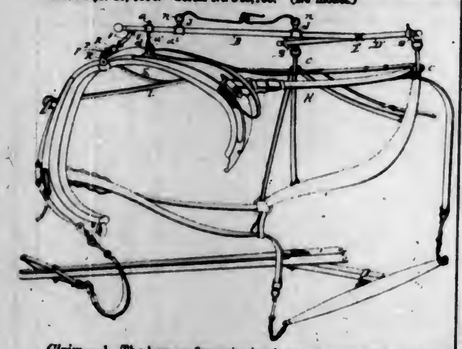


481,625. AZIMUTH-CIRCLE. EDWARD S. RITCHIE, Newton, Mass. Filed Oct. 8, 1891. Serial No. 408,188. (No model.)

Claim.—1. The combination, in an azimuth-circle, of the mirror D, the reflecting prism F, placed beyond the focus of the said mirror, and the cylindrical lens *f*, placed between the reflecting-prism and the compass-card, substantially as set forth.

2. The combination, in an azimuth circle, of the mirror D, the reflecting-prism F, and the case E, having the slit *e* between the said mirror and prism for the passage of solar rays to the compass-card.

481,626. CAPPING-MACHINE. JACOB F. WITTEMANN, Fort Hamilton, N. Y. Filed Oct. 31, 1891. Serial No. 410,478. (No model.)



Claim.—1. The combination, in a bottle-capping machine, with a lower stationary block and an upper slide-block, both having dovetailed recesses and overhanging stops or abutments at the rear ends of said recesses, of elastic compressing-jaws having dovetailed shanks inserted into said recesses, said shanks being of less length than the jaws and beveled at their rear ends, and threaded pins having enlarged heads for retaining the jaws in the blocks, substantially as set forth.

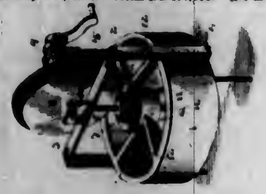
2. A compressing-jaw for a bottle-capping machine, formed of

elastic material and approximately of semicircular shape and provided with a dovetailed shank having an exterior sheet-metal reinforcing-sheath, substantially as set forth.

481,627. HANGER FOR SWINGING HARNESS. ROBERT G. ARMSTRONG, Wichita, Kans., assignor to R. G. Armstrong & Co., same place. Filed Apr. 16, 1890. Serial No. 348,163. (No model.)

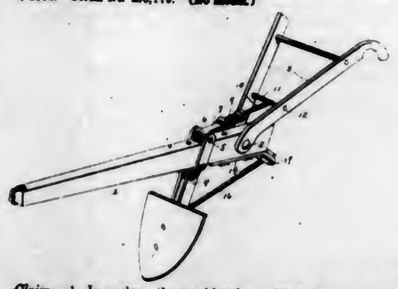
Claim.—1. The hanger for swinging harness, consisting of a longitudinal bar provided with adjustable rings or hooks for suspending it and with an adjustable depending hook for supporting the forward portion of the harness, two opposite laterally-extending arms or bars connecting with the longitudinal bar, and the two adjustable extending hooks arranged upon said lateral arms or bars, adapted to support the rear portion of the harness when the longitudinal bar is in a horizontal position and release the harness when said bar is tilted, substantially as specified.

2. The hanger for swinging harness, consisting of the combination of the bars D and D' D', the T-coupling E, the adjustable suspending-rings *n n*, the adjustable hooks *g g*, and the adjustable hook a^3, and clevis attachment V, V', R', and P, substantially as and for the purpose set forth.



481,628. BEDSTEAD-BRACE. JOHN GRIBBEN, Pittsburg, Pa. Filed Jan. 19, 1892. Serial No. 418,565. (No model.)

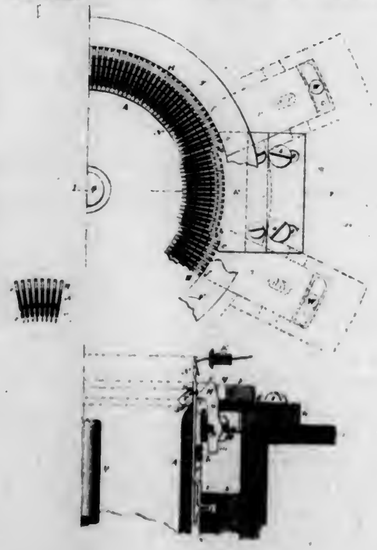
Claim.—1. In a bedstead-brace, the combination, with the corner-posts, of longitudinal tie-rods, each comprising two sections provided at their opposing ends, respectively, with right and left hand screw-threads and having their distal ends bent downwardly and forwardly, the latter portion being received by a recess in the posts, turnbuckles connecting the threaded ends of said sections, and keepers secured to the bed-posts and engaging the vertical portions of the tie-rod sections, substantially as and for the purpose set forth.



2. In a bedstead-brace, the combination, with the corner-posts, of the tie-rods, each comprising two sections screw-threaded at their opposing ends and bent at their distal ends, as shown, said ends entering recesses in the posts of the respective sides of the bedstead, the turnbuckles connecting the threaded ends of the tie-rod sections, the eyebolts connected with the tie-rods and passing through the posts, and the nuts disposed on the ends of said bolts, all arranged and adapted to operate substantially as and for the purpose set forth.

481,629. POTATO-CUTTER. FOUNTAIN JACKSON, Hawley's Store, N. C. Filed Sept. 30, 1891. Serial No. 407,235. (No model.)

Claim.—In a vegetable-cutter, the combination of a casing, a vertical shaft mounted therein, a conical knife-carrier mounted on the shaft and provided with blades, and the concavo-convex inclined partitions having curved edges arranged adjacent to the conical knife-carrier, substantially as described.



481,630. PLOW. OLE T. JESSEN, Weatherford, Tex. Filed Apr. 7, 1892. Serial No. 428,179. (No model.)

Claim.—1. In a plow, the combination, with the beam, the opposite pivoted handles at the rear ends of the same, and the bifurcated standard embracing the beam and secured thereto, a bolt passing through the bifurcations of the standards above the beam, of a shackle having a perforated head mounted on the bolt, and a rearwardly-disposed stem terminating in a tenon, a turnbuckle swiveled on the tenon, a T-shaped coupling having its transverse portions engaging perforations in the handles and its stem threaded and engaged by the rear end of the turnbuckle, substantially as specified.

2. A plow consisting of the plow-beam, the opposite pivoted and perforated handles, and the bifurcated standard embracing and extending above the beam, the perforated bent plate bolted to the under side of and extending in rear of the beam, the threaded rod passed through the perforation of the plate and having its front end pivotally bolted to the standard near the lower end of the latter, nuts located upon the rod above and below the plate, the bolt passed through the upper ends of the bifurcations above the beam, the shackle pivoted on the bolt, the plate surmounting the shackle, the turnbuckle swiveled on the shackle, and the T-shaped coupling having its transverse portions engaging perforations in the handles and having its threaded stem engaging the turnbuckle, substantially as specified.

481,631. STITCH-HOLDING MECHANISM FOR KNITTING-MACHINES. FRANK LASHER, Bennington, Vt., assignor to the Lasher Stocking Company, same place. Filed Aug 21, 1888. Serial No. 283,361. (No model.)

Claim.—1. An oscillating stitch-holder provided with a thin standing web over which the yarn as it reaches from needle to needle is stretched, standing upon a base thicker than said web, so as to have a projecting rib or guard on each side of the web as a provision for fending off the needles from contact with the sides of the web and also provided with a hook or notch on or in the upper edge of said web, and an open notch in one edge of the body of the same for the reception of the fulcrum-pivot, in combination with a stationary fulcrum-pivot and means, substantially as shown, for holding said stitch-holder and pivot in proper working engagement, substantially as and for the purposes specified.

2. The combination, with a rotary knitting-needle cylinder having a series of longitudinal slots or ways, of a series of needles working in said ways, a fulcrum-ring surrounding said cylinder, a series of stitch-holders of substantially the form described provided with open pivot-notches and pivoted so as to oscillate upon said fulcrum-ring and in radial planes between the needles, said stitch-holders having provisions, substantially as shown, for engaging the last-formed range of stitches and sinking them inwardly during the process of introducing a new feed-thread, and cams for actuating them arranged to operate substantially in the manner described, and for the purposes set forth.

3. In combination with a needle-cylinder, of a series of needles arranged to work in longitudinal grooves upon said cylinder, a series of fulcrum-pivots surrounding said cylinder, a series of stitch-holders having open pivot-notches to oscillate upon said fulcrum-pivots between said needles, and a pair of cam-plates arranged one above and the other below the pivot of oscillation for imparting to said stitch-holders their proper oscillating movements by impact therewith during the revolution of the needle-cylinder, substantially in the manner described, and for the purposes set forth

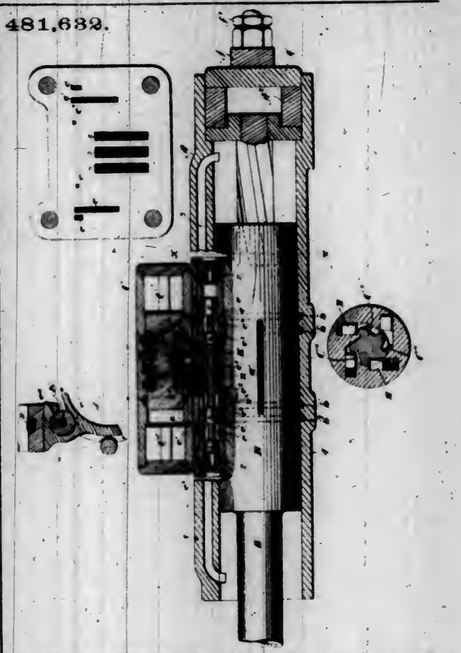
4. The combination, substantially as shown, of the needle-cylinder, needles, stitch-holders, concentric fulcrum-pivot ring slotted for the stitch-holders, and the spring-band for retaining the stitch-holders in place, substantially as specified.

5. The combination of the needle-cylinder, needles, and a series of stitch-supporters openly notched on one edge for a fulcrum-bearing and having the described notch or gap to engage the last row of completed stitches and sink the same between the needles pivoted side by side along or upon a fulcrum-bearing, with two cam-faces arranged one above and one below the plane of oscillation and adapted by their construction and connection with said stitch-supporters to impart to the same an oscillatory motion between the needles, substantially as described, and for the purposes set forth.

6. The oscillating stitch-holder provided with the described open fulcrum-notch, in combination with the fulcrum-ring, slotted pivot-band, and retaining-spring band as a means for permitting individual insertion and removal of stitch-holders without disturbing the fulcrum-ring or other pivot which may be provided instead or the adjacent stitch-holders, substantially as specified.

481,632. STEAM-ACTUATED ROCK-DRILL. SETH LLOYD and WILLIAM R. LLOYD, West New Brighton, N. Y. Filed Dec. 9, 1890. Serial No. 374,074. (No model.)

Claim.—1. In a variable-stroke drill or analogous machine that requires a variable stroke of piston, the combination, with a cylinder, piston, and main valve, of an auxiliary valve constructed and adapted to be operated by the piston at its shortest stroke, substantially as set forth.



2. In a variable-stroke drill or analogous machine that requires a variable stroke of piston, the combination, with a cylinder, piston, and a main valve adapted to move quickly, of an auxiliary valve adapted to be operated by the piston at its shortest stroke and to operate the main valve after consuming in its stroke the time required for the piston to complete its full stroke, substantially as set forth.

3. In a variable-stroke drill or analogous machine in which a variable stroke is required, the combination, with a cylinder, piston, and a main valve, of an auxiliary valve adapted to be operated by the piston at its shortest stroke and supplied with ports connecting it with the main steam-chest and with the interior of the cylinder, one or more of said ports being restricted, substantially as set forth.

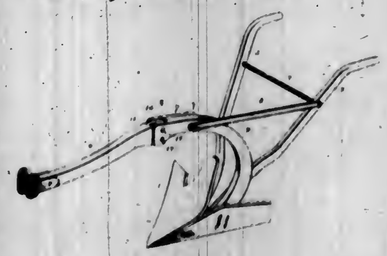
4. In a rock-drill or analogous machine, the combination, with a cylinder having an annular groove adapted to connect with the valve and another groove connecting with the exhaust, of a piston having a longitudinal groove which serves to establish communication between the grooves in the cylinder for the purpose of exhausting the valve, substantially as set forth.

5. In a rock-drill, the combination, with a cylinder having annular grooves therein, two of said grooves being in communication with the main exhaust, of a main valve and an auxiliary valve, said auxiliary valve communicating with other grooves in the cylinder, the piston being provided with a slot adapted to connect the exhaust-grooves

481,632.

with the grooves communicating with the auxiliary valve, substantially as set forth.

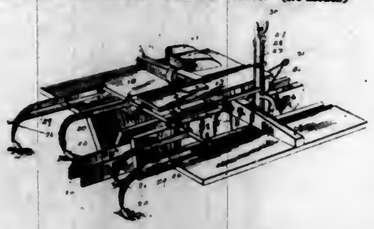
6. In a variable-stroke rock-drill or analogous machine requiring a variable stroke or piston, the combination, with a cylinder, piston, and main valve constructed to move quickly, of an auxiliary valve adapted to be operated by the piston at its shortest stroke and having its stroke lengthened to admit of close regulation, substantially as set forth.



7. In a rock-drill or analogous machine, the combination of a cylinder, piston, and main valve with an auxiliary valve, the exhaust-port of said auxiliary valve being restricted, as and for the purpose described.

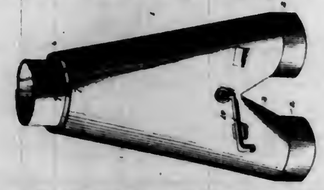
8. In a rock-drill or analogous machine, the combination of a cylinder, piston, and main valve with an auxiliary valve, the inlet-port of said auxiliary valve being restricted, as and for the purpose described.

9. In a variable-stroke rock-drill or analogous machine that requires a variable stroke of piston, the combination, with a cylinder, piston, and a main valve constructed to move very quickly, of an auxiliary valve adapted to be operated by the piston at the shortest stroke and having inlet-ports connecting it with the main valve chest to supply it with steam, substantially as set forth.



10. In a variable-stroke drill or analogous machine requiring a variable-stroke piston, the combination, with a cylinder, piston, and a main valve constructed to move quickly, of an auxiliary valve adapted to be operated by the piston at its shortest stroke and having exhaust ports placing it in communication with the piston, substantially as set forth.

481,633. PLOW. JOHN F. B. LORENTSEN, Hector, Minn. Filed Feb. 24, 1892. Serial No. 422,662. (No model.)



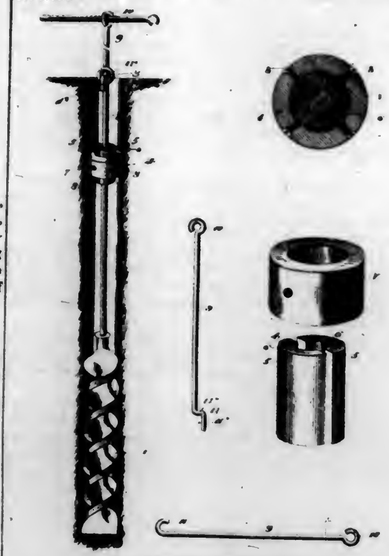
Claim.—The beam terminating at its rear end in a goose-neck standard, the adjacent ends of the standard and beam being widened and the latter bifurcated to receive the former, a pivot-pin connecting the adjacent ends near their upper edges, and a wooden brake-pin connecting the same near their lower edges, substantially as specified.

481,684. HARROW FOR LISTED CORN. ROBERT LYONS, Peiro, Iowa. Filed Mar. 15, 1892. Serial No. 424,993. (No model.)

Claim.—In a combined harrow and cultivator, the combination, with the harrow-section, of the transverse rock-shaft journaled thereon, means for oscillating the rock-shaft, cultivator-bars extending rearwardly from and secured rigidly upon the rock-shaft and terminating in downwardly-disposed shovel-carrying standards, and the clearance rods or bars extending rearwardly from the harrow at the sides of the standards, substantially as specified.

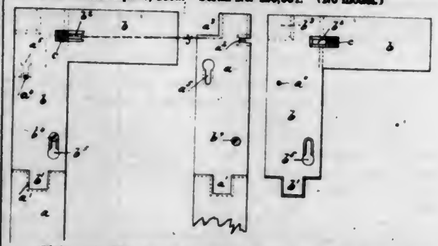
481,685. RAIN-WATER CUT-OFF. WILLIAM C. MAXFIELD, Columbus, Ohio, assignor of one-half to John W. Champion, same place. Filed May 14, 1892. Serial No. 432,993. (No model.)

Claim.—1. The combination, with the conical cut-off chamber terminating at its lower end in the discharge-openings and provided intermediate the same with the inverted-V-shaped partition forming flared mouths for the discharge-openings, the internal ring at the upper end of the cut-off chamber having diametrically-opposite slots and a depending collar, of the cut-off pipe mounted for reciprocation and vibration within the chamber and embracing the collar, pins projecting upward therefrom and through the slots, and means for vibrating the pipe and reciprocating the same at the end of its vibrations into the upper flared ends of the discharge-openings, substantially as specified.



2. The combination, with the conical cut-off chamber terminating at its lower end in the opposite discharges and provided at its upper end with the internal collar extending into the chamber and with the annular ring for supporting the collar, which ring is provided at diametrically-opposite sides of the collar with slots, of the cut-off pipe having its upper end loosely encircling the collar, pins extending from said upper end and passing loosely through the slots of the ring, the crank-shaft journaled in the wall of the chamber, stops located upon the exterior of the chamber at diametrically-opposite sides of the shaft, and an arm rigidly mounted on the inner end of the shaft and pivotally connected to the lower end of the cut-off pipe, substantially as specified.

3. The combination, with the conical cut-off chamber terminating at its lower end in the opposite discharges and provided at its upper end with the internal collar extending into the chamber and with the annular ring for supporting the collar, which ring is provided at diametrically-opposite sides of the collar with slots, of the cut-off pipe having its upper end loosely encircling the collar, pins extending from said upper end and passing loosely through the slots of the ring, the crank-shaft journaled in the wall of the chamber, and an arm rigidly mounted on the inner end of the shaft and pivotally connected to the lower end of the cut-off pipe, substantially as specified.



481,686. WELL-BORING APPARATUS. DANIEL L. MONROE, Bloomfield, Iowa. Filed June 24, 1891. Serial No. 397,334. (No model.)

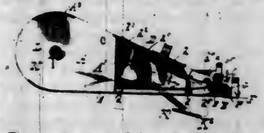
Claim.—1. The combination, with an auger, of the elongated semi-cylindrical boxes having longitudinally-grooved meeting faces fitted upon the stem of the auger and entirely inclosing the clamped portion of the same and a band fitted around the said boxes and provided with radially-set screws bearing against the latter, substantially as and for the purpose set forth.

2. In a boring apparatus, the main auger-stem provided at one end with an eye and the extension stem or stems provided with outwardly or offstanding hooks adapted to detachably engage said eyes, said hooks comprising a right-angled portion at right angles to the stem and passing through said eyes, and a straight end portion projecting beyond the eyes and in line with both stems, substantially as set forth.

481,687. SEPARABLE SQUARE. FREDRICK F. POOLE, Newark, N. J. Filed Apr. 6, 1892. Serial No. 428,061. (No model.)

Claim.—1. The herein-described square, one of the arms *a* being provided with a recess a' at or near its center and also provided with a square or rectangular recess a^2, the other arm *b* with projections b' and b^2, adapted to fit in said recesses a' and a^2 of arm *a*, slots a^3 and b^3 arranged parallel to each other in arms *a* and *b*, respectively, pins b^4 and a^4, secured to said arms and adapted to fit and slide in their respective slots, and a locking mechanism arranged at right angles to said slots, substantially as described, and for the purposes set forth.

2. The herein-described square, one of the arms *a* being provided with a series of locking-pins *e* and at its outer edge with a series of recesses *g*, the other arm *b* with recesses *d* and pins *f*, said recesses and pins being adapted to mesh with the pins and recesses of arm *a*, elongated slots a^3 and b^3, arranged parallel to each other in the arms *a* and *b*, respectively, pins b^4 and a^4, secured to said arms and adapted to fit and slide in their respective slots, and a locking mechanism arranged at right angles to said slots, substantially as specified.



481,688. SHOE-FASTENING. HERBERT S. PULLMAN, Meriden, Conn. Filed Oct. 15, 1890. Serial No. 368,225. (No model.)

Claim.—In a spring clasp or buckle, the combination of a book-shaped tongue or lever, a base of two thicknesses of metal lying contiguous, the lower plate of said base having an opening for the lever, pintle-bearings, and the solid integral bar *e*, struck up to rest in a plane with the top plate and forward of the pintle-bearings and the top plate of said base terminating at its front edge approximately at the rear edge of the bar of the lower plate, all as described and shown, and for the purpose set forth.

481,688.

481,689. ADDRESSING-MACHINE. FRANK D. RETTICH, Cincinnati, Ohio, assignor to the Mather Manufacturing Company, Philadelphia, Pa. Filed June 20, 1891. Serial No. 396,912. (No model.)

Claim.—1. The combination of the outer case, the strip carrying roll mounted therein, the stationary cutter and pivoted cutter at the opposite end of the case, the lever H, pivoted upon the axis of the paper-roll and connected to the pivoted cutter, the lever-arm K, having one arm extending below the case, the link *k*, connecting the opposite arm to the lever H, the pivoted arm K′, pivoted to the case opposite K, the foot K^2, secured to the lever K and arm K′ to bring the knives in cutting contact when the case is brought down upon the article to be addressed, a spring to return the pivoted knife to its upper position when the machine is lifted, and means, such as shown, for feeding the paper strip to the cutters, substantially as shown and described.

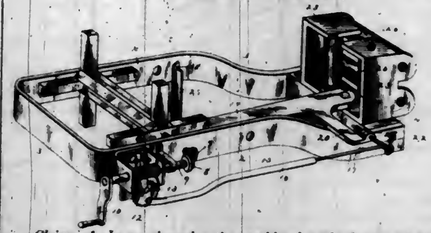
2. In an addressing machine, the combination of the case having transverse partition A^1, the paste-roll B, and pressure-roll C, fitted in the front end thereof, the paste-box having its discharge-opening closed by the upper rear half of the paste-roll and held up against said roll by the transverse partition, the strip-roll, the shearing-cutters, and means, such as shown, to feed the paper strip forward and for operating the shearing-cutter, substantially as shown and described.

3. The combination, in an addressing-machine, of the case, the strip-guides, the strip-roll L, mounted in the rear of the case and longitudinally slotted, the spring-latch M, having one end secured in the slot at one end of the roll and the opposite end bent to pass through the rod, said latch being held normally within the slot by spring-pressure, substantially as shown and described.

4. The hereinbefore-described addressing-machine, consisting of the case, the slotted roll L, fitted therein, the spring-catch M, the paste-box D, having sliding cover d^6, the paste-roll B, the pressure-roll C, the guides d' and G, the cutters F F′, the levers H K, link *k*, arm K′, and foot K^2 for operating the cutter F′, the upright H′, the spring A^3, to return the cutter after an address is severed, and the wheel *b′* on the extended end of the shaft-roll B, and the inclined plate E, having rib *e*, combined and arranged substantially as and for the purpose hereinbefore set forth.

481,640. BARREL-STAND. CHARLES RETTIG, Philadelphia, Pa. Filed May 25, 1892. Serial No. 434,367. (No model.)

Claim.—1. A barrel-stand comprising four beds adjustably held together by tie-rods and sleeve-nuts, said beds having inclined ways and carrying adjustable bases, and saddles held to said bases by ball-joints, whereof the respective members interlock with each other, substantially as and for the purposes set forth.



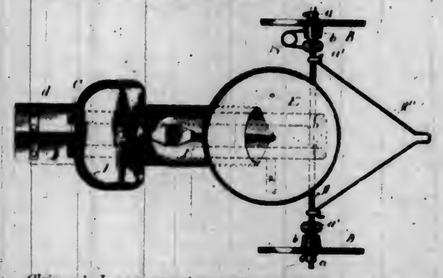
2. A barrel-stand comprising four beds adjustably held together by tie-rods, said beds having inclined ways and carrying adjustable bases and saddles, said saddles attached to said bases by ball-joints, substantially as and for the purposes set forth.

3. In a barrel-stand, sets of beds having inclined ways, bases adjustably attached to said ways and having the ball members of a ball-joint, saddles having the concave members of a ball-joint and fitting over the bases, said beds adjustably held together by tie-rods and mounted on a supporting-surface, and rollers located between said beds and said surface, substantially as and for the purposes set forth.

4. A barrel-stand comprising a set of beds held together by tie-rods, said beds having inclined ways for adjustably supporting bases and saddles with reference to the floor-line, substantially as and for the purposes set forth.

5. A barrel-stand comprising a set of beds held together by tie-rods, said beds having inclined ways and supporting bases and saddles, the latter connected by interlocking ball-and-socket joints, the bases having the cut-away ball portions of such joints and the saddles having the partially-contracted cup-shaped portions of such joints, substantially as and for the purposes set forth.

481,641. REEL-CARRIER. JOHN F. SCHNEIDER, Livingston, Wis. Filed Apr. 11, 1892. Serial No. 428,694. (No model.)



Claim.—1. In a reel-carrier, the combination of a frame, a spool-shaft journaled therein and adapted to carry a spool and provided at one end with a pinion, a counter-shaft journaled on the frame and having a pinion meshing with the pinion of the spool-shaft and provided with a worm, a cog-wheel arranged to mesh with the worm, an oscillating guide adapted to deliver wire equally to a spool, and a pitman connected to the cog-wheel and with the guide and oscillating the same, substantially as described.

2. In a reel-carrier, the combination of a frame, a spool-shaft journaled therein, an L-shaped guide pivoted to the frame and having one of its arms arranged in front of the shaft and provided with a vertical wire-holder, its other arm extending transversely of the frame and provided with a threaded opening, an adjusting-screw engaging the opening, and a pitman connected with the adjusting-screw, substantially as described.

3. In a reel-carrier, the combination of a frame, a spool-shaft journaled therein, an L-shaped guide pivoted to the frame and having one of its arms provided with a wire-holder and arranged in front of the shaft, an adjusting-screw mounted on the other arm, and a pitman connected to the screw and composed of adjustable sections, substantially as described.

4. In a reel-carrier, the combination of a frame, a spool-shaft journaled therein, a stationary guide mounted at the front end of the shaft and comprising a casing, vertical rolls journaled therein and arranged at the sides thereof and horizontal rolls arranged at the top and bottom of the casing, and the L-shaped oscillating guide having one arm provided with a wire-holder arranged in front of the shaft and having its other arm connected with suitable motive power, substantially as described.

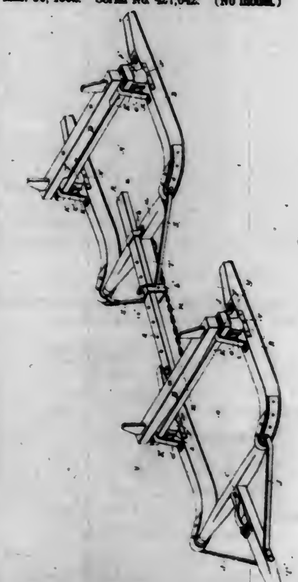
481,642. POTATO-PLANTER. SILAS C. SCHOFIELD, Freeport, Ill. Filed Oct. 26, 1891. Serial No. 409,788. (No model.)

Claim.—1. In a potato-planter, the combination, with a main frame, a hopper mounted thereon, and a suitable support for the rear

end thereof, of an axle and suitable wheels and a vertically-adjustable swivel connecting the front of the frame with the axle, substantially as shown and described.

2. The combination, with the frame C, of the shoe D, supporting the rear end thereof, the axle A and wheels B B, the collar A', fastened upon the center of the axle, the vertical pin P, supported by the collar and swiveled in the front end of the frame, and the collar *p*, vertically adjustable upon the pin P and regulating the distance of the front end of the frame above the axle, substantially as shown and described.

3. The combination, with the frame C, the axle A, the wheels B, and the vertically-adjustable swivel connecting the front of the frame with the axle, of the shoe D, lying under the rear end of the frame, and the braces D', fastened at their lower ends to the shoe and formed at their upper ends with a series of bolt-holes, whereby they may be adjustably fastened to the frame, the frame thus being rendered vertically adjustable with reference to the shoe and the axle, substantially as shown and described.



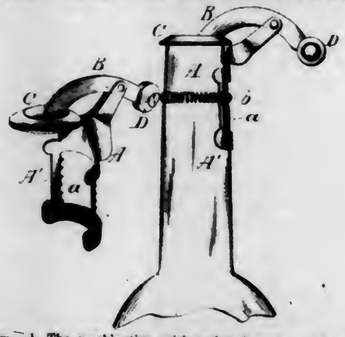
4. The combination, with the frame and its supports, of the hopper E, supported upon the frame, the feeding-spout F, opening from the lower end of the hopper, the feeding-tube G, extending downward from a suitable opening in the feeding-spout, and the valve V, adapted to close said opening in the feeding-spout when desired, substantially as shown and described.

5. The combination, with the frame and its supports, of the hopper, the feeding-spout opening therefrom, the planting-tube opening from the feeding-spout, the valve V, adapted to cover the opening from the feeding-spout to the planting-tube, and the adjustable seat I, mounted upon the frame, substantially as shown and described.

6. The combination, with the frame, the hopper, the feeding-spout, and the planting-tube, of the braces *e*, connecting the hopper with the frame and provided at their lower ends with the lateral extensions *e'*, and the adjustable seat I, mounted upon the frame, substantially as shown and described.

7. The combination, with the frame and the planting devices supported thereby, of the axle supporting the front of the frame, the wheels mounted upon and supporting the axles and provided with hubs formed with ridges *b*, the collars *a a'*, adjustably fastened on the axle and holding the wheels in place, and the spring S, having one of its ends clamped in one of the collars *a'*, while its free end presses upon the hub and is adapted to spring from one ridge *b* to another as the wheel turns and serve as an annunciator for indicating the progress of the planter, substantially as shown and described.

481,648. BOB-SLED. SAMUEL F. SPARR, Bozeman, Mont. Filed Mar. 30, 1892. Serial No. 427,042. (No model.)



Claim.—1. The combination, with bob sleds, of a reach-bar pivotally secured to the front sled and adjustably connected with the rear sled, said rear sled having a short tongue projecting forwardly therefrom, a chain pivotally connected with the rear sled and removably and adjustably attached to the front sled, and braces pivotally attached to the runners of the rear sled and secured at their forward ends to said tongue of the rear sled, the said tongue of the rear sled being carried by a front cross-beam which is pivotally connected, substantially as described.

2. The combination of a front bob-sled having a pivoted bolster, a reach-bar pivotally connected to said bolster, a rear bob-sled having a tongue connected to a pivoted cross-bar and having loops or sleeves secured thereto, braces movably connected with the front portions of the runners of said rear bob-sled and to said tongue, said reach-bar being adapted to be adjustably mounted in said loops or sleeves, a chain pivotally connected to the rear bob-sled and removably engaging an eye secured to the front bob-sled, substantially as described.

3. The combination of a bob-sled having a transverse bed-beam or bunk supported by hollow metallic knees on the runners, said knees being formed with upper securing-flanges and a lower grooved curved side, a wooden plug in each of said knees of tapered form and having lateral projections to bear on parts of said knees and an upper extension which is fitted into and secured to said transverse bed-beam or bunk, and metal straps secured at their ends to the runners and extended over the said bed-beam or bunk, substantially as described.

4. A knee for joining the runner of a bob sled to a transverse bed-beam or bunk, consisting of a socket having separated arms projecting upwardly therefrom formed with angular flanges at the upper ends thereof, and shoulders on opposite sides at the lower termination of said arms, together with recesses in said sides, and a groove in the lower end thereof to bear on the runner, and a wooden plug constructed with an upper tenon which is inserted in said bed-beam or bunk, as set forth, and the lower end thereof fitted in said socket, substantially as described.

481,644. AUTOMATIC BOTTLE STOPPER AND COVER. CHARLES WEHRDEL, Louisville, Ky., assignor of one-half to F. A. Inder Stroth, same place. Filed Mar. 21, 1892. Serial No. 426,780. (No model.)

Claim.—1. The combination, with a plate bent to conform substantially to the shape of a bottle-neck, said plate provided with notches, and a band adapted to surround a bottle-neck and rest in notches of the plate for retaining the plate in position, of an arm pivotally supported at the upper end of the plate and provided at the inner end with a cap for closing the bottle-mouth, the outer end of the arm adapted to act as a counter-balance for the cap and opposite end of the arm, substantially as set forth.

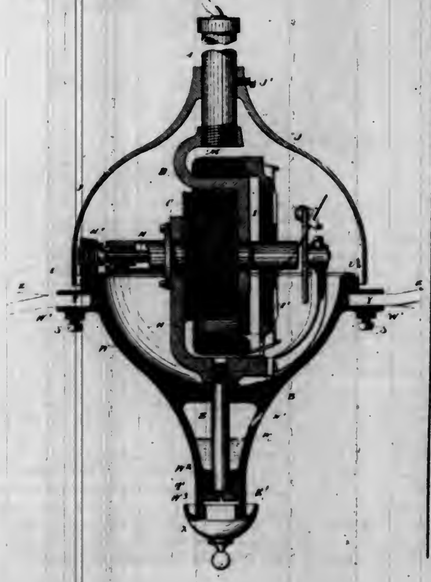
2. The combination, with a plate bent to conform to the general shape of a bottle-neck and having a central slot the edges of which are notched, and a band adapted to surround the bottle-neck and rest in notches of the plate, of an arm pivoted on the plate and provided at one end with a cap and at the other with a weight, substantially as set forth.

3. The combination, with a bracket bent in the form shown and provided with a series of teeth, of a curved arm pivotally connected to said bracket, a cover or stopper lined with cork and attached to one end of said arm and a weight connected to its opposite end, and a coil spring or rubber band which engages the teeth in the bracket and holds the parts against displacement on the bottle, substantially as set forth.

481,645. POTATO-DIGGER. PETER J. WIBORG, Boston, Mass. Filed May 15, 1891. Serial No. 392,823. (No model.)

Claim.—1. The combination, in a potato-digger, of a rising and falling main frame mounted on wheels and having an endless apron, a scoop pivotally connected at its upper end with the main frame and adapted to swinging laterally in a horizontal plane, a lever mechanism for horizontally swinging the scoop, and an independent lever mechanism acting on the surface traversed to bodily raise the main frame and thereby elevate the scoop which is pivotally connected therewith, substantially as described.

2. The combination, in a potato-digger, of a main frame mounted on wheels and having an endless apron, a scoop pivoted to the forward end of the main frame and adapted to swing laterally in a horizontal plane, steering mechanism connected with the scoop for swinging the latter horizontally, and a lever mechanism for raising and lowering the main frame and attached scoop, substantially as described.



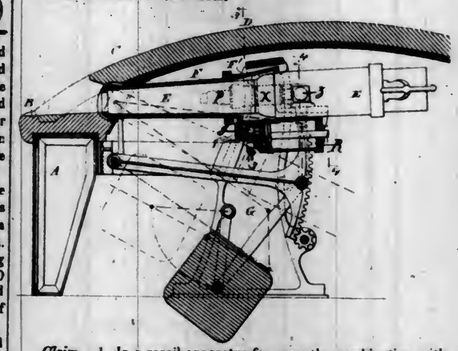
3. The combination, in a potato-digger, of a main frame mounted on wheels and having an endless apron, a scoop pivoted to the forward end of the main frame, adapted to swing laterally in a horizontal plane and provided with a draw-bar, a carriage traveling on the ground and having a spindle journaled in the draw-bar and provided with a lever for adjusting the carriage and causing the scoop to turn laterally on the main frame, and a lever mechanism for raising and lowering the main frame and attached scoop, substantially as described.

4. In a potato-digger, a frame A A and rollers journaled in the same, combined with an endless apron E, having alternate lateral rows of hooks *e e'*, the length of the hooks in one row being different from the ones in front and rear, substantially as and for the purpose set forth.

5. In a potato-digger, a frame A A, mounted on wheels and having a scoop pivoted to its forward end, combined with a treadle-lever O O', pivoted to the forward end of the frame, a roller or wheel on said lever, and a connecting device between said lever and the draw-bar of the scoop, substantially as and for the purpose set forth.

6. The combination, in a potato-digger, of a main frame mounted on wheels and having an endless apron, a scoop pivoted to the forward end of the main frame and adapted to swing laterally in a horizontal plane, a draw-bar connected with the scoop, a carriage having a spindle journaled in the draw-bar and provided with a lever, and a treadle mechanism adapted to act upon the surface traversed for lifting the scoop and main frame, substantially as described.

481,646. ELECTRIC FAN. FRANKLIN H. BEERS, Newark, assignor to himself, Wm. M. Tallman, Plainfield, N. J., and Erastus Hayes and Al. R. Brandly, New York, N. Y. Filed Feb 26, 1892. Serial No. 422,875. (No model.)

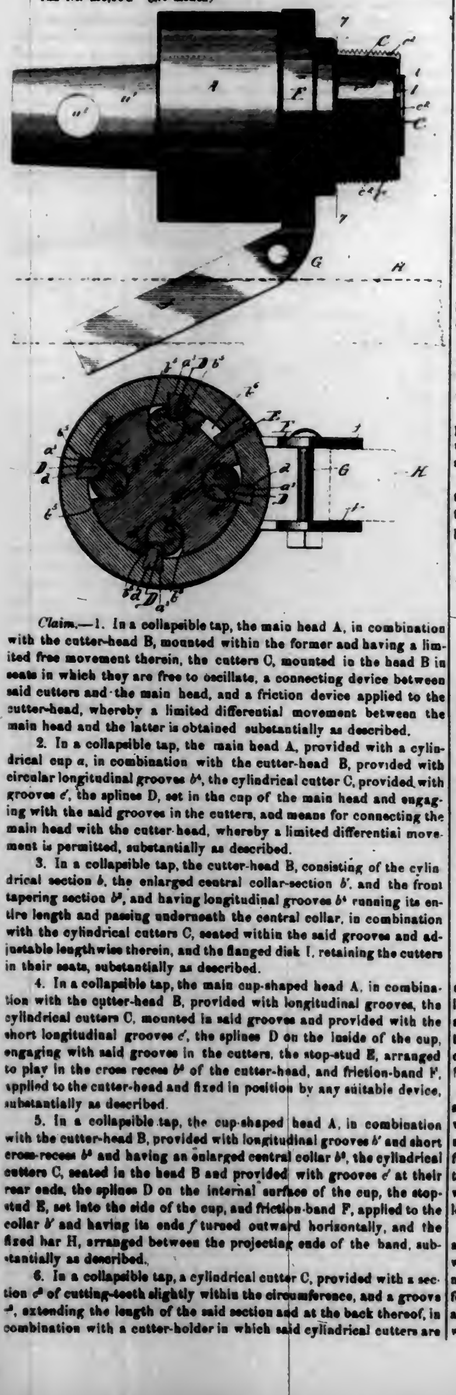


Claim.—1. An electric fan having the fan-blades attached to a revolving shell encompassing the driving-motor, as herein specified.

2. An electric fan having the fan-blades attached to a revolving shell encompassing the driving-motor, in combination with such motor and with bevel friction-gear for communicating motion therefrom to such shell, and with a movable cover, all arranged to serve substantially as herein specified.

3. The fan-driving mechanism comprising a motor having a rapidly-revolving armature and shaft, a conical friction-pulley carried thereby, a shell capable of revolving and carrying the fans turning on a central fixed rod, and provisions for storing and supplying oil to the supporting-bearing, all arranged for joint operation, as herein specified.

481,647. APPARATUS FOR MODERATING THE RECOIL OF GUNS. LÉON DÉMOTEL, Paris, France, assignor to the Compagnie Anonyme des Forges de Chatillon et Commentry, same place. Filed Oct. 15, 1890. Serial No. 368,247. (No model.)



Claim.—1. In a recoil apparatus for guns, the combination, with a shoe for engaging a trunnion of the gun and movable therewith, of a recoil-cylinder, a piston therefor having a piston-rod, and a connection between said rod and said shoe, consisting of a head on the one, a recess adapted to receive said head on the other, and a removable key for locking said head in said recess adapted to be removed by a lever, whereby the gun can be separated from the recoil-cylinder by removing said key, and thereby its ready replacement is permitted.

2. In a recoil apparatus for guns, the combination, with the gun, of the shield F', recoil-cylinders X X, arranged at the respective sides of the gun, formed integrally with said shield, pistons P P, arranged in said cylinders and having rearwardly-extending piston-rods Q Q, connected, respectively, to the trunnions of the gun, a third cylinder R, arranged beneath the gun and formed integrally with said shield, conduits communicating between said recoil-cylinders and said third cylinder, a piston within the latter, a liquid medium contained in said recoil-cylinders and adapted when the pistons thereof are moved under the recoil of the gun to be forced through said conduits into said third cylinder, and thereby to move the piston of the latter, and a resisting-spring acting to resist the movement of the piston in said third cylinder, whereby when the gun recoils its recoil is transmitted through said liquid medium to said spring and is taken up by the latter, and on the termination of its recoil under the reaction of said spring the gun is restored to position, said parts constructed substantially as and for the purpose set forth.

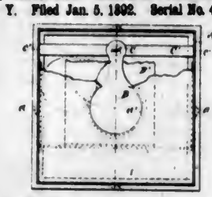
3. In a recoil apparatus for guns, the combination of two recoil-cylinders arranged at the respective sides of the gun in front of its trunnions and parallel with its longitudinal axis, pistons arranged in said cylinders and having rearwardly-extending piston-rods connected at their rear ends to the gun and movable parallel with its axis and in a plane coincident with the axis of its trunnions, a third cylinder, conduits communicating between said cylinders, a piston within the third cylinder, a liquid medium contained in said recoil-cylinders and adapted when the pistons thereof are moved under the recoil of the gun to be forced through said conduits into said third cylinder, and thereby to move the piston of the latter, a resisting-spring acting to resist the movement of the piston in said third cylinder, whereby when the gun recoils its recoil is transmitted through said liquid medium to said spring and is taken up by the latter, and on the termination of its recoil under the reaction of said spring the gun is restored to position, and a separable connection between said piston-rods and the gun, consisting of a head on the one, a recess on the other, and a removable key for locking said head in said recess, said connection constructed when disengaged to permit the dismounting of the gun by its direct rearward movement in direction coincident with its longitudinal axis, whereby other than axial movement is unnecessary to the separation

of the gun from its recoil apparatus, substantially as and for the purpose set forth.

481,648. COLLAPSIBLE TAP. WILLIAM W. DOOLITTLE, Chicago, Ill., assignor to the Crane Company, same place. Filed Feb. 9, 1892. Serial No. 420,904. (No model.)

Claim.—1. In a collapsible tap, the main head A, in combination with the cutter-head B, mounted within the former and having a limited free movement therein, the cutters C, mounted in the head B in seats in which they are free to oscillate, a connecting device between said cutters and the main head, and a friction device applied to the cutter-head, whereby a limited differential movement between the main head and the latter is obtained substantially as described.

2. In a collapsible tap, the main head A, provided with a cylindrical cup *a*, in combination with the cutter-head B, provided with circular longitudinal grooves b^4, the cylindrical cutter C, provided with grooves c', the splines D, set in the cup of the main head and engaging with the said grooves in the cutters, and means for connecting the main head with the cutter-head, whereby a limited differential movement is permitted, substantially as described.



3. In a collapsible tap, the cutter-head B, consisting of the cylindrical section *b*, the enlarged central collar-section b', and the front tapering section b^2, and having longitudinal grooves b^4 running its entire length and passing underneath the central collar, in combination with the cylindrical cutters C, seated within the said grooves and adjustable lengthwise therein, and the flanged disk I, retaining the cutters in their seats, substantially as described.

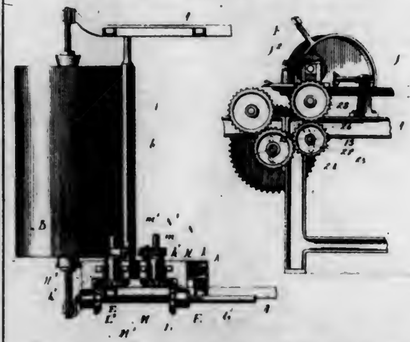
4. In a collapsible tap, the main cup-shaped head A, in combination with the cutter-head B, provided with longitudinal grooves, the cylindrical cutters C, mounted in said grooves and provided with the short longitudinal grooves c', the splines D on the inside of the cup, engaging with said grooves in the cutters, the stop-stud E, arranged to play in the cross recess b^3 of the cutter-head, and friction-band F, applied to the cutter-head and fixed in position by any suitable device, substantially as described.

5. In a collapsible tap, the cup-shaped head A, in combination with the cutter-head B, provided with longitudinal grooves b' and short cross-recess b^3 and having an enlarged central collar b^5, the cylindrical cutters C, seated in the head B and provided with grooves c' at their rear ends, the splines D on the internal surface of the cup, the stop-stud E, set into the side of the cup, and friction-band F, applied to the collar b' and having its ends *f* turned outward horizontally, and the fixed bar H, arranged between the projecting ends of the band, substantially as described.

6. In a collapsible tap, a cylindrical cutter C, provided with a section c^3 of cutting-teeth slightly within the circumference, and a groove c^4, extending the length of the said section and at the back thereof, in combination with a cutter-holder in which said cylindrical cutters are free to oscillate and mechanism whereby in the backward movement of the tap the cutters are oscillated backward out of working position, substantially as described.

481,649. INKSTAND. GEORGE H. FOSTER and PHILIP H. FARRELL, Brooklyn, N. Y. Filed Jan. 5, 1892. Serial No. 417,061. (No model.)

Claim.—1. The combination, with an ink-fount, of a top therefor provided with an opening, an automatically-operating closing-cover for said opening, and a movable finger rest or piece which may be operated in the act of passing a pen to the opening to effect the uncovering of the opening, substantially as specified.



2. In an inkstand, the combination, with a fount, of a tilting top having an opening through it and a closure operated by the movements of said top, substantially as specified.

3. In an inkstand, the combination, with a fount, of a tilting top plate provided with an opening and having trunnion-bearings in said fount and a laterally-movable closure operated by the movements of said top plate, substantially as specified.

4. In an inkstand, the combination, with a fount, of the tilting top plate having an opening, a closure for said opening, a cam on said closure, and a rock-bar having a bearing for said cam, substantially as specified.

5. In an inkstand, the combination, with the fount or body, of the metal frame secured in said fount or body, a tilting plate having trunnion-bearings in said frame, and a closure for an opening in the plate, operated by movements of said plate, substantially as specified.

481,650. PAPER-BAG MACHINE. ALBERT C. GETTER, Chicago, Ill. Filed Oct. 26, 1891. Serial No. 409,775. (No model.)

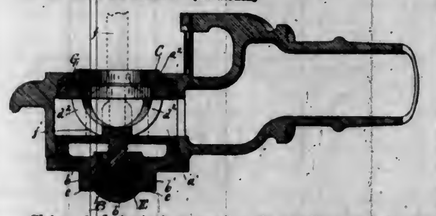
Claim.—1. In a paper-bag machine, the combination, with suitable mechanism for feeding the web of paper and severing it into lengths and with means for varying the relative speed of the feeding and severing mechanism, of adjustable punches or dies located in position to perforate the paper and adjustable shafts for said punches or dies, whereby the adjustment of the punches can be effected for different lengths of bags, substantially as described.

2. In a paper-bag machine, the combination, with suitable mechanism for feeding the web of paper and severing it into lengths and with means for varying the relative speed of the feeding and severing mechanism, of adjustable punches or dies located in position to perforate the paper adjacent to but entirely at one side of the line of the top edge of each bag, and adjustable shafts for said punches or dies, whereby the adjustment of the punches can be effected for different lengths of bags, substantially as described.

3. In a paper-bag machine, the combination, with suitable mechanism for feeding the web of paper and severing it into lengths and with means for varying the relative speed of the feeding and severing mechanism, of adjustable punches or dies located in position to perforate the paper, adjustable shafts for said punches or dies, and suitable gearing connecting said shafts with the striker or mechanism whereby the web of paper is severed, substantially as described.

4. In a paper-bag machine, the combination, with suitable mechanism for feeding the web of paper and severing it into lengths and with means for varying the relative speed of the feeding and severing mechanism, of punches or dies located at the front of the machine and in position to perforate the paper adjacent to the edge of the web and in advance of the folding mechanism or former, individual shafts for carrying said punches or dies, individual gear-wheels for said shafts, and suitable gearing connecting said shafts with the shaft of the striker or paper-severing mechanism, substantially as described.

5. In a paper-bag machine, the combination, with suitable mechanism for feeding the web of paper and severing it into lengths and with means for varying the relative speed of the feeding and severing mechanism, of adjustable punches or dies located in position to perforate the paper, adjustable shafts for said punches, a gear-wheel for each of said shafts, adjustable gear-wheels for engaging with the gear-wheels of the punch-carrying shafts, and suitable gearing for transmitting movement to said gear-wheel, substantially as described.



6. In a paper-bag machine, the combination, with suitable mechanism for feeding the web of paper and severing it into lengths and with means for varying the relative speed of the feeding and severing mechanism, of adjustable punches or dies located in position to perforate the paper, adjustable shafts for said punches, a gear-wheel for each of said shafts, adjustable gear-wheels for engaging with the gear-wheels of the punch-carrying shafts, a shaft whereon said adjustable gear-wheels are carried and upon which they are longitudinally adjustable, and suitable gearing for connecting said shaft with the shaft of the striker or paper-severing mechanism, substantially as described.

7. In a paper-bag machine, the combination, with suitable mechanism for feeding the web of paper and severing it into lengths and with means for varying the relative speed of the feeding and severing mechanism, of adjustable punches or dies for perforating the paper, shafts for said punches or dies, adjustable bearings for carrying said shafts, a suitable support or bracket for said adjustable bearings, and gear-wheels for driving said punch-carrying shafts, also connected to said adjustable bearings, substantially as described.

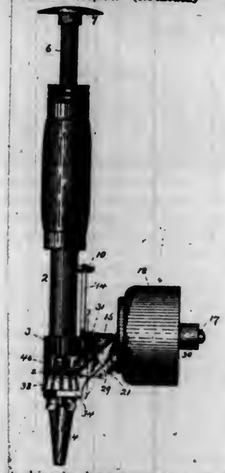
8. In a paper-bag machine, the combination, with suitable mechanism for feeding the web of paper and severing it into lengths and with means for varying the relative speed of the feeding and severing mechanism, of adjustable punches or dies for perforating the paper, holders to which said punches or dies are adjustably connected, shafts whereon said holders are adjustably mounted, suitable adjustable bearings for said shafts, and gearing for transmitting movement to said shafts, substantially as described.

9. In a paper-bag machine, the combination with suitable mechanism for feeding the web of paper and severing it into lengths and with means for varying the relative speed of the feeding and severing mechanism, of adjustable punches or dies located in position to perforate the paper adjacent to but entirely at one side of the line of the top edge of each bag, adjustable shafts for said punches or dies, gear-wheels connected to said shafts, adjustable gear-wheels for engaging with the gears upon said shafts, and a shaft extending outside the machine-frame and connecting with the striker-shaft, substantially as described.

481,651. COUPLING FOR AIR-BRAKES. JAMES T. HAYDEN, Chicago, Ill., assignor to the Crane Company, same place. Filed Mar. 31, 1892. Serial No. 427,197. (No model.)

Claim.—1. In brake-hose coupling, the coupling-case A, in combination with the coupling-cap B, the packing-ring C, and the packing-ring retainer D, provided with a threaded stem d', set in a threaded socket in the cap, whereby the retainer may be adjusted without moving the cap, substantially as described.

2. In brake-hose coupling, the coupling-case A, in combination with the packing-ring C, the cap B, provided with interior socket *b*, the internally-threaded bushing E, set in said socket, and the packing-ring retainer D, provided with threaded stem d', adapted to fit said bushing, substantially as described.



481,652. TROLLING-SPOON. HENRY LOFTIS, Syracuse, N. Y. Filed Dec. 12, 1891. Serial No. 414,831. (No model.)

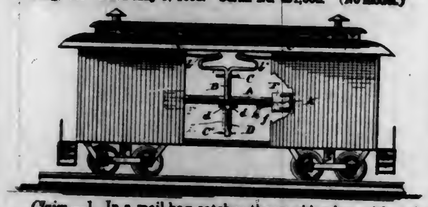
Claim.—1. The combination, with the shaft *a*, of a spring-clip mounted revolubly on said shaft and terminating with a tongue extending lengthwise of the shaft and free therefrom, the spoon hung on said clip, and a ferrule on the shaft, passing over the free end of the aforesaid tongue and confining the spoon on the clip, as set forth.

2. The combination, with the shaft *a*, of the sleeve *c*, mounted revolubly on said shaft, the loop *b*, projecting laterally from the lower end of said sleeve and terminating with the upwardly-extending tongue b', standing free from the sleeve, the spoon provided with an eye adapted to slip over the said tongue and into the loop, and the ferrule *d*, removably embracing the ends of the sleeve and tongue, substantially as described and shown.

481,653. HAND TACKING IMPLEMENT. NATHANIEL LOMBARD, Boston, Mass., assignor of one-half to Orlando E. Lewis, same place. Filed Sept. 10, 1891. Serial No. 405,290. (No model.)

Claim.—1. In a tacking implement, a reciprocating plunger, the tube in which it works, and a feed-duct forming part of the devices for supplying tacks below the said plunger, in combination with a clearer reciprocating across the said feed-duct to force out the lower tack alone, a spring bearing against this clearer, a shaft on which this spring is wound, and a slotted lever connected to this shaft and receiving a stud on the said plunger in order that the descent of the latter may rock the said shaft and increase the tension of the said spring, thereby causing the latter to operate the said clearer, substantially as set forth.

2. In a tacking implement, a tack-receiver, a revoluble feed-cylinder, and a duct leading from the said receiver to the said cylinder, in combination with a clearer reciprocating across the said duct to force out one tack at a time, a spring acting on the said clearer, a lever arranged to increase the tension of the said spring when rocked in one direction, a shaft on which the said spring is wound and to which the said lever and spring are connected, and a tack-driving plunger having a sliding connection with the said lever to effect the motion of the said clearer when the said plunger is depressed to drive a tack, substantially as described.



3. In a tacking implement, a reciprocating plunger, in combination with a tack-containing receptacle, connections between the said receptacle and the said plunger for causing the rotation of the former by the stroke of the latter, and devices for conducting the tacks from the said receptacle to the space below the said plunger, the said receptacle being provided with a series of buckets extending inward and also with a concentrically-arranged series of rods which are nearer the center of the receptacle than said buckets and are arranged to enable the said buckets to retain a part of their contents long enough to effect a more even distribution thereof, substantially as set forth.

4. In a tacking implement, a reciprocating plunger, a plunger-tube, and a feed-cylinder connected therewith, in combination with a tack-containing receptacle adapted to be revolved intermittently by the action of the said plunger, a series of rods arranged concentrically

within said receptacle, and a series of buckets between the said rods and the inclosing shell of the receptacle, the said rods being in such proximity to the said buckets as to enable the latter to retain a part of their contents and distribute the latter more evenly as the receptacle revolves, substantially as set forth.

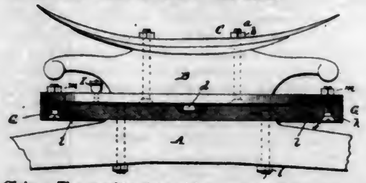
5. In a tacking implement, a tack-driving plunger, in combination with a tack-receptacle rotated thereby and a duct for conveying the tacks from the said receptacle, a clearer reciprocating across the said feed-duct to force out one tack at a time, a spring acting on the said clearer, a lever arranged to increase the tension of the said spring when rocked in one direction, a shaft on which the said spring is wound and to which the said lever and spring are connected, a sliding connection between said lever and said plunger to effect the motion of said clearer when the said plunger is depressed, and a fixed inclined inwardly-projecting deflector 28, arranged within the said receptacle in proximity to the said duct, but outside of the same and operating, when the feed-duct is full, to turn away the rejected tacks, substantially as set forth.

481,654. MAIL-BAG CATCHER. GEORGE W. MOORE, Jr., Lynchburg, Va. Filed May 3, 1892. Serial No. 431,662. (No model.)

Claim.—1. In a mail-bag catcher, the combination, with a shaft mounted in suitable bearings, of an arm secured thereto and provided with a double hook and a lever pivoted directly to said shaft, said arm and lever being provided with rods projecting laterally upon both sides of the same, substantially as set forth.

2. In a mail-bag catcher, the combination, with a shaft mounted in suitable bearings, of an arm secured thereto and provided with a double hook, a lever pivoted directly to said shaft, said arm and lever being each provided with a rod projecting laterally on both sides of the same, the said shaft being capable of a partial rotation in its bearings, whereby the said arm may be adjusted to a horizontal or vertical position, and means for holding said arm in either of its adjusted positions, substantially as set forth.

3. In a mail-bag catcher, the combination, with a shaft detachably mounted in suitable bearings, of an arm secured thereto and provided with two hooks extending in opposite directions, a lever pivoted to said shaft, said arm and lever being each provided with a rod projecting laterally upon both sides of the same, said shaft having a partial rotation in its bearings to swing said lever from a vertical to a horizontal position, shoulders upon the end of the shaft engaging recesses in the bearings for holding the arm in a horizontal position, and a locking lever for holding the arm in a perpendicular position, as set forth.



4. In a mail-bag catcher, the combination of a shaft A, carrying a fixed hooked arm B and a pivoted lever D, said arm and lever being respectively provided with laterally-projecting rods C C for holding a mail-bag, and separable bearing-blocks F, one member of which is detachable from the other, in which the ends of the shaft are journaled, whereby the device can be removed from its bearings on one door-frame and journaled in the opposite door-frame, substantially as set forth.

5. In a mail-bag catcher, the combination, with the shaft A, carrying the fixed hooked arm B, having rod C, and pivoted lever D, having rod C', splines E, arranged upon each end of the shaft, and the bearing-blocks F, provided with bearings for the ends of the shaft and with double recesses H, within which said splines lie and serve to hold the shaft in a position to support the arm B in a horizontal position, substantially as set forth.

6. In a mail-bag catcher, the combination, with the shaft A, carrying the fixed hooked arm B, having rod C, and pivoted lever D, having rod C', the bearing-blocks F, in which the ends of said shaft are journaled, the locking-lever k, pivoted within a groove formed in one end of the shaft, and a recess k' in one of said bearing-blocks for the reception of said locking-lever, whereby the shaft is locked in position to support the arm B in a vertical position, substantially as set forth.

7. In combination with the shaft A, arm B, having rod C, and lever D, having rods C', the bearing-blocks F, each consisting of the blocks *f f'*, provided upon their adjacent faces with half-bearings for the ends of the shaft, the block *f* being provided with two bolt-holes and the block *f'* with two open slots in alignment with said bolt-holes, and bolts passing through the said bolt-holes and slots, secured therein by nuts, all constructed and arranged whereby the block *f'* may be detached from the block *f* without removing the bolts, for the purpose specified.

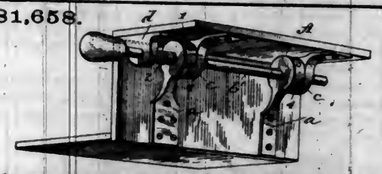
481,655. FIFTH-WHEEL. HENRY OLSEN, Winona, Minn. Filed Apr. 18, 1892. Serial No. 429,590. (No model.)

Claim.—The combination, with a wagon-bolster and an axle, of the fifth-wheel consisting, essentially, of the following instrumentalities in combination, viz: the upper top plate or disk having a centrally-depending boss or lug on its under side and also having bolt-holes through its body and at points around its margin for the passage of bolts which connect it to the axle, the base plate or disk having a central recess or socket on its upper side to receive said depending boss or lug of the top plate or disk and rabbeted on its under marginal edge and also having bolt-holes in its body for the passage of bolts, which connect it to the axle, a ring rabbeted to receive the rabbeted edge of the lower plate or disk and having holes to register with the marginal holes in the upper plate or disk, and bolts or the like for securing the ring to said upper plate, and consequently the lower or base plate thereto, substantially as specified.

481,656. CUTTER OR DRILL APPLICABLE TO COAL, &c. HANS RENOLD, Manchester, and WALTER T. GOOLDEN, LLEWELYN B. ATKINSON, and SYDNEY C. G. GOLD, London, England. Filed Sept. 5, 1891. Serial No. 404,873. (No model.) Patented in England Aug. 24, 1889, No. 13,362.

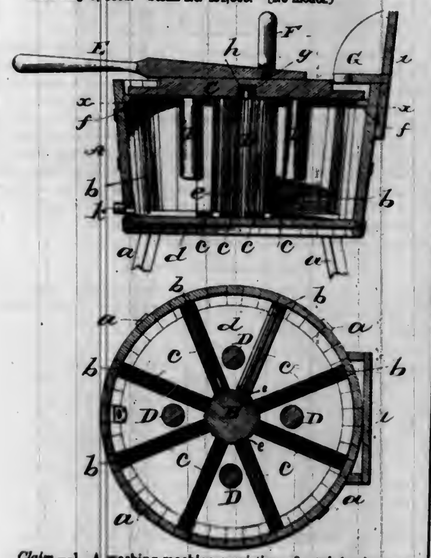
Claim.—In a cutter-bar or drill, the combination, with a plain cylindrical bar provided with a flange for attachment to the cutting or drilling machine, of a series of taper holes drilled tangentially to a small circle about the axis and cutters with taper shanks frictionally held therewith, cutting faces slightly inclined to the plane of revolution, the said holes arranged at equal distances upon the intersection of each pair of pitch-lines, one left-handed with a pitch about once the length of the bar and one right-handed of short pitch about one-tenth the length of the bar, the cutters being thus adapted both to feed out the cuttings by the right-hand spiral setting and also by the left-hand spiral setting to engage only successively in any stratum parallel to the axis of the bar.

481,657. GAME-COUNTER. SAMUEL D. STURGIS, Jr., and FREMONT P. PECK, Presidio, Cal. Filed Sept. 26, 1889. Serial No. 325,123. (No model.)



Claim.—In a game-counter, the combination, with the casing provided at opposite ends with two depressed portions and with the intermediate opening, of the two disks B and B', mounted side by side to turn within said casing, said disks provided with the teeth and corresponding numbers adapted to be brought opposite the opening, the finger *g*, pivoted to disk B, its returning-spring and stop, and the two independent disk-actuating dogs mounted at opposite ends of the casing and each provided with an arm extending through the casing into the depressed portions thereof.

481,658. EXTENSIBLE STEP FOR CARS. WILLIAM H. VOSS, East Stroudsburg, Pa. Filed May 16, 1892. Serial No. 433,201. (No model.)



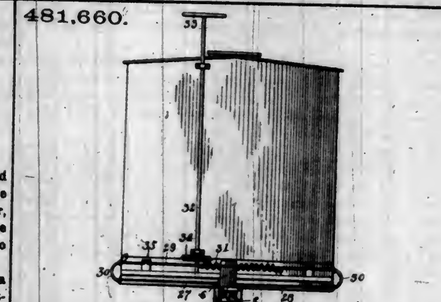
Claim.—1. In combination with a fixed step provided with suitable hangers, a movable step pivoted thereto by a suitable rod, and hangers secured to the movable step and secured to the said rod, the said hangers being provided with locking-faces engaging each other, said pivoted rod being capable of longitudinal movement with the folded step, so as to disengage the locking-faces of the hangers and to permit the step to be turned, substantially as described.

2. In combination with a fixed step, hangers carried thereby, a movable step pivoted by means of a rod to the fixed step through suitable hangers, the hangers of the fixed step being provided with locking-faces, and a spring for keeping the faces in engagement, the said rod being secured to the hangers of the movable step and adapted to be moved longitudinally against the pressure of the spring, substantially as described.

481,658.

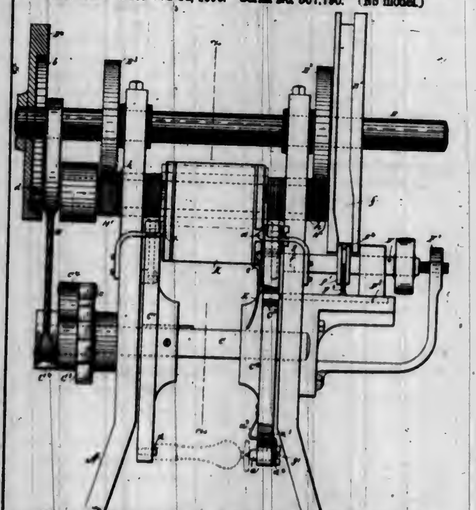
481,659. WASHING-MACHINE. REUBEN BITNER, Lebanon, Pa. Filed May 5, 1892. Serial No. 431,868. (No model.)

Claim.—1. A washing-machine consisting of a tub having a central column and rubbers secured to the bottom, the inside of the tub, and to said column, in combination with a cover provided with studs projecting downward from the under side, a lever for oscillating the cover, and an annular flange, substantially as described.



2. A washing-machine consisting of a tub having a central column provided with vertical ribbed and grooved rubbers or bars, like grooved and ribbed rubbers or bars secured to the inner side of the tub and like radial rubbers attached to the bottom of the tub, and an annular inwardly-projecting flange, in combination with a cover supported upon said column and flange and provided with a lever and a vertical handle, substantially as and for the purpose described.

481,660. CAR-COUPLING. EDWARD BROCKWAY, Separ, N. Mex. Filed Dec. 5, 1891. Serial No. 414,108. (No model.)



Claim.—1. The combination of a draw-head having an upper casing, a pin working therein, a pin-carrying block having guideways, guide-studs on the pin, a spring adapted to engage the pin when up, a trip-lever for actuating the spring, and a pivoted trip for operating the trip-lever.

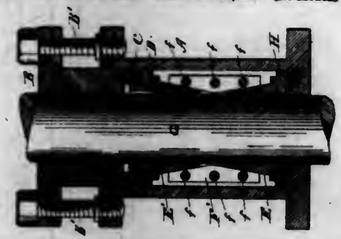
2. The combination of a coupling-pin and its inclosing casing, pulleys within the casing, a cord or chain attached to the pin, branch cords or chains leading to each side of the car, a reciprocating rod on the car to which the cord is attached, and means for operating the same.

481,660.

481,661. WOOD-TURNING MACHINE. JAMES U. GAREY, Cleveland, Ohio. Filed Oct. 11, 1890. Serial No. 367,790. (No model.)

Claim.—1. In a wood-turning machine, the combination, with a rotary blank-carrier and means connected therewith for holding blanks, of a rotary reciprocating shaft arranged to engage and impart motion to said blanks, means for throwing this shaft in and out of engagement with the blank-holders, and a locking device connected with said reciprocating shaft for locking the blank-holder, substantially as set forth.

2. The combination, with a rotary blank-holder and live-centers adapted to engage the blanks, of a reciprocating rotary shaft adapted to engage the live-centers and rotate the latter when in contact therewith, a shaft having a cam thereon adapted to co-operate with the rotary reciprocating shaft to impart endwise movement to the latter, and a locking-bar connected with the reciprocating shaft and adapted to lock the blank-holder when the reciprocating shaft engages one of the live-centers, substantially as set forth.

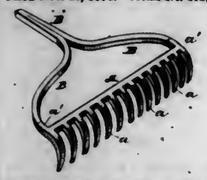


3. The combination, with a disk having slots therein and perforations in proximity to the slots, of centers extending loosely through the perforations, springs secured to the disk and passed through the slots and connected with the centers, said springs bowed away from

the disk, and a cam in position to be struck by the bowed portions of the springs, whereby the centers are thrown outward, substantially as set forth.

4. The combination, with a rotary blank-holder, a feed-spout, and means for automatically engaging said blanks, of means for locking the holder and rotating the blanks, cutter-head, and cam mechanism for throwing the latter in position to operate upon the blank being rotated, substantially as set forth.

5. The combination, with a main shaft carrying a series of cams, of a cutter-shaft mounted in movable bearings, each of the latter being engaged by a cam on the main shaft, a carrier for the blanks, means connecting the carrier-shaft with the main shaft for imparting intermittent rotary movement to said carrier-shaft, a shaft for rotating the carrier-centers, and a cam on said main shaft for imparting a longitudinal movement to the shaft which rotates the centers, substantially as set forth.



481,662. METALLIC ROD-PACKING. JOHN D. CHAPMAN, Boston, Mass. Filed Oct. 15, 1891. Serial No. 408,633. (No model.)

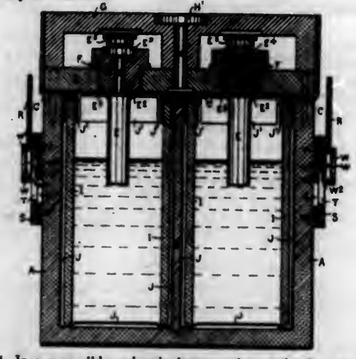
Claim.—1. In a stuffing-box, the combination of a piston-rod packing device consisting of a clamping-ring F F', smaller than the interior of said stuffing-box, and soft-metal rings E E', with a soft-metal follower C, and an expanding ring D, all operating together substantially as described, and for the purpose set forth.

2. In a stuffing-box, the combination of a piston-rod packing device consisting of a clamping-ring F F', smaller than the interior of said stuffing-box, and soft-metal rings E E', with a leveling-ring H, soft-metal follower C, and an expanding ring D, all adapted to operate together substantially as described, and for the purpose set forth.

481,663. METHOD OF MAKING RAKES. WARREN H. COWDERY, Ashtabula, Ohio. Filed Nov. 17, 1891. Serial No. 412,153. (No model.)

Claim.—1. The improvement in the method of making rakes, which consists in forming the head with lugs projecting from the edge of the head and thereupon welding the braces to said lugs, substantially as set forth.

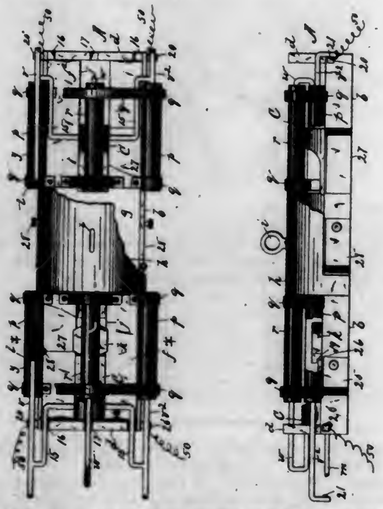
2. The method of making rakes, which consists in first forming the ends of the head with lugs, then bending said lugs at an angle to the edge of the head, and finally welding the braces to said lugs, substantially as set forth.



3. The method of making rakes, which consists in forming the head with lugs projecting from its edge, doubling a rod to form braces, forging the doubled portion of the rod to form the tang, and welding the ends of the braces to the lugs upon the head, substantially as set forth.

481,664. GALVANIC BATTERY. WILLIAM J. ENGLEDUE, Byfleet, England. Filed Mar. 23, 1892. Serial No. 426,169. (No model.)

Claim.—1. The combination, in a reversible battery, of the cells, the cover B, extending over the cells, the interposed packing *c*, the headed bushing extending through the cover, the packing F between the said headed bushings and the cover, the shouldered zinc elements E, having screw-threaded stems projecting through the said bushings, the countersunk nuts E^4 on the said stems, the packing interposed between the said shoulder of the elements E and the cover, the nuts E^5 above the nuts E^4 for making the electrical connections, and the top G, extending over the cover B and held thereto, forming cavities for the bushings, substantially as described.

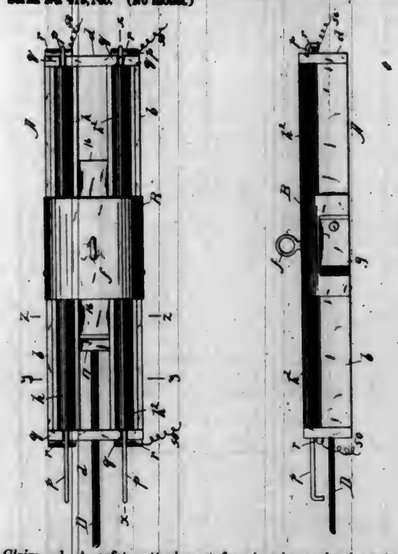


2. The combination, in a galvanic battery, of the cells, the elements E, extending into the same, the cover, the sealing means therefor, the elements I, and the frames J within the cells for holding the said elements I, substantially as described.

3. In a reversible galvanic battery, the cells, the liquid-tight case, the bushings, the handle, the slip-joint, and connection between the said handle and the case, including the locking means therefor, substantially as described.

4. In a reversible galvanic battery, the mechanism for locking the handle in position, whether the battery is being carried thereby in its normal or in its inverted position, the said mechanism consisting of plates S, secured to the sides of the battery and having slots T, recesses U and projections V V' formed therein, pins W, of square or other suitable section, taking into correspondingly-shaped holes in the ends of the handle R and having cylindrical parts W^3 passing through the slots T in the plates S and having riveted on their inner ends washers W^4, which take into the recesses U and each having a notch W^5 formed therein to engage with one or other of the projections V V', combined, arranged, and operating substantially as hereinbefore described, and illustrated in the drawings.

481,665. SAFETY ATTACHMENT FOR ELECTRIC CONDUCTORS. RUDOLPH FURSANG, Boston, Mass. Filed Jan. 18, 1892. Serial No. 418,398. (No model.)



Claim.—1. In a device of the character described, a frame of conducting material provided with a slideway open at one end, in combination with a block fitted to slide in said ways and to which the conducting-wire may be attached, a series of cylinders on said frame, spring-pushed pistons in said cylinders, and a shoe connected to the rods of said pistons, arranged to operate substantially as described.

2. The frame A, in combination with the sliding block *k*, attached to the conducting-wire, the cylinders *r p*, provided with spring-pushed pistons *t*, and the shoes C, connected with the rods of said pistons and normally in engagement with said block, substantially as described.

3. The frame A and insulated supporting-arch *h*, in combination with the wire-blocks *k*, fitted to slide in said frame, the cylinders *p r*, and spring-pushed pistons *t*, and the shoes C, connected with said pistons and adapted to project said blocks from the frame when the tension on said blocks is released, substantially as described.

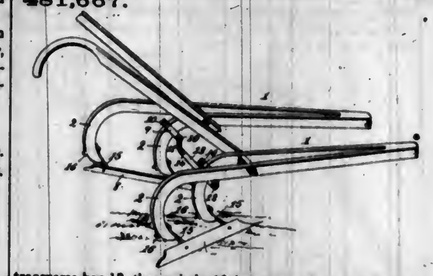
481,666. SAFETY ATTACHMENT FOR ELECTRIC CONDUCTING-WIRES. RUDOLPH FURSANG, Boston, Mass. Filed Jan. 26, 1892. Serial No. 418,140. (No model.)

Claim.—1. A safety attachment for electric conducting-wires, comprising a frame of conductive material, two sets of twin cylinders secured thereto and provided with spring-pushed pistons, companion pistons being rigidly connected, and a block or bar sliding in slots in the lower cylinders of each set in front of their pistons, to which the conducting-wire is attached, substantially as described.

2. In a device of the character described, a frame of conductive material and an insulated supporting connection therefor, combined with two sets of twin cylinders on said frame, a block to which the conducting-wire is attached, fitted to slide in corresponding cylinders of each set, and spring-pushed pistons in said cylinders, companion pistons being rigidly connected and adapted to eject said block when the tension on the conducting-wire is removed, substantially as described.

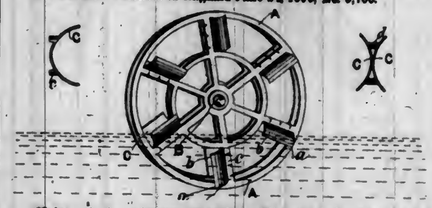
3. In a device of the character described, the frame A, provided with twin cylinders h i h^3 i^3, having the connected spring-pushed pistons *k t*, in combination with the line-wire bar 17, fitted to slide in slots 15 of the cylinders i i^3, substantially as and for the purpose set forth.

4. In a device of the character described, the frame A, provided with insulated bosses *r* and ground-wire 50, in combination with the rigidly-connected spring-pushed pistons *k t*, housed in connected cylinders, the line-wire bar 17, fitted to slide in corresponding cylinders and be ejected by said pistons, and the rods *p* for engaging said bosses, all being arranged to operate substantially as described.



5. In a device of the character described, the frame A, having the insulated supporting-arch B, in combination with the cylinders h i h^3 i^3, mounted in said frame and provided with spring-pushed connected pistons *k t*, said cylinders being slotted at *j*, slots 15, the bar 17, fitted to slide in the slots 15 behind the pistons *t*, the line-wire D, secured to said bar, and the rods *p* on pistons *k*, adapted to form ground connections with the frame when the tension on said wire is removed, substantially as described.

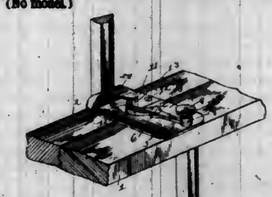
481,667. CULTIVATOR ATTACHMENT. ALBERT S. GILKEY, Burlington, Kans. Filed Oct. 9, 1891. Serial No. 408,239. (No model.)



Claim.—1. The combination, with the diverging beams of the two-gang cultivator, of the opposite pairs of metal clamps embracing the inner standards of the beams, bolts passed through the ends of the clamps, a transverse bar, and short chains connected to the ends of the bar and to the front bolts of the clamps, substantially as specified.

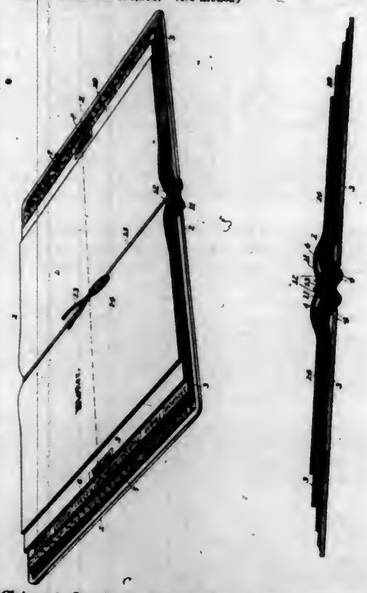
2. The combination, with the two-gang cultivator-beams, of the transverse bar 13, the eyebolts 12, inserted in the ends of the bar and provided with perforations, keys passed through the ends of the bar and the perforations, and short chains connecting the eyes to the cultivator-standards, substantially as specified.

3. The combination, with the lower diverging ends of opposite pairs of cultivator-beams, of cast-metal sockets receiving the same, set-bolts passed through the sockets and bearing on the beams, perforated twisted bars, bolts connecting the same with the sockets, and the plow-share pivotally connected to the lower ends of the bars, substantially as specified.



481,668. PADDLE-WHEEL FOR STEAMERS. JOHN HOWARD, Farnworth, near Bolton, assignor to the Concave Paddle Wheel Company, Limited, Liverpool, England. Filed Jan. 9, 1892. Serial No. 417,597. (No model.) Patented in England June 24, 1890, No. 9,760.

Claim.—1. As an improvement in paddle-wheels for steam-vessels, the combination, with the radial arms of the wheel arranged in pairs, of paddles or floats having concave or channeled striking-surfaces and provided at their rear sides with parallel securing wings or lugs, the latter being adapted to contact with and be secured to said arms, substantially as and for the purpose set forth.



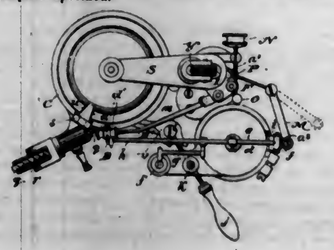
2. As an improvement in paddle-wheels for steam-vessels, the combination, with the radial arms of the wheel arranged in pairs, of concave or channeled floats provided at their rear sides with parallel securing wings or lugs fitting between the pairs of said arms, substantially as and for the purpose set forth.

481,669. FASTENER FOR THE MEETING-RAILS OF SASHES. EDWIN L. KING, New Bedford, Mass. Filed May 6, 1891. Serial No. 391,789. (No model.)

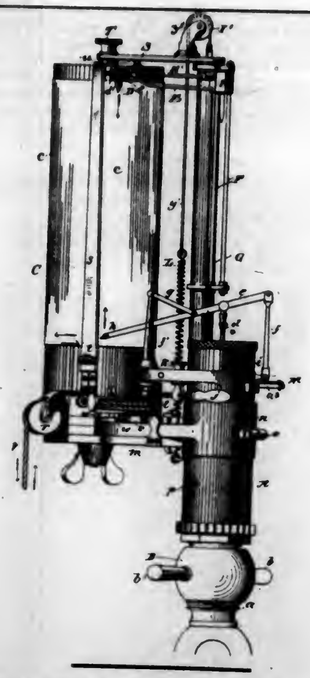
Claim.—As an improved article of manufacture, a sash-fastener for attachment to the meeting-rails of sashes, the same comprising a plate 4, adapted to be secured to the meeting-rail of the lower sash and provided with a perforation 5 and a pivot-stud 6, a plate 11, bent upwardly upon itself at its rear edge to form a guard 14 and provided with a locking-stud 13, the locking-lever 7, fulcrumed at an intermediate point upon the stud 6, said lever being provided at its front end with a cam-faced hook 10 to engage the locking-stud and at its rear end with a vertically-perforated head 8, and the gravity-bolt 9, mounted in the perforation of head 8 and provided with a flattened head 9^a on its lower end to engage the perforations 5 in plate 4 when the hook is in engagement with the locking-stud, and a head 10^a on its upper end, all constructed and combined substantially as specified.

481,670. COMBINED RECORD, DIARY, AND LEDGER. HENRY MEYER, Galveston, Tex., assignor of three-fourths to Herman Riedel, Herman Grosser, and Charles Meynaber, same place. Filed Apr. 30, 1892. Serial No. 431,296. (No model.)

Claim.—1. In a book of the character set forth, the combination of the double index on each side of the center of the same and running in opposite directions and centrally-situated leaves between said indices forming a record, a ledger, and a letter-writing blotter, substantially as described.

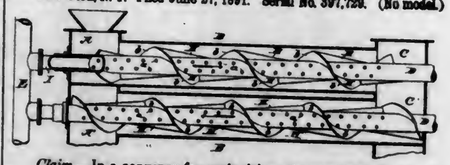


2. In a book of the character set forth, the combination of the double indices on opposite sides of the center thereof and a letter-writing blotter removably mounted between said indices, substantially as described.



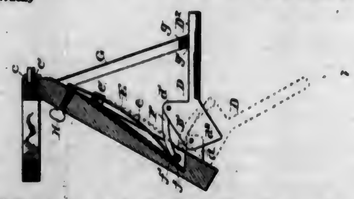
3. In a book of the character set forth, the combination of the eaves provided with double indices on opposite sides thereof and stub-stripe between said leaves, substantially as described.

4. In a book of the character set forth, the combination of the double indices on opposite sides of the center of the book and running in two directions, a ledger-section between said indices, a record adjacent to said ledger-section, and a letter-writing blotter removably secured between said record and ledger, substantially as described.



481,671. VALVE-MOTION INDICATOR FOR STEAM-ENGINES. JOHN MILLIS, U. S. Army. Filed May 9, 1891. Serial No. 392,217. (No model.)

Claim.—A valve-motion indicating attachment for steam-engines, which comprises a reciprocating pencil-carrying device, a revolving tube upon which said device is mounted, the valve, devices which connect said pencil-carrying device with the valve of the engine, which said valve communicates motion in one direction to the pencil-carrying device, a spring which communicates motion in the opposite direction to said pencil-carrying device, and devices which turn said tube and bring said pencil-carrying device into or away from contact with the card on which diagrams are to be drawn, substantially as shown, and for the purposes specified.



481,672. CONVEYER FOR GRAIN-DRIERS. EDWARD M. PARKER, New York, N. Y. Filed June 27, 1891. Serial No. 397,729. (No model.)

Claim.—In a conveyer for grain-driers, the combination of a hollow perforated shaft, a screw-thread extending spirally around said perforated shaft, and a series of tapering paddles set into said perforated shaft at right angles to the screw-thread, substantially as shown, and for the purposes specified.

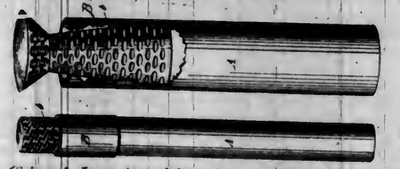
481,673. CRANE FOR SUSPENDING MAIL-BAGS. ETHEL A. RAY, Florence, S. C. Filed Apr. 12, 1892. Serial No. 428,821. (No model.)

Claim.—1 In a mail-crane, the combination, with the crane proper provided with arms having journals at their free ends, of plates or bars provided each with a bearing portion located at an angle to the main portion and receiving the journals, said plates or bars projecting inwardly, and a spring-held trigger carried by each plate or bar and adapted to yield toward each other, substantially as set forth.

2. As an improvement in mail-cranes, a bag-attaching device comprising a plate or bar adapted to swing laterally, a trigger pivoted at the free end thereof, a spring, and connections between said spring and the trigger, substantially as set forth.

3. As an improvement in mail-cranes, a bag-attaching device comprising a plate or bar adapted to swing laterally, a trigger provided with a cam and pivoted at the free end of said bar, a spring provided at its free end with a transverse eye, and links pivotally connecting the cam-head with the eye in the spring, substantially as set forth.

4. As an improvement in mail-cranes, a bag-attaching device comprising a plate or bar adapted to swing laterally, a trigger mounted at the free end thereof and provided at one side with an extension and at the opposite side with a stop, a spring disposed longitudinally at the face of the plate or bar, and links connecting the spring with the trigger, said links having their ends adjacent to the spring curved toward the trigger, substantially as set forth.



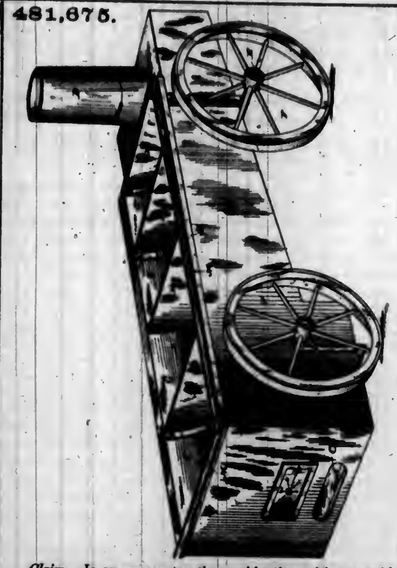
5. As an improvement in mail-cranes, a bag-attaching device comprising a plate or bar adapted to swing laterally, a trigger mounted at the free end thereof, a spring, connections between the latter and the trigger, and a cushioned stop carried by the plate or bar and adapted to limit the movement of the trigger toward the same, substantially as set forth.

6. As an improvement in mail-cranes, a bag-attaching device comprising a carrying plate or bar, a trigger pivotally mounted upon the same, a flat spring carried by said plate or bar, devices connecting the trigger with the spring, and means for regulating the tension of the spring to control the yielding movement of the trigger, substantially as set forth.

7. As an improvement in mail-cranes, a bag-attaching device comprising a plate or bar adapted to swing laterally, a trigger pivoted at the free end thereof, a spring secured upon the face of the plate or bar, connections between the free end of the spring and the trigger, and a set-screw passing through the plate or bar and bearing against the distal end of the spring, substantially as set forth.

8. As an improvement in mail-cranes, a bag-attaching device comprising a plate or bar adapted to swing laterally, a trigger pivoted at the free end thereof and provided with an extension and with a stop, a spring secured upon the face of the plate or bar, connections between the free end of the spring and the extension of the trigger, and a cushioned stop carried by the plate or bar and adapted to be engaged by the trigger when in normal position, substantially as set forth.

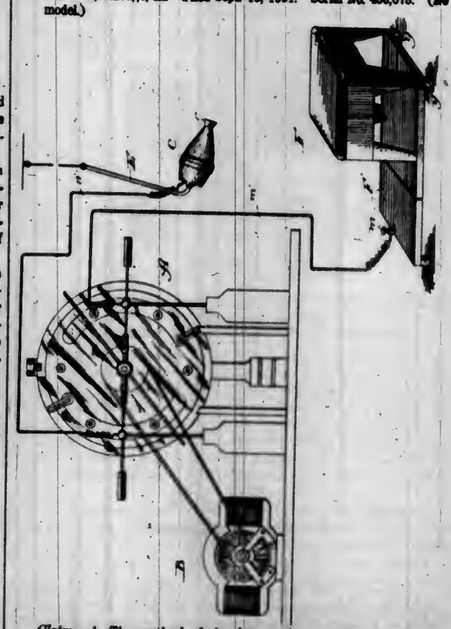
481,674. ARGAND LAMP. FRANK REHM, Meriden, Conn., assignor of one-half to the Edward Miller & Company, same place. Filed Mar. 30, 1892. Serial No. 427,116. (No model.)



Claim.—1. In an Argand lamp, in combination, a central draft-tube through which air is supplied to the inner mantle of the flame and a distributer coacting therewith and provided with perforations one diameter or dimension of which is greater than a diameter or dimension transverse thereto, substantially as described.

2. In an Argand lamp, in combination, a central draft-tube through which air is supplied to the inner mantle of the flame and a distributer coacting therewith and provided with perforations one diameter or dimension of which is greater than a diameter or dimension transverse thereto, said greater diameter being at an angle with the axis of said distributer, substantially as described.

3. In an Argand lamp, in combination, a central draft-tube through which air is supplied to the inner mantle of the flame and a distributer coacting therewith and provided with perforations one diameter or dimension of which is greater than a diameter or dimension transverse thereto, said perforations being so disposed that no vertical line can be drawn on said distributer between said perforations, substantially as described.



481,675. PORTABLE EVAPORATING APPARATUS. THEOGENE R. RICHARD, Lake Charles, La. Filed Apr. 5, 1892. Serial No. 427,676. (No model.)

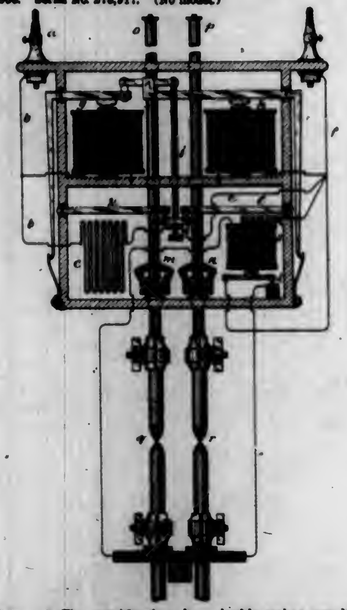
Claim.—In an evaporator, the combination, with a portable elongated furnace, of a semicircular evaporating-pan removably fitting within the top of said furnace along the entire length thereof and having a gutter extending along one side and end thereof, a series of partitions arranged within said pan to form separate and independent compartments decreasing in size from the fire-box of the furnace to the opposite end, and a strengthening and supporting band encircling the upper edge of the furnace and the evaporating-pan resting thereon, substantially as set forth.

481,676. APPARATUS FOR GENERATING OZONE. CHRISTOPHER C. SHARP, Chicago, Ill. Filed Sept. 18, 1891. Serial No. 406,073. (No model.)

Claim.—1. The method of simultaneously generating ozone and applying it to a body, which consists in applying one terminal of the

electric generator to the body, maintaining the other terminal out of contact with the said body, generating ozone at the non-conducting terminal, and closing the circuit between the ozone-generating terminal and the body by the current of ozonized air, substantially as described.

2. In a machine for generating and applying ozone, the combination, with an electric generator, of an ozone-generator forming one only of the electric terminals and having a discharge-opening for the ozone, the other terminal being adapted for application to the body, substantially as and for the purpose set forth.



3. In an electric apparatus, the combination, with the electric generator, of an ozone-generator forming one only of the terminals and comprising a bulb of insulating material having a discharge-opening and an electrode in the bulb, to which the conducting-wire leads, provided with projections of conducting material, the other terminal being constructed for application to the body, substantially as described.

4. In an electric apparatus, the combination, with the electric generator, of an ozone-generator forming one of the terminals and comprising a bulb of insulating material having a contracted discharge-opening and lined on its inner surface with conducting material and an electrode in the bulb, to which the conducting-wire leads, provided with pointed metal projections, the other terminal being constructed for application to the body, substantially as described.

5. In an electric apparatus, the combination, with the electric generator, of an ozone-generator forming one of the terminals and comprising a bulb of insulating material having a contracted discharge-opening and lined on its inner surface with conducting material and an electrode in the bulb, to which the conducting-wire leads, comprising a metal cup provided on one of its surfaces with pointed metal projections, the other terminal being constructed for application to the body, substantially as described.

6. In an electric apparatus, the combination, with the electric generator, of an ozone-generator forming one of the terminals and comprising a bulb of insulating material having a contracted discharge-opening and lined on its inner surface with conducting material and an electrode in the bulb, to which the conducting-wire leads, comprising a metal cup provided on its inner and outer surfaces with pointed metal projections, the other terminal being constructed for application to the body, substantially as described.

481,677. DUPLEX-ARC LAMP. CHARLES R. SCRIBNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed July 3, 1888. Serial No. 278,917. (No model.)

Claim.—1. The combination, in a double-carbon arc lamp in which the different sets are arranged initially in closed parallel circuits, of a unitary electro-magnetic device for controlling the different sets, and an electro-magnetic cut-out with its coil included in circuit with one set and its armature and back-stop included in circuit with the other set, whereby the different sets are caused to burn in succession, substantially as described.

2. The combination, with the multiple circuit of an electric-arc lamp, of two sets of carbons and a unitary electro-magnetic device for controlling said sets of carbons, one set being included in each side of the said multiple circuit, clutch mechanism operated by electro-magnetic devices to separate said carbons at the same time, and an electro-magnetic cut-out or relay with its coil in circuit with one set of carbons and its armature in circuit with the other set of carbons for opening the circuit of the set of carbons in the side of the parallel circuit containing the armature immediately upon closing the circuit through the lamp, whereby one set of carbons is consumed before the other sets begins to burn, substantially as and for the purpose specified.

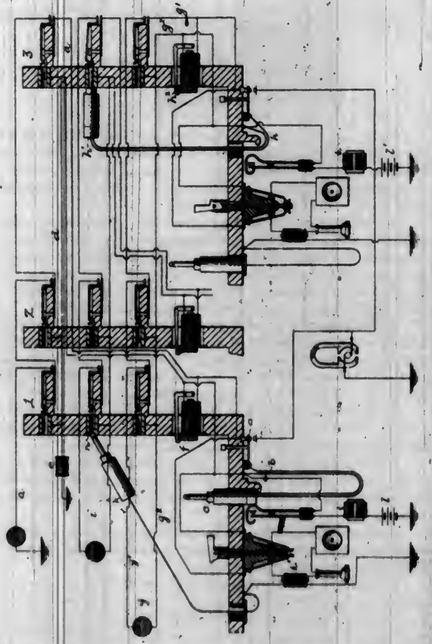
3. The combination, with the multiple circuit of an electric-arc lamp, of two sets of carbons and a unitary electro-magnetic device for controlling said sets of carbons, one set being in each side of the said multiple circuit, clutch mechanism operated by electro-magnetic devices to separate and feed the carbons, and an electro-magnetic cut-out or relay with its coil in one parallel circuit and its armature in the other parallel circuit for opening the circuit of one set of carbons when the circuit is closed through the lamp, whereby one set of carbons is consumed before the other begins to burn.

4. The combination, with the two sets of carbons connected with the same circuit in multiple arc, a unitary electro-magnetic regulating mechanism therefor, and an electro-magnet included in that portion or side of the circuit containing the set of carbons first to burn, and its armature-lever adapted to open the side or portion of said circuit containing the second set of carbons initially—that is, immediately on first closing circuit through the lamp—whereby the second set of carbons is prevented from burning until the first set is practically consumed or the descent of the rod of the first set arrested, substantially as and for the purpose specified.

5. In an electric arc lamp, the combination, with two sets of carbons and a unitary mechanism for lifting and feeding the same, of an electro-magnetic cut out with its coil included in circuit with one of said sets (the set first to burn) and the armature of said electro-magnetic cut-out mechanically connected with a key included in circuit with the other set of carbons, (the set last to burn,) whereby the circuit of the carbons last to burn is held open by said key as long as the arc persists at the first set, said circuit of the second set being automatically closed by said key when the arc of the first set is extinguished to bring said second set into active operation, substantially as and for the purpose specified.

6. In an electric-arc lamp, two sets of carbons having the lower members of each pair insulated from one another and included in different sides of the same circuit, of an electro-magnetic circuit-controller for automatically holding open one side of said parallel circuit while the arc is burning between the set included in the other side of said circuit, said electro-magnetic circuit-controller on the extinguishment of the arc acting to close the circuit which had been held open to permit the arc to be established between the second set of carbons.

7. The combination, in an electric-arc lamp containing two sets of carbons in multiple arc, the lower members of the two sets of carbons being insulated from one another, of mechanism for separating and feeding the same and an electro-magnetic circuit-controller having the coil thereof in circuit with one set of carbons and the contact or key controlled by the armature of said electro-magnetic circuit-controller included in the circuit of the other set of carbons between the lower carbon thereof and the point where the two parallel circuits unite.



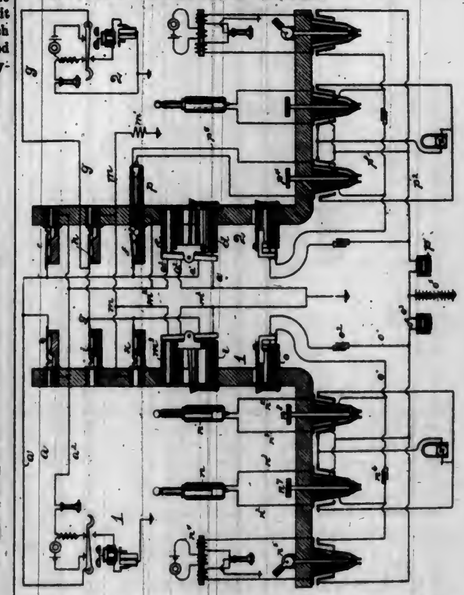
8. The combination, with the sets of carbons of a double-carbon lamp, of mechanism for initially lifting simultaneously the upper members of both pairs, the cut-out around the lamp being opened by such initial movement, and the sets of carbons being connected in multiple arc, an electro-magnetic cut-out with its coils included in circuit with one set, and its armature and back-stop included in circuit with the other set, substantially as specified.

481,678. MULTIPLE-SWITCHBOARD TELEPHONE-EXCHANGE SYSTEM. CHARLES R. SCRIBNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Nov. 22, 1889. Serial No. 331,205. (No model.)

Claim.—1. In a multiple-switchboard system, the combination, with each line of the system, of a cord provided with a terminal loop-plug, one for each line, and branch circuits, one from a strand of each cord through a retardation-coil and battery to ground, in combination with a switch included in the circuit of each of said branches to open and close its said branch circuit to make its particular line test "busy" or "not busy," as may be desired.

2. In a telephone-exchange system, the combination, with each line of the exchange, of test-rings upon the different switchboards, the said test-rings being connected together, a connecting-cord for each line, with which said test-rings are connected, a branch circuit through a retardation-coil and battery to ground, said branch circuit being connected with the circuit of the test-rings and cord, and a switch included in the circuit of the branch circuit to open and close said branch circuit, whereby the battery may be connected to or disconnected from the said test-ring circuit, substantially as and for the purpose specified.

3. In a telephone-exchange system, the combination, with each telephone-line, of switches, one switch upon each of the switchboards, one portion of the line being connected to the springs and contacts of the switches and another portion of the same line being connected to the test-rings of the said switches, plugs and cords, one plug and cord for each line, each cord being connected with its line, switches, one for each line, adapted to be operated by its plug, a branch circuit through a retardation-coil, and a battery connected through said switch to its line, whereby on lifting the plug the circuit of the battery is closed to the line to bring the line in electrical condition to indicate the busy-test.



4. In a telephone-exchange system, the lines connected with their respective switches on the different boards, each line connecting with a double-stranded cord terminating in a double-contact plug, one portion of the plug being adapted to make contact with the test-piece of the spring-jack into which it is to be inserted, a branch circuit from this strand through a switch, a retardation-coil, and a battery to ground, substantially as and for the purpose specified.

5. A telephone-line looped through the switches of the different switchboards, one portion of the loop connecting with the test-rings, the other portion of the loop connecting with the springs and their contacts, an annunciator bridged across the loop, a listening-key, two of the contacts of which are connected to the two sides of the loop, a double-stranded cord, each of the two strands being connected with a side of the loop, and a two-part connecting-plug connected with said double stranded cord, substantially as and for the purpose specified.

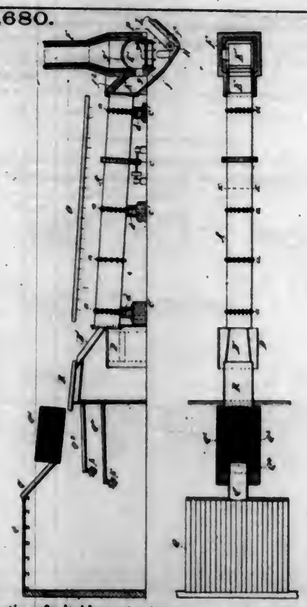
6. A subscriber's outfit consisting of a generator, bell, and telephone connected with different switches upon different switchboards of the same telephone-exchange in metallic circuit, one side of said metallic circuit including the springs and contacts of the switches and the other side being connected with the test-pieces of said switches, in combination with an individual annunciator bridged across the two sides of said metallic circuit between the contact of the switch on the last board and the test-piece of said switch, said line being provided with a double-stranded flexible cord and terminal plug, one of the strands of said cord being connected with a switch normally held open by said plug resting in its socket, and a ground branch including a battery and retardation-coil connected through said switch with one of the strands of the cord of said plug, said switch being closed when the plug is lifted from its socket, substantially as and for the purpose specified.

7. The combination, with metallic circuits connected with switches on different switch-boards at the central office, of the terminal loop-plug a cord-switch, and a branch from each line through a retardation-coil to a test-battery and ground, said branch being closed to the line automatically on lifting the plug of the line from the socket of its cord-switch, substantially as and for the purpose specified.

481,679. TELEPHONE-EXCHANGE. CHARLES R. SCRIBNER, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Nov. 16, 1891. Serial No. 411,961. (No model.)

Claim.—1. The combination, with the individual annunciator provided with two electro-magnets connected in different branches of the subscriber's telephone line, of the clearing-out drop included with the condenser in a bridge-wire between the strands of the cords, said cords and their terminal plugs, the retardation-coil in the branch leading to the retaining-battery, and said battery, whereby the individual annunciator is prevented from being thrown down when generator-current is sent to line from the subscriber's station, while the clearing-out drop is traversed by such generator-current and operated thereby, substantially as described.

2. The combination, with a battery o^3, of branch circuits $o^1 p^1$, each including a retardation-coil and a set of plugs with double-stranded cords for each branch circuit, and a clearing-out annunciator and a condenser in a bridge-wire between the strand of each set of cords, substantially as specified.



481,680. APPARATUS FOR TREATING THE REFUSE OF CITIES. JACOB J. STORER, East Orange, N. J., assignor to Mary L. Storer, same place. Filed Mar. 18, 1891. Serial No. 385,500. (No model.)

Claim.—1. In a furnace and apparatus for treating the refuse of cities, the combination, with the revolving furnace and the smoke-stack, having a gas-combustion chamber with a perforated roof in its base, substantially as herein shown and described, of a pit with two perpendicular and two sloping sides beneath said combustion-chamber, designed for the continuous reception of the dried or cremated material continuously delivered from the furnace, and an elevator for continuously removing said material from said pit, substantially as set forth.

2. In a furnace and apparatus for treating the refuse of cities, the combination of a revolving screen Q^2, a sorting-table R to receive the material passing over the lower end of said screen, the shaking and sorting screens Q^3 Q^4, arranged below said revolving screen to receive the material that passes through the meshes of the revolving screen, and the revolving cylinder-furnace A, set below the lower end of the sorting-table R to desiccate or cremate the material passing over the lower end of said table, substantially as described.

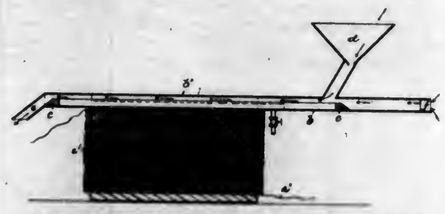
3. In a system designed for the cremation of the refuse of cities,

481,680.

the combination of suitable mechanisms embracing revolving and shaking screens and shaking table for receiving and separating the component parts of the refuse, mechanism for delivering the garbage into the cremating-cylinder, a brick-lined revolving cylinder-furnace set nearly in a horizontal plane, a fire-box at the head of the furnace for delivering heated air and flame into the interior of the same, a gas-combustion chamber with perforated dome in the bottom of the smoke-stack opposite the lower end of the cylinder, a pit beneath the smoke-stack for continuously receiving the cremated garbage as it falls from the furnace, and an elevator for continuously removing the contents of said pit, all arranged and operated substantially as herein shown and described.

481,681. PNEUMATIC TIRE. JOSEPH WELLSTEIN and MORGAN E. MAXFIELD, Milwaukee, Wis. Filed Apr. 11, 1892. Serial No. 428,574. (No model.)

Claim.—1. A pneumatic tire consisting of an inner air-tube, a flat spring wound thereabout with its edges contacting to form a continuous or non-open elastic metallic covering, a reinforcing wrapping maintaining said spring in position, and an outer inclosing tube, substantially as set forth.



2. A pneumatic tire consisting of an inner air-tube, a rubber-coated binding wound thereabout, a flexible band of spring metal surrounding the central tread-line of the tube, a flat spring wound continuously about the tube, a rubber-coated binding interposed between the strips and the spring, a similar binding wound about said spring, and an outer inclosing-tube, substantially as set forth.

481,682. SOLE. HENRY WOODIN, Northampton, England. Filed Mar. 1, 1892. Serial No. 423,420. (No model.)

Claim.—In a welted boot or shoe, the combination, with the upper, the inner sole, the damp-proof filling, and the outer sole, of the double welt, all of said parts being secured by one line of stitching and having the edge of the lower welt trimmed off to form a rand and the projecting welt sewed to the outer sole, substantially as set forth.

481,683. METHOD OF AND APPARATUS FOR EXTRACTING GOLD AND SILVER FROM THEIR ORES. JONAS W. AYLSWORTH, Orange, and ARTHUR C. PAYNE, Elizabeth, N. J. Filed July 3, 1891. Serial No. 398,444. (No model.)

Claim.—1. The process of extracting precious metal from its ore, which consists in subjecting the ore to the amalgamating action of a magnetic mercurial amalgam, and then passing said ore through a magnetic field and extracting the remaining amalgam, substantially as set forth.

2. The process of extracting precious metal from its ore, which consists in passing the ore containing said precious metal into close association with a magnetic composition and combining the said precious metal therewith, and then forcing the particles of precious metal combined with said composition through a magnetic field and attracting the magnetic particles therefrom, substantially as set forth.

3. The process of extracting precious metal from its ore, which consists in subjecting the ore to the action of an amalgam of mercury and iron, and after separating said ore from the body of said amalgam subjecting the same to the action of a magnet and attracting the remaining particles of said amalgam, substantially as set forth.

4. The process of separating magnetic amalgam from comminuted gangue, which consists in forcing said gangue through a magnetic field and over a surface of mercury, substantially as set forth.

5. The process of separating magnetic amalgam from comminuted gangue, which consists in forcing the dry gangue by pneumatic power over a surface of mercury arranged in a magnetic field, substantially as set forth.

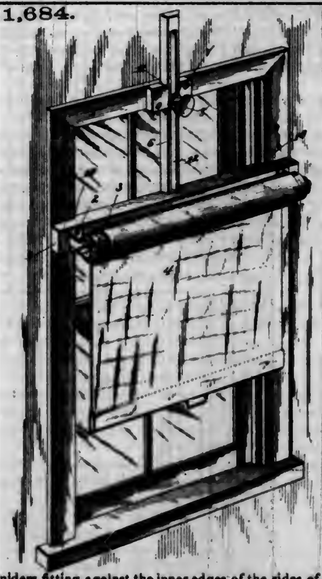
6. The process of separating magnetic amalgam from its gangue, which consists in attracting said magnetic amalgam toward a body of fluid metal, substantially as set forth.

7. The process of separating precious metal from its ore, which consists in passing said ore into a magnetic body of mercury amalgam, the ore being relatively smaller in quantity than the said mercury, and allowing said ore to rise to the surface of said amalgam, then passing said ore over a magnetic field adjacent to a body of liquid metal and attracting particles of amalgam toward and into said body of liquid metal, substantially as set forth.

8. The process of extracting precious metal from comminuted ore, which consists in subjecting said ore to the action of an amalgam containing particles in suspension, such as iron, susceptible to magnetic attraction, substantially as set forth.

9. The combination, with a magnet and a pan or receptacle for mercury, of a blower or other means for forcing the ore over said mercury and through the field of said magnet, substantially as set forth.

10. The combination, with a pan or receptacle for mercury, of a magnet having its pole-pieces in said pan, and means for supplying the pan with comminuted ore, and pneumatic means for forcing said ore in a dry state over said mercury, substantially as set forth.



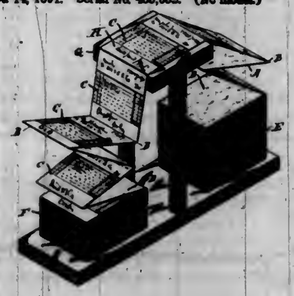
11. The combination, with a closed pan having the longitudinal edges of the pole-pieces a^3 within the same, of a body of mercury within said pan covering the line of greatest magnetic force and means for forcing the dry ore through said pan, substantially as set forth.

12. In combination, a closed pan, a magnet *a*, having pole-pieces in said pan, said pole-pieces having knife-edges, a body of mercury covering said edges, an outlet-opening *e* from the pan, a hopper *d* at the opposite end, and an inlet-opening *f* for pneumatic force, all said parts being arranged and combined substantially as and for the purposes set forth.

481,684. CURTAIN-FIXTURE. CHARLES M. BAKER, Boardman, Fla. Filed Feb. 10, 1892. Serial No. 420,961. (No model.)

Claim.—The combination, with a window-frame, of a horizontal bar having its ends resting against and adapted to slide on the outer faces of the sides of the window-frame and provided on its inner face

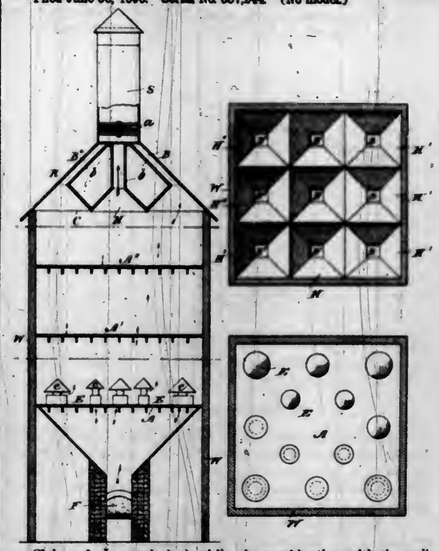
481,684.



with shoulders fitting against the inner edges of the sides of the frame to prevent longitudinal movement of the bars, curtain-roller brackets mounted on the bar, the blocks 7, secured to the top of the frame at the center thereof and having their inner edges beveled and forming a dovetailed way, the vertically-adjustable bar provided with a longitudinal slot and having its side edges beveled on its outer face and fitting between the blocks and having a flat inner face bearing against the top of the frame, said vertically-adjustable bar having its lower end centrally and permanently secured to the horizontal bar, and a set-screw mounted on the top of the frame and arranged between the blocks and passing through the longitudinal slot of the vertical bar and securing the latter in its adjustment, substantially as described.

481,685. ARTIFICIAL MUSK AND PROCESS OF MAKING THE SAME. ALBERT BAUR, Gispersleben, near Erfurt, assignor to the Society Fabriques de Produits Chimiques de Thann et de Mulhouse, Thann, Germany. Filed Mar. 7, 1892. Serial No. 424,067. (No specimens.) Patented in France Aug. 5, 1891, No. 215,355; in Belgium Aug. 5, 1891, No. 95,915; in Italy Aug. 10, 1891, No. 30,943, and in England Aug. 12, 1891, No. 13,613.

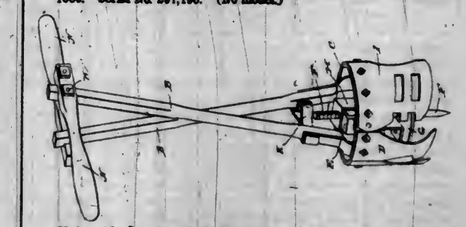
Claim.—1. The described process of obtaining a substitute for musk by mixing an ether of metacresol or other substituted phenols with metallic chloride, heating, mixing with water, and isolating the butylated cresolether, thereby obtaining an aromatic, colorless liquid, introducing the ether into fuming nitric (or nitric and sulphuric) acid, heating and crystallising from a suitable solvent, such as alcohol, as set forth.



2. The artificial musk herein described, being a trinitro-derivative of the butylated or analogous metacresol in a white crystalline form, characterized by the odor of natural musk, as set forth.

481,686. WRITING-TABLET. FREDERICK BENTEL, Hamilton, Ohio. Filed Sept. 14, 1891. Serial No. 405,652. (No model.)

Claim.—In a writing-tablet, the combination, substantially as set forth, of a strip of paper having pressed opposite folds and forming two piles connected by an intermediate portion of the strip, a support for each of said piles, and a table-surface disposed between said two piles and under said intermediate portion of the trip and at a height from said supports equal at least to the sum of the heights of said two piles.

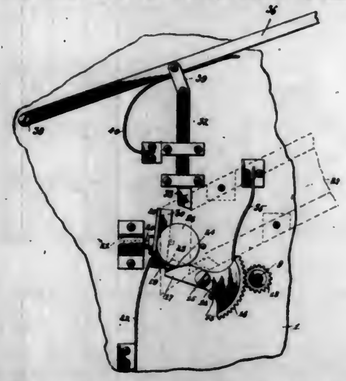


481,687. MALT-DRYING KILN. CARL G. BOSCH, Davenport, Iowa. Filed June 30, 1890. Serial No. 357,244. (No model.)

Claim.—1. In a malt-drying kiln, the combination, with the walls of the drying-chamber, of a floor immediately in the line of the air-supply connections, said floor being provided with openings uniformly increasing in size from the central portion of said floor in all directions toward said walls, a ceiling with openings arranged uniformly throughout its plane or surface, said openings having upwardly-extending walls diminishing in cross-section, a draft tower or exit for the air, and perforated floors or trays located intermediate of the said floor and ceiling to carry and support the material to be dried, all substantially as described.

2. In a malt-drying kiln, the combination, with the walls of the drying-chamber, of a floor immediately in the line of the air-supply connections, said floor being provided with tubular openings uniformly increasing in size from the central portion of said floor in all directions toward said walls, said tubular openings being provided with overhanging shields, a ceiling with openings arranged uniformly throughout its plane or surface, said openings having upwardly-extending walls diminishing in cross-section, a draft tower or exit for the air, and perforated floors or trays located intermediate of the said floor and ceiling to carry and support the material to be dried, all substantially as described.

481,688. POST-HOLE DIGGER. WILLIAM Z. BROWN, Atlas, Ill., assignor of one-half to George Manewal, Buckin, Mo. Filed Jan. 22, 1889. Serial No. 297,193. (No model.)



Claim.—1. In a post-hole digger, the combination, with the sections pivoted together, of the bridge extending across one section and the plunger carried by the bridge, substantially as described.

2. In a post-hole digger, the combination, with the frame formed

in halves pivoted together and an operating-handle connected to each half, of the blades secured to the frames and the relatively small removable cutting-points independently secured to the frame in advance of the blades, substantially as described.

3. In a post-hole digger, the combination of the sections pivoted together and formed of relatively small removable cutting points or shares and the perforated blades, substantially as described.

481,689. VENDING-MACHINE. ALFRED B. CHANDLER and GUY H. POWELL, Chicago, Ill., assignors of one-third to C. T. Chandler, Jr., same place. Filed Feb. 19, 1892. Serial No. 422,060. (No model.)

Claim.—1. The combination, with the journal 9 and the lever for turning said journal, of the latch for preventing said journal from turning, means for lodging a coin against said lever and latch, and means for operating said latch and lever through the medium of the coin, substantially as set forth.

2. The combination, with the casing having a discharge opening or chute, of a cylinder journaled in said casing having a pocket adapted to coincide with said discharge-opening, a lever for turning said cylinder, a latch for locking said cylinder, a coin-chute adapted to lodge a coin upon said lever and against said latch, and a plunger adapted to impinge the coin, substantially as set forth.

3. The combination, with the casing having a discharge-opening or delivery-chute, of a cylinder journaled in said casing having a pocket adapted to coincide with said discharge opening or chute, a spur-wheel on said cylinder, a toothed lever adapted to engage said wheel for turning said cylinder, a latch for locking said cylinder, a coin-chute adapted to lodge a coin upon said lever and against said latch, and a plunger adapted to impinge the coin, substantially as set forth.

4. The combination, with the casing having a discharge chute or opening, of a cylinder journaled in said casing, having a pocket adapted to coincide with said discharge opening or chute, a pivoted lever for turning said cylinder, a latch for locking said cylinder, a coin-chute adapted to lodge a coin upon said lever and against said latch, a plunger adapted to impinge said coin, a lever for actuating said plunger, and springs for returning said levers to their normal positions, substantially as set forth.

5. The combination of the journal 9, having a spur-wheel thereon, a toothed lever for rotating said spur-wheel, a latch for preventing said journal from turning, having a shoulder or flange, a coin-chute adapted to lodge a coin against said flange and lever, and a plunger adapted to impinge said coin, substantially as set forth.

6. The combination of the journal 9, having a spur-wheel thereon, a toothed lever for turning said spur-wheel, a sliding latch for preventing said journal from turning, having a flange or shoulder formed thereon, a guideway for said latch, a coin-chute adapted to lodge a coin against such flange and lever, and a plunger adapted to impinge said coin, substantially as set forth.

7. The combination of the journal 9, having a spur-wheel thereon, a toothed lever for turning said spur-wheel, having a rounded or beveled end, a latch for preventing said spur-wheel from turning, having a shoulder formed thereon, a coin-chute having a shield or projection overlapping said latch and lever and adapted to lodge a coin upon said lever and against said shoulder or flange, and a plunger adapted to descend upon the coin while thus supported, substantially as set forth.

8. The combination, with the journal 9, having a spur-wheel thereon, of a toothed lever for turning said spur-wheel, a latch for preventing said spur-wheel from turning, provided with the shoulder 25 and plate 30, a coin-chute having a shield overlapping said plate and said coin-chute being adapted to lodge a coin between said shield and plate against said flange, and a plunger adapted to descend upon the coin and disengage said latch and oscillate said lever, substantially as set forth.

9. The combination, with the delivery-cylinder, of a latch for preventing said cylinder from turning, having the flange 25, the coin-chute at the end of which said latch is arranged adapted to lodge a coin against said flange 25, a lever adapted to turn said cylinder, having its end arranged adjacent to said flange 25, so as to assist in supporting the coin, and a plunger having a beveled end adapted to descend upon the coin while thus supported, substantially as set forth.

10. The combination, with the cylinder, of a lever for turning said cylinder, a spring-latch for preventing said cylinder from turning, a coin-chute adapted to lodge a coin against said latch and upon the end of said lever, a spring-actuated plunger having a beveled end adapted to descend upon the coin while thus supported, and a lever for operating said plunger, substantially as set forth.

11. The combination, with the shaft or journal 9 of a device to be actuated, of a spur-pinion on said journal, a pivoted segment-lever engaging said pinion, a spring-actuated latch for engaging said lever, having a flange or shoulder, a coin-chute adapted to lodge a coin upon said lever and against said shoulder, a plunger adapted to descend upon said coin while thus lodged, a lever 36, pivoted to said plunger, and means for returning said lever 36 and segment-lever to their normal positions, substantially as set forth.

12. The combination of a magazine having an open bottom adapted to contain rolls therein in a single row, a journaled delivery-cylinder arranged under said magazine and having a pocket as large as the open bottom of said magazine, a pinion for rotating said cylinder, a segment-lever engaging said pinion, a latch for locking said segment-lever, and means for actuating said segment-lever and latch through the medium of a coin, substantially as set forth.

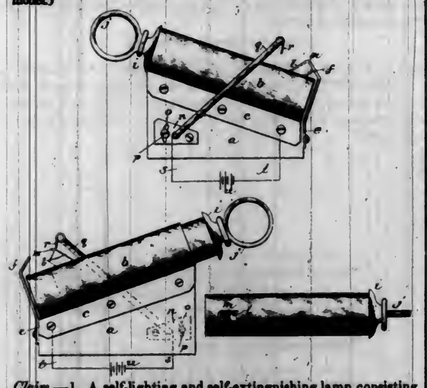
13. The combination, with the casing 1, provided with the offset 10, having a slot 37 therein, of a delivery-cylinder mounted at the lower end of said casing, means for locking said cylinder arranged in said offset 10, and a lever pivoted in said offset 10 and projecting through slot 37 and adapted to unlock and actuate said cylinder through the medium of a coin, substantially as set forth.

481,690. RATCHET-WRENCH. PETER COSSETTE, Crystal Falls, Mich., assignor of one-third to Clifford Terrian, same place. Filed June 3, 1892. Serial No. 435,413. (No model.)

Claim.—1. In a wrench, the combination, with a handle, the nut-socket having a shank, and the ratchet-wheels arranged on the shank and provided with the oppositely-disposed teeth 12, of the two sets of pawls pivotally mounted on the handle, springs arranged at opposite sides of the handle and engaging the pawls and adapted to hold them in operative position, and a rotating ring mounted on the handle and adapted to engage the springs to throw the pawls out of mesh to reverse the wrench, substantially as described.

2. In a wrench, the combination, with a handle, a nut-socket having a shank, and the ratchet-wheels mounted on the shank and provided with oppositely-disposed teeth, of the two sets of pawls pivotally mounted on the same, the oppositely-disposed springs secured to the handle and engaging the pawls, and a rotating ring mounted on the handle and provided with enlargements forming cams to engage the springs and having a lug arranged between the cams, substantially as and for the purpose described.

3. In a wrench, the combination of a handle having a rounded portion and provided with a shoulder having curved recesses, a nut-socket having a shank, the ratchet-wheels mounted on the shank and provided with oppositely-disposed teeth, the two sets of pawls pivotally mounted on the handle and having their inner ends arranged in the curved recesses, springs secured to the handle and engaging the pawls, and a rotating ring mounted on the round portion of the handle and having one-half of it enlarged to form cams adapted to throw the springs outward to reverse the wrench, substantially as described.



481,691. PICKLE-LIFTER. JOHN A. CURRIE, Jr., and JESSE W. CURRIE, Pipe Creek, Tex. Filed Apr. 11, 1892. Serial No. 428,690. (No model.)

Claim.—1. In a pickle-lifter, the combination of a supporting-arm having eyes in the body thereof and a bent foot at the lower end thereof formed by bending said supporting-arm, and a sliding arm mounted in connection with said supporting-arm and having a lower pointed end, and a limiting-shoulder at the upper portion of the said sliding arm, formed by a bend and adapted to engage one of the eyes of said supporting-arm, substantially as described.

2. In a pickle-lifter, the combination of a supporting-arm having a loop at the upper end thereof and a bent foot at the bottom of the same, together with intermediate eyes formed by bending said supporting-arm, and a sliding arm fitted in said eyes of the aforesaid arm and having a lower pointed or sharpened end, a ring at the upper end of the same, an eye in the body thereof embracing the supporting-arm, and a limiting-shoulder intermediate said eye and ring, said sliding arm being bent to form said parts, substantially as described.

481,692. ELECTRIC CIGAR-LIGHTING LAMP. WILLIAM J. EASTMAN, Waterville, N. Y. Filed Feb. 8, 1892. Serial No. 420,745. (No model.)

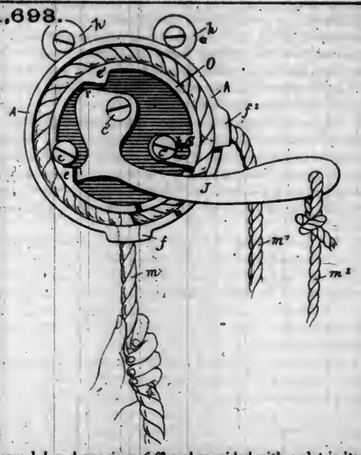
Claim.—1. A self-lighting and self-extinguishing lamp consisting, essentially, of a stationary sheath or holder, electrodes of an electric circuit applied thereto, and a torch adapted to be removed from said sheath to close the circuit, and thereby ignite the torch, and to be inserted in said sheath, and thereby extinguish the torch, substantially as described.

2. A self-lighting and self-extinguishing lamp comprising a base, a sheath or holder constructed as an open-ended longitudinally-slotted tube mounted thereon, electric spark-producing means, an extinguisher overhanging one end of the sheath or holder, and a torch fitted to slide in said sheath or holder and having a projecting wick-tube which travels in the slot, substantially as described.

3. A lamp having a base, a sheath or socket composed of sections secured to said base and separated by a passage-way, and light producing and extinguishing means combined with a torch adapted to be moved into and out of said sheath and having a wick-tube traveling in said passage-way, substantially as described.

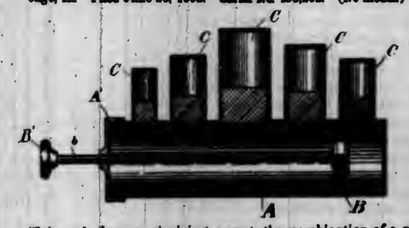
4. The combination, with the tubular slotted sheath and its igniting and extinguishing devices, of a torch having a wick-tube fitted to said slotted sheath, substantially as described.

5. The combination, with the tubular slotted sheath and its electric igniting devices, comprising a spring-contact overhanging the slot in the sheath, of a torch having a wick-tube traveling in said slot and curved transversely, so as to insure engagement with the spring contact centrally over its wick, substantially as described.



6. The combination, with the sheath, of a torch having a wick-tube, which torch is adapted to be slid longitudinally in said sheath, and a stationary end strip having a terminal overhanging the sheath in the line of movement of the wick-tube and serving as an extinguisher for the torch, substantially as described.

7. A torch open at one end, and thereby adapted to be filled at such end, and a screw-plug for closing such end and terminating in a handle for the torch, substantially as described.

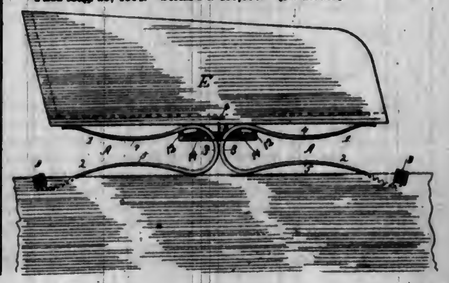


481,698. FIRE-ESCAPE. CHARLES M. FOWLER, Salem, Mass. Filed Apr. 30, 1892. Serial No. 431,232. (No model.)

Claim.—1. In a fire-escape, the combination, with the case A, of the circle O, having the lugs $c\,c'$ and extension x, provided with slot g, the rope m, coiled around the circle O, and the lever J, pivoted as at c', all substantially as described and set forth.

2. The combination, in a fire-escape, of the circular case A, having the ears A A and openings $f\,f^2$ and provided with a slot in its side, the circle O, bearing within the case and provided with the slotted extension x and lugs $c\,c'$, the rope m, coiled around the circle O and within the case, with its free ends carried without through the openings $f\,f^2$, the screws $c\,c'$, and the lever J, pivoted as at c', provided with extensions $i\,i'$ to contact with shoulders $e\,e'$ and with rope m^2, secured to its outer end, all substantially as described and set forth.

481,694. MUSICAL INSTRUMENT. JAMES B. GALLOWAY, Chicago, Ill. Filed June 23, 1892. Serial No. 438,292. (No model.)



Claim.—1. In a musical instrument, the combination of a main cylinder, a piston therein, means for operating the piston, and a series of organ-pipes connected with the interior of the cylinder, whereby as the piston is moved back and forth the pipes will be played upon, substantially as described.

2. In a musical instrument, the combination of a cylinder, a piston therein, means for operating such piston, and a series of organ-pipes of various sizes connecting with the interior of such cylinder, whereby as the piston is moved back and forth the pipes will be played upon, substantially as described.

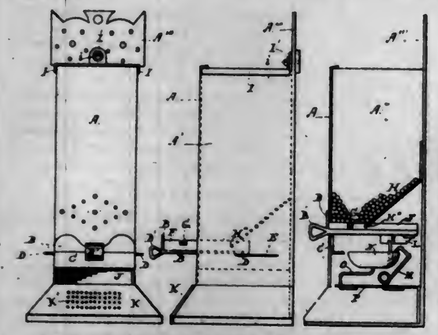
3. In a musical instrument, the combination of a cylinder, a piston therein, means for operating such piston, and a series of pipes arranged in a row along the outside of the cylinder and communicating with the interior thereof, whereby as the piston is moved back and forth the pipes will be played upon, substantially as described.

481,695. VEHICLE-SPRING. GEORGE T. GLOVER, Chicago, Ill. Filed Aug. 25, 1891. Serial No. 403,658. (No model.)

Claim.—1. A pair of double-armed springs formed with bent middle portions 3, which are arranged to abut against and back one another, as set forth, the springs being attached to a seat or body at points above their bent middle abutting portions and having the outer ends of their upper arms free to slide against a bearing on the seat or body, substantially as described.

2. The combination of a pair of double-armed springs, for the purpose set forth, and a keeper engaging and holding together the springs and serving to attach them to a seat or body supported upon them, said springs being arranged with their bent middle portions 3 abutting against one another and the outer ends of their upper arms free to slide against a bearing on the seat or body, substantially as described.

3. The combination of a pair of double-armed springs having curved middle portions 3, a keeper formed with a central transversely-arranged bearing portion for a fastening-bolt and oppositely-arranged openings 9 for the said bent middle portions of the springs, and a bolt D, extending up through the central bearing portion 8, so as to attach the keeper to a seat or body supported upon the springs, substantially as described.



4. A vehicle-seat provided with double-armed supporting-springs arranged in pairs and attached to the seat by keepers which engage the springs adjacent to their middle bends and hold the two springs of each pair with their middle bent portions 3 opposite one another and with the outer end portions of their upper arms, which extend from their middle bends respectively against the front and rear under side portions of the seat, the outer end portions of the lower arms of the springs being provided with hooks for engaging the sides of a vehicle-body, substantially as described.

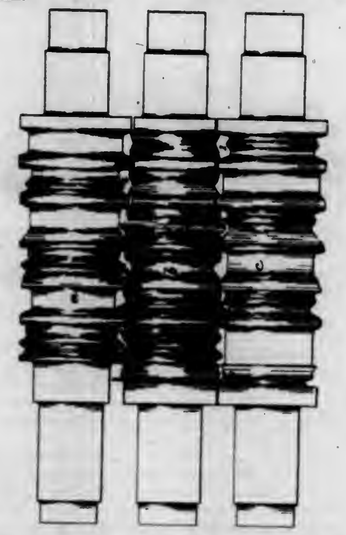
5. The combination, with a vehicle-seat, of double-armed springs arranged in pairs at opposite ends of the seat and having the outer ends of their lower arms provided with hooks adapted to catch onto the sides of the vehicle-body, keepers connecting the springs in pairs, and bolts for attaching the keepers to the seat, substantially as described.

6. The combination, with a pair of double-armed springs, of a keeper provided with a middle bearing portion 8, openings 9, through which the middle bent portions of the springs extend, and ends which bear against the under side of the upper spring-arms at points forward of said bent middle portions of the springs, substantially as described.

7. A double-armed spring applied for supporting a vehicle seat or body, to which it is attached by a keeper adjacent to its middle bend and formed with a straight upper arm 1^a, which is applied with its outer end portion bearing against but free to slide upon a bearing arranged upon the seat or body, so as to provide between the same and the straight portion of the spring between said bearing and its middle bend a space into which the said normally-straight portion of the spring may bend when cushioning upon the lower arm of the spring, substantially as described.

481,696. AUTOMATIC MATCH-SAFE. GEORGE W. HEFFNER, Montgomery County, Ohio. Filed Jan. 11, 1892. Serial No. 417,763. (No model.)

Claim.—1. In an automatic match-safe, a drawer having two or more longitudinal ribs extending upwardly and secured to the bottom thereof, each rib having a notch adapted to receive a single match.



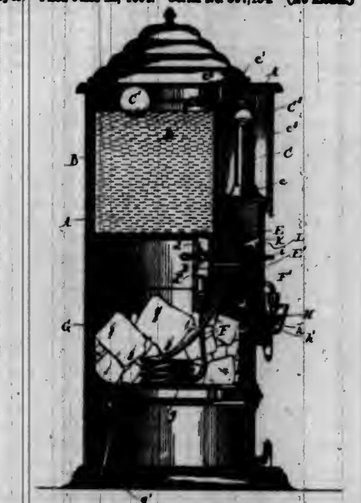
2. In an automatic match-safe, a box having an inclined plane provided with two or more notches at its lower end, secured to the back of said box, in combination with a sliding drawer having the bottom thereof provided with a series of ribs extending upwardly from the bottom, each rib having a notch adapted to receive a single match, substantially as described.

3. In an automatic match-safe, a drawer having a series of ribs extending upwardly from the bottom thereof, each rib having a single notch adapted to receive a single match, the said drawer provided with lugs (attached to the bottom thereof) projecting from its opposite sides and extending through slits made in the opposite sides of the box, whereby the rear of the drawer is supported and its motion in an inward and outward direction may be limited, (by the length of said slits,) as herein shown and described.

4. In an automatic match-safe, the combination of a box having an inclined plane attached to the back thereof, said plane having notches at its lower extremity, with a drawer having a series of longitudinal ribs secured to the bottom thereof, extending upwardly, each rib having a transverse notch adapted to receive a single match when placed in a position at right angles to the ribs.

5. In an automatic match-safe, a box having attached to the back thereof an inclined plane provided with notches and intermediate points at its lower extremity, each notch adapted to straddle each one of the series of ribs of a drawer, each of the said ribs having a notch to receive a single match, said drawer constructed to slide back and forth below said inclined plane and limited in its motion by lugs at the bottom thereof, which extend through slits in the opposite sides of said box, as herein described.

481,697. ROLLS FOR FORMING CONNECTING-PLATES FOR RAIL-JOINTS. DAVID H. LEWIS, Roanoke, Va., and ABRAHAM W. THOMPSON, Newark, N. J., assignors to the Continuous Rail Joint Company of America, of New Jersey. Filed Dec. 10, 1891. Serial No. 414,554. (No model.)



Claim.—1. In a machine for forming railway-rail connecting-plates, the combination of the roll *b*, having a narrow projecting flange g^{13}, with oppositely-inclined working faces g^4 g^5, and at one side of said flange having the working surfaces g^6 g^7 and comparatively low projection g^7, the said working faces g^6 g^7 g^5 being adapted to form with the co-operating roll to the concavous vertical portions of the said connecting-plates, and the roll *c*, having a working face g^{12} substantially parallel with the line of the working faces g^4 g^5 and having a deep groove formed by the oppositely-inclined faces g^{11} g^{12} lying substantially parallel with the faces g^4 g^5, the said working faces being formed to produce a connecting-plate having a vertical part to engage the web of the rail and bearings to engage the top and bottom of the flange thereof, substantially as set forth.

2. In a machine for making connecting-plates for railway-rails, the combination, with the roll *b*, having the working surfaces *y*, of the roll *c*, having the working surfaces g^5, the two sets of surfaces forming the pass 7, of which the portions 18 27 form a sharply-acute angle one with the other, and the portion 17, having the bearing-recesses g^4 and g^5, forms an obtuse angle with the portion 18 to roll a connecting-plate having a bearing or bearings on the web of the rail and on the top and bottom surface of the flange of the rail, substantially as set forth.

3. In a machine for making connecting-plates for railway-rails, the combination of rolls forming passes 1, 2, 3, 4, 5, 6, and 7, of which the first of said passes has a coincident angular recess and projection, the second a similar recess and projection, the pass being of reduced depth, the third of still further reduced depth and having another, an obtuse angle, formed in the pass, the fourth, fifth, and sixth passes being also of reduced depth and having, respectively, the projections d^{12}, e^{12}, and f^{12} forming, with the coincident working faces, pass portions approximating right angles, and the pass 7, having the projection g^{12}, formed much more acute than said projections d^{12} e^{12} f^{12}, the portions 18 27 of said pass being adapted to form the upper and lower bearings to engage the rail-flange and the portion 17 to form the web-bearings, substantially as set forth.

4. In a machine for making railway-rail connecting-plates, the rolls having a series of passes which gradually contract in depth and the last pass of the series having the portions 27 18 17, of which portions 27 18 form a sharply-acute angle and the portions 18 17 an obtuse angle to give the desired shape or form to the vertical web-bearing and the top and bottom flange-bearings, substantially as set forth.

481,698. LIQUID-DISPENSING APPARATUS. ROBERT H. LITTLE, Chicago, Ill., assignor of two-thirds to Henry H. Heimerdinger and Isaac Meyer. Filed June 23, 1891. Serial No. 397,154. (No model.)

Claim.—1. In apparatus of the class described, the combination, with a liquid-delivery pipe or channel and a liquid-discharge pipe or channel, of a series of movable vessels, a handle for moving said vessels coincident with said delivery and discharge pipes or channels, and an intermediate coin-controlled mechanism, whereby said handle may be thrown into engagement with said vessels to shift the same, substantially as described.

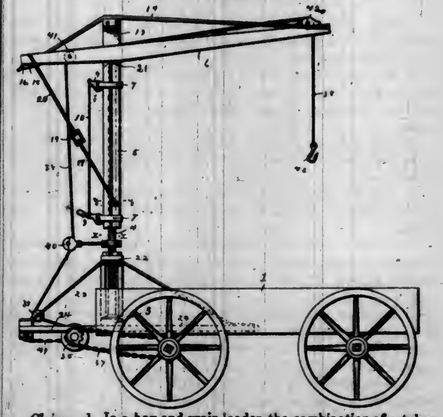
2. In apparatus of the class described, the combination, with a liquid-delivery pipe or channel and a liquid-discharge pipe or channel, of a series of rotatable vessels, a rod and handle for rotating said vessels, a coin-carrier connected with said rod, and suitable mechanism connected with said vessels, whereby when a coin is in the seat of the coin-carrier said carrier will engage with and serve to shift said vessels to move the same successively coincident with the delivery and discharge channels, substantially as described.

3. In apparatus of the class described, the combination, with a liquid delivery or induction pipe or channel, of a series of rotatable vessels, a rod and handle for rotating said vessels, a coin-carrier mounted upon and connected to said rod and provided with a seat to receive a coin, suitable devices, such as pawls or dogs, in suitable connection with said vessels for engaging the coin within the coin-carrier, and a suitable releasing-arm for throwing said dogs or pawls out of engagement with the coin, substantially as described.

4. In apparatus of the class described, the combination, with a cover-plate provided with delivery and discharge pipes or channels, of a series of movable vessels, each of which is open at one end and closed at the opposite end, said vessels having their open ends held closely against said plate, said plate serving to close said vessels except when coincident with the delivery and discharge pipes or channels, and a handle for shifting said vessels to bring them coincident with the delivery and discharge pipes or channels, substantially as described.

5. In apparatus of the class described, the combination, with a tank B, of a cover-plate D, provided with the pipes or channels *d* and *d'*, the vessels E and E', held against said cover-plate D, a vessel-holder E^2, by which said vessels are sustained, a spring E^3 for holding said vessels against said cover-plate, a rod I and handle *i*, whereby said vessels may be rotated, and suitable means for effecting the engagement of said rod I with said vessel-holder E^2, substantially as described.

6. In apparatus of the class described, the combination, with a cover-plate having a delivery pipe or channel and a discharge pipe or channel therein, of a series of open-ended vessels adapted to be brought coincident with said pipes or channels and a cooling-pipe connected with said discharge pipe or channel, whereby that portion only of the liquid within said cooling-pipe will be chilled, substantially as described.



7. In apparatus of the class described, the combination of a coin-chute, a coin-carrier, an operating-rod whereon said coin-carrier is mounted, a device—such, for example, as a vessel-holder—to be rotated, a suitable engaging pawl or dog upon said device, a releasing device for moving said dog or pawl to release the coin, and a spring for returning said coin-carrier to its normal position, substantially as described.

8. In apparatus of the class described, the combination of a coin-carrier, an operating-rod connected with said coin-carrier to shift the same, a plate provided with a coin-slot, a chute for receiving the coin and delivering it to the coin-carrier, said chute being movably sustained, and a spring for shifting said chute to close the coin-slot, substantially as described.

9. In apparatus of the class described, the combination of a cover-plate provided with an induction or delivery pipe or channel, a series of rotatable vessels adapted to be brought coincident with said pipe or channel, a vessel-holder for said vessels, a rod and handle whereby said vessels are rotated, a coin-carrier mounted upon said rod and provided with a seat for the coin, a ratchet-wheel connected to said vessel-holder, a check-pawl for engagement with said ratchet-wheel, suitable coin-engaging devices upon said ratchet-wheel, and a coiled spring for returning said coin-carrier to its normal position, substantially as described.

10. In apparatus of the class described, the combination of a cover-plate D, provided with pipes or channels *d* and *d'*, a vessel-holder E^2, vessels E and E', carried by said vessel-holder, a ratchet-wheel P, connected to said vessel-holder, an operating-rod I, a coin-carrier M, having a seat *m*, a chute L for delivering the coin to said coin-carrier, a pawl *p* for engagement with said ratchet-wheel, a spring O for returning said coin-carrier to its normal position, suitable dogs R R' for engaging a coin within the coin-carrier, and a fixed plate N, provided with a releasing-arm for contacting with said pawls or dogs R R' to release the coin, substantially as described.

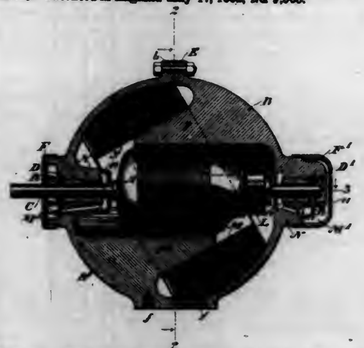
481,699. HAY AND GRAIN LOADER. FRANKLIN J. LOVELL, Litchfield, Mich. Filed Aug. 7, 1890. Renewed Aug. 17, 1891. Again renewed June 23, 1892. Serial No. 437,690. (No model.)

Claim.—1. In a hay and grain loader, the combination of a tubular upright movably secured within the wagon-body, a sectional sleeve embracing said upright and carrying a boom, and clamps carried by the sleeve to hold the same at any desired height on the upright.

2. In a hay and grain loader, the combination of an upright rotatably mounted upon the wagon-body, a sectional sleeve carrying clamping devices embracing the said upright, a boom pivoted upon the said sleeve, and adjustable guy-rods connecting the sleeve and boom.

3. In a hay and grain loader, the combination of an upright rotatably mounted upon the wagon-body, a sleeve embracing the said

upright, having a knife-edge bearing, a boom engaging the said bearing, and adjustable guy-rods connecting the sleeve and boom.



4. In a hay and grain loader, the combination of a standard rotatably mounted upon the wagon-body, an arm rigidly secured thereto, a block having a sliding connection with said arm, a sleeve carried by the upright, a boom carried by the sleeve, and a rope extending from the boom to a suitable elevating mechanism and extending through the said block.

481,700. BRICK. PHILIP S. LOVERIDGE, Knoxville, Pa. Filed May 17, 1892. Serial No. 433,280. (No model.)

Claim.—A brick having a recess or inset in one edge at substantially the center point from end to end, said recess or inset being in depth substantially half the width of the brick and in length substantially half the length of the brick.

481,701. ELECTRIC MOTOR OR DYNAMO-ELECTRIC MACHINE. ROBERT LUNDELL, Brooklyn, assignor of two-thirds to Edward H. Johnson, New York, N. Y. Filed Mar. 14, 1892. Serial No. 424,818. (No model.) Patented in England May 17, 1892, No. 9,365.

Claim.—1. An electric motor having a rotary armature and two overlapping field-magnet poles, all surrounded by a single field-magnet coil, substantially as described.

2. An electric motor having the axes of its field-magnet and armature coils inclined at an angle to each other, with field-magnet poles included in the angular space between said coils, substantially as described.

3. Two semi-spherical field-magnet cores having internally-projecting overlapping pole-pieces and a single field-magnet coil, substantially as described.

4. Two semi-spherical field-magnet cores having internally-projecting overlapping pole-pieces integral therewith, substantially as described.

5. A pair of semi-spherical field-magnet cores having internally-projecting overlapping pole-pieces integral therewith, a rotary armature, and a single surrounding field-magnet coil, substantially as described.

6. A pair of semi-spherical field-magnet cores inclosing a single field-magnet coil and a rotary armature, the effective poles of the field-magnet lying between the armature and the surrounding field-magnet coil, substantially as described.

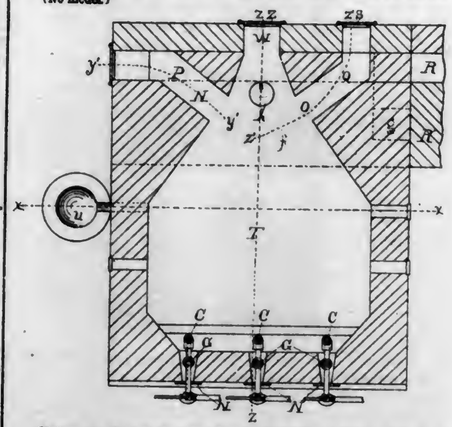
7. Two hemispheres made of magnetic material having internal overlapping pole-pieces cast integral therewith, and a single field-magnet coil which surrounds the pole-pieces, and a rotary armature, substantially as described.

8. Two hemispheres of magnetic material having internal overlapping pole-pieces integral therewith and means for holding the said hemispheres together, substantially as described.

9. Two hemispheres of magnetic material having each an internal semi-cylindrical pole-piece integral therewith and each overlapping the other, substantially as described.

10. Two hollow hemispheres of magnetic material having each a semi-cylindrical pole-piece integral with its inner face, said pole-pieces overlapping each other, a rotary armature journaled in the opposite hemispheres and lying between the pole-pieces, in combination with a single field-magnet coil, substantially as described.

11. An electric motor having all of its parts inclosed in a two-part magnetic shell, which sustains the journal-bearings of the armature-shaft and the commutator-brushes, the latter being adjustably secured in insulating-sleeves, substantially as described.



12. An iron-clad electric motor consisting of two hemispheres of magnetic material having the journal-bearings of the armature shaft in the opposite hemispheres and commutator-brushes secured in one of said parts in insulating-sleeves, substantially as described.

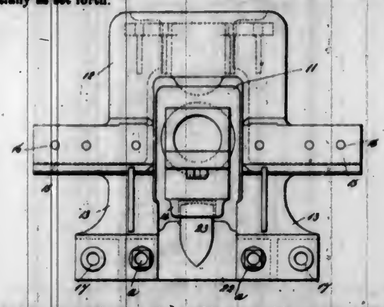
481,702. TREAD FOR STAIRS, &c. JONATHAN MASON and JOSEPH MASON, London, and WILLIAM S. CONNER, Stoke Newington, Middlesex, England. Filed June 11, 1892. Serial No. 436,339. (No model.) Patented in England Apr. 7, 1891, No. 5,968; in France Apr. 25, 1891, No. 212,963, and in Belgium Apr. 29, 1891, No. 94,712.

Claim.—A tread for stairs and other purposes, consisting of a plate A, of hard metal, provided with ribs *a* and undercut or dovetail-shaped spaces *b* between the ribs, in combination with filling-pieces *c*, of soft non-slipping material, placed in the spaces *b*, as and for the purpose set forth.

481,708. REVERBERATORY SMELTING-FURNACE. HENRY MATHEY, South Riverside, Cal. Filed Feb. 24, 1891. Serial No. 382,444. (No model.)

Claim.—1. A reverberatory furnace comprising the combination of a hydrocarbon-burner, a suitable deflecting-roof arranged to receive the flame from such burner and direct the heat downward upon the charge to be smelted, and a chamber narrowed by diagonally-arranged walls at the end opposite that at which the flame is introduced and provided with two or more draft-flues opening, respectively, from the chamber through such diagonal walls.

2. A hydrocarbon-burning reverberatory furnace having its chamber narrowed by diagonally-arranged walls at the ends opposite that at which the flame is introduced and provided with two or more draft-flues opening, respectively, from the chamber through such diagonal walls.



3. A hydrocarbon-burning reverberatory furnace having its chamber narrowed by diagonally-arranged walls at the end opposite that at which the flame is introduced, two or more draft-flues opening, respectively, from the chamber through such diagonal walls, and means for partially closing one or more of such flues to direct the draft toward the other draft flue or flues.

481,704. CAR-TRUCK GEAR. EDGAR PECKHAM, New York, N. Y. Filed Aug. 18, 1891. Serial No. 403,000. (No model.)

Claim.—1. In a car-truck gear, the combination, with an axle-box, of a yoke comprising two members detachably connected together, the upper member having a bearing in the top of the axle-box and the lower member having a bearing in the bottom of said axle-box, substantially as set forth.

2. In a car-truck gear, the combination, with an axle-box, of a yoke comprising an upper and a lower member detachably connected together and in contact, respectively, with said axle-box at top and bottom thereof by suitably adjustable bearings, spaces being provided between the vertical sides of the axle-box and the yoke to facilitate the removal of the axle-box, substantially as set forth.

3. In a car-truck gear, the combination, with an axle-box, of a yoke comprising two members detachably connected together, the upper member having a bearing in and coacting with the top of the axle-box and the lower member having a bearing in and coacting with the bottom of the axle-box, the bearing-surface in the bottom of said axle-box elongated in the direction of the width of the truck, substantially as set forth.

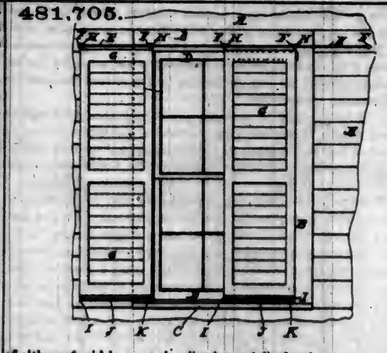
4. In a car-truck gear, the combination, with an axle-box provided in its top with a semi-spherical bearing-surface, of a yoke provided on the under side of its upper horizontal portion with a bearing-surface the complement of the bearing surface on the axle-box, the legs of said yoke equipped with lateral arms, as 15, for securing the same to the truck-frame, substantially as set forth.

5. In a car-truck gear, the combination, with an axle-box provided with a recess on its under side, of a yoke supported by said box and provided with a vertical projection extending upward into said recess, substantially as set forth.

6. In a car-truck gear, the combination, with an axle-box, of a yoke supported by said box and provided with vertical legs extending downward along the sides of said box, and a cross connection between said legs, detachably joined thereto and co-operating with the under side of the axle-box, substantially as set forth.

7. In a car-truck gear, the combination, with an axle-box, of a yoke supported on top of said box and provided with vertical legs having a detachable connection underneath said box inserted into sockets provided on said legs, substantially as set forth.

8. The combination, with an axle-box provided with an elongated socket in its bottom and a yoke supported on top of said axle-box, of a detachable retaining-piece coacting with the lower part of the yoke and having a pin or stud operating within said socket of the axle-box, substantially as set forth.



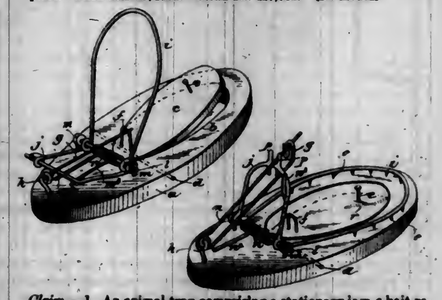
9. In a car-truck gear, the combination, with an axle-box, of a yoke supported on top of said box and a bearing-piece with curved surface detachably connected with said yoke and engaging with a corresponding bearing-surface on top of the axle-box, substantially as set forth.

10. In a car-truck gear, the combination, with an axle-box, of a yoke supported by said box and provided with a recess for receiving an elastic cushion and a bearing-piece supporting said cushion in the yoke and engaging with a bearing-surface on top of the axle-box, substantially as set forth.

11. In a car-truck gear, the combination, with an axle-box, of a yoke supported by said box and provided with a cylindrical recess in the under surface of its upper horizontal member, a hollow metallic bearing-piece fitted to slide within said recess, and a suitably-formed elastic cushion or spring inserted in said bearing-piece within the recess of the yoke, substantially as set forth.

481,705. SHUTTER-WORKER. NEHEMIAH SALTMARSH, Concord, N. H. Filed Apr. 14, 1892. Serial No. 429,108. (No model.)

Claim.—The sliding blinds pivotally connecting by brackets at their top to a horizontal rod mounted near the top of a window-frame, suitable operating-cords passing from each upper corner of said blinds over a roller and through an opening made for the purpose in said window-frame to the interior of a room, the said roller located upon the outside and a metallic socket upon the inner side of said window-frame, suitable guides connecting the bottom of said blinds with the window-sill, and means for holding either of said blinds at an angle with the window, comprising a brace or rod adjustably pivoted at one end to either blind and having at its free end a hook, and an eye upon either side of said window-frame for engaging the hook at the free end of either of said brace-rods, all substantially for the purpose set forth.



481,706. HARVESTER AND BINDER. JOHN M. TRIER, Jefferson, Ind. Filed Jan. 26, 1892. Serial No. 419,260. (No model.)

Claim.—The combination, with the harvester truss-frame having the slots *c* formed therein, of an attachment consisting of the segment-rack adapted to slide in the said slots, the plate G, extending across the rack and provided with legs *f*, secured to the said rack, the spiral springs secured to the plate, and the rods F, passing through the truss-frame, the springs, and the plate, whereby the weight of the harvester is transferred from the segment-rack to the springs, substantially as shown and described.

481,707. ANIMAL-TRAP. CHAUNCEY B. TRUMBLE, Groton, N. Y., assignor, by mesne assignments, of one-half to Hiram G. Moe, same place. Filed Jan. 23, 1892. Serial No. 419,002. (No model.)

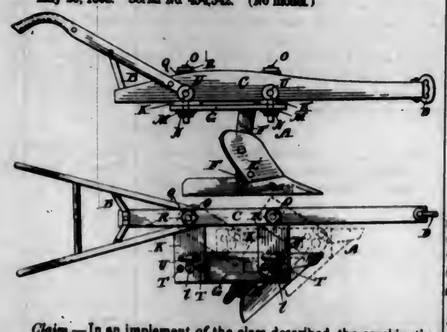
Claim.—1. An animal-trap comprising a stationary jaw, a bait-receiving device, a movable spring-jaw pivoted to the stationary jaw and having a rigid integral back piece by which it may be set, and a trigger secured to the stationary jaw and adapted to be laid over the back piece to engage the bait-receiving device to set the trap, substantially as described.

2. In an animal-trap, a spring-jaw having a front portion constructed to catch and kill animals and a back piece arranged substantially at right angles to the front portion and integral therewith, combined with a base or lower stationary jaw to which the spring-jaw is pivoted, a spring constructed independently of the two jaws and interposed between the two jaws, and a trigger for setting the spring-jaw, substantially as described.

3. In an animal-trap, a movable jaw composed of an active portion provided with a right-angled back portion integral with the active portion and by which the active portion may be manipulated and having pivot-holes, combined with a pivot, a spring for the jaw, a trigger, a stationary jaw, and a baiting device, substantially as described.

4. In an animal-trap, a movable jaw composed of an active por-

tion having a right-angled back portion integral therewith for manipulating the jaw, combined with a pivot fitted to pivot-holes in the movable jaw, a spring for closing the jaw forcibly, a trigger connected and moving with the back portion, a stationary jaw, a baiting device, and a spring normally moving the baiting device toward the movable jaw, substantially as described.



5. In an animal-trap, a stationary jaw having a suitable baiting device and trigger, combined with a movable spring-jaw having an active portion and an integral and rigid right-angled back or manipulating portion and pivoted to the stationary jaw, substantially as described.

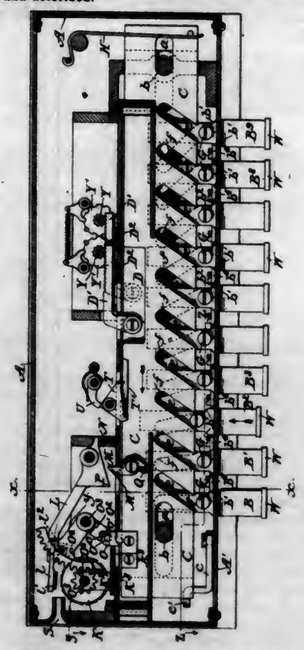
6. An animal-trap comprising a stationary jaw, a bait-receiving device, a movable spring-jaw pivoted to the stationary jaw and having a back piece by which it may be set, and a trigger secured to the stationary jaw and adapted to be laid over the back piece and engage the bait-receiving device to set the trap and having a notch or offset to engage the back piece when the trap is sprung to lock the movable jaw and prevent its victim from raising it, substantially as described.

7. An animal-trap comprising a stationary jaw, a bait-receiving device, a movable spring-jaw pivoted to the stationary jaw and having a back piece by which it may be set, and a trigger permanently engaged with the back piece and adapted to be extended over it when it is prone into engagement with the bait-receiving device to set the trap and having a notch or offset to engage the back piece when the trap is sprung to lock the movable jaw and prevent its victim from raising it, substantially as described.

8. An animal-trap comprising a stationary jaw, a bait-receiving device, a movable spring-jaw pivoted to the stationary jaw and having a back piece by which it may be set, and a trigger permanently engaged with the back piece and adapted to be extended over it when it is prone into engagement with the bait-receiving device to set the trap, substantially as described.

481,708. PLOW. EDWARD L. WARD, Santa Rosa, Cal. Filed May 25, 1892. Serial No. 434,342. (No model.)

Claim.—In an implement of the class described, the combination of a plow-stock, a plowshare, parallel links connecting said share with said stock, pivotal connections of said links with said share and said stock, and a series of corresponding holes passing through said share and one end of each of said links, substantially as and for the purpose set forth.



481,709. CHECK PRINTING AND ADDING MACHINE. CARL W. WEHR, Brooklyn, N. Y., assignor to the Kruse Cash Register Company. Filed Sept. 9, 1891. Serial No. 405,184. (No model.)

Claim.—1. The combination of a type-wheel having a single peripheral row of type characters, means to rotate said wheel, a series of keys, means intermediate each of said keys and wheel to shift the latter longitudinally, a platen extending over the line of movement of the wheel, and means to produce an impression at different points in the line of travel of the wheel, substantially as shown and described.

2. The combination of a type-wheel having a single peripheral row of type characters, a shaft with which said wheel rotates and on which it is free to be moved longitudinally, means to rotate the shaft, a series of keys, means intermediate each of said keys and wheel to shift the latter upon the shaft, a platen extending over the line of movement of the wheel, and means to produce an impression at different points in the line of travel of the wheel, substantially as shown and described.

3. The combination of a type-wheel having a single peripheral row of type characters, a shaft with which said wheel rotates and on which it is free to be moved longitudinally, means to rotate the shaft, a series of keys, a sliding plate adapted to carry the wheel with it, means intermediate said keys and plate to shift the latter, a platen extending over the line of movement of the wheel, and means to produce an impression at different points in the line of travel of the wheel, substantially as shown and described.

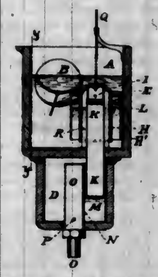
4. The combination of a type-wheel, a shaft with which said wheel rotates and on which it is free to be moved longitudinally, means to rotate the shaft, a series of keys, a sliding plate adapted to carry the wheel with it and formed with an incline, and means actuated by said keys to co-operate with said incline and shift the plate, substantially as shown and described.

5. The combination of a type-wheel, a shaft with which said wheel rotates and on which it is free to be moved longitudinally, means to rotate the shaft, a series of keys, a sliding-plate adapted to carry the wheel with it and formed with an incline, and a sliding bar adapted to co-operate with said incline to shift the plate and to be moved by said keys, substantially as shown and described.

6. The combination of a type-block movable in a plane parallel with its face and bearing a single line of type characters, a series of keys, means intermediate each of said keys and type block to shift the latter in the plane of its movement and at a right angle to the line of type characters, a platen extending over the line of movement of the type, and means to produce an impression at different points in the line of travel of the type, substantially as shown and described.

7. The combination of a type-block movable upon bearings parallel with its face and having a single line of type characters, a sliding plate adapted to carry said type-block with it, a series of keys, means intermediate said keys and plate to shift the latter, a platen extending over the line of movement of the type, and means to produce an impression at different points in the line of travel of the type, substantially as shown and described.

8. The combination of a type-wheel, a shaft with which it rotates, a series of rows of keys, a series of swinging arms corresponding to said rows of keys, means intermediate said arms and shaft to rotate the latter, a series of sliding bars adapted to engage said arms, and means intermediate said rows of keys and the corresponding bars to shift the latter, substantially as shown and described.

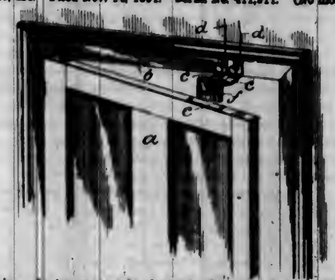


9. The combination of a type-wheel, a shaft with which it rotates, a series of sliding bars, a series of swinging arms having notches with which said bars are adapted to engage, means to move said bars, and means intermediate said arms and shaft to rotate the latter, substantially as shown and described.

10. The combination of a type-wheel, a shaft carrying said wheel, a second shaft, gearing intermediate said shafts, a series of arms upon said second shaft, a series of rows of keys, and means actuated by said keys and adapted to engage said arms, substantially as shown and described.

11. The combination, with a type-wheel, a series of bars movable

longitudinally, and means intermediate said bars and wheel to rotate the wheel, of a series of stop-plates severally pivoted between said bars and formed with shoulders adapted to stand in the path of movement of said bars and to contact with corresponding shoulders of adjacent stop-plates, and a series of rows of keys, and intermediate means to shift said bars, substantially as shown and described.



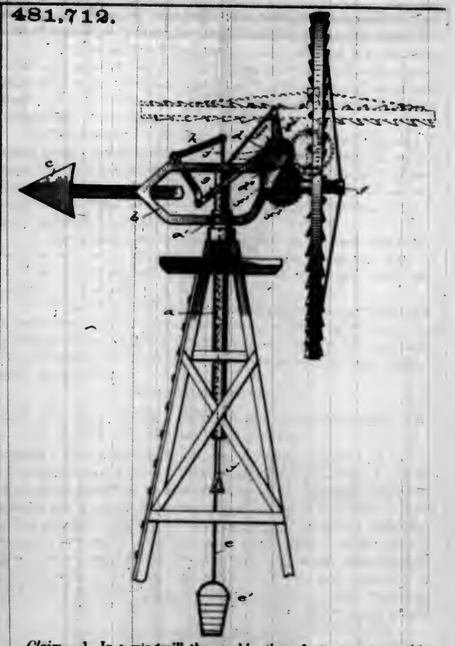
481,710. FLUSH-TANK. BENEDETTE WILLIAMS and CHARLES POOLE, Chicago, Ill. Filed Sept. 19, 1891. Serial No. 406,286. (No model.)

Claim.—1. The combination, with an automatically-filling tank containing the intaking-limb of a siphon, of an independent open-bottomed and voluminous air-chamber connected near its top with the head of said siphon by means of a small air-passage and sealed and unsealed by the rise and fall of water in said tank through the action of said siphon and the action thereof permanently broken through said enlarged air-chamber and air-passage, substantially as specified.

2. The combination, with an automatically-filling tank containing both the intaking-limb of a siphon and an independent open-bottomed and voluminous air-chamber and an air-passage connecting said chamber and head of said siphon, of a tank provided with a discharge-pipe and a trap to the discharging end of said siphon, substantially as specified.

481,711. ELECTRIC DOOR-ALARM. MERTON W. RESSEY, Waterville, Me. Filed Nov. 14, 1891. Serial No. 411,911. (No model.)

Claim.—1. In an electric alarm for doors, windows, and the like, the combination of a pair of metallic plates on the frame or casing, a metallic connecting strip on the door, and a piece of insulating material adapted to be interposed between the plates and the strip as the door moves in one direction only, substantially as described.



2. The combination of the metallic plates *c*, secured to the frame, the connecting metal strip *e*, attached to the moving part, and the insulating-strip *f*, arranged to be struck by the moving part and interposed between the plates and the strip, as and for the purpose set forth.

3. The combination of the wires *d*, the metallic plates *c*, the metallic connecting-strip *e*, and the piece of insulating material *f*, attached at its upper end to the outer ends of the plates *c*, substantially as described.

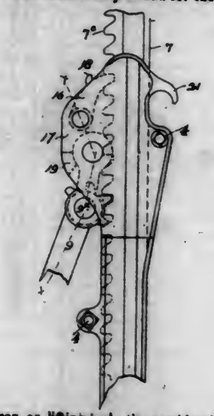
4. The combination of the metallic plates *c* on the frame or casing, a hinged cover or housing protecting and concealing the same, the connecting metal strip *e* on the door, and a strip of insulating material depending below the housing and the frame and arranged so as to be struck by the door in moving in one direction and interposed between the plates *c* and the connecting-strip, substantially as described.

481,712. WINDMILL. GEORGE W. CAMPBELL, El Paso, Tex., assignor to John V. Taggart and James H. Boone, same place, and Frank Brown, Jr., Austin, Tex. Filed Dec. 22, 1891. Serial No. 415,875. (No model.)

481,712.

Claim.—1. In a windmill, the combination of a tower, a rotatable frame mounted thereon, a counterbalancing-weight upon the front end of this frame, a vertically-swinging frame pivotally supported upon the rear end of the rotatable frame, an operating-cord connected to the swinging frame above its pivotal point, a wind-wheel having its shaft journaled in the lower end of the vertically-swinging frame, the axis of the wind-wheel shaft being below the axis of the swinging frame, a gear-wheel on the wind-wheel shaft, gearing supported on the swinging frame and meshing with the gear-wheel on the wind-wheel shaft, and operating mechanism connected to the gearing, substantially as described.

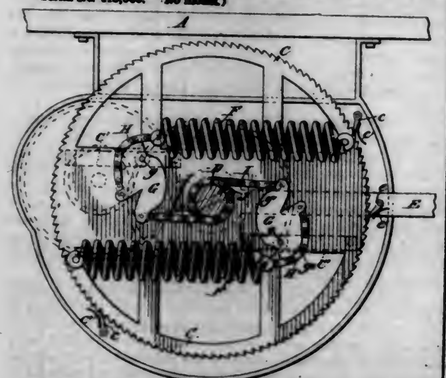
2. The combination of a tower, a vertical tube thereon, a revolving frame on said tube, an upright swinging frame pivoted on the other end of said revolving frame, a wind-wheel having its shaft journaled in the lower end of the latter frame and provided with a bevel-pinion, gear-wheels journaled on said swinging frame and meshing with said pinion, a forwardly-extending connecting-rod connected to one of said gear-wheels, an angle-lever pivoted on the revolving frame and having one of its arms attached to said connecting-rod, and a working rod connected to the other arm of said angle-lever and extending down through the vertical tube, substantially as described.



3. The combination of a revolving frame, an upright swinging frame pivoted on the rear end of said frame, a wind-wheel having its shaft journaled on the lower end of said swinging frame below its pivotal point, operating mechanism connected to said wheel-shaft, and a depending cord or wire connected to the upper end of said swinging frame above its pivotal point and carrying a variable weight at its lower end, substantially as described.

4. The combination of a tower, a tube thereon, a rotatable frame on said tube and having its rear end provided with arms *d d*, a counter-balance on its forward end, an open frame *d'*, journaled between the arms *d d*, a wind-wheel having its shaft journaled in the frame *d'* below its pivotal point, a bevel-gear on said shaft, a bevel-gear f^3, journaled in the frame *d'* and meshing with the gear on the shaft, a gear f^4, journaled in the swinging frame and meshing with the gear *d*, a rod *g*, connected to the gear f^4, and means connecting this rod to the operating-cord connected to the upper end of the swinging frame *d'* and extended down through the tube and carrying an adjustable weight, substantially as described.

481,718. WAGON-JACK. MANUEL C. JACKSON, Denver, Colo. Filed Dec. 1, 1891. Serial No. 413,795. (No model.)



Claim.—1. The combination, with a suitable frame provided with a hook 21, of a movable rack-bar supported therein and having a hook 20, a lever fashioned to engage the face of said bar, a movable fulcrum located on the frame and supporting the lever, and a locking-dog pivoted on the frame and automatically locking the movable bar

as it is released by the lever, whereby hooks 20 and 21 are made to approach each other, substantially as and for the purpose set forth.

2. In a wagon or lifting jack, the combination, with a suitable frame, of a movable rack-bar supported therein, a lever engaging the face of the movable bar and provided with an oscillating fulcrum pivoted on the frame at one extremity and to the lever at the opposite extremity, the frame being shouldered to engage said section and to prevent the teeth of the lever from engaging the bottoms of the recesses between the teeth of the rack, the frame being provided with an interiorly-projecting lug adapted to engage said fulcrum and to prevent its outer movement after the disengagement of the lever from the rack-bar, substantially as and for the purpose set forth.

481,714. SPRING-MOTOR. JOHN F. LANE, Emerson, and JAMES W. ROPER, Cartersville, Ga., assignors to themselves, and Woodville Latham and Enoch J. Rector, Chattanooga, Tenn. Filed Dec. 14, 1891. Serial No. 415,009. (No model.)

Claim.—1. In a spring-motor, the combination of a driving-shaft, a wheel, pivoted devices on said wheel, coiled springs connected to said wheel and to said devices, and connections between said devices and the shaft.

2. In a spring-motor, the combination, with the main shaft, of a winding wheel and parallel coiled springs pivoted thereto, said springs being capable of extension and contraction in the line of their axes and being so connected and arranged with the shaft as to actuate the latter, substantially as described.

3. In a spring-motor, the combination, with the main shaft, of a winding-wheel mounted thereon, coiled springs pivoted to the wheel near its periphery, pivoted lever-acting cams having suitable elliptical or curved edges, chains connecting the ends of the springs with said cams, and chains connected to the main shaft and also to the said cams, so that when the winding-wheel is rotated forward the chains may wind on the shaft, substantially as described.

4. In a spring-motor, the combination of a main driving-shaft, the winding-wheel, cams pivoted to said wheel, said cams having suitably-curved edges and having their pivotal points near one end thereof, connections between the cams and the main shaft, and coil-springs which are capable of expansion and contraction in the line of their axes, said springs being connected to the wheel and to the cams, substantially as described.

5. In a spring-motor, the combination of a main shaft, a ratchet-wheel, pivoted cams on said wheel on opposite sides of the shaft, coiled springs pivoted to the wheel near its periphery, chains connecting the other ends of said springs with the cams, and chains connecting the cams with the shaft, substantially as described.

6. In a spring-motor, the combination of a driving-shaft, a winding ratchet-wheel, a holding pawl or pawls therefor, a winding pawl-carrying lever, cams pivoted to said wheel, the coiled springs on the wheel near its periphery, and connections between the springs and its cams and between the cams and the shaft, substantially as described.

7. In a spring-motor, the combination, with a driving-shaft, of the winding-wheel mounted thereon, a cam pivoted to said wheel, a coiled spring pivoted to the wheel near its periphery, a flexible connection between the other end of said spring and the cam, and another connection between said cam and the shaft, substantially as described.

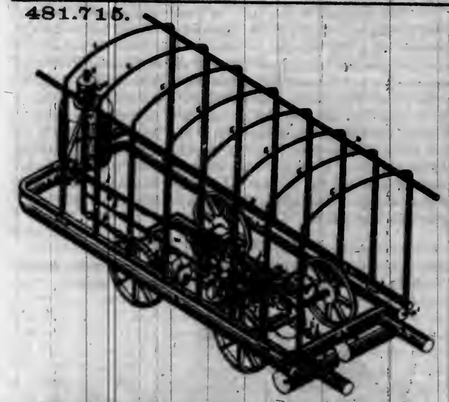
8. In a spring-motor, the combination of a main driving-shaft, a winding-wheel mounted loosely thereon, an elliptical or curved cam pivoted near one of its foci to the wheel, a coiled spring pivotally connected to the wheel near its periphery, a flexible chain or cable connection between the end of the spring and the cam, and another similar connection between the cam and the shaft, which latter is adapted to wind about the shaft, all arranged so that the leverage of the cam will increase as the resiliency of the spring decreases in the compression of the latter, so that thereby an equality of action may be produced in the operation of the driven shaft, substantially as described.

9. In a spring-motor, the combination of a main driving-shaft, a ratchet-wheel mounted loosely thereon, cams pivoted to the face of said wheel, coiled springs pivoted to the wheel near its periphery, flexible connections between the ends of said springs and the cams, similar connections between the cams and the main shaft that wind around the latter, holding-pawls for the ratchet-wheel, the winding-handle provided with a pawl that engages the said wheel, the fixed gear on the main shaft, and suitable multiplying gearing between it and the driving-pulley, substantially as described.

10. In a spring-motor, the combination of the main driving-shaft having a fixed gear thereon, a train of gearing between it and the driving pulley, and suitable braking devices for regulating the speed of the driving-shaft and gearing, a winding-wheel mounted loosely on the driving-shaft, the actuating coiled springs for said winding-wheel, pivoted thereto and arranged so as to exert their resiliency to produce a rotation of the main shaft, and a winding-lever which engages the said winding-wheel and rotates it sufficiently to extend the springs and thereby wind up the machine when required, substantially as described.

11. In a spring-motor, the combination, with the main shaft, of a winding-wheel thereon, coiled springs pivoted to the wheel, cams pivoted to the wheel, and connections between the springs and cams and the cams and shaft, the gearing actuated by said shaft, a smooth pulley on one of the gear-shafts, a strap partially surrounding said pulley, and a bent vibratory lever pivoted on the frame and connected to one end of said strap, the whole arranged for the purpose of regulating the speed of the machine, substantially as specified.

12. In a spring-motor, the combination of the main shaft, a suitable train of gearing to be actuated thereby, a wheel mounted loosely on said shaft, coiled springs pivoted thereto near its periphery, and cams G G, pivoted to the wheel near the end of their major axes at points g g, said cams having the oppositely-located curved edges g' and g^2, and the flexible connecting-links pivotally attached to the cams at their ends farthest from their pivotal points and to the main driving-shaft and the free ends of the coiled springs, respectively, substantially as described.



13. In a spring-motor, the combination, with the main shaft, of winding mechanism consisting of a rotary wheel, a handle for rotating it, a coiled spring for driving it, said spring being pivoted on the face of the wheel and capable of expansion and contraction in the line of its axis, and a connection between said spring and the shaft, so that after the spring has been extended the force of its compression may rotate the said shaft, substantially as specified.

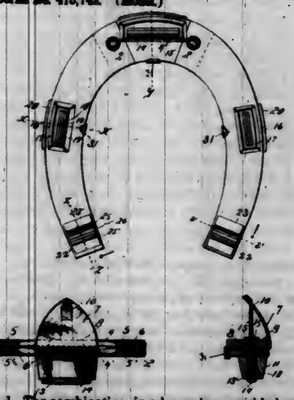
14. The combination, in a spring-motor, of the shaft, a wheel mounted thereon, and a coiled spring carried on the face of said wheel, said spring being capable of expansion and contraction in the line of its axis and arranged and connected with the shaft for the purpose of actuating it, substantially as described.

481,715. MOTOR FOR STREET-CARS. JAMES G. LIGHTFOOT, Indianapolis, Ind. Filed July 3, 1891. Serial No. 398,404. (No model.)

Claim.—1. The combination, in a street-car, of the main frame-work consisting of the sills A A, distributing-pipes B B, stanchions C C, eaves D D, and roof-rafters E E, all being pipes and providing storage for the gas and being connected by pipes n n', all substantially in the manner and for the purpose set forth.

481,715.

2. In a street-car, the combination of the gas-pumps t t, air-pumps f f, engine-shaft b, spur gear-wheels e e, pump-shafts e e, having cranked ends that drive the pistons in pumps f f, substantially as described.



3. In a street-car motor, the combination of the main framework, all formed of pipes and providing a storage for a gas, the shaft b, friction-wheel X, idler friction-wheels Y Y, the driven friction-wheels W W, the truck-axles Z Z, and the lever P, substantially as described.

4. The combination of the main framework consisting of the storage-pipes A, B, C, D, and E, the gas-pumps t t, air-pumps f f, engine-shaft b, spur gear-wheel e e, pump-shafts e e, friction-wheel X, idler friction-wheels Y Y, driven friction-wheels W W, and truck-axles Z Z, substantially as described.

5. In a street-car motor, the combination of the idler friction-wheels Y Y, the links U U U U, the stands V V V V, shafts p p, the arms T T, the rods R S, arm Q, the shaft O, the lever P, and the segmental guide-plate l, for the purpose as set forth.

6. In a street-car motor, the combination of the boiler F, the engine-cylinders a a, the friction-wheels X, Y Y, and W W, the air-pumps f f, gas-pumps t t, reducing-valve i, and storage-pipes A A, B B, C C, D D, and E E, &c., substantially as described, and for the purpose as set forth.

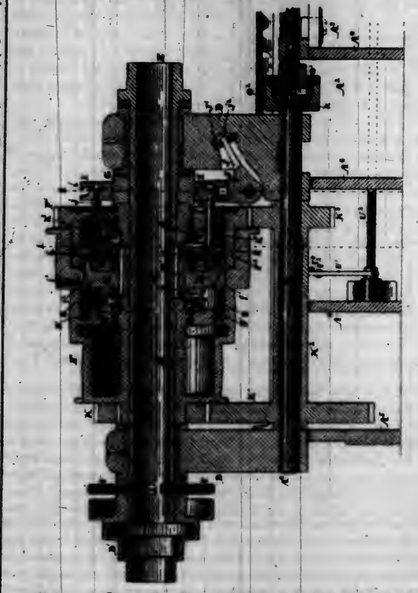
481,716. HORSESHOE. HOLGER OLSON, Henderson Grove, assignor of one-half to John Olson Lander, Knoxville, Ill. Filed Dec. 21, 1891. Serial No. 415,742. (Model.)

Claim.—1. The combination, in a horseshoe provided with a slot, of an integral calk-socket secured thereto by a wedge and trapezoidal-shaped sections extending in said slot, substantially as described.

2. The combination, in a horseshoe provided with a slot, of an integral calk-socket secured thereto by means of a wedge and sections provided with lugs extending in said slot, substantially as specified.

3. The combination, in a horseshoe provided with a slot, of an integral calk-socket secured to the shoe by a wedge and trapezoidal-shaped sections provided with lugs extending into said slot, substantially as described.

4. In a horseshoe provided with a slot, an integral calk-socket, in combination with calk-sections passing through the socket and slot and adapted to engage the walls of the latter to hold the calk and socket in position, in the manner and for the purpose set forth.



5. The combination, in a horseshoe made of plates provided with a slot, of a pointed metallic toe-shield provided with a slot which registers with slots in the plates, the upper end of said shield being bent backward and provided with a hole through which passes a wedge, substantially as described.

6. The combination, in a horseshoe, of a toe-section composed of plates and a pointed metallic shield secured between said plates, one end of which shield is bent around the inner edge of one of the plates, the other end being pointed and bent upward and backward and provided with a transverse hole through which a wedge is adapted to pass, substantially as specified.

7. The combination, in a horseshoe, of an integral calk-socket provided with a transverse recess, said socket being secured to the shoe by sections provided with shoulders which fit within the recess, substantially as described.

8. The combination, in a horseshoe, of a calk-socket provided with a transverse recess, said socket being secured to the shoe by sections having shoulders which fit within the recess, lugs on the upper ends of said sections, and a wedge driven between said sections, substantially as described.

481,717. LATHE. CHARLES G. RICHARDSON, Boston, Mass. Filed Jan. 25, 1892. Serial No. 419,156. (No model.)

Claim.—1. In a lathe, the combination of a work holding and rotating chuck, a bed provided with suitable ways, a carriage supported by and movable endwise of said ways, and an annular tool-carrier surrounding said bed and supported by said carriage and having provision for securing the cutting-tool holders to it.

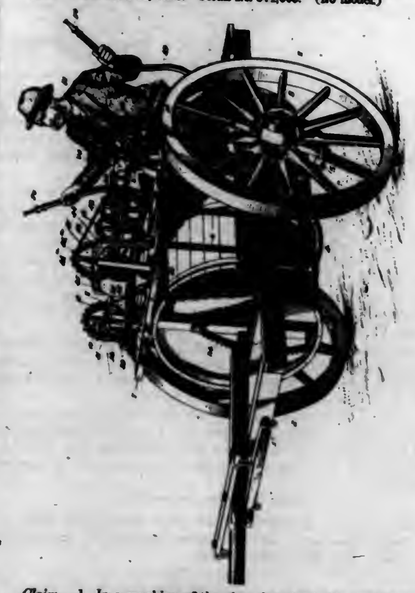
2. The combination, in a lathe, of a bed having suitable ways, a work holding and rotating chuck carried by said bed, a carriage mounted upon and movable along said ways and provided with a ring-like portion extending around said bed, and an annular carrier fitted to said ring-like portion of said carriage and surrounding said bed, mechanism for automatically moving said carrier about said bed and carriage, and means having provision for locking said carrier after each intermittent partial rotation.

3. The combination, in a lathe, of a bed having suitable ways, a work holding and rotating chuck supported by said bed, a carriage mounted upon and movable endwise of said ways, a tool-carrier mounted on said carriage and revoluble thereon, a toothed rack secured in a fixed position on said bed, a worm carried by said carriage, a worm-wheel and a train of gears interposed between said rack and worm, said worm-wheel and certain of the gears being carried by pivoted radius arms, a revolving shaft driven or operated from any suitable source of power, suitable gears for imparting motion from said shaft to the worm, an intermittently-revolving shaft, a ratchet-and-pawl mechanism connected with said shaft, a series of cams on the tool-

carrier for operating said ratchet-and-pawl mechanism, a series of rest-bars arranged around, carried by, and adjustable lengthwise of said shaft, and a lifting-bar for raising said worm-wheel into contact with the worm and constructed and arranged to maintain such contact by engagement with one of said rest-bars, whereby the length of feed of the carriage and tool-carrier is determined by the distance from said lifting-bar at the start to the end of said bar or a notch therein where said lifting-bar is disengaged.

4. The combination, in a lathe, of a bed having suitable ways, a work holding and rotating chuck, a carriage mounted upon and movable endwise of said ways and surrounding said bed, an annular tool-carrier mounted upon said carriage and surrounding it and said bed and having a polygonal outer periphery fitted to receive a tool-holder on each of the flat sides of the polygon, a bolt for locking said carrier, a series of sockets in said carrier to receive said bolt, a constantly-revolving shaft operated from any suitable source of power, a second shaft, a friction-clutch mechanism interposed between said shafts and adapted to connect them and cause said second shaft to revolve, a pinion on said second shaft revoluble therewith and freely movable endwise thereof, an internal gear mounted on said carrier and adapted to be revolved about its axis by the revolution of said pinion, a lug pendent from the upper portion of the carriage and slotted to embrace or straddle said shaft and pinion and adapted to engage and move the pawl-carrying block, an adjustable block, a pawl pivoted to said block and provided with an upwardly-projecting wedge-shaped lug, a two-armed lever pivoted to the carriage and engaging the locking-bolt by one of its ends and having its opposite end in position to engage said wedge-shaped lug, means having provision for adjusting the pawl-carrying block on its shaft and means having provision for holding said block in position on its shaft without interfering with the rotation of said shaft, and a spring constructed and arranged to permit a slight endwise movement of said pinion-carrying shaft.

5. The combination, in a lathe, of the bed A, provided with ways A' A', a work holding and rotating chuck, the carriage M, the carrier N, a constantly-revolving shaft operated from any suitable source of power and provided with the friction-clutch hub k, the shaft O, provided with a longitudinal spline-groove and the female coupling-sleeve O^2, the pinion N^2, the spur-gear N', the internal gear l, mounted on the carrier, the block P, movable endwise on the shaft O, the pawl P', provided with the wedge-shaped lug o^3 and the arm o^4, the spring o^5, the screw-shaft O^2, fitted to a threaded hole in the block P, the tie-block O^3, connecting said shafts, as set forth, the spring p', the lever P^2, the locking-bolt m^2, the spring n, a series of bushings m', set in the carrier, the push-pin u, mounted in the carriage, as set forth, the spring u', and the series of pins v, set in the carrier and adapted to act upon said push-pin to move it endwise to trip the pawl P' from engagement with the lever P^2 to allow the locking-bolt to engage with said bushings.



6. In a lathe head-stock, the combination of a chuck-carrying spindle, a cone-pulley mounted loosely thereon and carrying a spur-gear, a gear-wheel also mounted loosely on said spindle between two collars or sleeves firmly secured to said spindle, suitable gears connecting the gear on the cone with the gear on the spindle, a friction-wheel mounted upon said spindle, so as to be revolubly therewith, and movable endwise thereof and having its outer periphery composed of two frusto-conical surfaces, two friction-rings fitted one within the cone-pulley and the other within the rim of the gear loosely mounted on the spindle, said rings having their inner surfaces shaped to fit the frusto-conical surfaces of said friction-wheel and being connected to said cone and gear, so as to be revolubly therewith and movable therein toward or from each other, springs for moving said rings toward each other, a toothed clutch on each side of said friction-wheel, and a shipper mechanism constructed and arranged to move said friction-wheel lengthwise of said spindle in either direction and cause it to first engage one of the friction-rings and then one of the positive clutches.

7. In a lathe, the combination, with the bed and a carriage mounted on and movable endwise of said bed, of a tool carrier mounted on said carriage and intermittently revoluble thereon, a constantly-revolving feed-shaft, a train of feed-gearing constructed and arranged to be thrown into and out of connection with said feed-shaft, an intermittently-revoluble shaft, a series of rest-bars arranged around and parallel to said shaft and adjustable lengthwise thereof, and a lifting-bar for raising the train of feed-gearing and provided with a shoulder to engage said rest-bars, substantially as described.

8. The combination, in a lathe, of a bed having suitable ways, a work holding and rotating chuck supported above said bed, a carriage mounted upon and movable endwise of said ways, a tool-carrier mounted upon said carriage and revoluble thereon, a rest-bar supported by and adjustable lengthwise of said bed, a bar or lever mounted upon and movable with said carriage and constructed and arranged to bear upon said rest-bar during the movement of said carriage and adapted to drop off the end of said rest-bar or through a notch cut therein, and mechanism interposed between said bar or lever and said carriage whereby the movement of said carriage will be stopped by the disengagement of said bar or lever from said rest-bar.

9. The combination, in a lathe, of a bed having suitable ways, a work holding and rotating chuck supported above said bed, a carriage mounted upon and movable endwise of said ways, a tool-carrier mounted upon said carriage and revoluble thereon, a series of rest-bars supported by and independently adjustable endwise of said bed, mechanism for throwing either of said rest-bars into position for action, a bar or lever mounted upon and movable with said carriage and constructed and arranged to engage with or bear upon the rest-bar in action during the movement of said carriage and adapted to drop off the end of said bar or through a notch cut therein, and mechanism interposed between said bar or lever and carriage whereby the movement of said carriage will be stopped by the disengagement of said bar or lever from said rest-bar.

481,718. SPRAYING-MACHINE. FRANKLIN SALISBURY, Catskill, N. Y. Filed Nov. 11, 1890. Serial No. 371,065. (No model.)

Claim.—1. In a machine of the class described, the combination of a tank pivotally and adjustably mounted upon suitable transporting-wheels, a central transverse bearing-brace supported within the tank, a horizontal revoluble shaft journaled in one end of the tank and said central brace and carrying agitators or dashers, a vertical bevel-gear mounted upon the drive-shaft adjacent to said brace, a vertical drive-shaft projecting above the tank and having its lower end stepped in the top of said bearing-brace, said vertical shaft carrying a horizontal pinion meshing with said vertical pinion, a force-pump arranged within the tank, a horizontal crank-shaft mounted upon the top of the tank and loosely connected with the pump-piston within the tank, gearing connecting said crank-shaft with the vertical drive-shaft, and means for transmitting motion to the vertical drive-shaft from the transporting-wheels, substantially as set forth.

2. In a machine of the class described, the combination of a tank mounted upon suitable transporting-wheels, a force-pump arranged within said tank and having an exit-pipe connected with an air-chamber, a horizontal exit-chamber located above the tank and provided with a narrowed portion and a depending tubular chamber projecting from said narrowed portion into the tank and open at its lower end, spring-actuated sliding rods working on each side of the upper exit-chamber and the depending chamber, a valve carried upon the lower ends of said rods and normally closing the open lower chamber and opening into the tank, a branch pipe connecting said exit-pipe with the tubular chamber, and a spray pipe or pipes connected to the upper end of said exit-chamber, substantially as set forth.

3. In a machine of the class described, the combination of a tank mounted upon suitable transporting-wheels, a force-pump arranged within said tank, means for transmitting motion to said force-pump from the transporting-wheels of the machine, an outlet-pipe connecting said force-pump with an air-chamber and having a check-valve, a branch pipe connecting said outlet-pipe with a tubular elongated exit projecting into and above the tank and chamber, having a downwardly-opening spring-actuated valve at its lower open end in the tank, a pipe or pipes connected to the upper end of said exit-chamber and having suitably-constructed nozzles, and adjustable supporting-rods adapted to support the said nozzles and to direct the spray in different directions, substantially as set forth.

4. The combination of the tank, the force-pump within the same, the outlet-pipe, an exit-chamber or casing mounted above the tank and having the cylindrical downward extension projecting within and above the tank and provided with a valve-seat and opening into the tank, a valve mounted upon vertically-movable rods, and springs to force the valve in an upward direction, said cylindrical extension of the chamber being connected with the outlet-pipe of the pump and spray-pipes being connected with the said exit-chamber, substantially as set forth.

5. In a machine of the class described, the combination of the tank, a force-pump for expelling the contents of the latter, and a safety-valve attachment comprising a chamber or casing arranged above the tank and having a narrowed portion provided with a cylindrical extension extending into the tank, the perforated lugs formed adjacent to the narrowed portion of the casing, the vertically-sliding rods mounted in said lugs and carrying a valve that closes the lower end of the cylindrical extension, thumb-nuts mounted adjustably upon the upper ends of said rods, and springs interposed between said thumb-nuts and the perforated lugs, substantially as and for the purpose set forth.

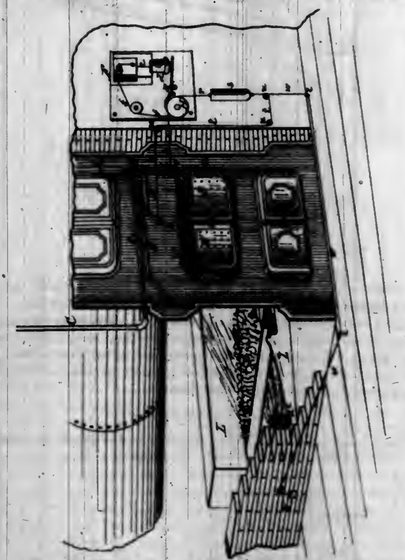
6. In a machine of the class herein described, the combination, with a tank, of a force-pump to expel the contents of said tank, the pipe or pipes having suitably-constructed nozzles, the supporting-rods carrying slotted nozzle rests or supports loosely receiving said nozzles and also having balls at their lower ends, the sockets adapted to receive the said balls and having set-screws for retaining the latter and the supporting-rods at any desired adjustment, and means for vibrating said nozzles in said rests, substantially as and for the purpose herein set forth.

7. In a machine of the class herein described, the combination of a tank, a force-pump for expelling the contents of said tank, the pipe or pipes having suitably-constructed nozzles, means for adjustably supporting the said nozzles, and mechanism for transmitting a laterally-vibrating motion to said nozzles from the transporting-wheels upon which the tank is mounted automatically and simultaneously with the operation of the pump, substantially as set forth.

8. In a machine of the class described, the combination of a tank, a force-pump for expelling the contents of the same, the spray pipe or pipes having suitably-constructed nozzles, a movable support or supports having slotted rests loosely receiving said nozzles, a bell-crank lever located at a suitable point of attachment adjacent to said supports, and connecting-links connecting the arms of said bell-crank with the pipe or pipes and the driving mechanism of the pump, substantially as set forth.

9. In a machine of the class described, the combination of a tank, a force-pump for expelling the contents of the same, the pipe or pipes having suitably-constructed nozzles, a cross-bar mounted adjustably and having slots to support the said nozzles, a horizontally-slotted guide-plate to support the conducting pipe, a connecting-link, a bell-crank lever, and mechanism for transmitting motion to said bell-crank lever from the transporting-wheels upon which the machine is mounted, substantially as and for the purpose set forth.

10. In a machine of the class described, the combination of a tank suitably mounted in a frame having transporting-wheels, a force-pump to expel the contents of said tank, a segmental rack upon the front end of the latter, and a shaft mounted transversely in the frame and having at its inner end a pinion engaging said rack and at its outer end a crank or hand-wheel, substantially as and for the purpose herein described.



481,719. SMOKE-CONSUMER. JAMES GARDNER, Rochester, N. Y. Filed Mar. 5, 1892. Serial No. 423,877. (No model.)

Claim.—1. In a smoke-consumer, the combination, with a furnace-door, of time mechanism having an escapement, a steam-pipe opening into the furnace, a connection between the door and pipe, and a connection between the door and time mechanism, by which, respectively, the steam is turned on and the time mechanism wound in opening the door, said mechanism having suitable connections for turning off the steam at the end of a given time, substantially as specified.

2. In a smoke-consumer, the combination, with time mechanism having an escapement, of a main furnace-door, a supplemental door or valve, and connections between the main door and the supplementary door or valve and between the main door and time mechanism, whereby, respectively, the supplementary door will be opened and the time mechanism wound by the opening of the furnace-door, substantially as specified.

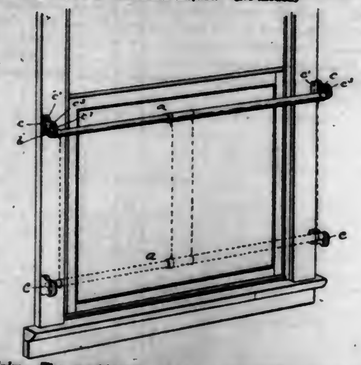
3. In a smoke-consumer, the combination, with time mechanism having an escapement, of a main furnace-door, a supplementary door or valve, connections between the main door and the supplementary door or valve and between the main door and the time mechanism, whereby, respectively, the supplemental door will be opened and the time mechanism wound by the opening of the furnace-door, and connections between the time-movement and the supplementary door, whereby the latter will be closed at the end of a given time, substantially as specified.

4. In a smoke-consumer, the combination, with time mechanism having an escapement, of a main furnace-door, a supplementary door or valve, connections between the main door and the supplementary door or valve and between the main door and the time mechanism, whereby, respectively, the supplemental door will be opened and the time mechanism wound by the opening of the furnace-door, a steam-pipe and valve, and connections whereby the valve will also be opened by the furnace-door, and connections whereby it will be closed at a predetermined time by the time mechanism, substantially as specified.

5. The combination, with a furnace-door, of an inductive steam-pipe, an eductive steam-pipe, a steam-chamber divided by a diaphragm provided with ports into two compartments, with which said pipes connect, respectively, and a valve attached to the spindle within said chamber and adapted to cover and uncover the ports of the diaphragm, whereby the opening of the door turns on the steam and its closing turns the steam off, substantially as specified.

6. The combination of a furnace-door, a spindle attached to the same and turning with it, a pulley on the spindle, a cord attached to the pulley, and a time mechanism normally held at rest, with which the cord is connected, whereby the opening of the door will wind said mechanism, and a dog adapted to be released by the opening of the door to permit the time mechanism to act, substantially as specified.

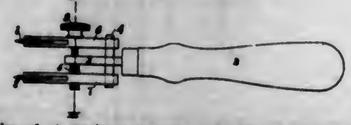
7. The combination of a furnace-door, a spindle attached to the same and turning with it, a winding-wheel on the spindle, a pair of pulleys mounted independently on the same support and connected by an engaging dog, a cord attached to the spindle passing over one of the pulleys and provided with a counter-weight, a cord winding on the other pulley and connecting with a drum of the time-movement, a dog for holding the first-named pulley, and a weight attached to the time-movement for operating the dog, as specified.



8. The combination of the two pulleys G H, the dog f, connecting the pulleys, the dog M, engaging with the pulley G, the time-movement F, provided with the weight d, resting over the outer end of dog M, the stop h^3 for disengaging the dog f^3, and the winding-cord f, as shown and described, and for the purpose specified.

9. The combination of the door B, the spindle n, turning therewith, the steam-chamber D, the valve-stem k, provided with the valve k', the diaphragm l, and the wheels i o, attached, respectively, to the spindle and valve-stem, one being provided with the slot q and the other with the pin p, as and for the purpose specified.

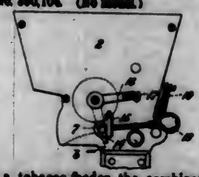
10. The combination, with a furnace-door, of a steam-pipe for injecting steam into the furnace, a connection between the door and the steam-pipe, whereby the steam will be turned on by opening the door, a damper in a draft-opening in the bridge-wall below the fire, and a connection extending from the door to the damper, whereby the damper will be opened by the opening of the door, as specified.



11. In a smoke-consumer, the combination of a time mechanism having an escapement with a steam-pipe adapted to admit steam to the combustion-chamber of the furnace and having a cock or valve and with intermediate devices whereby the steam can be automatically cut off at a predetermined time, substantially as described.

481,720. CURTAIN-ROD. SAMUEL R. SCOTTRON, Brooklyn, N. Y. Filed Feb. 6, 1892. Serial No. 420,842. (No model.)

Claim.—The combination of the bracket-plates provided with closed vertical slots c^3, said slots being enlarged between their ends, as at c^3, and an extensible curtain-rod provided with a button on each end connected to the rod by a narrow neck, said buttons being adapted to pass through the enlargements in the slots and permit their necks to rest either in the upper or lower ends of the slots out of line with the enlargement c^3, substantially as described.

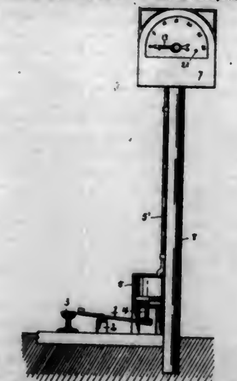


481,721. TRACING-TOOL. THALIA R. SIPE, Allegheny, Pa. Filed Apr. 16, 1892. Serial No. 429,309. (No model.)

Claim.—1. A tracing-tool having a handle, a shank projecting therefrom, a screw-threaded shaft passing through the shank and bearing two arms having tracing-wheels thereon, and a pin passing through holes in the shank and arms, substantially as and for the purposes described.

2. A tracing-tool having a handle, a shank projecting therefrom, a screw-threaded shaft passing through the shank and bearing two arms having tracing-wheels thereon, a head upon one end of the shaft, and a pin passing through holes in the shank and arms, substantially as and for the purposes described.

481,722. CIGAR-BUNCHING MACHINE. FRANCIS THOMPSON and EDWARD H. THOMPSON, Allegheny, Pa. Original application filed June 30, 1890, Serial No. 356,414. Divided and this application filed Apr. 23, 1891. Serial No. 390,104. (No model.)



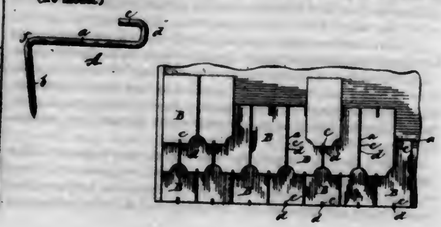
Claim.—1. In a tobacco-feeder, the combination of a swinging door to receive and discharge the tobacco, a hopper containing a rotary feed-cylinder, and a lever upon the protruding end of the feed-cylinder shaft engaging a projection upon the shaft of said swinging door, substantially as and for the purposes described.

2. In a tobacco-feeder, the combination of a hopper, a rotary feed-cylinder located therein, a lever on the shaft of said feed-cylinder, a swinging door, and a movable trigger on the door-shaft, adapted to be operated by the projection, substantially as and for the purposes described.

3. In a tobacco-feeder, the combination of a hopper, a feed-cylinder located therein, a lever on the shaft of said feed-cylinder, a swinging door beneath the cylinder, and a movable trigger on the door shaft, adapted to be moved by the lever on motion of the latter in one direction and to permit free passage of the same in its motion in the other direction, said lever having an adjustable engaging-stud, substantially as and for the purposes described.

4. In a tobacco-feeder, the combination, with the hopper and feeding mechanism, of a swinging door for receiving and discharging the tobacco from the feeding mechanism, said door having laterally-adjustable slotted end portions, substantially as and for the purposes described.

481,728. RAILWAY TIME-SIGNAL. ADELBERT H. THORP, Toledo, Ohio. Filed Sept. 26, 1891. Serial No. 406,960. (No model.)

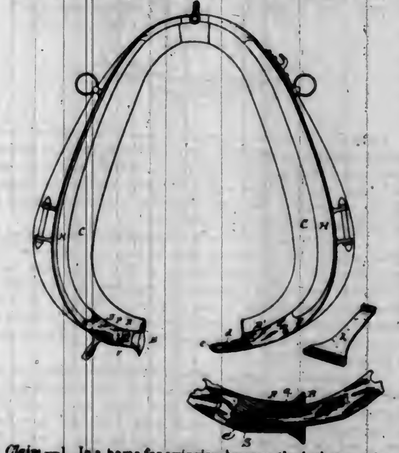


Claim.—1. In a railway time-signal, two connected air-compressors, one of which has connection with the pivoted lever adapted to operate the same when actuated by a moving train, a clock mechanism, a shaft actuated thereby, having a ratchet-wheel, a pointer having a spring-pawl engaging with the ratchet-wheel, a pinion upon the pointer-shaft, and a gear operated by one compressor to revolve the shaft and return the pointer to its starting-point.

2. In a time-signal, a pointer for indicating time, and mechanism connected therewith and with a lever having one end contiguous to the railway-track, said lever having a spring-actuated bearing-plate adapted to contact with the wheels of a passing train when moving in one direction and yield to the pressure of the wheel when contacted with by a train passing in an opposite direction.

3. In a railway time-signal, an air-compressor, a pivoted lever, one end of which is contiguous to the railway-track, the opposite end engaging the piston of the air-compressor, a clock mechanism having a ratchet-wheel on the outer end of the clock-shaft, a pointer having a shaft journaled on the clock-shaft, a spring-pressed bearing on the pointer bearing on the ratchet-wheel, and a gear-wheel on the opposite end of the pointer-shaft meshing with a segmental gear operated by the piston of an air-compressor, said air-compressors being connected by an air-conduit, substantially as described.

4. In a railway time-signal, an air-compressor actuated by a passing train, another air-compressor and an air-conduit between the two, said air-compressor having an upwardly-extending bifurcated piston-rod, a clock mechanism, a pointer moved thereby, having on its shaft a segmental gear, and a gear-wheel meshing therewith, having an integral arm adapted to rest in the bifurcated portion of the piston-rod and be actuated thereby.

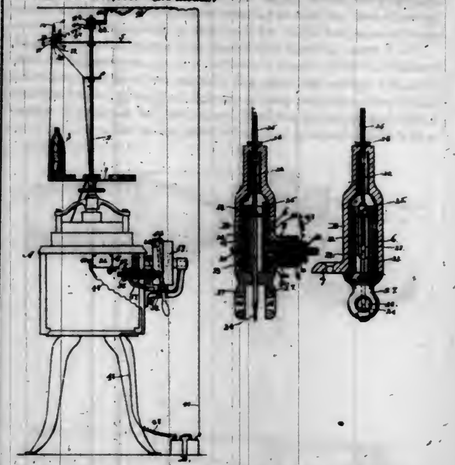


481,724. ROOFING AND SIDING SCREW OR FASTENING. ROLLIN R. L. WESTOVER, Rutland, Vt. Filed July 7, 1891. Serial No. 398,701. (No model.)

Claim.—1. The fastening for the covering-pieces of a roof or other structure, consisting of a piece of metal bent or shaped to form a vertical screw-threaded and pointed penetrating-limb *b*, a clamping-limb *a*, having a downward inclination from the point of its junction with the vertical limb *b*, and an abutment and confining-loop *d*, having a short limb *c*, the said limb *a* lying at an inclination from a right angle with the limb *b* and thus exerting a spring binding or clamping action upon the covering pieces of the roof when the fastening is in use and the limb *c* lying substantially parallel with the limb *a* and conforming to the inclination of the covering-piece of the roof which extends under it and abuts against the bowed portion of the loop, substantially as described.

2. The combination, with the supporting-timbers and the covering-pieces of the roof, of the fastening consisting of a piece of springy metal bent or shaped to form a vertical screw-threaded pointed penetrating-limb *b*, a clamping-limb *a*, having a downward inclination from the point of its junction with the vertical limb *b*, and an abutment and confining-loop *d*, having a short limb *c*, the said limb *a* lying at an inclination from a right angle with the said limb *b* and thus exerting a spring binding or clamping action upon a covering piece of the roof when the fastening is in use and the said limb *c* lying substantially parallel with the limb *a* and thus substantially conforming to the inclination of the covering-piece of the roof which extends under it and abuts against the bowed portion of the loop *d*, said fastening being adapted for penetrating the timbers and being applied in the parting-lines between the covering-pieces, substantially as described.

481,725. HAME-FASTENER. ROBERT G ARMSTRONG, Wichita, Kans., assignor to R. G. Armstrong & Co., same place. Filed Aug. 20, 1891. Serial No. 403,163. (No model.)



Claim.—1. In a hame for swinging harness, the lock thereof consisting of the extending shank of one hame part provided with a hollow in one side, the socket of the fellow hame part arranged to have the said shank entered therein, and provided in said socket part with the tumbler arranged crossing the socket-chamber and hollowed in one side, and the spring for yieldingly holding the tumbler, substantially as and for the purpose set forth.

2. A hame-lock for swinging harness, comprising a socket formed in one hame part provided with a bell-shaped entrance, a tumbler arranged crossing one side portion of the socket-chamber and provided with a hollow in one side presentable within said chamber, and with a cross-slot in one end for the admission of a key for turning it, a spring for yieldingly holding the tumbler from turning, and an extending shank, of the fellow hame part provided with a hollow in one side and adapted to enter into said socket-chamber, substantially as and adapted to operate in the manner specified.

3. In the hame-lock described, the combination, with the part B, provided with the socket, with the cross-bearing, and with the rear chamber and covering-plate thereof, of the tumbler arranged in said cross-bearing and provided with a hollow in one side arranged to register with the socket, with a flattened shank arranged extending into said rear chamber, and with a cross-slot in its opposite end and accessible at the lock-front, and the spring arranged in said chamber and bearing at its ends oppositely against the tumbler-shank, substantially as and for the purpose set forth.

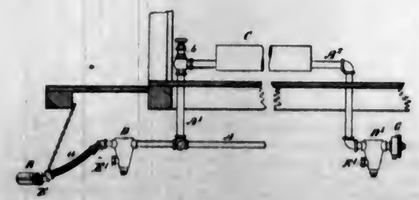
481,726. ELECTRICALLY-CONTROLLED STOP-MOTION FOR KNITTING-MACHINES. VERNON S. CLOTE, Cohoes, N. Y., assignor of one-half to William W. Stevenson, same place. Filed Oct. 26, 1891. Serial No. 410,099. (No model.)

Claim.—1. In a knitting-machine, a thread-guide consisting of a metallic body-piece provided with an insulating-plug having an adjustable electrical contact-point fixed therein, a sleeve fitted to slide loosely in said body-piece and provided with pendent lugs that have oppositely-located openings for the thread therein, said sleeve being provided with a contact-spring fitted to form an electrical contact with the contact-point of said body-piece, a tension-spring whereby said sleeve is supported in its normal position, and an adjusting-screw whereby the tension of said spring can be regulated, as and for the purpose herein specified.

2. In a thread-guide, the combination of a sleeve fitted to slide in a loose manner in the body-piece of the device, said sleeve being provided with pendent lugs having oppositely-located openings for the passage of the thread therethrough, and a drop fitted to slide loosely in said sleeve and provided with an eye through which the thread passes to normally retain said drop in its raised position, said drop being provided with a lug which when the drop falls takes against a contact-point in the body-piece of the device, as and for the purpose herein specified.

3. The combination of a spring-actuated belt-shipper provided with a sliding bar fitted to engage with a stationary point of the machine, and electrically-controlled mechanism, as herein described, whereby said sliding bar will be released from its engagement with said stationary point, and a thread-guide consisting of the following elements: a metallic body-piece having an electrical contact-point, a sleeve fitted to slide loosely in said body-piece and having eyes for passing the thread through, said sleeve having a contact-spring fitted to take against said contact-point, a tension-spring fitted to normally retain said sleeve in a raised position, a drop fitted to slide loosely in said sleeve and having a lug fitted to take against said contact-point, said drop being normally held in a raised position by a thread passing through its eye, so as to retain the electrical circuit in an open condition, and a generator of electricity electrically connected to said thread-guide, and the mechanism for releasing said belt-shipper, as and for the purpose herein specified.

4. The combination of a belt-shipper provided with a sliding bar to which motion is imparted in one direction by means of a spring, said bar being fitted to engage with a stationary point of the machine to retain the driving-belt on the fast pulley, and a mechanism for releasing said sliding bar from its engagement, the same consisting of a sliding bolt provided with a tappet fitted to take against the sliding bar of said belt-shipper and having a spring fitted to forcibly move said bolt downwardly, a detent-lever connected with said sliding bolt and fitted to engage with a swinging armature, and electro-magnets arranged to attract said armature and effect the disengagement of the latter from said detent-lever, as and for the purpose herein specified.



481,727. DRAINAGE-TRAP. EDWARD R. GOLD, New York, N. Y. Filed June 27, 1892. Serial No. 438,065. (No model.)

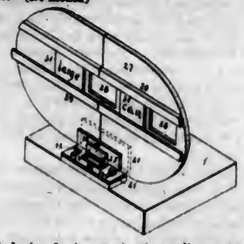
Claim.—1. A steam-drainage trap consisting of a body or casing having an opening through it and formed with a seat, combined with

a valve arranged to close outwardly against said seat under an internal steam-pressure, and a counterweighting-stem attached to said valve and projecting laterally therefrom, with its center of gravity arranged sufficiently to one side to impart to the valve a tendency to open by tilting on its seat, whereby upon being relieved of pressure it automatically tilts open and drains out the water of condensation.

2. A steam-drainage trap consisting of a plug or body having an opening through it, a seat at its inner end, a valve arranged to close outwardly against said seat, and a counterweighted stem projecting fixedly from said valve, passing through the opening, and of sufficient weight and projecting sufficiently to one side of the valve to impart to the valve a tendency to open by tilting on its seat.

3. A steam-drainage trap consisting of a body or casing having an opening through it, a seat at its inner end, a valve arranged to close outwardly against said seat and having a stem passing through said opening, and a baffle-disk mounted on said stem outside of said opening in the path of an issuing current of steam, whereby the weight of said disk and stem imparts to the valve a tendency to open, while the impact of steam against the disk contributes a tendency to close the valve.

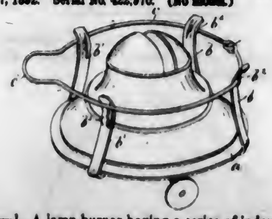
4. A steam-drainage trap consisting of a body or casing having an opening through it made tapering and smaller at the inner end, a seat at the inner end of said opening, and a valve arranged to close outwardly against said seat and having a stem passing through said opening and nearly filling the smaller end thereof, whereby it guides the valve relatively to the seat, and said stem made of sufficient weight and projecting laterally sufficiently to one side of the valve to throw the valve open on the relief of internal pressure against it.



5. A steam-drainage trap consisting of a plug or body having an opening through it in lateral direction and formed at its inner end with an inclined seat, combined with a valve arranged to close outwardly against said seat and having a counterweighted stem passing through said opening, with its center of gravity sufficiently to one side of the valve to impart to the valve a tendency to open by tilting on its seat.

6. A steam-drainage trap consisting of a plug or body having an opening through it in lateral direction and formed at its inner end with an inclined seat at an inward inclination from the vertical, combined with a valve arranged to close outwardly against said seat and having a counterweighted stem passing through said opening with its center of gravity sufficiently to one side of the valve to impart to the valve a tendency to open by tilting on its seat, whereby the valve, when closed by internal pressure, tilts past the vertical and its stem is thrown upwardly to an inclination above the horizontal, thus insuring a maximum opening when opened.

7. A steam-drainage trap consisting of a plug or body having a conical opening through it in lateral direction, smaller at the inner end, an enlarged head at the outer end of said plug, with a recess within it, a seat formed on the inner end of the plug, a valve arranged to close outwardly against said seat and formed with a stem passing through said opening, and a baffle-disk mounted on the outer end of said stem and arranged within said recess so that it is protected thereby.



8. A steam-drainage trap consisting of a plug or body having a horizontal opening through it, a seat at its inner end, a valve arranged to close outwardly against said seat, a counterweighted stem projecting laterally through said opening and arranged to impart to said valve a tendency to open, and a cup-shaped strainer fastened to the inner end of said body and inclosing the valve.

481,728. DEVICE FOR INSTRUCTION IN READING AND CALCULATING. WILLIAM W. HALLETT, Lee, Ill. Filed Feb. 17, 1892. Serial No. 421,890. (No model.)

Claim.—A device for instruction in reading and calculating, having a supporting-frame, shafts journaled therein, disks bearing instructive matter mounted on the shafts, a screen for hiding certain portions of the disks, a bracket for supporting said screen, the bracket having a stationary upright back and a spring-actuated movable jaw, between which and the back the screen is held.

481,729. LAMP-BURNER. BARTLETT P. LUDE, Boston, Mass. Filed Feb. 27, 1892. Serial No. 422,970. (No model.)

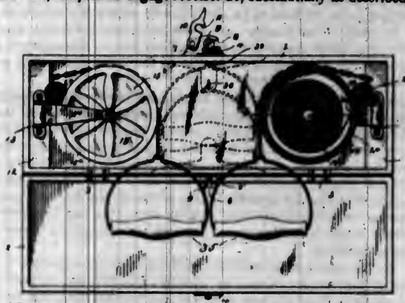
Claim.—1. A lamp-burner having a series of independent elastic chimney holding arms projecting upwardly from its base and adapted to bear independently on a cylindrical chimney at their upper ends and having loops or offsets, and a reinforcing spring-band engaged with the said loops or offsets and adapted to exert an additional inward yielding pressure thereon, as set forth.

2. A lamp-burner having a series of independent elastic chimney-holding arms projecting upwardly from its base and adapted to bear independently on a cylindrical chimney at their upper ends, one or more of said arms having a cam-shaped projection, combined with a tilting spring-band hinged to one or more of the other arms and adapted to be engaged with said cam-shaped projections by an upward movement of the spring-band and thereby exert inward pressure on the arms, as set forth.

3. A lamp-burner having a series of independent elastic arms projecting upwardly from its base and adapted to bear independently on a cylindrical chimney at their upper ends, one or more of said arms having an eye or loop b^3, while one or more of the other arms has a cam b^3, said eye and cam being integral with the arms on which they are formed, combined with a spring-band passed through said eyes and adapted to be engaged with said cams by an upward movement of the spring-band, as set forth.

4. A lamp-burner having a series of independent elastic chimney-holding arms projecting upwardly from its base and adapted to bear independently on a cylindrical chimney at their upper ends, one or more of said arms having a cam-shaped projection consisting of a series of steps, combined with a tilting spring-band hinged to one or more of the other arms and adapted to engage either of said steps, as set forth.

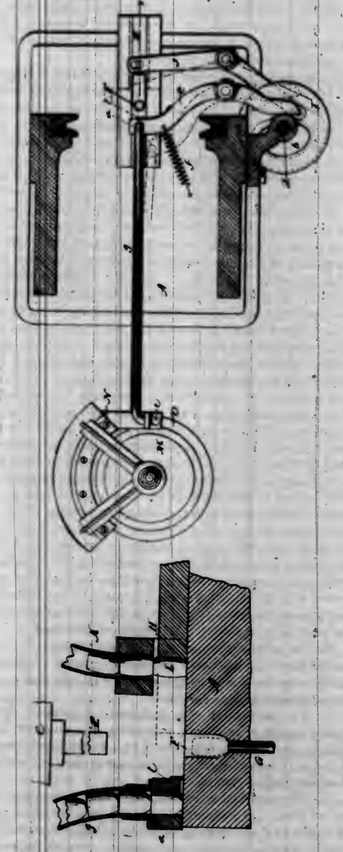
5. A lamp-burner having elastic chimney-holding arms, and a reinforcing spring-band engaged with said arms and provided with a closing or contracting spring c^4 of helical form, as set forth.



481,730. EXERCISING-MACHINE. CHARLES G. MILLER, Waterbury, Conn. Filed Apr. 22, 1892. Serial No. 430,171. (No model.)

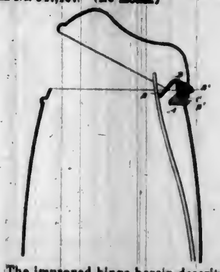
Claim.—1. In an exercising-machine, the combination, with the operative parts of the machine, of a portable case within which the operative parts are inclosed and which is provided with slotted plates 5 and 7 and a latch 10, by which it is secured to the wall.

2. The combination, with a swinging yoke, a spring-actuated drum pivoted therein, and a band attached to said drum and coiled thereon, of a rubber disk having a tube 30 extending through it, said tube being slotted at its ends, a holder 31 engaging the band and the slots in



the tube, a chain connected to the holder, and a handle connected to the chain.

3. The combination, with a swinging yoke and a spring-actuated drum pivoted therein, said drum having recesses 26 in its side pieces and a slot 27 in one of said side pieces, of a band 24, having a cross-piece 25, adapted to engage recesses 26, substantially as described.



4. The combination, with the swinging yoke, the shaft, and the drum, of a spring connected to the shaft and the drum, and pads between said spring and the side pieces of the drum, whereby rattling is prevented.

481,731. MACHINE FOR SWAGING AND CREASING BULLETS. JOHN P. MCGRAIL, New Haven, Conn., assignor to the Winchester Repeating Arms Company, same place. Filed Sept. 7, 1891. Serial No. 404,940. (No model.)

Claim.—In an apparatus for swaging and creasing bullets, the combination of the swaging die and punch, a reciprocating follower adapted to work up and down through the die, a slide arranged to reciprocate in a path at right angles to the path of the punch and between the punch and die, the slide having an opening through it of a diameter corresponding substantially to the diameter of the swaged bullet and so that when the said slide is presented over the die the upward movement of the follower in the die will force a swaged bullet from the die into said slide, a tube leading from the upper side of said slide and terminating at an opening to the creaser, substantially as described, whereby the swaged bullets delivered from the die through said slide form a column in the tube, which automatically conducts and delivers the said bullets successively to the creaser.

481,732. HINGE. CHARLES OSBORNE, New York, N. Y., assignor to the Whiting Manufacturing Company, same place. Filed Apr. 8, 1890. Serial No. 347,107. (No model.)

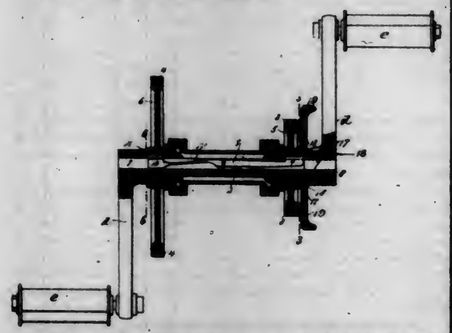
Claim.—1. The improved hinge herein described, composed of a plate A, having upon its face the spheroidal bosses A' and A^2 and similarly-shaped cavity a' lying between said bosses, and the plate B, provided with boss B' and cavities b' and b^2 upon each side thereof and adapted to closely engage, respectively, with the cavity and bosses on the plate A, and the pivot-pin C, passed through all of the bosses, said plates being formed with interengaging extensions A^* and B^*, respectively, formed upon curved lines conforming to the outlines of the bosses and adapted to serve as stops, and the plate B, formed upon the opposite side of the pivot-pin C from said curvilinear extensions, with an arm D extending angularly therefrom, substantially as specified.

2. A hinge provided at the back with abutting-stops adapted to interlock when the hinge is open, so as both to arrest the opening of the hinge and when said hinge is open to restrain the movement of its parts upon each other lengthwise of the pivot-pin, substantially as described.

3. A hinge composed of a pivot-pin, in connection with plates having on their opposing faces spheroidal bosses and cavities curved in the direction of the axis of the hinge as well as transversely thereto, the said opposing faces being of greater width than the diameter of said bosses and cavities, and the said cavities inclosing the greater part of the convex surfaces of said bosses both in a direction transverse to the said axis and longitudinally thereof, substantially as described.

4. A hinge provided at the back with abutting stops and at the front with an angular arm, said stops being adapted to interlock when the hinge is open, so as at such times to restrain the movement of its parts upon each other lengthwise of the pivot-pin, and said arm being adapted to receive the pressure of a spring, substantially as described.

481,738. SPRING SHADE-ROLLER. JUDSON C. PERKINS, Meriden, Conn., assignor, by direct and mesne assignments, to the Meriden Curtain Fixture Company, same place. Filed Jan. 13, 1892. Serial No. 417,936. (No model.)



Claim.—In a spring-roller fixture for window-shades, the combination of the following-named instrumentalities, viz: first, the roller adapted to be mounted in brackets and to support the shade, as usual; second, the actuating-spring arranged within the roller and having one end held fast, as usual, but having its other end detached from the roller, and, third, means operating automatically to effect an engagement between the detached end of the actuating spring and the roller whenever, with the spring in its normal condition, the latter rotates in the proper direction to wind up the spring and to maintain such engagement so long as the spring remains under tension, the combination being and operating substantially as hereinbefore set forth.

481,788.

481,784. BICYCLE. LUCIUS J. PHELPS, Passaic, N. J. Filed Oct. 3, 1891. Serial No. 407,645. (No model.)

Claim.—1. The combination, with the driving-shaft and crank-shaft of a cycle, of two sets of driving connections between the crank-shaft and driving-shaft constructed to drive at different speeds, a lever carried by one of the shafts and adapted to close either of the connections between the crank shaft and driving-shaft according to its position, and a cam mounted on the shaft, and connections whereby said lever may be shifted by the foot of the rider, substantially as described.

2. The combination, with the driving-shaft and crank-shaft of a cycle, of two sets of driving connections between the crank-shaft and driving-shaft constructed to drive at different speeds, and a lever carried by one of the shafts and forming a key adapted to close either of the connections between the crank-shaft and driving-shaft and break the other according to its position, substantially as described.

3. The combination, with the driving-shaft and crank-shaft of a cycle, of two sets of driving connections between the crank-shaft and driving-shaft constructed to drive at different speeds, a lever carried by one of the shafts and forming a key adapted to close either of the connections according to its position, and a cam for rocking said lever to shift the connections, substantially as described.

4. The combination, with the driving-shaft and crank-shaft of a cycle, of two sets of driving connections between the crank-shaft and driving-shaft constructed to drive at different speeds, a lever carried by one of the shafts and adapted to close either of the connections according to its position, a spring pressing the lever in one direction to close one set of the connections, and a cam adapted to move the lever against the tension of the spring to close the other set of connections, substantially as described.

5. The combination, with the driving-shaft and crank-shaft of a cycle, of two sets of driving connections between the crank-shaft and driving-shaft constructed to drive at different speeds, a lever carried by one of the shafts and adapted to close either of the connections according to its position, and a sleeve loosely mounted on the shaft and normally carried thereby, said sleeve being provided with a cam-surface adapted to control the position of the lever to close either set of connections according to its position on the shaft, substantially as described.

6. The combination, with the driving-shaft and crank-shaft of a cycle, of two independent sets of driving connections between the crank-shaft and driving-shaft constructed to drive at different speeds, a lever carried by one of the shafts and adapted to close either of the connections according to its position, a sleeve loosely mounted on the shaft and normally carried thereby, said sleeve being provided with a cam-surface adapted to control the position of the lever to close either set of connections, and one or more arms on the sleeve whereby it may be held stationary to shift the connections, substantially as described.

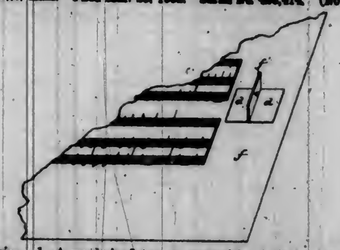
7. The combination, with the crank-shaft and driving-shaft of a cycle, of two sprocket-wheels on each shaft, and chains connecting said wheels to form two sets of connections between the crank-shaft and driving-shaft, said connections being constructed to drive at different speeds, the sprocket-wheels on one of said shafts being mounted loosely, and a cam mounted on the shaft, and connections whereby said sprocket-wheels may be connected to and disconnected from the shaft by the foot of the rider, substantially as described.

8. The combination, with the crank-shaft and driving shaft of a cycle, of two sprocket-wheels on each shaft and chains connecting said wheels to form two sets of connections between the crank-shaft and driving-shaft, said connections being constructed to drive at different speeds, the sprocket-wheels on one of said shafts being mounted loosely, and a lever carried by said shaft and forming a key connecting one or the other of the sprocket-wheels with the shaft according to its position, substantially as described.

9. The combination, with the crank-shaft and driving-shaft of a cycle, of two sprocket-wheels on each shaft and chains connecting said wheels to form two sets of connections between the crank-shaft and driving-shaft, said connections being constructed to drive at different speeds, the sprocket-wheels on one of said shafts being mounted loosely, a lever carried by said shaft and connecting one or the other of the sprocket-wheels with said shaft according to its position, and a cam controlling the position of said lever, substantially as described.

10. The combination, with the crank-shaft and driving-shaft of a cycle, of two sprocket-wheels on each shaft and chains connecting said wheels to form two sets of connections between the crank-shaft and driving-shaft, said connections being constructed to drive at different speeds, the sprocket-wheels on one of said shafts being mounted loosely, a lever carried by said shaft and carrying keys adapted to lock either sprocket-wheel to the shaft according to the position of the lever, said lever having a spring-arm by which one of the keys is carried, a spring pressing the lever into position to close connections by the other key and break connections by the key carried by the spring-arm, and a cam adapted to move the lever against the tension of the spring to reverse the connections, substantially as described.

11. The combination, with a crank-shaft and driving-shaft of a cycle, of two sprocket-wheels on each shaft and chains connecting said wheels to form two sets of connections between the crank-shaft and driving-shaft, said connections being constructed to drive at different speeds, the sprocket-wheels on one of said shafts being mounted loosely, a lever carried by said shaft and carrying keys adapted to lock either sprocket-wheel to the shaft according to the position of the lever, said lever having a spring-arm by which one of the keys is carried, a spring pressing the lever into position to close connections by the other key and break connections by the key carried by the spring-arm, and a sleeve loosely mounted on said shaft and normally carried thereby and provided with a cam-surface adapted to depress the lever against the spring-pressure or release the lever to shift the connections according to its position on the shaft, substantially as described.

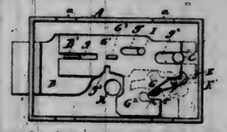


12. The combination, with shaft *c*, having groove 7, of wheels 5 6, mounted loosely on said shaft and having grooves 13 14, and lever 8, pivoted in groove 7 and carrying keys 9 10, adapted to enter said grooves, substantially as described.

13. The combination, with shaft *c*, having groove 7, of wheels 5 6, mounted loosely on said shaft and having grooves 13 14, lever 8, pivoted in groove 7 and carrying keys 9 10, adapted to enter said grooves, and sleeve 15 on said shaft having a cam-surface controlling said lever, substantially as described.

14. The combination, with shaft *c*, having groove 7, of wheels 5 6, mounted loosely on said shaft and having grooves 13 14, lever 8, pivoted in groove 7 and carrying keys 9 10, adapted to enter said grooves, spring 11, pressing said lever into position to connect one of said wheels to the shaft, and sleeve 15 on said shaft having a cam-surface controlling said lever, substantially as described.

15. The combination, with shaft *c*, having groove 7, of wheels 5 6, mounted loosely on said shaft and having grooves 13 14, lever 8, pivoted in groove 7 and carrying keys 9 10, adapted to enter said grooves, one arm of said lever being a spring-arm, spring 11, pressing the other arm of said lever into position to lock the wheel on that side to the shaft, and a cam for moving the lever against the pressure of the spring, substantially as described.



481,785. TAB FOR MUSIC-LEAVES. CHARLES F. PIDGIN, Cambridge, Mass. Filed Mar. 26, 1892. Serial No. 426,414. (No model.)

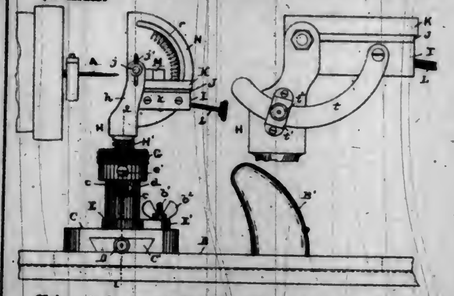
Claim.—1. A music-leaf turner comprising in its construction a tab of paper or other suitable material, having a base extending at an angle to the tab, said base being adapted to be attached to a sheet of music, as described.

2. A music-leaf turner comprising in its construction a tab of paper or other suitable material, having a base extending at an angle to the tab and provided on its lower surface with gum or other adhesive material, as described.

481,786. LOCK. JAMES ROOME, Terryville, Conn., assignor to the Eagle Lock Company, same place. Filed Apr. 4, 1892. Serial No. 427,655. (Model.)

Claim.—1. In a safety-lock, the combination, with the bolt thereof, of a spring-actuated pivotal dog located near one of the side edges of the said bolt and having its respective ends adapted to engage one at a time with the edge thereof, its inner edge being hooked to lock the bolt in the projected position of the same and its opposite end being adapted for engagement by the bolt which is thereto constructed to turn it on its pivot, one or more tumblers also combined with the bolt and locking the same independently of the said dog, and independent means for the initial operation of the said tumbler or tumblers and the dog, substantially as set forth.

2. In a safety-lock, the combination, with the bolt thereof, of a locking-dog therefor, a secondary bolt for co-operating with the said dog, one or more tumblers combined with the main bolt and locking it independently of the said dog, and independent means for operating the said tumbler or tumblers and the secondary bolt, substantially as described.



3. In a safety-lock, the combination, with the bolt thereof, of a locking-dog therefor, a secondary bolt co-operating with the said dog, one or more tumblers combined with the main bolt and locking it independently of the said dog and superimposed upon the said secondary bolt, and independent means for operating the said tumbler or tumblers and secondary bolt, substantially as described.

4. In a safety-lock, the combination, with the bolt thereof, which is furnished with a stump, of a locking-dog therefor, a secondary bolt co-operating with the said dog for unlocking the same and having a stump, one or more tumblers having two independent openings respectively receiving the stumps of the main and secondary bolts, and independent means for operating the said tumbler or tumblers and secondary bolt, substantially as described.

5. In a safety-lock, the combination, with the main bolt thereof, of a locking-dog therefor, a secondary bolt which co-operates with the said dog and is extended at one edge to inclose the same, one or more tumblers arranged to lock the main bolt independently of the dog, and independent means for operating the said tumbler or tumblers and the secondary bolt, substantially as described.

6. In a safety-lock, the combination, with the main bolt thereof, of a locking-dog therefor hung on a pivot close to the lower edge of the said bolt and having its respective ends adapted to co-operate one at a time with the said edge of the bolt, its inner end being hooked, a spring engaged with the said dog to be shifted thereby and to exert itself on opposite sides of the pivot on which the dog turns according to the position of the dog, one or more tumblers to lock the said bolt, and independent means for operating the said tumbler or tumblers and dog, substantially as described.

481,787. WORK-HOLDER FOR BORING-MACHINES. FREDERICK SCHMIDT, Baltimore, Md. Filed Feb. 20, 1892. Serial No. 422,208. (No model.)

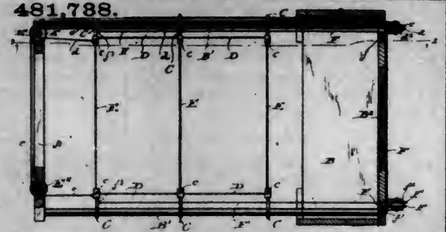
Claim.—1. In a work-holder for boring-machines, the combination of a carriage arranged to be moved toward and away from the boring tool, a swiveled standard on said carriage and having a side extension with an arc slot, a fastener engaging said arc slot and adapted to lock the swiveled standard at different positions in a horizontal plane, and a table supported by said standard.

2. In a work-holder for boring-machines, the combination of a carriage arranged to be moved toward and away from the boring-tool, a tubular standard on said carriage and having an exterior annular groove, a screw-shank fitting in said standard, a threaded collar fitting on the standard and engaging the screw-shank, said collar having pins which engage the exterior groove in the standard, and a table supported by the screw-shank.

3. In a work-holder for boring machines, the combination of a carriage arranged to be moved up to and away from the boring-tool, a tubular standard on said carriage, having a vertical slot or split and provided with a screw-bolt to draw the split parts together, a screw-shank fitting in said standard, a threaded revolvable collar loosely confined on the said standard and engaging the screw-shank, and a table supported by the said screw-shank.

4. In a work-holder for boring-machines, the combination of a carriage arranged to be moved toward and away from the boring-tool, a standard on said carriage, a vertically-adjustable shank fitting said standard and having a bracket at its upper end comprising a horizontal cross-arm and two vertical side arms, a table between said two side arms and pivotally connected with the same at its forward part, and means for adjusting said table at different angular positions in a vertical plane, substantially as described.

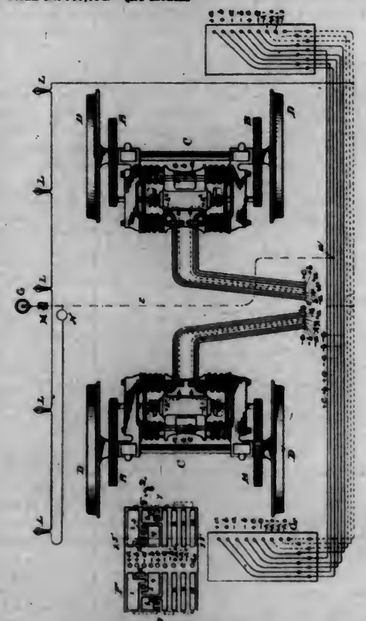
5. In a work-holder for boring-machines, the combination of a carriage arranged to be moved toward and away from the boring-tool, a bracket having two side arms and supported on said carriage, a table between the said two side arms and comprising a base-board pivotally connected therewith, a top board, and a movable wedge between said base-board and top board, and means for adjusting the table at different angular positions in a vertical plane.



6. In a work-holder for boring-machines, the combination of a carriage arranged to be moved toward and away from the boring-tool, a standard on said carriage, a vertically-adjustable shank fitting said standard and having a bracket at its upper end comprising a horizontal cross-arm and two vertical side arms, a table between said two side arms and comprising a base-board pivotally connected therewith, a top board and a movable wedge between said base-board and top board, and means for adjusting said table at different angular positions in a vertical plane.

7. A work-holder for boring-machines, arranged to be moved up to and away from the boring-tool and having a table on which the work is held, said table arranged to have a lateral adjustment, a vertical adjustment, an angular adjustment in a horizontal plane, and an angular adjustment in a vertical plane and having a separately-adjustable top.

481,788. CLOTHES-DRYING APPARATUS. FRANK SCHILL, HENRY SCHILL, and NICHOLAS SCHILL, Milwaukee, Wis. Filed Nov. 14, 1891. Serial No. 411,807. (No model.)



Claim.—A clothes-drying apparatus comprising parallel horizon-

481,788.

tal supporting-bars, a series of hangers engaged with said supports and longitudinally movable thereon, said hangers being arranged in pairs and each provided with a suitable clamp, ropes or cords engaged with said clamps and extending transversely between said hangers, ropes or cords extending lengthwise of the supporting-bars and engaged at intervals with said clamps, cords engaged with the outer pair of hangers and extending rearwardly and trained over suitable pulleys and adapted to be operated to retract said transverse ropes or cords, and cords also connected with the outer hangers and trained over pulleys at the outer end of the structure and adapted to be operated to extend said series of transverse ropes or cords, substantially as set forth.

481,739. ELECTRIC MOTOR AND REGULATING DEVICE THEREFOR. FRANK J. SPRAGUE, New York, N. Y., assignor to the Sprague Electric Railway and Motor Company, same place. Filed Apr. 20, 1889. Serial No. 308,031. (No model.)

Claim.—1. The combination, with an electric motor, of two regulating commutators or switches therefor connected in multiple arc to each other, contacts and circuits extending therefrom to the source of power and making an invariable connection with said source, and other contacts and circuits extending therefrom to the motor-circuit for adjusting said motor-circuit to produce variations in mechanical effects in said motor, each of said regulating-switches having a point of open circuit, whereby either of said switches may be used alone and independently of the other to regulate said motor, substantially as set forth.

2. The combination, with two electric motors, of two regulating commutators or switches therefor connected in multiple arc to each other, contacts and circuits extending therefrom to the source of power and making an invariable connection with said source, and other contacts and circuits extending therefrom to both motors for varying the mechanical effects in both said motors simultaneously by the adjustment of the motor-circuits, each of said switches having a point of open circuit, whereby either of said switches may be used alone and independently of the other for regulating both motors, substantially as set forth.

3. The combination, with an electric motor, of two regulating commutators or switches therefor connected in multiple arc to each other, each provided with contacts and circuits extending therefrom for varying the mechanical effects in said motor and with contacts and circuits for reversing the direction of rotation of said motor, substantially as set forth.

4. The combination, with an electric motor, of a regulating commutator or switch composed of a cylinder having metal contact-plates and a row of contact-buttons adapted to bear on said plates, said buttons being connected to the two terminals of the line and motor, to a series of coils for regulating the resistance of the motor-circuit, and to a reversible part of the motor, substantially as set forth.

5. The combination, with an electric motor, of a regulating commutator or switch composed of a cylinder having two sets of contact-plates, each set comprising regulating-plates and reversing-plates, the reversing-plates being oppositely connected in the two sets, and a row of contact-buttons adapted to bear on either set of plates, the said buttons being connected to the two terminals of the line and motor, to a series of coils for regulating the resistance of the motor-circuit, and to a reversible part of the motor, substantially as set forth.

6. The combination, with an electrically-propelled vehicle, of a vertical cylindrical switch or commutator on each end of the vehicle, having a vertical row of contact-buttons bearing thereon, corresponding buttons on the two switches being connected by conductors extending along the vehicle, and an electric motor connected to said conductors at an intermediate point of the vehicle, each of said switches being provided with connections for regulating the resistance of the motor-circuit and reversing the motor, substantially as set forth.

7. The combination, with a vehicle, of a propelling motor and two regulating commutators or switches therefor connected in multiple on the two ends of the vehicle, respectively, each provided with circuits and contacts for regulating the resistance of the motor-circuit and reversing the motor and each having a point of open circuit, whereby one only may be used at a time to control the motor, substantially as set forth.

8. The combination, with an electric motor, of a regulating commutator or switch composed of a cylinder having two sets of contact-plates separated by an intermediate space and a series of contact-buttons adapted to bear on both sets of contact-plates but narrower than the said separating-space, part of said contact-plates acting to regulate the resistance of the motor-circuit when brought in contact with said buttons and being duplicated in the two sets, the remaining plates being connected oppositely in the two sets and acting to reverse the motor, substantially as set forth.

9. In a regulating commutator or switch for an electric motor, the combination, with an insulating revolving cylinder, of two sets of contact-plates thereon, a portion being duplicates and a portion being duplicates in form but oppositely connected electrically, the former adapted to bear upon contact-buttons connected to coils in the motor-circuit and to connect said coils so as to regulate the resistance of the said circuit and the latter adapted to bear upon contact-buttons connected to a reversible part of the motor, whereby the same regulation may be effected with opposite directions of rotation of the armature by a continuous movement of the cylinder, substantially as set forth.

10. The combination, with an electric motor, of a regulating commutator or switch composed of a cylinder F, having a series of contact-plates thereon, a contact-button *a*, connected to one motor and line-terminal, a contact-button Gr, connected to the opposite line-terminal, and intermediate series of contact-buttons $+b-a+c-d$ connected to a series of coils for regulating the resistance of the motor-circuit, and additional contact-buttons connected to the terminals of a reversible part of the motor, substantially as set forth.

11. The combination, with a vehicle, of two electric motors, one for each axle of said vehicle, two regulating switches or commutators, one at each end of the vehicle, a series of conductors extending along the vehicle and connecting corresponding parts on the two switches, there being two such conductors for the outer field-magnet terminals, respectively, and two for the armature-terminals, respectively, individual branches from each of said conductors to both of the motors, and line connections for the first and the last of said conductors, respectively, substantially as set forth.

12. The combination, with an electric motor, of two circuit-controlling devices for regulating the mechanical effects in said motor, two reversing-switches, one for each controlling device, and common operating means for each controller and its respective reversing-switch, substantially as set forth.

13. The combination, with an electric motor, of two controlling devices for regulating the current in the motor-circuit and two reversing-switches, one for each controlling device, with common operating means for each controller and its respective switch, substantially as set forth.

14. The combination, with two electric motors connected in multiple arc with the same circuit, of two independent regulating commutators or switches composed each of a cylinder having a number of metal contact-plates and a series of contact-buttons adapted to bear on said plates, one button on each switch being connected to the corresponding button on the other switch and to one line and motor terminal, a second button on each switch being connected to the corresponding button on the other switch and to the opposite line and motor terminal, and the remaining buttons being connected to a series of coils for regulating the resistance of the motor-circuit and to a reversible part of the motor, substantially as set forth.

15. The combination, with two motors in multiple arc having a common circuit at a point between their fields and armatures, of two reversing-switches, each acting to reverse both motors, and two regulating devices connected to the two reversing-switches, respectively, so as to be operated by a common means, substantially as set forth.

16. The combination, with two motors in multiple arc having a common circuit at a point between their fields and armatures, of a common reversing-switch having two terminals adjacent to the line and field terminals and a circuit from said two terminals branching to the two armatures, substantially as set forth.

481,740. DENTAL BURRING-TOOL. RUFUS G. STANBROUGH, New York, N. Y. Filed Jan. 20, 1892. Serial No. 418,696. (No model.)

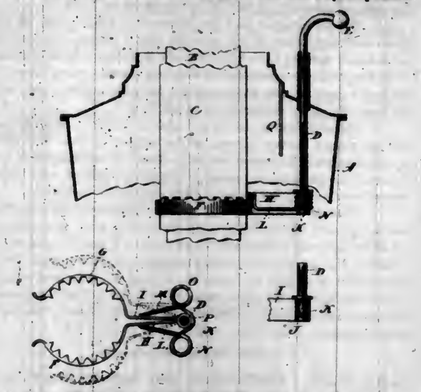
Claim.—1. In burring or cutting mechanisms for dental operations, a vertically-adjustable bifurcated guide-pin or holder, substantially as described.

2. In combination with a frame, a shaft carrying burrs or cutters and means, substantially as described, for adjustably securing the shaft and burrs in the frame, for the purposes set forth.

3. In burring or cutting mechanisms for dental operations, a shaft carrying burrs or cutters held in a frame by means of a collar or hollow cone-bearing at one end and a pin or pivot bearing at the other end and jam-nuts for rendering said bearings adjustable, substantially as described.

4. In burring or cutting mechanisms for dental operations, a bifurcated guide-pin or holder the legs of which are screw-threaded and adapted to straddle the shaft carrying the burrs or cutters and to engage with a set or regulating screw to adjust said guide-pin or holder to different altitudes, substantially as described.

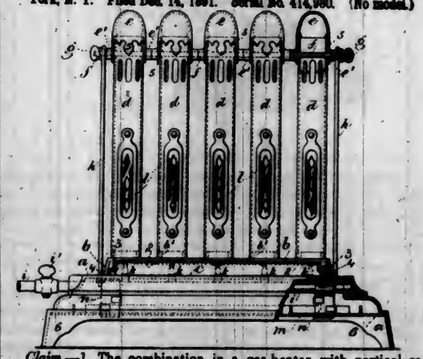
5. In burring or cutting mechanisms for dental operations, a frame having a central slotted extension, a regulating-screw working over said extension, a shaft carrying burrs or cutters secured in said frame by a collar or hollow cone-bearing on one side and a pin or pivot bearing on the other side, with jam-nuts for rendering said bearings adjustable, and a bifurcated guide-pin or holder the legs of which are screw-threaded and adapted to straddle the shaft carrying the burrs or cutters and to extend through slots in the frame and central extension thereof and be adjusted vertically by means of the regulating-screw thereon, substantially as described, for the purposes set forth.



6. In burring or cutting mechanisms for dental operations, integral burrs or cutters provided with an encircling groove, substantially as described, for the purposes set forth.

7. In burring or cutting mechanisms for dental operations, burrs or cutters integral with the shaft and provided with a central encircling groove and a hollow or recess at one end to engage a pivot-bearing, in combination with a tapered centering-point *h*, substantially as described.

8. In burring or cutting mechanisms for dental operations, burrs or cutters integral with the shaft and provided with a central encircling groove, a hollow or recess at one end to engage a pivot-bearing, and a tapering or conical projection on the other side to form a cone-bearing, in combination with the conical centering-point *h*, substantially as described, for the purposes set forth.



481,741. WICK-RAISER FOR CENTRAL-DRAFT LAMPS. WALDO L. UPSON, Meriden, Conn., assignor to The Bradley & Hubbard Manufacturing Company, same place. Filed Nov. 23, 1891. Serial No. 412,784. (No model.)

Claim.—1. In a wick-raiser for central-draft lamps, the combination of a pair of jaws adapted to embrace the wick one upon each side, the said jaws constructed with arms extending radially outward, and a vertical rod extending vertically through a bearing in the fount, one of the said jaws made fast to the lower end of said rod and the other jaw hinged thereto with a spring the tendency of which is to yieldingly hold the jaws in the closed position, substantially as specified.

2. In a wick-raiser for central-draft lamps, the combination of a pair of jaws adapted to embrace the wick within the fount, each jaw constructed with an arm extending radially outward, the jaws being adapted to swing the one from the other, and a vertical rod upon which the said arms of the jaws are arranged, the said rod extending vertically upward through a suitable bearing in the fount, combined with a wire spring composed of two coils N O, with a bead P between the coils across the rod, the arms L M of the said coils extending inward and adapted to bear upon the outer side of the said arms of the jaws, substantially as described.

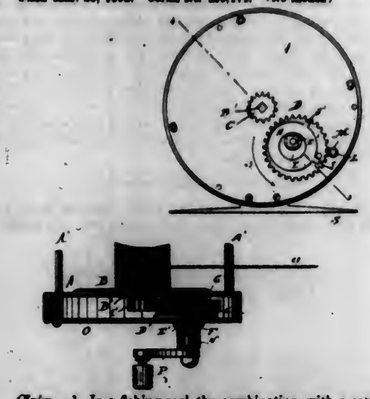
481,742. GAS HEATER OR RADIATOR. ARBOVITE WOLFF, New York, N. Y. Filed Dec. 14, 1891. Serial No. 414,960. (No model.)

Claim.—1. The combination, in a gas-heater, with vertical radiating-tubes, a gas-pipe, and burners, of a base *a*, having a central opening with a surrounding flange *a'*, an auxiliary base *b*, adapted to set over the said flange *a'* and having an opening along one side with a flanged edge 2 and bearing-lugs 4, and a longitudinal plate *c*, fitting the aforesaid opening and having hubs 3 in the lugs 4, on which the plate swings, whereby access is given for lighting the burners, substantially as specified.

2. The combination, in a gas heater or radiator, with the base, of sheet-metal radiating-tubes setting upon said base, separate caps fitting over the sheet-metal tubes, a rod passing horizontally through these caps and tubes to connect them together, and tie rods engaging the ends of the said rod and secured to the base to compact and hold together the parts of the heater, substantially as set forth.

3. The combination, in a gas heater or radiator, with the base and sheet-metal radiating-tubes, of separate caps fitting over the sheet-metal tubes and having perforated abutting side hubs, a rod passing horizontally through these caps and tubes to connect them together, and tie-rods engaging the ends of the said rod and secured to the base to compact and hold together the parts of the heater, substantially as set forth.

4. The combination, in a gas heater or radiator, with the base and sheet-metal radiating-tubes, of the separate hollow convex cap *c*, fitting over the sheet-metal tubes, each cap having an internal flange and

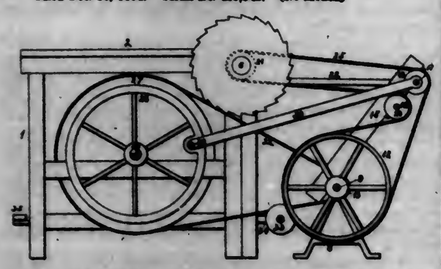


being imperforate above the radiating-tubes, having depending ornamental flanges 5, surrounding the upper ends of the radiating-tubes, and with perforated abutting side lugs *d* and tie-rods *f* for connecting the caps, substantially as and for the purposes set forth.

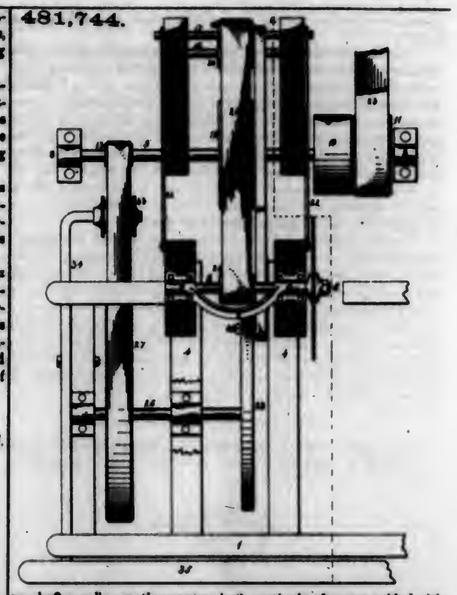
5. The combination, in a gas heater or radiator, with the sheet-metal radiating-tubes, of the separate caps *c*, fitting over the sheet-metal tubes, each cap having flanges 5 and perforated abutting side lugs *d*, the longitudinal connecting-rod with screw ends passing through the tubes and caps, and the screw-nuts for bringing together and holding the caps and tubes, substantially as specified.

6. The combination, in a gas heater or radiator, with the base *a* and gas-pipes *i*, having burners, of the bottom plate *m*, with turned-up edges to leave air-spaces and with corners 6, and the straps *n*, surrounding the gas-pipe and passing through the plate *m*, with the ends turned over to support the plate, substantially as set forth.

7. The combination, in a gas heater or radiator, with the base *a* and gas-pipes *i*, having burners, of the bottom plate *m*, with turned-up edges to leave air-spaces and with corners 6, and the straps *n*, surrounding the gas-pipe and passing through the plate *m*, with the ends turned over to support the plate, and a sheet of wire-gauze *o*, extending across the base midway between the burners and bottom plate and connected to the gas-pipe for distributing and breaking the force of the air passing to the flames, substantially as specified.

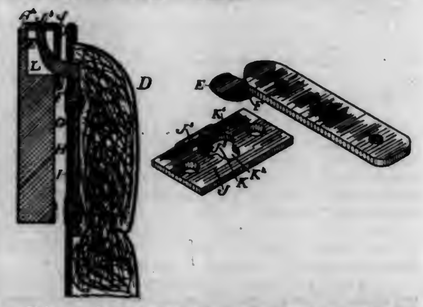


481,748. FISHING REEL. JOHN BORCHARDT, Jersey City, N. J. Filed Mar. 28, 1892. Serial No. 426,171. (No model.)



Claim.—1. In a fishing-reel, the combination, with a casing, of a drum, a pinion fixed on the axle of the drum, a cog-wheel adapted to engage said pinion and having an eccentric opening, a disk in said opening, a tubular projection on said disk, which projection is eccentric to the disk, a handle connected with said projection, and a pin on the casing passing through said tubular projection, arms on said disk, and a pin on said cog-wheel, substantially as set forth.

2. In a fishing-reel, the combination, with a casing, of a drum in the same, a pinion on the axle of the drum, a cog-wheel having an eccentric opening, a disk within said opening and mounted eccentrically on a pin of the casing, a spiral spring attached to the cog-wheel and said disk, arms on the disk, and a pin on the cog-wheel, which pin is encountered by the said arms, substantially as set forth.

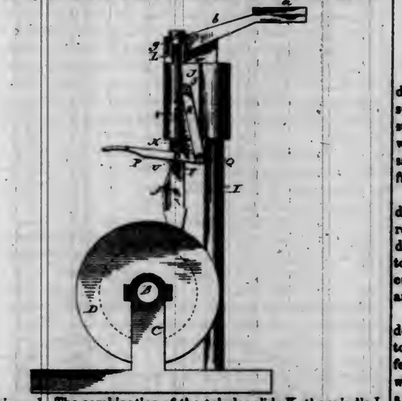


481,744. SWINGING SAW. BENJAMIN BROWN, Rockford, Ill. Filed Dec. 16, 1891. Serial No. 415,543. (No model.)

Claim.—A circular-sawing machine having a supporting-frame, a carriage capable of a sliding movement, a saw on the carriage, a counter-shaft, a pulley on the counter-shaft, a swinging frame provided with pulleys, a belt passing over the pulleys and over the saw-arbor, a loose belt connecting the shaft of the swinging frame with the pulley on the counter-shaft, a tightener for the belt, a disk on the counter-shaft, and an arm connecting this disk with the swinging frame.

481,745. LAZY-BACK FOR VEHICLE-SEATS. ANTHONY G. BRENNEMAN and HERMAN H. UCKOTTER, Cincinnati, Ohio. Filed Dec. 26, 1891. Serial No. 416,128. (No model.)

Claim.—1. In a seat, the cushion made separable from the back-frame and provided with interlocking devices, as follows: a supporting-piece secured to the cushion and provided with the neck bent outward, forward, and then upward and terminating in the enlarged portion or head E, the planes of whose sides are bent obliquely forward and upward and whose head is enlarged over the neck in the direction of its lateral edges, the lower and front side of the neck and the front side of the head being in a continuous curve outward and upward and presenting when the lazy-back is in position an oblique surface to the plane of the frame, and the frame A, provided with opening K, composed of the larger opening K′ above and the smaller opening K² below and recess at rear thereof, substantially as and for the purposes specified.

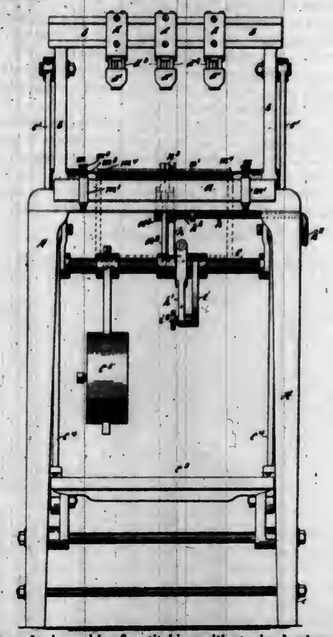


2. In a lazy-back, the cushion made separable from the back-frame and provided with interlocking devices made substantially as follows, to wit: a supporting-piece G, secured to the cushion and provided with the neck F, bent substantially as described, terminating in the enlarged portion, the head E, curved in two directions, and the plate J, secured to the back-frame and having opening K, composed of larger opening K′ above and smaller opening K² below, and the recess L, formed in the frame-piece A′, the plate J being further provided with the lip J², extending from the upper portion of the plate rearward and forming a roof to the upper edge of the recess, and an abutment against which the head E may strike when introduced through the opening K into the recess L, substantially as and for the purposes specified.

3. In a lazy-back, the cushion made separable from the back-frame and provided with interlocking devices made substantially as follows, to wit: a supporting-piece G, secured to the cushion and provided with the neck F, bent substantially as described, terminating in the enlarged portion, the head E, curved in two directions, and the frame A, provided with the opening K, composed of larger opening K′ above and the smaller opening K² below and recess at rear thereof, the length of the head E being such that when the neck F is in opening K′ the upper end of the head will be so near to the roof of the recess that a vertical movement of the cushion cannot enable the neck to be lifted out of opening K², substantially as and for the purposes specified.

4. In a lazy-back, the cushion made separable from the back-frame and provided with interlocking devices made substantially as follows, to wit: a supporting-piece G, secured to the cushion and provided with the neck F, bent substantially as described, terminating in the enlarged portion, the head E, curved in two directions, and the frame A, provided with the opening K, composed of a larger opening K′ above and the smaller opening K² below and recess at rear thereof, the length of the head E being such that when the neck F is in opening K′ the upper end of the head will be so near to the roof of the recess that a vertical movement of the cushion cannot enable the neck to be lifted out of the opening K², the roof of the recess being formed by the flange J² of the plate J, substantially as and for the purposes specified.

5. In a seat, the cushion made separable from the back-frame and provided with interlocking devices, as follows: a supporting-piece secured to the cushion and provided with the neck bent outward, forward, and then upward, and terminating in the enlarged portion or head E, the planes of whose sides are bent forward and upward and whose head is enlarged over the neck in the direction of its lateral edges, but is of a diminishing thickness from front to rear and of less thickness in this direction than the neck, the lower and front side of the neck and the front side of the head being in a continuous curve without projection, and the inner and upper side of the neck being in one continuous curve with the rear side of the head and without projections, substantially as and for the purposes specified.



481,748. PIN-STICKING MACHINE. EDWARD A. DURGIN, New Haven, Conn. Filed Oct. 2, 1891. Serial No. 407,539. (No model.)

Claim.—1. The combination of the tubular slide K, the spindle L, arranged within said slide and carrying a punch N at its lower end, the slide constructed with a conductor O, leading into the opening below the said punch and so as to conduct a pin thereto, the slide constructed with a vertical slot T, a lever P, hung by one end in rear of the spindle and so as to swing in a vertical plane, the lever extending forward of the spindle so as to form a handle, with a stud U projecting from said spindle through said slot and into connection with said lever P, substantially as and for the purposes described.

2. The combination of a tubular slide K, the vertical reciprocating spindle L, arranged therein and carrying the punch N, a lever hung by one end in rear of the spindle so as to swing in a vertical plane, the lever extending forward of the spindle so as to form a handle, the said lever in connection with said spindle and slide, whereby the vertical reciprocating movement is imparted to said slide and spindle, a hopper adapted to receive a mass of pins, an inclined channel leading therefrom, a transverse slide *d*, arranged to reciprocate across the lower end of said channel, the said slide constructed with a vertical notch *e*, adapted to receive a pin, mechanism for imparting reciprocating movement to said slide transverse to the said channel, and a conductor *f*, leading from the said notch in the slide at one side of the lower end of said channel to the opening in the slide K below the punch N, substantially as and for the purpose described.

481,747. MACHINE FOR STITCHING WITH STAPLES. ROBERT BURNEY, East Orange, N. J. Filed Aug. 24, 1891. Serial No. 403,566. (No model.)

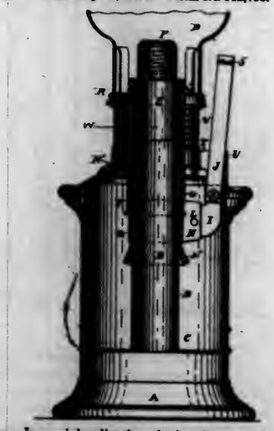
Claim.—1. A machine for stitching with staples, having a staple driving and feeding device consisting of two plates or devices movably supported in their relation to each other, one of which is provided with a staple-suppporting and feeding rod or device and the other provided with a device operated thereby to reciprocate adjacent to the end of said feeding rod or device and regulate the feed of the staples therefrom, substantially as described, and for the purpose set forth.

2. A staple-driving machine having a staple driving and feeding device consisting of two plates or devices adjustably supported in their relation to each other, one of which is provided with a staple-feeding device and the other with a device having an opening therein adapted to operate adjacent to the end of said feeding device to allow of and cut off the feed of the staples from the latter, substantially as described, and for the purpose set forth.

3. A staple-driving machine having a staple driving and feeding device consisting of two plates or devices adjustable in their relation to each other, one of which is provided with a staple supporting and feeding device and the other with a plate having an opening therein with shoulders or projections adapted for engaging with and releasing a staple from the said supporting and feeding device, substantially as described, and for the purpose set forth.

4. The combination, in a machine for stitching with staples, of a staple driving and feeding device consisting of two plates or devices adapted to operate in a line with each other, one of which is provided with a vertically-arranged groove or guideway and with a staple-feeding rod or device and the other provided with a device adapted to regulate the feed of the staples from the said feeding device into said guideway, a spring-arm extending into said guideway, and a reciprocating staple-driver, substantially as described, and for the purpose set forth.

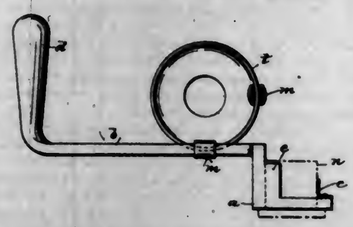
5. The combination, with a supporting-frame, of a sliding bed or table mounted in suitable ways thereon and provided with teeth or projections, a pivoted lever carrying a pawl for engaging with and operating said bed or table, a cam or eccentric adjustably mounted on a rock-shaft for operating said pivoted lever, an adjusting device or plate secured on said rock-shaft, and means for adjustably connecting the



said cam or eccentric therewith, substantially as described, and for the purpose set forth.

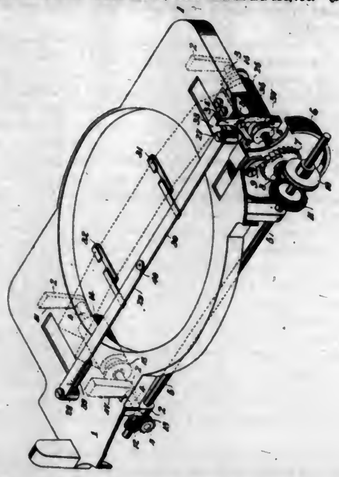
6. The combination, with a supporting-frame, of a sliding bed or table mounted in suitable ways thereon and provided with teeth or projections on its under surface, a pivoted lever carrying a pawl for engaging with and operating said bed or table, a cam or eccentric adjustably mounted on a rock-shaft for operating said pivoted lever, an adjusting device or plate secured on said rock-shaft provided with a series of openings therein, and a pin, screw, or other device for adjustably connecting said cam or eccentric with the adjusting device or plate by insertion into one of the said openings thereon, substantially as described, and for the purpose set forth.

7. In a machine for stitching with staples, the combination, with the supporting-frame and a sliding bed or plate mounted in suitable ways thereon, of holding or clamping devices, consisting of a plate adapted for adjustable attachment with said sliding table and provided with spring-arms elastically supported thereby, substantially as described, and for the purpose set forth.



8. In a staple-driving machine, the combination, with the supporting-frame, the sliding bed or table mounted thereon, and the staple-driving mechanism, of a horizontally-sliding gage located above said sliding table and adjustably supported in an arm or bracket located on the supporting-frame by means of a clamping device or screw, substantially as described, and for the purpose set forth.

481,748. WICK-LIFT FOR LAMPS. HORACE L. CLARK, Rutherford, N. J. Filed May 31, 1892. Serial No. 312,755. (No model.)



Claim.—In a wick-adjusting device for central-draft lamps, the combination, with a wick-band having a laterally-projecting shank constructed with an upwardly-projecting extension, of a draw-bar having its lower end pivotally connected with the upper end of the said extension of the shank, substantially as set forth.

481,749. CARRIAGE-WRENCH. JOHN A. COREY, Hope Valley, R. I. Filed June 15, 1892. Serial No. 436,776. (No model.)

Claim.—A carriage-wrench consisting of a shank having a light square open head to receive the nut with cheek-flanges on either side of the opening and a spring attached to its outer bar to hold the nut when off the axle, in combination with a spring-clasp attached to the shank, substantially as described, for the purpose of holding the wrench, as herein set forth.

481,750. TYPE-WRITING MACHINE. LOUIS P. DEE, Ilion, assignor to the Remington Standard Type Writer Manufacturing Company, New York, N. Y. Filed Jan. 21, 1892. Serial No. 418,780. (No model.)

Claim.—1. In a type-writing machine, the combination of an inking-ribbon, a ribbon-spool shaft 4, arranged to revolve alternately in opposite directions, a ribbon-spool connected to said shaft to turn therewith in whichever direction said shaft may be rotated, a ribbon-spool shaft 3, arranged to turn always in the same direction, and a ribbon-spool frictionally connected to said shaft, so that it may turn either with said shaft or in a direction opposite to that of the rotation of said shaft, according to the direction of rotation of the opposite shaft and spool.

2. In a type-writing machine, the combination of an inking-ribbon, a ribbon-spool shaft 4, arranged to revolve alternately in opposite directions, a ribbon-spool frictionally connected to said shaft, so as to turn therewith in whichever direction said shaft may be rotated, but capable of being turned by hand independently of said shaft, a ribbon-spool shaft 3, arranged to turn always in the same direction, a ribbon-spool frictionally connected to said shaft, but in a manner to have less friction or resistance than the first-mentioned spool, so that it may turn either with said shaft or in a direction opposite that in which said shaft turns, and an intermediate connecting-shaft transmitting the motion of shaft 3 and arranged to revolve in opposite directions and alternate the direction of revolution of the shaft 4 and its spool.

3. In a type-writing machine, the combination of an inking-ribbon, ribbon-spool shafts 3 and 4, ribbon-spools connected to said shafts, a beveled gear on the shaft 3, a worm-wheel on the shaft 4, and an intermediate shiftable shaft 5, provided at one end with a worm and at its other end with two beveled gears, the arrangement being such that the shaft 3, which rotates always in one direction, may rotate the shaft 4 through the shaft 5 alternately in opposite directions.

4. In a type-writing machine, the combination of an inking-ribbon, a spool-shaft arranged to revolve always in one direction, a ribbon-spool frictionally connected to said shaft and capable of revolving alternately in opposite directions, a spool-shaft arranged to have a slower movement than the first-named shaft and a movement alternately in opposite directions, and a ribbon-spool connected to said slower shaft to turn always therewith and wind and unwind the ribbon.

5. In a type-writing machine, the combination, with an inking-ribbon, a pair of ribbon-spool shafts, and a pair of ribbon-spools, of a horizontally-arranged pivoted arm having a ribbon-support and having a slow step-by-step movement in one direction and a quick rebounding movement in the opposite direction.

6. In a type-writing machine, the combination, with an inking-ribbon, a pair of ribbon-spool shafts, and a pair of ribbon-spools, of a horizontally-arranged pivoted arm having a ribbon-support and connected to one of said ribbon-spool shafts in a manner to be vibrated step by step through the rotations of said shaft.

7. In a type-writing machine, the combination, with an inking-ribbon, a pair of ribbon-spool shafts, and a pair of ribbon-spools, of a pivoted ribbon-carrier, a lever for moving the same, and a cam for actuating said lever.

8. In a type-writing machine, the combination, with an inking-ribbon, a pair of ribbon-spool shafts, and a pair of ribbon-spools, of a pivoted ribbon-carrier, a driving-cam, and an intermediate transmitting

device for moving said carrier in one direction and a spring for moving said carrier in the opposite direction.

9. In a type-writing machine, the combination, with an inking-ribbon and a pair of ribbon-spools, of a pair of pivoted arms geared together at their inner ends and provided with ribbon-guides.

10. In a type-writing machine, the combination, with an inking-ribbon, a pair of ribbon-spool shafts, and a pair of ribbon-guides, of a pair of pivoted arms geared together at their inner ends and provided with ribbon-guides and means connected with one of the spool-shafts for vibrating said arms and moving the ribbon laterally.

11. In a type-writing machine, the combination, with an inking-ribbon, a pair of ribbon-spool shafts, and a pair of ribbon-spools, of a pair of pivoted arms geared together at their inner ends and provided with ribbon-guides, means connected to one of the spool-shafts for vibrating said arms in one direction, and a spring for vibrating said arms in the reverse direction.

12. In a type-writing machine, the combination, with an inking-ribbon and a vibratory ribbon-carrier, of a pair of spool-shafts, one arranged to revolve slower than the other, and a ribbon-spool connected to each of said shafts, substantially as described, whereby the lines of type impressions on the ribbon will be oblique and parallel to each other and close together.

13. In a type-writing machine, the combination of an inking-ribbon, a vibratory ribbon-carrier, a spring for moving it in one direction, a lever and cam for moving it in the opposite direction, a ribbon-spool, a shaft for said spool, bearing said cam and revolving faster than its spool, a second ribbon-spool, and a shaft therefor arranged to revolve slower than the first-named shaft.

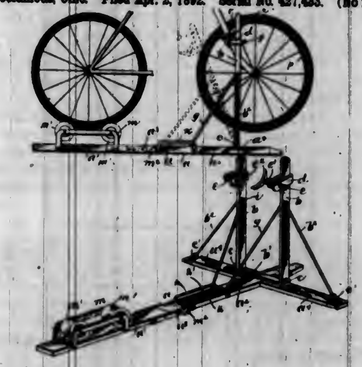
14. In a type-writing machine, the combination of pivoted arms provided with ribbon-guides, a spring, the lever, the cam, and the ribbon-spools, all arranged to operate substantially as and for the purpose set forth.

15. In a type-writing machine, the combination, with an inking-ribbon, of a rotating ribbon-spool shaft, a sleeve connected to said shaft, and a spool detachably connected to said sleeve by a detent arranged between the sleeve and the spool.

16. In a type-writing machine, the combination, with an inking-ribbon, of a rotating spool-shaft, a sleeve mounted on the said shaft by means of friction devices and capable of turning independently of said shaft, and a spool detachably connected to said sleeve.

17. In a type-writing machine, the combination, with an inking-ribbon, of a spool-shaft, a sleeve mounted on said shaft, a pair of collars secured to said shaft, a spring arranged to press said sleeve between the said collars, and a spool connected to said sleeve.

18. In a type-writing machine, the combination, with an inking-ribbon, of a spool-shaft, a sleeve mounted on said shaft, the collars, the cup, the washers, the spring, the ribbon-spool, and the spring-detent.



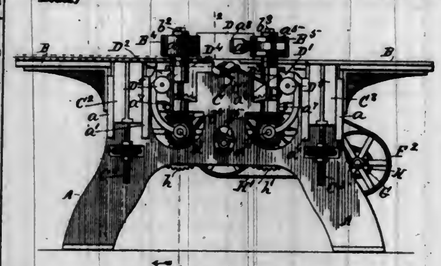
19. In a type-writing machine, the combination, with hangers, of a horizontally-arranged spool-shaft and a vertically-arranged confining-slide for said shaft.

20. In a type-writing machine, the combination, with hangers, of a horizontally-arranged spool-shaft, a vertically-arranged confining-slide, and a detent or lock for said slide.

21. In a type-writing machine, the combination, with hangers, of a spool-shaft having a groove and a confining-slide having a lateral projection to engage said groove and prevent endwise movement of the shaft.

22. In a type-writing machine, the combination, with hangers having hook-shaped bearings, of a spool-shaft, the cap-plate 41, arranged as described, and the slide 43.

481,751. BICYCLE-SUPPORTING FRAME. RICHARD A. ENGLER, Columbus, Ohio. Filed Apr. 2, 1892. Serial No. 427,433. (No model.)



Claim.—1. In a bicycle-supporting frame, the combination, with the base, of a standard-frame rising therefrom and jointedly connected therewith and transverse rest-pins supported from the arms of said standard-frame and adapted to support, as described, the coasting-pins of a bicycle, substantially as specified.

2. In a bicycle-supporting frame, the combination, with the base *a*, a standard-frame rising therefrom and jointedly connected therewith, and rests *a'*, carried by said standard-frame, of a guide-frame *k*, substantially as described, rising from the base, and a sliding brace *g*, pivotally connected with the arms of said standard-frame and adapted to slide within said frame *k*, substantially as specified.

3. In a supporting-frame for bicycles, the combination of the base *a*, a standard-frame having arms *b*, jointedly connected with said base, yokes *d*, adjustably secured to the standard *b*, and rest-pins *e*, projecting from said yokes, substantially as specified.

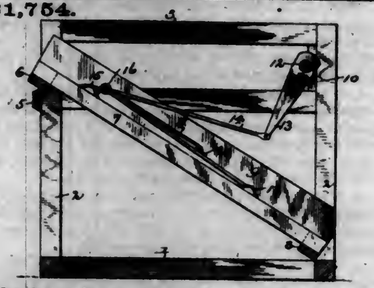
4. In a bicycle-supporting frame, the combination of the base *a*, formed with two jointed sections, a standard-frame jointedly connected therewith and rising therefrom at one end, transverse rests *a'*, supported from said standard-frame, a roller-frame *m*, supported from the base-section *a'*, and rollers *m'*, journaled therein, substantially as and for the purpose specified.

481,752. BOX-BOARD MATCHER AND JOINTER. REINHERT FISCHER, Chicago, Ill. Filed Mar. 7, 1890. Serial No. 343,044. (No model.)

Claim.—1. In a matching and joining machine, the combination, with the feed-tables, the inner fixed feed-rollers, the outer feed-rollers having a positive movement toward the fixed rollers as well as a spring movement toward the same, of gage-plates located between the pairs of inner feed-rollers, curved arms rigidly supporting said gage-plates at their outer ends, cross-bars to which said arms are attached, the spring-arms a^4, adjustably mounted on the frame, and the rollers a^3, carried by said arms, substantially as described.

2. In a matching and joining machine, the combination, with the feed-tables, the inner fixed feed-rollers, the outer feed-rollers having a positive movement toward the fixed rollers as well as a spring movement toward the same, and rigid gage-plates located between the pairs of inner feed-rollers, of the posts a^5, mounted on the carriages of the movable feed-rollers, spring-arms a^4, carried thereby, and the rollers a^3, carried by the inner bifurcated ends of the spring-arms, thereby giving a positive as well as a spring adjustment to said rollers, substantially as described.

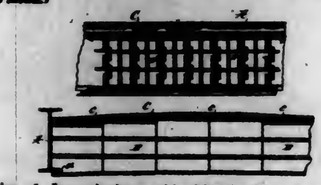
481,753. FERRULE. WILLIAM H. GASKILL, Philadelphia, Pa., assignor to Samuel W. Evans, Jr., same place. Filed Jan. 23, 1892. Serial No. 419,022. (No model.)



Claim.—A ferrule provided with a peripheral bead or knurl, in combination with a point inserted in the ferrule below said bead or knurl and a retaining-piece located in and embraced by the said bead, substantially as described.

481,754. COAL-SCREEN. SAMUEL GRIFFITHS, Weir, Kans. Filed Feb. 20, 1892. Serial No. 422,221. (No model.)

Claim.—1. In a coal screen or separator, the combination, with the frame, the inclined separating-bars with intervening spaces, and the side walls, of the inverted-V-shaped scraping-plates, the interme-

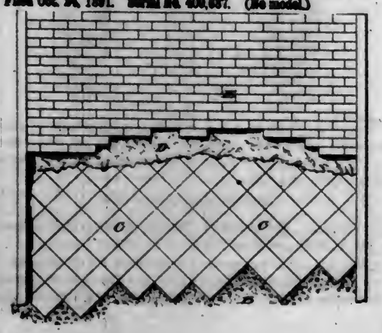


481,754.

diate flat plate, and means, substantially as described, for reciprocating said plates.

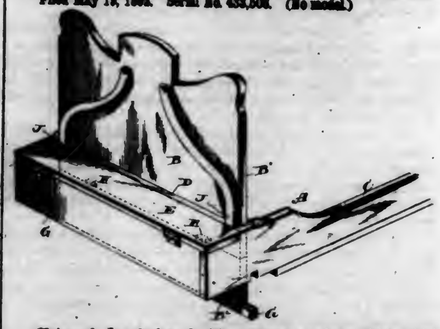
2. In a coal screen or separator, the combination, with the frame, the inclined separating-bars with intervening spaces, and the side walls, of the oscillating shaft provided with cranks, the bars pivoted thereto, the transverse inverted-V-shaped plate secured to said bars, the transverse bar, the rods pivoted thereto and provided with an inverted-V-shaped plate, the intermediate flat plate, and the rods connected therewith, pivoted to said transverse bar, substantially as described.

481,755. COHESIVE COMBINED LINTEL-CEILING. RAFAEL GUASTAVINO, Jr., Boston, Mass. Filed June 23, 1891. Serial No. 397,268. (No model.)



Claim.—1. In a cohesive combined lintel-ceiling, a course of hollow tile-blocks provided on their long sides with interlocking tongue-and-groove joints and laid in cement or plaster with their longitudinal sides perpendicular to the supporting-beams and breaking joints and cooeting with one another to form continuous grooved joints interlaced with each other to form a lintel from beam to beam, substantially as set forth.

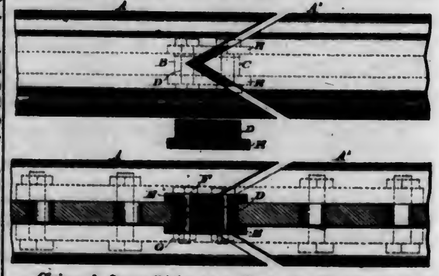
2. In a cohesive combined lintel-ceiling, a course of hollow tile-blocks provided with interlocking tongue-and-groove joints and laid in plaster or cement with their longitudinal sides perpendicular to the supporting-beams and breaking joints with one another and a second course of thin tiles laid flat in cement or plaster on top of said course of interlocked tile-blocks and breaking joints with the latter, substantially as set forth.



3. In a cohesive combined lintel-ceiling, a course of hollow tile-blocks provided with tongue-and-groove joints on their long sides and laid in cement with their longitudinal sides perpendicular to the supporting-beams and of variable heights or thicknesses from the beams toward the crown of the arch, thus forming a series of steps, a filling of cement to even up the top surface of the structure, and a course of thin flat tiles laid in cement on the top of the whole, substantially as set forth.

481,756. BRICK PAVEMENT. JOHN R. HALDEMAN, Normal, Ill. Filed Oct. 24, 1891. Serial No. 409,687. (No model.)

Claim.—A pavement composed of a suitable bed, a layer of square bricks laid flatwise diagonally across the street, a layer of cement filling the joints and covering the said layer, a layer of sand on the said cement, and an upper layer of bricks set on edge lengthwise across the street on said sand and cement, substantially as specified.

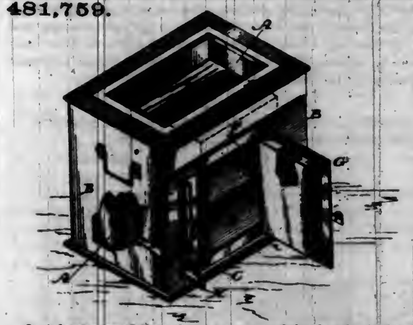


481,757. FOLDING BEDSTEAD. FLOYD HAMBLIN, Mohawk, N. Y. Filed May 19, 1892. Serial No. 433,508. (No model.)

Claim.—1. In a bedstead with recesses or pockets, within which the head or foot board moves, a head or foot board consisting of two hinged sections, said board being vertically movable within certain limits, and stops for limiting said vertical movements, substantially as shown and described.

2. In a bedstead, the combination, with the bedstead having at its ends recesses or pockets, as described, of head and foot boards, each constructed of two hinged sections, the lower section being of substantially the width of the side boards of the bedstead and provided at its ends with extensions G, adapted to engage the lower edges of said side boards and limit the upward movement of the head or foot board when the same is raised, and the stops, substantially as and for the purpose described.

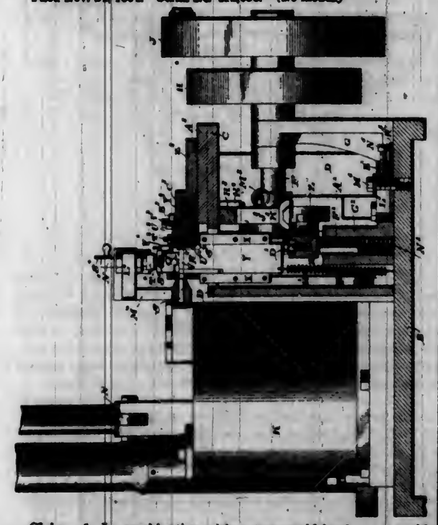
481,758. RAILWAY-JOINT. HENRY T. HEY, Philadelphia, Pa., assignor of one-half to Adolph A. Poehner, same place. Filed Sept. 24, 1891. Serial No. 406,641. (No model.)



Claim.—1. In a rail-joint, two-rails, one having a V-shaped projecting end and the other rail having a recessed end coinciding with said projecting end, recesses in the adjacent ends of the webs of said rails, and a sliding key applicable and removable endwise in said recesses and having side pieces embracing the sides of the webs of the rails, one of said side pieces being connected with the key and the other side piece adapted to be secured thereto, said parts being combined substantially as described.

2. In a rail-joint, two rails having locking ends with coinciding recesses and a key fitted in said recesses and applicable to and removable therefrom in endwise direction and permitting the rails to move longitudinally thereon, the side pieces being connected with said key by bolts and embracing the webs of said rails, said parts being combined substantially as described.

481,759. HEATER FOR FOOD, &c. GUSTAV L. HINDERER, Philadelphia, Pa. Filed Apr. 25, 1892. Serial No. 430,444. (No model.)



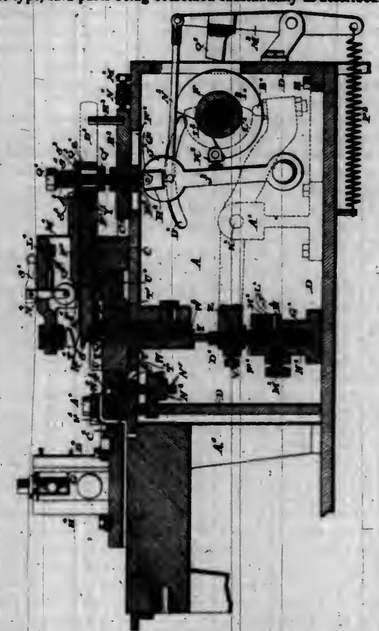
Claim.—1. A heater having a water-reservoir with double side walls and a lid, a heating-chamber within said reservoir, having an open space on its sides and top, and a door connected with the side of the reservoir and opening into said chamber, said parts being combined substantially as described.

481,759.

2. A heater consisting of a water-reservoir having the double side walls B, the bottom C, and the lid D, the metallic chamber E within said reservoir, with the opening F therein, having the door G, opening outside the reservoir, and the faucet H, leading from the said reservoir, said lid D having a valve for the escape of the steam, said parts being combined substantially as described.

481,760. TYPE-CASTING MACHINE. THOMAS K. HERSHELLWOOD, Philadelphia, Pa., assignor of one-half to Hermann Popp, same place. Filed Nov. 21, 1891. Serial No. 412,653. (No model.)

Claim.—1. In combination with a type-mold having a movable body-piece therein, an operating-lever adapted to bear against said body-piece, and an adjustable stop with which said lever contacts for regulating the length of movement of said body-piece of the mold, consisting of a hollow block having a slot in one side, a pin movable in said block and provided with a stud working in the said slot, a spring bearing against said bolt, and a clamping-screw for said bolt, substantially as described.



2. In combination with a type-mold having a movable body-piece therein, an operating-lever adapted to raise said body-piece, a hollow block having a slot in one side and a recess in the same side, forming a shoulder, a pin movable in said block and provided with a stud working in the said slot and adapted to stop the downward movement of the said lever, a metallic strip or piece interposed between said stud and shoulder, and a clamping-screw for said bolt, substantially as described.

3. In combination with a type-mold having a movable body-piece therein, an operating-lever adapted to raise said body-piece, a hollow block having a slot in one side and a recess in the same side, forming a shoulder, a pin in said block adapted to limit the downward movement of said lever, a stud on said bolt working in said slot, a spring normally raising said bolt, a strip of suitable material interposed between said shoulder and stud, and a clamping-screw for said bolt, substantially as described.

4. In a type-casting machine, a stationary mold having a recess therein, a body-piece vertically movable in said recess, an operating-lever provided with a cushion adapted to contact with said movable body-piece, a spring secured to said body-piece for automatically lowering the same, and an adjustable stop adapted to be in contact with said lever, limiting its downward movement, said parts being combined substantially as described.

5. In a type-casting machine, a mold having a sliding body-piece, the sliding arm P', with a longitudinal groove, the block Q^x in said arm and having a recessed portion on its under side for engaging the type, the movable piece S' in said groove and provided with an inclined under face on its front end, a spring secured to said piece P' and bearing against the block Q^x, and a binding-screw for said piece S', said parts being combined substantially as described.

6. In a type-casting machine, a mold having a recess therein, a movable body-piece in said recess, the sliding arm P', with a depending block Q', forming a top wall for the said recess, and the block Q^x, adjustable in said arm and having a recessed under face for engaging the type, said parts being combined substantially as described.

7. In a type-casting machine, a mold with a movable body-piece therein, an arm with a block movable on said mold and adapted to form a top wall for a recess therein, a block adjustable in said arm and having a recessed under face for engagement of the type, a reciprocating arm movable in ways on the bed of the machine and having a stud projecting therefrom, and a block secured on said stud and connected with said first-mentioned arm, said parts being combined substantially as described.

8. In a type-casting machine, a mold with a recess therein, a sliding body-piece vertically movable in said recess, the arm P', with depending block Q', movable on said mold, the block Q^x, adjustable in said arm and having a recessed under face to engage the type, and mechanism, substantially as described, connected with said arm for reciprocating the same, said parts being combined substantially as described.

9. In a type-casting machine, a mold having a movable body-piece therein, the arm P', with depending block Q', movable on said mold and forming a top wall for a recess therein, the block Q^x, held in said arm P' and having a recessed under face, a block Z', having a stud on which the arm P' is mounted, an arm having a pin on which the block Z' is secured, the spring D^s, attached to said block, and the pin E^3, against which said spring is adapted to bear, said parts being combined substantially as described.

10. In a type-casting machine, a mold with a type-recess therein, mechanism, substantially as described, for lifting the type from said recess to the top of said mold, an arm for removing said type from said mold, a supporting-block to which said arm is rotatingly attached, a reciprocating arm on which the block is rotatingly mounted, and a

spring attached to said block for keeping said arms and block in line, said parts being combined substantially as described.

11. In a type-casting machine, a mold having a movable body-piece therein, the arm P', with depending blocks Q' and Q^x, the latter having a recessed under face, the block Z', with the stud Y', the reciprocating arm P^2, movable in ways on the frame of the machine and provided with the pin A^2, on which the block Z' is adapted to turn, and the spring D^2, secured to the said block and bearing against a pin or projection on the frame of the machine, said parts being combined substantially as described.

12. In a type-casting machine, a mold having a movable body-piece, the reciprocating arm P', having an inclined upper portion at its front end and provided with the depending block Q' and the adjustable block Q^x, the latter having a recessed under face adapted to engage the type, the wedge T^2, with inclined under surface, and the downwardly-spring-pressed roller F^2, said parts being combined substantially as described.

13. In a type-casting machine, a mold having a movable body-piece, a reciprocating arm having an inclined portion on its upper face near its front end and provided with a block for covering a recess in said mold, a block held by said arm and adapted to engage and move the type when on the mold, a wedge supported on the frame of the machine and adapted to engage the inclined face of said arm, and a roller adapted to bear on said arm, said parts being combined substantially as described.

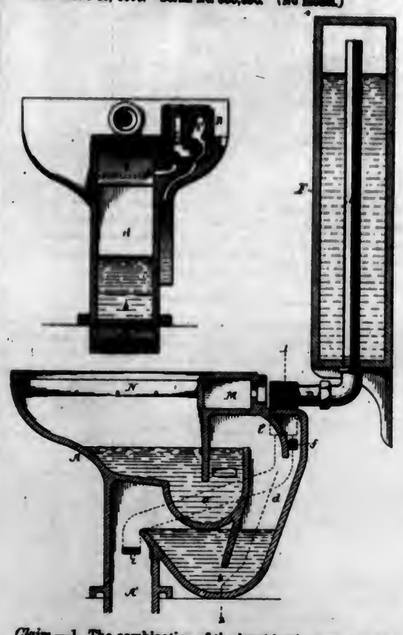
14. In a type-casting machine, a mold having a recess therein and a movable piece for removing the type from said recess, a reciprocating arm having an inclined portion on its upper face near its front end and provided with a block for covering said recess and a block for moving the type on said mold, a wedge adapted to engage said inclined face, and a spring-pressed roller bearing downwardly against said arm, and a cam-lever for lifting said roller, said parts being combined substantially as described.

15. In a type-casting machine, a frame, a mold having a movable body-piece therein, the arm P', with the depending block Q', adapted to cover a recess in said mold, the type-removing block Q^x in said arm, a reciprocating arm movable in ways on the frame and having a depending lug, mechanism connecting said arms, a lever, a block pivoted to said lug and located in a recess in said lever, and a driving-shaft with a cam thereon operating said lever, said parts being combined substantially as described.

16. A frame, a mold with a recess therein and a body-piece movable in said recess, an arm with means connected therewith for covering said recess and for engaging said type on said mold, mechanism, including a lever, connected with said arm for advancing the same, and a lever pivoted to the frame and connected by a rod with said operating-lever and by a spring with the frame for withdrawing the type-moving arm, said parts being combined substantially as described.

17. A frame, a mold with a type-recess therein and a body-piece movable in said recess, an arm with means connected therewith for covering said recess and for engaging the type when on the top of the mold, mechanism, including a lever, connected with said arm for advancing the same, and mechanism, including a lever, connected with said lever of the advancing mechanism for withdrawing said arm, said lever of the withdrawing mechanism having a projecting arm adapted to be engaged by a cam on the driving-shaft of the machine, said parts being combined substantially as described.

18. In a type-casting machine, a frame, a mold having a type-recess therein, and a body-piece vertically movable in said recess, a block movable on a track on said frame to and from said mold, the arm U^3, with stem adjustably fitted in said block and a projecting portion W^2, a holder having a vertical adjustment in said arm by means of a dovetail connection and provided with a horizontal recess extending across one end thereof, a matrix fitted in said recess, and clamping-screws in said holder and projecting portion for said matrix, said parts being combined substantially as described.



19. In a type-casting machine, a frame, a mold having a movable body-piece, with operating means for raising the type to the top of the mold, a reciprocating arm with the block Q', forming a top wall for the type-recess, and the adjustable block Q^x, with shoulder P^x, and an adjustable support provided with cutters for rubbing the shoulders on opposite sides of the face end of the type, substantially as described.

20. In a type-casting machine, a frame, a mold with a movable body-piece therein, an oscillating lever for raising said body-piece journaled on a cylindrical pivot, and a latch pivoted to one side of said lever and having a recessed face on its free end, adapted to rest on the pivot of said oscillating lever, said parts being combined substantially as described.

21. In a type-casting machine, a frame, a mold with a recess therein, a vertically-movable body-piece in said recess, a reciprocating arm with the blocks Q' and Q^x connected therewith, the latter block for advancing the type on the mold, and a spring-actuated plate in the frame in advance of the mold, having its front edge normally raised, said parts being combined substantially as described.

22. In a type-casting machine, a pusher, a connecting-block, a sliding bar on which said block is mounted, a spring connecting said block and bar, and a bolt working in hangers on the machine-frame and with an end adapted to engage in a recess in said block, said parts being combined substantially as described.

481,761. WATER-CLOSET. SETH R. HUSSEY, Philadelphia, Pa. Filed June 18, 1890. Serial No. 355,890. (No model.)

Claim.—1. The combination of the bowl having upper and lower traps, the tank, the exhaust-pipe leading therefrom, and a valve-box communicating with the exhaust-pipe and having two chambers, one communicating with the space between the two traps and the other with a discharge-passage leading to the discharge-pipe of the bowl, this latter chamber having a valve for preventing backflow through the discharge-passage, substantially as specified.

2. The combination of the bowl having upper and lower traps, the tank, the exhaust-pipe leading therefrom, and a valve-box communicating with the exhaust-pipe and having two chambers, one communicating with the space between the two traps and the other with a discharge-passage in the bowl, both of said chambers having valves, one for preventing backflow into the space between the traps and the other for preventing backflow through the discharge-passage, substantially as specified.

3. The combination of the tank, the inlet-valve chest and its valve, a float-lever, and a valve-rod having a disk covering the mouth of said inlet-chest, substantially as specified.

4. A siphon water-closet bowl having a flushing-rim of capacity equal to or in excess of that of the trap which seals the short leg of the siphon, substantially as specified.

5. A siphon water-closet bowl having a flushing-rim enlarged in area in that portion which extends across the rear of the bowl, whereby the capacity of the rim is caused to equal or exceed that of the trap which seals the short leg of the siphon, substantially as specified.

481,762. VALVE FOR PNEUMATIC TIRES. JOHN F. IVES and FRANK B. COLMAN, New York, N. Y. Filed May 4, 1892. Serial No. 431,842. (No model.)

Claim.—1. A valve consisting of an inflexible or metallic shank carrying a flexible cap, in combination with a hollow valve-stem, said flexible cap normally closing said valve-stem and being adapted to be distended to open said valve-stem, substantially as described.

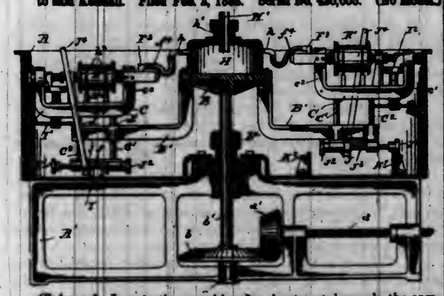
2. In a valve, the combination of the hollow stem A, with the flexible cap I contained therein, and the plunger H, substantially as described.

3. In an automatic valve, the combination of the valve-stem A, with the shank E, carrying the plunger H, and with the flexible cap I, adapted to be elongated by the plunger H to open said valve, substantially as described.

4. In an automatic valve, the combination of the valve-stem A, the shank E, having longitudinal grooves F F and carrying the flexible cap I, adapted to normally close the valve, and with the plunger H, carried by the shank E, adapted to overcome the normal tendency of the flexible cap I, substantially as described.

5. In an automatic valve, the combination of the valve-stem A, the grooved or perforated shank E, with the plunger H, the flexible cap I, and the washer L of absorptive material, all arranged substantially as described.

6. In an automatic valve, the hollow stem partially threaded internally, the therein-contained valve mechanism, as described, with the cap K, adapted to fit to the upper end of the valve-stem and having the projection M of substantially the same diameter as the plunger H, substantially as and for the purpose described.



7. In an automatic valve, the valve-stem A, the shank E, carrying the plunger H, and the flexible cap I, having the outwardly-projecting lip J to more closely contact with the sides of the hollow stem A, all arranged to normally permit the passage of air through the stem in one direction and check its return in the opposite direction, substantially as described.

481,763. WIRE-TIGHTENER. LAFAYETTE M. JOHNSON, Seneca, Mo., assignor of one-half to Robert Briggs, same place. Filed Apr. 8, 1892. Serial No. 428,509. (No model.)

Claim.—A fence-wire-tightening device consisting of a shank A, provided at one end with a handle B and at its other end with a tapered portion C and hook D, the end *d* of said hook being bent or deflected to one side, substantially as shown and described, and for the purpose specified.

481,764. CAR-TESTING MACHINE. CHARLES B. KENDALL, Newton, Mass., and HENRY SCHAAKE, Baltimore, Md.; said Schaake assignor to said Kendall. Filed Feb. 2, 1892. Serial No. 420,053. (No model.)

Claim.—1. In a testing-machine for sheet-metal vessels, the combination, with a stationary receiving-tank containing liquid bath for the vessels, of rotating vessel-carrying trucks traveling within the tank and imparting motion to the liquid bath, mechanism for clamping and filling the clamped vessels with compressed air secured to the traveling trucks, and mechanism for automatically submerging the vessels within the bath and raising the same therefrom while the bath is in continuous motion, as and for the purpose set forth.

2. In a testing-machine for sheet-metal vessels, the combination, with mechanism to automatically clamp the vessels and connect them with a compressed-air supply, of a stationary receiving-tank containing a horizontally-moving liquid bath and mechanism for automatically submerging the vessels within the bath and raising same therefrom while the bath is kept in continuous motion, as and for the purpose set forth.

3. In a testing-machine, the combination, with the stationary receiving-tank, said tank containing a liquid bath, of a frame rotating within the tank, vessel-carrying devices secured thereto and carried thereby, said frame and carrying devices with the rotation thereof imparting unagitated motion to the liquid bath, clamping devices for automatically securing the vessels and connecting them with an air-supply, and mechanism for automatically and gradually submerging the vessels within the bath and raising same therefrom while the bath is in continuous motion, as and for the purpose set forth.

4. In a testing-machine, the combination, with the receiving-tank containing a liquid bath for the vessels, of vessel-carrying trucks rotating within said tank and with the rotation imparting motion to the said bath, vessel-holders and clamps carried thereby adapted to receive and automatically clamp the vessels and fill same with air, and mechanism to automatically and gradually submerge the air-filled vessels within the liquid bath and raise same therefrom while the bath is kept in continuous motion, as and for the purpose set forth.

5. In a testing-machine, the combination, with the receiving-tank containing a moving liquid bath, of vessel carrying and clamping devices rotating within the bath and mechanism for automatically submerging the vessels within the horizontally-moving bath and raising same therefrom, as and for the purpose set forth.

6. In a testing-machine, the combination, with a delivery-chute of a receiving-tank containing a moving liquid bath, vessel-carriers rotating within the tank and provided with vessel-holders, and clamps adapted to automatically receive, clamp, and fill the vessel with compressed air, and mechanism for automatically submerging the filled vessels within the moving bath and raising same therefrom, as and for the purpose set forth.

7. In a testing-machine, the combination, with the receiving-tank containing an unagitated moving liquid bath, of vessel carrying and clamping devices rotating within the tank and imparting motion to the bath, and mechanism for automatically and gradually submerging the vessels within the moving bath and raising same therefrom without disturbing or agitating the liquid, as and for the purpose set forth.

8. A testing-machine comprising the horizontally-movable frame, vessel carrying and clamping devices carried thereby, air-supply connected thereto, receiving-tank, within which the horizontally-traveling frame rotates, liquid bath contained within the tank and kept in motion by the rotating frame, and mechanism for automatically submerging the vessels within the moving bath and raising the same therefrom, as and for the purpose set forth.

9. A vessel-tester consisting of a receiving-tank partially filled with a liquid bath, frame rotating horizontally within receiving-tank and carrying clamping devices, said frame during its rotation imparting motion to the liquid bath, and mechanism for first automatically and gradually submerging the traveling vessels and thence raising same above the moving water at different points, so as not to agitate the surface of the moving water, as and for the purpose set forth.

10. In a testing-machine for sheet-metal vessels, the combination, with a stationary receiving-tank containing a liquid bath, of mechanism for imparting rotary motion to the bath and mechanism for clamping and gradually submerging the vessels and raising same from within the continuously-traveling bath, as and for the purpose set forth.

11. In a testing-machine for vessels, the combination, with a stationary receiving-tank, said tank containing a liquid bath, of mechanism for imparting an unagitated continuous traveling movement to the testing-bath, as and for the purpose set forth.

12. In a testing apparatus for vessels, the combination, with the vessel-carrying trucks, of the spring-actuated clamping-heads and the automatic operating-cam for locking and unlocking the clamping-heads during travel of carrying-trucks, as and for the purpose set forth.

13. In a testing apparatus for sheet-metal vessels, the combination, with the vessel-carrying trucks, of the spring-actuated clamping-heads, compressed-air supply connected with one of said heads, and the operating-cam for locking the clamping-heads and filling the vessels with air and for unlocking the heads in order to release the vessels and at the same time close the air-supply during horizontal travel of carrying-trucks, as and for the purpose set forth.

14. In a testing apparatus, the combination, with the receiving-tank containing a liquid bath, of mechanism for imparting a continuous unagitated traveling movement thereto, vessel-holding trucks secured to the traveling mechanism, clamping-heads working therein, air-supply connected to one of the clamping-heads, and the operating-cam adapted to automatically lock the carried vessels between the clamp-heads and open the air-supply so as to fill same and to release the clamped vessels after passing through the testing-bath and close the air-supply, as and for the purpose set forth.

15. In a testing apparatus, the combination, with the vessel-carrying trucks, spring-actuated clamp-heads working therein, and movable sleeve working upon stem of one head, of the automatic cam adapted with the movement thereof to operate the movable sleeve so as to lock or unlock the vessel between clamp-heads, as and for the purpose set forth.

16. In a testing apparatus, the combination, with the delivery-wheel, of the traveling vessel-carrying trucks and the adjustable vessel-seats working within the trucks, as and for the purpose set forth.

17. In a testing apparatus, the combination, with the vessel-carrying trucks, of mechanism for imparting horizontal rotation thereto, clamp-heads secured thereto, one of said heads connected with an air-cylinder, mechanism for moving the heads in or out so as to automatically clamp or unclamp the vessels and fill same with air, and the feed-chute for supplying vessels to the trucks, as and for the purpose set forth.

18. In a testing apparatus, the combination, with the horizontally-traveling trucks and clamp-heads secured thereto, of mechanism for automatically moving the clamp-heads in or out in order to lock or unlock the held vessel during rotary travel of the vessel-carrying trucks, as and for the purpose set forth.

19. In a testing apparatus, the combination, with the receiving-tank, said tank containing a liquid bath, of mechanism for holding the delivered vessel, having horizontal rotation within receiving-tank and imparting corresponding motion to the testing-bath, said holding mechanism adapted to be automatically raised and lowered gradually within the moving water, and mechanism for automatically locking the vessels and admitting air thereto prior to submerging same and unlocking the held vessels and closing the air-supply prior to discharge of same from within receiving-tank, as and for the purposes set forth.

20. In a testing apparatus, the combination, with a receiving-tank containing a liquid bath, of mechanism for imparting a continuous unagitated horizontal rotating movement thereto, vessel-carrying trucks carried thereby, feed-chute for supplying vessels to the tester, mechanism for automatically locking or unlocking the vessels between clamp-heads of the trucks, and devices for allowing the rotary traveling trucks to be gradually lowered or raised within the continuous traveling liquid bath, as and for the purpose set forth.

21. In a testing apparatus, the combination, with the vessel-carrying trucks, of the automatic operating-cam, vessel-clamp heads, and the movable sleeve operated by the automatic cam in order to lock or unlock the clamp-heads during travel of vessel-carrying trucks, as and for the purpose set forth.

22. In a tester, the combination, with the automatic operating-cam and guide-plate moved with the throw of the cam, of the movable sleeve connected to the guide-plate and carried in or out thereby in order to lock or unlock the clamp-heads, as and for the purpose set forth.

23. The combination, with the automatic operating-cam, of the guide-plate provided with groove, said plate rotated with throw of the cam, and movable sleeve provided with depending roller working within groove of guide-plate and adapted with rotation of said plate to carry the movable sleeve in or out in order to lock or unlock the clamp-heads for the vessels, as and for the purpose set forth.

24. The combination, with the spring-actuated sleeve and guide-plate to which said sleeve is connected, of the automatic operating-cam adapted by its throw to move the sleeve in or out so as to lock or unlock the clamp-heads, as and for the purpose set forth.

25. The combination, with the vessel-carrying trucks, of a tester of the movable sleeve working therein, pin or lug for preventing turning of the movable sleeve, and the automatic operating-cam for moving the sleeve in or out in order to lock or unlock the clamp-heads, as and for the purpose set forth.

26. In a testing apparatus, the combination, with vessel-carrying trucks, clamp-heads working therein, one of said heads provided with a spring-actuated hollow stem, piston-rod secured therein, and cap connected to outer end of hollow stem and provided with air-passage communicating with passage-way of hollow stem, of the air-chamber connected with the cap and mechanism for operating the opposite clamp-head, in order that the pressure thereof against vessel held against the heads will cause clamp-head F' to move outward in order to unseat piston-head and allow flow of air through hollow stem to vessel, as and for the purpose set forth.

27. In a testing apparatus, the combination, with the clamp-heads, of the vessel-carrying trucks, one of said heads provided with a hollow spring-actuated stem, said stem communicating with passage-way of an air-supply, and mechanism for automatically moving the opposite head forward or backward, in order that the pressure or removal of pressure upon held vessel will serve to cause backward or forward movement of head F', so as to control supply of air to the carried vessel, as and for the purpose set forth.

28. In a testing apparatus, the combination, with the clamping-heads for the vessel, of the rubber cushion or ring secured to one of said heads, adapted to form an air-tight seat for open end of vessel when pressed thereagainst by inward movement of opposite head, and mechanism for automatically imparting forward or backward movement to head D², in order to likewise move opposite head and cause air-supply to be opened or closed, as and for the purpose set forth.

29. In a testing apparatus, the combination, with the vessel-carrying trucks, tank within which same rotates, feed-chute for supplying vessels to the carrying-trucks, automatic operating-cam, and fixed cam secured to wall of receiving-tank with which operating-cam contacts and is thrown with travel of vessel-truck, of mechanism adapted with throw of automatic cam to lock and unlock the vessel between clamp-heads of vessel-carrying trucks during horizontal travel thereof, as and for the purpose set forth.

30. In a testing-machine, the combination, with a stationary tank, of fixed cam secured thereto, vessel-carrying trucks horizontally traveling within the tank, and automatic operating-cam carried thereby and with the movement thereof contacting with the fixed cam in order to lock the vessels carried by the trucks, as and for the purpose set forth.

31. In a testing-machine, the combination, with the receiving-tank provided with a series of fixed cams, of the traveling vessel-carrying trucks, and the operating-cam carried thereby and adapted with the travel of same to contact with the fixed cams and by the throw imparted locking or unlocking the clamp-heads, as and for the purpose set forth.

32. In a testing apparatus, the combination, with the stationary tank for reception of tester-bath, of the horizontally-rotating mechanism traveling therein, vessel-carrying trucks carried thereby, raising and lowering devices for said trucks, and the inclined trackways secured to bottom of tank, as and for the purpose set forth.

33. In a testing apparatus, the combination, with the receiving-tank, of the vessel-carrying trucks having horizontal rotation within the tank, said trucks having vertical movement, frame secured to lower end thereof, sliding rod or axle working therein, wheels secured to outer ends thereof, operating-lever for shifting axle and wheels, and the inclined trackways located within bottom of tank and upon which wheels of sliding axle travel in accordance as to whether vessel is perfect or imperfect, as and for the purpose set forth.

34. In a testing apparatus, the combination, with the receiving-tank, of the inclined trackways, horizontally-rotating vessel-carrying trucks, and the shifting raising devices for the trucks, said device by moving upon either of the trackways serving to raise the submerged vessels, as and for the purpose set forth.

35. In a testing apparatus, the combination, with the tank, of inclined trackways, vessel-carrying trucks having horizontal rotation within the tank, said trucks adapted to be raised or lowered, sliding axle, guide secured thereto, and frog located within the tank and in line with guide-piece, as and for the purpose set forth.

36. The combination, with the shifting axle for guide-wheels, of guide-piece projecting therefrom and frog located within bottom of tester-tank and with which guide of sliding axle contacts in order to impart full movement to the sliding axle, as and for the purpose set forth.

37. In a tester, the combination, with the vertically-moving vessel-carrying trucks, said trucks having horizontal rotary travel within the tank, of the downwardly-inclined guide-track secured to tank, guide-wheels secured to a sliding axle working thereunder, inclined tracks located within the tank for raising the submerged vessels, and devices for shifting the sliding axle in order to cause the guide-wheels to travel upon one of the inclined trackways, as and for the purpose set forth.

38. In a tester, the combination, with the receiving-tank containing a bath, of inclined trackways located therein, sliding axle secured to the horizontally-rotating mechanism provided with guide-wheels, and devices for shifting the guide-wheels in line with one of the trackways, as and for the purpose set forth.

39. In a can-tester, the combination, with the tank, horizontally-rotating vessel-trucks, and sliding axle connected thereto, of the frog for insuring travel of guide-wheels upon proper trackways, as and for the purpose set forth.

40. The combination, with tester-tank, of the inclined trackway, as K', fixed cam, as O², horizontally rotating vessel-carrying mechanism, and the automatic operating-cam adapted during its line of movement to contact with cam O² and unlock clamp-heads of vessel-carrying trucks, as and for the purpose set forth.

41. The combination, with inclined trackways secured within receiving-tank, of guide-frog and the shifting device connected to the horizontally-traveling trucks, as and for the purpose set forth.

42. In a tester, the combination, with tank, of horizontally-traveling vessel-trucks, inclined trackway secured within tank, as K², for raising of submerged imperfect vessels, operating-cam for unlocking the clamp-heads, so as to release the clamped vessels, releasing fixed cam, as O', adapted to engage operating-cam during travel of rotating trucks, and discharge-chute for imperfect vessels, as and for the purpose set forth.

43. In a testing apparatus, the combination, with the tank, of the horizontally-rotating vessel-carrying trucks, said trucks having vertical movement, and the inclined trackways for raising said trucks, so as to bring the submerged vessels above level of bath contained in tank, as and for the purpose set forth.

44. The combination, with the receiving-tank, of the horizontally-rotating vessel-holding trucks, said trucks having vertical adjustment, inclined trackways for raising submerged vessels in line with discharge-chute for imperfect vessels, automatic operating-cam connected by suitable devices to the clamp-heads, and fixed cams secured within the tank for operating said cam so as to lock and unlock clamp-heads, as and for the purpose set forth.

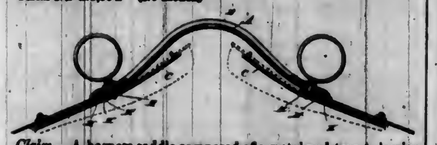
45. The combination, with the shifting mechanism, of the trackway-cam for moving guide-wheel in line with downwardly-inclined guide-track, as and for the purpose set forth.

46. The combination, with the horizontally-traveling vessel-carrying trucks, of the discharge-chute, vessel-holders secured to the traveling trucks, and outwardly-projecting tongue connected to the discharge-chute and adapted to unseat the tested vessels from rotating trucks and allow for discharge of same into chute, as and for the purpose set forth.

47. The combination, with a testing apparatus, discharge-chute, endless traveling discharging-belt working therein, and horizontally-rotating vessel-carrying trucks, of the outwardly-projecting tongue secured to inner end of chute and adapted during travel of trucks to unseat the tested vessel and raise same so as to become engaged by traveling belt, as and for the purpose set forth.

48. The combination, with the flexible projecting tongue of the discharge-chute, of vessel-carrying trucks provided with vessel-holders, said tongue adapted to raise the vessels from their holders or seats during rotation of the trucks, as and for the purpose set forth.

49. The combination, with the vessel-carrying trucks of a tester, of the projecting tongue connected to the discharge-chute, said tongue adapted to raise the vessels from their seats during travel of the trucks, and mechanism for receiving and carrying the same within a discharge-chute, as and for the purpose set forth.



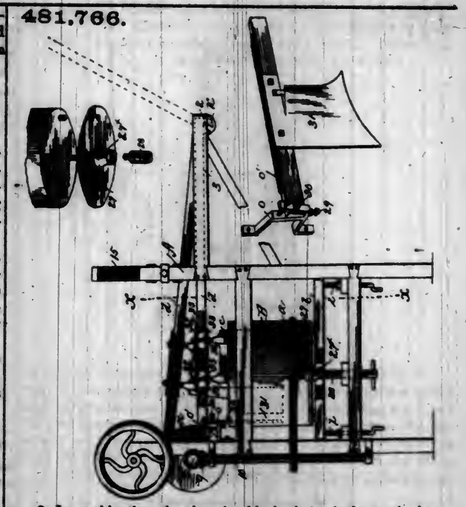
50. The combination, in a testing apparatus with the vessel-carrying trucks, of the vessel-delivery wheel provided with vessel-seats, and mechanism for imparting a uniform speed to traveling trucks and delivery-wheel, as and for the purpose set forth.

51. The combination, in a testing apparatus, with the vessel-carriers, of the feed-chute, vessel-seating delivery-wheel located therein for delivering the vessels to the carriers, and the spring-actuated cover for said chute, as and for the purpose set forth.

52. In a testing apparatus, the combination, with the vessel-carriers, feed-chute, delivery-wheel erected within inner end, spring-actuated door or cover for the chute, of mechanism for operating the delivery-wheel, as and for the purpose set forth.

53. In a testing apparatus, the combination, with the stationary tank, of horizontally-moving bath contained therein, horizontally-rotating vessel-carrying trucks, delivery-wheel for supplying vessels to the trucks, clamp-heads, automatic cam for locking and unlocking the vessels between the clamp-heads through suitable connecting devices, cams located within the stationary tank for operating automatic cam during rotation of trucks in order to allow of locking and unlocking of clamp-heads, devices for submerging and raising the tested vessels, delivery-chutes for carrying off same, and mechanism for imparting travel to trucks, bath, and rotation to delivery-wheels, as and for the purpose set forth.

481,765. HARNESS-SADDLE. DAVID F. MAHER, Mansfield, Ohio, assignor of one-half to Nicholas S. Read, same place. Filed Apr. 9, 1892. Serial No. 428,564. (No model.)

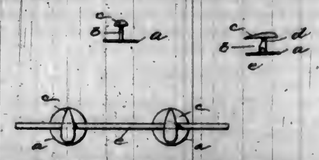


Claim.—A harness-saddle composed of a metal pad-tree A, having upwardly-projecting flanges B and provided in the center with the holes *a a* and at each end with the holes F, also, slotted holes *e*, *e*, and *f*, a pad-plate C, secured to each end, having a pivot movement, and a hinge-block having studs *g g*, secured rigidly to the ends of the pad-tree, and in which are pivoted the pad-plates, the hinge-block being held rigid by the turrets, allowing the removal of the turrets and the replacing of new ones without displacing the pads, substantially as shown and described.

481,766. CHOPPING-MACHINE. George W. Mason, Sharon, Pa. Filed Dec. 4, 1891. Serial No. 414,090. (No model.)

Claim.—1. In combination, the chopping-block, the supporting-frame, the pivoted bars carrying the knives, the means for operating the said bars upward, and the vertically adjustable and removable frame 15, arranged to slide in ways on the main frame and carrying the tension means and guides for the bars, which pass through the guides and are pressed upon by the tension means, substantially as described.

481,766.



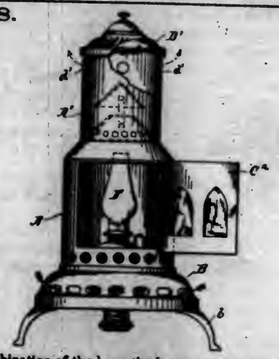
2. In combination, the chopping-block, the main frame, the bars *d*, pivoted thereto and having slots 32 extending longitudinally thereof, the knives, the supporting-bolts for said knives passing through slots in the bars and having yokes secured to the knives, whereby the knives may be adjusted across the chopping-block, each of said knives having a rounded bearing 38 to bear upon the yoke, substantially as described.

3. In combination, the main frame, the knife-bars, with operating means, the chopping-block, with means for rotating it, the table *b*, having rollers upon which the chopping-block rests, the means for vertically adjusting said table, the central bearing 27ˣ on the block, and the pivot-screw 28, vertically adjustable centrally through the table *b* to engage the bearing on the block, substantially as described.

4. In combination, in a meat-chopper, the knife-bars, with operating means therefor, the main frame, the chopping-block, with means for rotating it, the central pivot 28, the central bearing 27ˣ, and the plate 27, detachably connected with the lower end of the chopping-block and carrying the said pivot, substantially as described.

5. In combination, in a meat-chopper, of the knife having the curved bearing 38 on its upper edge, the means for supporting the knife pivoted at the center from which the curve of said bearing is struck, said means having a bearing in engagement with the curved edge to sustain the thrust of the knife, substantially as described.

481,767. COMBINED BUTTON AND LACING HOOK. ANNIE J. MILLER, New York, N. Y. Filed May 10, 1892. Serial No. 432,481. (No model.)

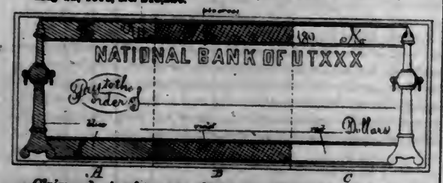


Claim.—The described button and lacing hook, having a thin flat shoe and an elongated hook portion rigidly attached to flat shank, said shank having a cut-away portion adjacent and at right angles to the hook portion for receiving the lacing-cord, and a perforation passing through the shank above the base and parallel with the cut-away portion, in combination with a cord threaded through the perforation, substantially as and for the purpose set forth.

481,768. COOKING, HEATING, AND ILLUMINATING LAMP-STOVE. JOHN F. MYERS, San Francisco, Cal. Filed Feb. 17, 1892. Serial No. 421,886. (No model.)

Claim.—1. The combination of the base having a central perforation and a series of air-openings, an inclosing casing secured upon said base and provided with a series of air-openings in its lower end, and the central-draft lamp suspended in the central perforation of the base and having its oil-reservoir depending below the same and its burner extending upward within the inclosing casing.

481,768.

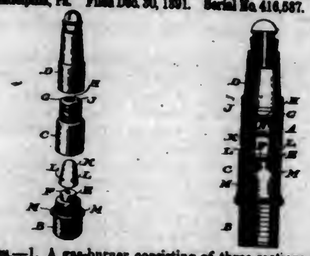


2. The combination of the base, the lamp supported thereby, the casing erected on the base, the deflecting-plate secured to the upper end of the casing and provided with a series of perforations, the drum rising from the said plate and inclosing the perforations therein and provided with a series of air-openings near its upper end, the damper in the top of the drum, and a deflecting-cup secured within the drum and extending over the central opening of the deflecting-plate.

481,769. COFFEE-POT. ROBERT F. RANDALL, Newark, N. Y., assignor to himself, James P. Ballou, and E. Van Petrean, same place. Filed Apr. 6, 1892. Serial No. 428,089. (No model.)

Claim.—A coffee-pot attachment consisting of a conical vessel with tubular extension, an inverted cone-shaped vessel having its lower portion reticulated and a tubular portion detachably held on the tubular extension of the cone, and a spreader on the said tubular portion below the upper end thereof, as set forth.

481,770. SAFETY-PAPER. ALBERT SCHLUMBERGER, Paris, France. Filed Jan. 4, 1892. Serial No. 417,095. (Specimens.) Patented in France May 22, 1891, No. 213,226.

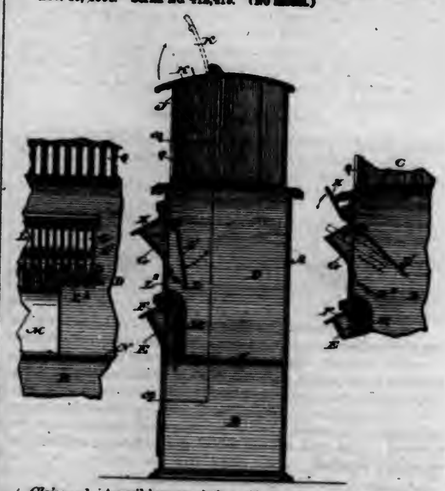


Claim.—1. A safety-paper for papers of value, documents, and the like, consisting in a sheet printed on both sides with coincident designs in such a manner that on holding the paper against the light only one impression is apparent, substantially as shown and described.

2. A safety-paper consisting in a sheet printed on both sides with coincident areas of various colors, the colors of the pairs of coincident areas all combining to produce the same compound color by transmitted light.

3. A safety-paper consisting in a sheet printed on both sides with coincident designs, the designs being arranged in coincident areas of various colors, the colors of the pairs of coincident areas combining to produce the same compound color.

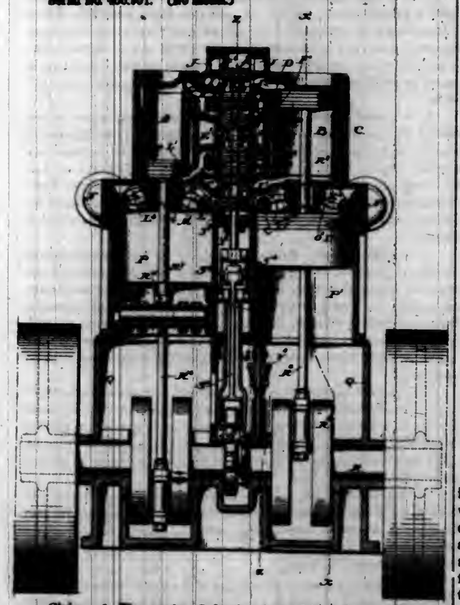
4. A safety-paper consisting in a sheet printed on both sides with coincident designs in various colors arranged in stripe, the stripe on both sides being coincident and the same colors being employed on both sides but arranged in reverse order.



481,771. GAS GOVERNOR AND BURNER. HENRY SCHRADER, Philadelphia, Pa. Filed Dec. 30, 1891. Serial No. 416,587. (No model.)

Claim.—1. A gas-burner consisting of three sections adapted to be fitted together and a valve between two of said sections, one of said two sections having a diaphragm at its upper end with opening therein and provided with a shoulder below said diaphragm and the other section being provided with a diaphragm at its upper end with central opening and a smaller vent aside of said opening, said valve being of inverted-cup shape, having vents in its sides and adapted to rest on said shoulders, said parts being combined substantially as described.

2. A gas-burner consisting of the sections B, C, and D, fitting together, and the inverted-cup-shape valve K, with vents L in its sides, the section B having the shoulder M and the diaphragm E, with a vent F thereon, and the section C having a diaphragm G, with a central opening and a smaller vent aside of said opening, the said valve being adapted to normally rest on the said shoulder M and its crown when raised to close said central opening, leaving said smaller vent opened, said parts being combined substantially as described.



481,772. LETTER-BOX. JAMES STEAR, Philadelphia, Pa. Filed Nov. 19, 1891. Serial No. 412,419. (No model.)

Claim.—1. A mail-box consisting of lower, top, and intermediate compartments, each provided with a throat covered by a door, the throat of the lower compartment extending above the bottom of the intermediate compartment, and the throat of the intermediate compartment having fingers within the compartment for closing the inner end of the throat, said parts being combined substantially as described.

2. A mail-box formed of two or more compartments arranged one above the other, each of said compartments having a throat and one of said compartments having fingers for closing its throat, and the throat of one compartment extending above the bottom of the compartment immediately above it, said parts being combined substantially as described.

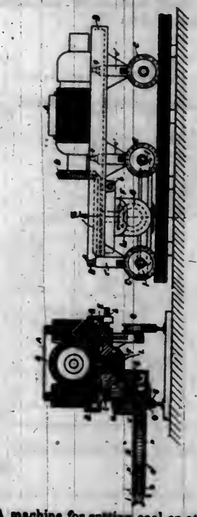
481,773. COMPOUND ENGINE. Gustave S. Strauss, New York, N. Y., assignor to James H. Gamble, Cincinnati, Ohio. Filed July 23, 1891. Serial No. 400,951. (No model.)

Claim.—1. The casting C, having formed in it the parallel cylinders A and B, the piston-valve chamber D, also lying parallel to said cylinders, the transversely-lying valve-chambers $L' L^2 L^3 L^4$, formed in the portion *c* of the casting, which constitutes the lower head of cylinders A and B, and the ports connecting the valve-chambers and cylinders, as described.

2. The casting C, having formed in it the parallel cylinders A and B, the piston-valve chamber D, also lying parallel to said cylinders, the transversely-lying valve-chambers $L' L^2 L^3 L^4$, formed in the portion *c* of the casting, which constitutes the lower head of cylinders A and B, and the ports connecting the valve-chambers and cylinders, as described, in combination with the cylinders P P', secured to the portion *c* of the casting and in line, respectively, with cylinders A and B.

3. In a compound engine, substantially as described, the combination of the link S^3 with the positively-connected rod S^4, the valves T^2 T^4 T^5 T^6, actuated by rod S^3 and governing the exhaust from cylinders A and B, the valves $O' O^2 O^3 O^4$, governing the admission and exhaust of cylinders P P' and also actuated by rod S^4, the rod S^5, adjustably connected with link S^3, and the steam-admission valve T, actuated by rod S^5, all substantially as and for the purpose specified.

481,774. CHIP FOR BEER, ALE, &c. JOHN J. WOLF, Philadelphia, Pa. Filed Mar. 14, 1892. Serial No. 424,840. (Model.)



Claim.—1. A beer-chip formed of strips or plates of corrugated metal and cross-bars connecting the same, substantially as described.

2. A beer-chip formed of corrugated metallic strips or plates and cross-bars of corrugated metal connecting the same, substantially as described.

3. A beer-chip formed of strips or plates with openings therein and cross-bars connecting the same, said bars and plates being formed of corrugated metal, substantially as described.

4. A beer or other chip formed of a non-absorbent material having a greater specific gravity than that of the liquid in which it is employed and provided with openings and reinforcing-pieces, substantially as described.

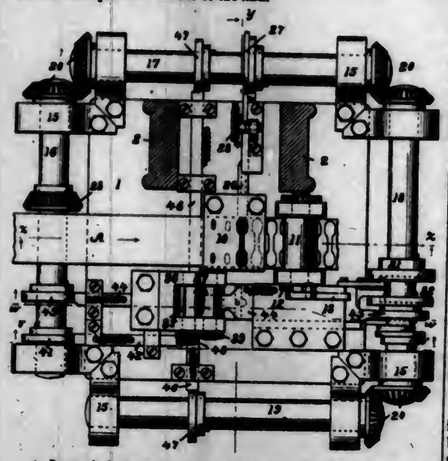
481,775. ELECTRICALLY-DRIVEN MACHINERY FOR CUTTING COAL. LLEWELYN B. ATKINSON and CLAUDE W. ATKINSON, London, England. Filed Aug. 16, 1891. Serial No. 402,019. (No model.)

Claim.—1. A machine for cutting coal or other mineral, consisting of an electrical motor mounted upon a traveling carriage B, provided with track-wheels and adjustable as to height thereon by vertical bearing-screws C C, a driving-shaft *d*, bevel-gears D E F G H O, and an annular ring carrying cutting-tools operated by said gears and adapted to revolve on and protected by fixed bearing-plates N N', forming part of the gearing-framing L and adapted to swivel on the traveling carriage by worm and worm-wheel *b l* round the axis of second vertical driving-shaft, substantially as described.

2. In a machine for cutting coal or other minerals, a revolving ring or annulus carrying the cutting-tools and provided with bevel-geared teeth, in combination with two rigid bearing-plates covering the said bevel-teeth and between which the said tool-ring provided with lubricating-channels is journaled, substantially as described.

3. In a machine for cutting coal or other minerals, a series of curved segments S, detachably attached to one another by cotters T, carrying the cutting-tools R, and adapted to engage by recesses *e'* upon projections *e* of a revolving ring I and to be drawn tightly upon the said ring by the cotters T, substantially as described.

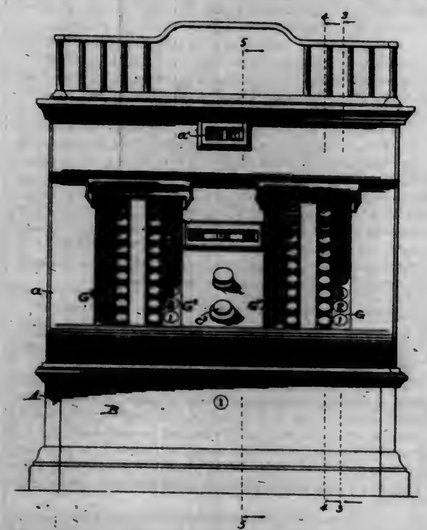
4. In a machine for cutting coal or other minerals, an electromotor mounted on a traveling carriage adjustable for height and level upon its track-wheels, in combination with a cutting-machine provided with a protected disk cutter on a divided and similar traveling carriage, also adjustable as to level upon its track-wheels, and a connection between the wheel-axles of the carriage, adjustable connecting-rods enabling joint movement on the track and a connection between the motor and cutting apparatus, and a sliding universal jointed shaft to communicate rotary motion whatever the irregularities of the track or movement of the apparatus, substantially as described.



481,776. MACHINE FOR MAKING SHEET-METAL CHAINS. HENRY J. AUSTIN and ROBERT T. LEWIS, Jr., Waterbury, Conn. Filed Mar. 3, 1892. Serial No. 423,496. (No model.)

Claim.—1. In a chain-machine, the combination, with suitable blanking mechanism for forming the links, of means, as described, for feeding the blanked link in the direction of its length and for turning the same, an anvil and bending-slide adapted to receive said fed link and to bend the same into U form, means, as described, for projecting said slide and anvil forward to thread the link, a pair of closing-dies for shaping the link, and a feed for the complete chain, substantially as set forth.

2. In a chain-machine, the combination, with suitable means for forming the blank, of means for feeding said blank in the direction of its length and turning the same, a pair of bending slides having independent and conjoint movement, whereby the link is bent to U form and fed forward and threaded, a pin or anvil for the support of the link during the bending process, and closing devices operated simultaneously on both sides of the link, and means for feeding the same.



3. In a machine of the character described, the combination, with means for forming the link, of the feed-block in which the link is de-

posited and which is inclined at one end for the turning of the link, a feed-slide operating through the feed-block to project the link in the direction of its length, a pair of bending-slides, whereby the link is first bent and then fed, and closing mechanism, substantially as described for the subsequent treatment of the link.

4. In a chain-machine, the combination, with suitable blanking mechanism, of a feed-block inclined at one end, as shown, a feed-slide working through said block and adapted to project the link in the direction of its length, a pair of bending-slides, one provided with a bending-die and the other with a pin or anvil, and means for first moving the die forward to effect the bending and both dies forward for the purpose of feeding the link, and a pair of closing-dies and suitable feeding mechanism.

481,777. CASH REGISTER, INDICATOR, AND RECORDER. WARREN F. REMY, Knoxville, Pa., assignor to the Eureka Cash Register Company, same place. Filed Feb. 27, 1892. Serial No. 423,061. (No model.)

Claim.—1. In a cash-registering mechanism and in combination with the registering mechanism, an endless operating-chain exposed on one side to be moved with the finger, and an adjacent scale to determine the length of movement, and a stop device with which a link of the chain engages and by which the movement is arrested at the proper point.

2. In a cash-register and in combination with an endless chain arranged to operate the same, the finger-piece upon the chain, the depressed shoulder or stop with which the finger-piece in action may automatically engage to arrest the movement of the chain, and a spring to disengage the finger-piece from the stop when the finger is removed.

3. In a cash-register, the combination of an endless actuating-chain, a wheel turned thereby, an indicator-drum provided with a driving-wheel, an intermediate wheel and a driving-spring connected therewith, a till, and connections through which the till shifts the intermediate wheel from the chain-driving wheel, whereby the chain is caused to wind the spring and the latter thereafter caused to turn the drum.

4. In a cash-register, the finger-chain and a gear-wheel driven thereby, in connection with an indicating-drum, a returning-spring therefor, and a gear-wheel connected thereto, with an intermediate movable wheel, a spring wound thereby, a detent to hold the same as the spring is wound, and means for engaging the intermediate wheel alternately with the chain-driving wheel and the drum-wheel and for releasing the detent when the engagement with the drum-wheel is effected.

5. In a cash-register, the finger-chain and the gear-wheel actuated thereby, in combination with the indicator-drum, its gear-wheel and returning-spring, the intermediate shifting wheel, its spring and detent mechanism, the detent to prevent backward motion of the indicator-drum, and devices whereby the intermediate wheel is engaged with the chain-driving wheel and the drum-wheel alternately and the detenting devices of the intermediate wheel and the drum-wheel released alternately.

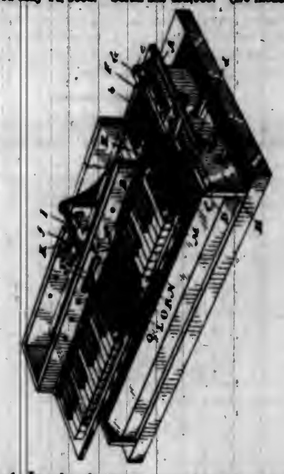
6. In a cash-register, in combination with a finger-chain movable in one direction only, an indicator-wheel, a spring to turn the same backward, a detent to hold it against the strain of the spring, gearing through which the chain acts intermittingly to turn the drum forward, and means for releasing the detent that the drum may turn backward independently of the chain.

7. In a cash-register, in combination with a finger-chain, an indicator-drum, a returning-spring therefor, intermediate gearing whereby the drum is connected intermittingly with the chain, a register-wheel, and connections through which the wheel is driven by the chain always in the same direction.

8. In a cash-register, in combination with a finger-chain and a gear-wheel permanently connected therewith, an indicator-drum, a gear-wheel permanently connected therewith, an intermediate gear-wheel and a spring connected therewith, a till, connections through which the till causes the intermediate gear to engage the other wheels alternately, a spring to turn the drum backward, a detent to hold the drum, and means for automatically releasing the detent when the intermediate wheel engages the drum-wheel.

9. In a cash-register, the combination, with the type-carrying drum, of the finger-chain for turning the same, a scale adjacent to the chain to indicate the amount of movement required, a stop to engage and arrest the chain at the proper point, an impression mechanism, and a movable till to operate the impression mechanism and produce a printed record.

10. In a cash-register, the finger-chain, the drum bearing type, intermediate connections through which the chain turns the drum, an impression mechanism, and a till by which the impression mechanism is actuated.



11. In a cash-register, in combination with the finger-chain, the gear connected therewith, the intermediate gear, the till and its connections to shift the intermediate gear, the winding-spring connected with the last-named gear, the detent therefor, the drum bearing type, its gear-wheel and detent, the impression mechanism, and the till arranged to release the detents and actuate the impression mechanism, substantially as described.

12. In a cash-register, in combination with the series of indicator-drums, their gear-wheels, returning-springs, and detents, the finger-chains, their gears connected therewith, the register-wheels turned by said gears, the intermediate shifting-gears, the springs moved thereby, their detents, and the tray arranged to release the detents.

13. In a cash-register, in combination with the finger-chains, the register-wheels geared thereto, the indicator-drums, their returning-springs and detents, the intermediate shifting-gears, their winding-springs and detents, the movable till, devices through which the till shifts the gear and actuates the detents, a spring to force the till open, and a latch to hold the till shut.

14. In a cash-register, the combination of a drum or wheel provided with peripheral type, a finger-chain and connections through which it turns the drum, a scale adjacent to the chain to indicate the extent of movement, a stop to engage and arrest the chain, an ink-ribbon, a paper-feeding mechanism, a sliding till, and an impression mechanism projecting into the path of the till and positively thrown against the drum thereby.

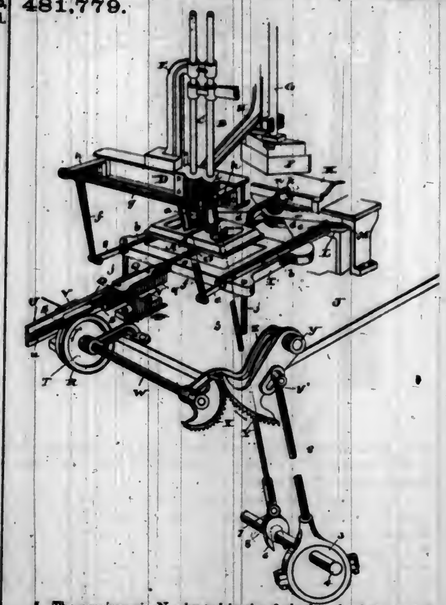
481,778. TRANSPOSING-KEYBOARD. ROBERT R. BELL, Toronto, Canada, assignor to Annie DIXON, same place. Filed June 13, 1891. Renewed May 14, 1892. Serial No. 433,969. (No model.)

Claim.—1. In a key instrument, a series of levers arranged between the keyboard and sounding mechanism of the instrument, in combination with mechanism by which the said levers may be first tilted and then adjusted so as to bring a higher or lower toned note in connection with the key in which the piece is written, substantially as and for the purpose specified.

2. In an organ, a series of levers arranged between the sticker-pins and keyboard and connected to a flexible frame pivoted on the center line of the sticker-pins and supported on a tilting frame, in combination with mechanism arranged to first tilt the levers clear of the buttons on the keys and then adjust them so as to bring a higher or lower toned note in connection with the key in which the piece is written, substantially as and for the purpose specified.

3. In an organ, a series of levers arranged between the sticker-pins and keyboard and connected to a flexible frame, in combination with a series of levers, one resting on each coupler-wire and arranged in connection with the adjusting-levers so that the octave will remain correct notwithstanding the adjustment of the said levers, substantially as and for the purpose specified.

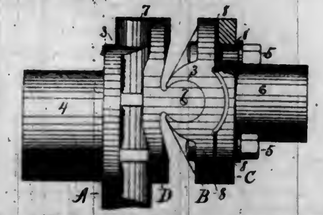
481,779. ENVELOPE-MACHINE. LOUIS P. BOUVIER, Toronto, assignor of one-half to William Harty, Kingston, Canada. Filed May 2, 1892. Serial No. 431,588. (No model.)



Claim.—1. In an envelope-machine, the combination, with the double-headed plunger and picker, with means for operating them, of a carrier-grip reciprocating between the heads of the plunger, and means for operating said grip, substantially as described.

2. In combination with the picker F and double-headed plunger, with means for operating them, the carrier-grip pivoted in the forked end of the rod O, the bar Q, connected to the said rod and moving on the guide-bar U, the wheel T, and belts R and S, connecting said wheel with the bar Q, substantially as described.

3. In combination with the picker F and double-headed plunger A, with means for operating them, the carrier-grip pivoted in the forked end of the rod O, and means for reciprocating said rod consisting of the bar Q, connected with its rear end and moving on the guide-bar U, the wheel T, secured to shaft W, belts R S, connecting said wheel with the bar Q, the quadrant *x*, also secured to shaft W, the quadrant Y, meshing therewith, and the rod 2, eccentric 3, and shaft 4, substantially as and for the purpose set forth.



4. In combination with the carrier-grip N, pivoted in the forked end of rod O, the bar Q, formed on the end of said rod and moving on the guide-bar U, the wheel T, belts R and S, connecting the wheel with the bar Q, and the bars *b*, with means for operating them, said means consisting of arms *f*, depending from a rod *g* and having their lower ends pivotally connected to said bars, an arm *i*, carried by the rod *g*, a cam on the main shaft, and connections between the said arm and main shaft, substantially as described.

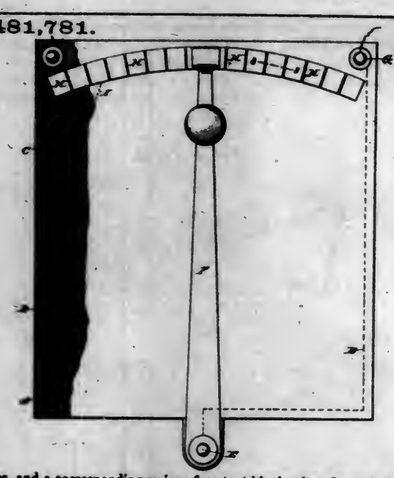
481,779.

5. The carrier-grip N, pivoted in the forked end of the rod O, means for reciprocating the rod, the notches n' n^2, formed in the grip in rear of the pivot-point, and the plunger P, provided with spring *p*, substantially as and for the purpose set forth.

481,780. UNIVERSAL COUPLING. ROBERT S. BROWN, New Britain, Conn., assignor of one-half to F. G. Platt, same place. Filed May 20, 1892. Serial No. 433,758. (No model.)

Claim.—1. The herein-described universal coupling, consisting of the heads A and B, each provided with transverse sockets of a circular form in cross-section, and the middle head D, provided with transverse ribs or projections fitted in said sockets and left free to move longitudinally therein and also to rock, as on a hinge, substantially as described and for the purpose specified.

2. In a universal coupling, the socket-head B, adapted to be coupled to a companion head on a different shaft, the sub-head C for connecting said socket-head with its shaft, and an insulating material S, interposed between said head and sub-head, substantially as described, and for the purpose specified.

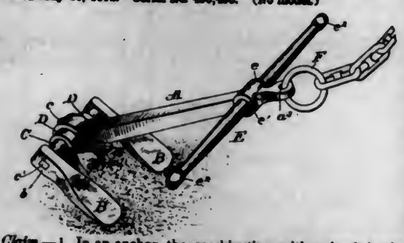


3. A coupling consisting of the heads A and B, having transverse sockets, a sub-head for connecting one of said heads with a shaft, and the middle head D, provided with transverse ribs or projections fitted in said sockets, substantially as described, and for the purpose specified.

481,781. RHEOSTAT. CHARLES R. CARPENTER, Minneapolis, Minn., assignor of one-third to W. S. Andrews, New York, N. Y. Filed Feb. 16, 1891. Serial No. 381,295. (No model.)

Claim.—1. A rheostat or resistance comprising a base-plate corrugated, ribbed, or recessed on the rear face thereof and provided with a coating of enamel or similar vitreous material on the front face and resistance coils or sections embodied in such coating, substantially as and for the purpose described.

2. A rheostat comprising a base-plate provided with a coating of enamel or similar vitreous material, a series of resistance coils or sec-



481,781.

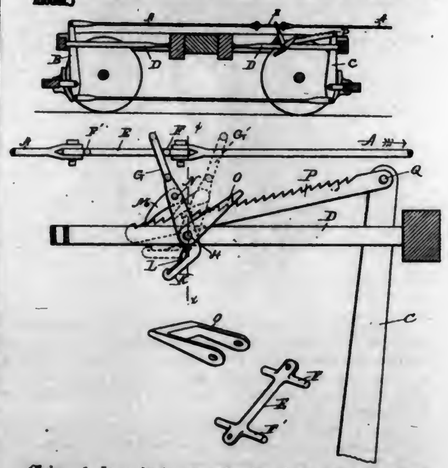
tions, and a corresponding series of contact-blocks therefor embedded in such coating, and a switch-key co-operating with such series of blocks, substantially as described.

3. A rheostat comprising a base-plate provided with a coating of enamel or similar vitreous material, a series of resistance coils or sections, and connecting-wires embedded in said coating beneath the surface thereof, but out of contact with the base-plate, a corresponding series of contact-blocks also embedded in said coating, but projecting beyond the surface of the same, and a switch-key co-operating with series of blocks, substantially as and for the purpose described.

481,782. ANCHOR. ROBERT S. R. CHRISTENSEN, Charleston, S. C. Filed May 18, 1892. Serial No. 433,493. (No model.)

Claim.—1. In an anchor, the combination, with a shank having a suitable stock attached thereto and having a cylindrical aperture in the lower end thereof and a slot opening into said cylindrical aperture and partially encircling the same, of a shaft having a stud thereon adapted to move freely in said slot and to bring up against the end faces thereof, flukes B, rigidly attached to said shaft, and auxiliary flukes D, having arms d and d' set at an angle to said flukes B, also rigidly secured to said shaft, substantially as and for the purposes described.

2. In an anchor, the combination, with a shank having a suitable stock attached thereto, of a transverse shaft passing through the lower end of said stock, with means for holding said shaft after it has turned through a given angle, the flukes B, rigidly attached to said shaft, and auxiliary flukes D, having arms d and d' set at an angle to said flukes B, also rigidly secured to said shaft, substantially as and for the purpose described.



481,783. VIOLIN TAIL-PIECE. JAMES A. CLOSE, Woodstock, Canada. Filed June 2, 1892. Serial No. 435,230. (No model.) Patented in Canada Apr. 9, 1892, No. 36,634.

Claim.—1. In a violin, a tail-piece, a plate C, having clips L to embrace the tail-piece and carrying the pivoted string-sheave A, on which a string may be wound, and a stop, as the spring-finger M, for preventing accidental unwinding, substantially as described.

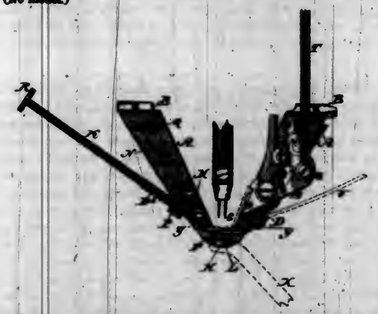
2. In a violin, a pivoted string-sheave mounted on the tail-piece, in combination with a wheel having an elastic rim arranged to press on the string when wound on the sheave to prevent the string accidentally uncoiling, substantially as described.

481,784. SLACK-ADJUSTER FOR CAR-BRAKES. FRANCIS J. COLE, Baltimore, Md. Filed Apr. 30, 1892. Serial No. 431,330. (No model.)

Claim.—1. In a brake-shoe-adjusting device for railroad-car trucks, the combination of the dead brake-lever, a rack-bar connected to the upper end of the dead brake-lever and by which it may be moved, a pawl pivoted to a stationary part of the truck and engaging and holding the rack, a lever also pivoted to a stationary part of the truck and provided with a pawl which also engages the rack-bar, and the pull-rod of the brake mechanism, provided with attachments for engaging and moving the pivoted lever when the brakes are applied and released, the lever and its pawl moving the rack-bar, and its stationary pawl holding it at the point to which it is moved by the lever.

2. In a brake-shoe-adjusting device for railroad-car trucks, the combination of the dead brake-lever, a bar connected to the upper end of said dead brake-lever and by which it may be moved to adjust the shoes, a lever pivoted to a stationary part of the truck and provided with means for engaging, moving, and holding the bar of the dead brake-lever, the pull-bar of the brake mechanism, provided with attachments for engaging and moving the pivoted lever, as and for the purpose specified.

3. In a brake-shoe-adjusting device for railroad-car trucks, the combination of the dead brake lever, a bar connected to the upper end of said dead brake-lever and by which it may be moved to adjust the shoes, a gripping mechanism secured to a stationary part of the truck and engaging and holding the bar when adjusted, a lever pivoted to a stationary part of the truck and provided with means for engaging and moving the bar of the dead brake-lever, the pull-bar of the brake mechanism, provided with attachments for engaging and moving the pivoted lever, as and for the purpose specified.



481,785. ELECTRIC-LIGHTING SYSTEM. PITT CRAVATH, Whitewater, Wis. Filed May 31, 1892. Serial No. 435,033. (No model.)

Claim.—1. The combination, in an electric-lighting system, of a source of electric energy, a main circuit leading therefrom, a series of branch circuits, each containing a lamp or lamps, and a multiple switch between the main and branches and having a series of independently-movable contacts less in number than the branches, whereby the number of branch circuits in use is limited, but a selection permitted.

2. In an electric-lighting system, the combination, with a source of electric energy, main circuits leading therefrom, and branch circuits carrying current from said mains through lamps or other translating devices to the other main, of a switch interposed between one of the mains and the branch circuits, said switch having independently adjustable contacts less in number than the branch circuits.

481,786. ATTACHMENT FOR STAPLING-MACHINES. HORACE E. CUNNINGHAM, Brockton, Mass. Filed July 9, 1891. Serial No. 398,902. (No model.)

Claim.—1. A welt-guiding device having a throat and a flat portion in line with said throat and having a vertical opening in line with said throat, and a head with a stem adjustable by a rotatable shaft, said parts being combined substantially as described.

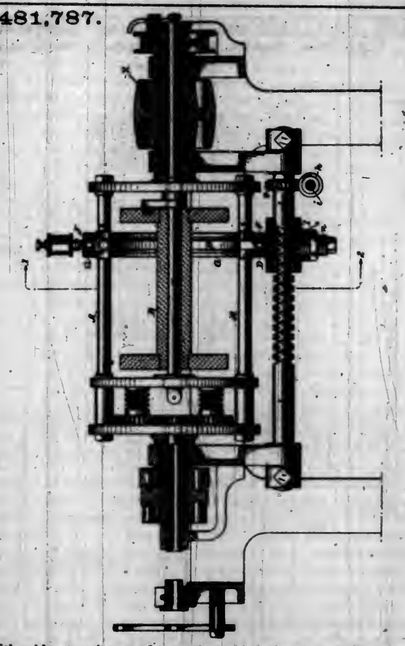
2. A bracket with an opening and adapted to be applied to a boot or shoe stapling-machine, a plate connected with said bracket having a throat leading across said opening, a feeding device adapted to reciprocate across said opening in the line of the throat, and an adjustable guide adapted to be moved across said opening at right angles to the line of the throat to regulate the projecting width of the welt, said parts being combined substantially as described.

3. A welt-guiding attachment comprising a support, a head with stem movable in said support, a rack on said stem, and a rotatable rod with pinion meshing with said rack, said parts being combined substantially as described.

4. A welt-guiding attachment comprising a support, a head with stem movable in said support, a rack on said stem, and a rotatable rod with a pinion meshing with said rack, a ratchet-wheel on said rod, and a spring-catch engaging said ratchet-wheel, said parts being combined substantially as described.

5. A welt-guiding attachment comprising a support, a head with stem movable on said support, a rack on said stem, a rotatable rod with a pinion meshing with said rack, a ratchet-wheel on said rod, a catch engaging said ratchet-wheel, and a coil-spring encircling said rod and having one of its ends secured thereto and the other secured to the support, said parts being combined substantially as described.

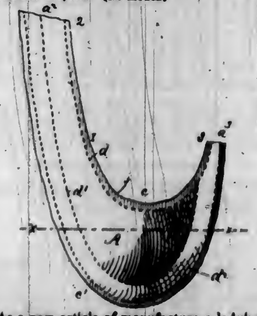
481,787. TRAVERSE-MOTION FOR SPINNING AND TWISTING MACHINES. ROBERT DAWS, Philadelphia, Pa. Filed Jan. 9, 1892. Serial No. 417,650. (No model.)



Brief.—The flier of a frame for spinning or twisting cord or rope is provided with a ring having a guide for the rope, a circular frame extending about the ring having bearings for and guiding the ring, the said frame being reciprocated by means of a nut carried thereby and a right and left hand screw.

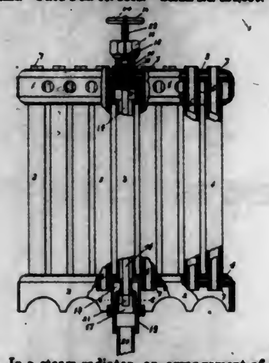
Claim.—1. The combination of the rotating flier of a spinning or twisting frame, a ring having a portion engaging with said flier and carrying a guide for the rope, a guided frame extending continuously more than half-way around said ring and having a nut, a right-and-left screw-shaft adapted to said nut, and means for rotating said screw-shaft, substantially as specified.

2. The combination of the rotating flier of a spinning or twisting machine with a ring having a portion engaging with said flier and carrying a guide for the rope, a guided frame completely surrounding said ring and having a nut, a right-and-left screw-shaft engaging with said nut, and means for rotating said shaft, substantially as specified.



3. The combination of the rotating flier of a spinning or twisting machine, a ring having a portion engaging with said flier and carrying a guide for the rope, a guided frame extending more than half-way around said ring and having an internal bushing providing a bearing therefor, a nut on said frame, a right-and-left screw-shaft engaging with said nut, and means for rotating said shaft, substantially as specified.

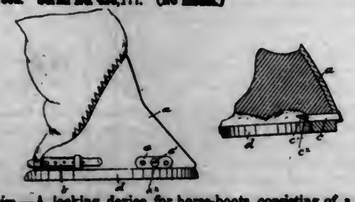
481,787.



4. The combination of the rotating flier of a spinning or twisting frame with a ring having a portion engaging said flier and a guide for the rope, a guided frame having a portion extending continuously more than half-way around said ring and providing front and rear bearings therefor, but free from peripheral contact therewith, a nut on said frame, a right-and-left screw-shaft engaging with said nut, and means for rotating said shaft, substantially as specified.

481,788. DRESS-PAD. EDWARD GOLDMAN, Baltimore, Md., assignor to the Eureka Coat Pad Company, of Maryland. Filed June 20, 1892. Serial No. 437,350. (No model.)

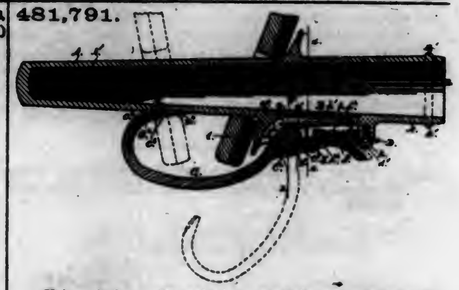
Claim.—As a new article of manufacture, a lady's dress-pad consisting of a main crescent-shaped section, having on one side an extension terminating with a shoulder straight-edge a^3 and opposite side prolongation tapering to armpit edge a^3, the pad having under layer of fabric a and upper covering a', between which is inserted a mass of soft yielding material s, the main body of which is confined by rows of stitches d d to conform it in crescent shape in alignment with outer edges c c', said yielding material s inclining from the median line of its body in every direction toward boundaries of its confining stitching-lines d d and surrounded on its larger arc with a pocket formed by lines of stitches d^2 d^2, into which is placed a thin layer of yielding stuffing s, the whole thing being surrounded by integral marginal superimposed layers of the covering fabric, forming free edges c c', adapted to be sewed along said edges to a lady's dress between its main fabric and lining, as and for the purpose intended, substantially as described.



481,789. GRADUATING STEAM-RADIATOR. JOHN T. HAWKINS, Taunton, Mass. Filed Feb. 13, 1892. Serial No. 421,260. (No model.)

Claim.—1. In a steam-radiator, an arrangement of steam-inlets and water-outlet, consisting of an adjustable tube, as 14, closed at the top and inclosed within one of the radiating-tubes, as 8, having an opening, as 15, in its side near the top, and a valve, as 17, secured to its lower open end, both the said tube 14 and the valve 17 communicating with a common steam-inlet and water-outlet, as 20, a stuffing-box bonnet, as 10, through which the closed top of said tube 14 passes, containing a solid portion fitting against said tube 14, so as to close the said opening 15 when the said tube 14 is adjusted to bring said opening 15 within it, said bonnet 10 having a petcock, as 22, establishing communication with the open air, whereby steam is admitted to said radiator above any water which may be retained in it, the heating effect be varied by the adjustment of the opening for water-discharge, effecting a variation of the height at which the water of condensation is maintained, and air be expelled from said radiator through said petcock 22, when desired, substantially as and for the purpose set forth.

2. In a steam-radiator, an arrangement of steam-inlets and water-outlets, consisting of an adjustable tube, as 14, closed at the top and inclosed within one of the radiating-tubes, as 8, having an opening, as 15, in its side near the top, and a valve, as 17, secured to its lower open end, both said tube 14 and valve 17 communicating with a common steam-inlet and water-outlet, as 20, a stuffing-box bonnet, as 10, through which the closed top of said tube 14 passes, containing a solid portion fitting against said tube 14, so as to close the opening 15 when the said tube 14 is adjusted to bring the said opening 15 within it, said bonnet 10 having a petcock, as 22, establishing communication with the open air, one or more valves secured to or formed upon the said tube 14 above the valve 17, so constructed as to establish communication between the interior of said tube 14 and the interior of the radiating-tube 8 by the adjustment of the said tube 14 into the required position, whereby steam is admitted to said radiator above any water which may be retained in it by the adjustment of said tube 14, effecting a variation of the height at which the water of condensation may be maintained and air be expelled from said radiator through said petcock, when desired, substantially as and for the purposes set forth.

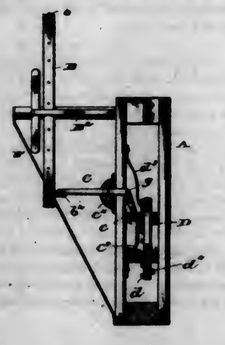


481,790. HORSE-BOOT. JOHN HOAR, Brookline, Mass. Filed Apr. 7, 1892. Serial No. 428,177. (No model.)

Claim.—A locking device for horse-boots, consisting of a plain shank *c*, provided with a T-shaped head *c'* on its inner end and having a beveled surface c^2 on its under side, its opposite end being provided with an interiorly-screw-threaded socket to receive a screw *d'*, and a plate *e*, provided with a hole e^2 for the admission of the screw *d'*, said plate *e* being dished to conform to the contour of the boot and held in position by rivets, substantially as shown and described.

481,791. VEHICLE-POLE TIP. THOMAS J. HOUSTON, Lancaster, Pa. Filed Dec. 17, 1890. Serial No. 375,048. (No model.)

481,791.

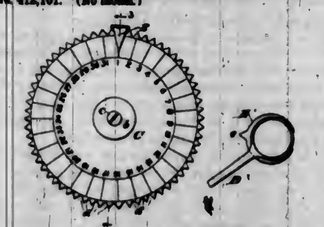


Claim.—1. In a safety pole-tip, a tip-shell or ferrule forming a socket to receive the forward end of a vehicle-pole and having a sloping ring guard or shield surrounding its body to keep the yoke-strap from slipping back, an ornamental bead around and near its rear end on the under side before the ring guard or shield, a forwardly-sloping projection to protect the point of the clasp-hook, and behind said ring guard or shield a rectangular chamber, the forward portion of its side walls having projecting ears to have pivoted therebetween the heel of the clasp-hook at the rear base of the ears, angular recesses to receive and hold the forward end of the slide-bolt, the remaining edges of the walls level to allow a sliding motion to the bolt, the rear wall thickened to receive a screw to hold the rear end of said bolt, and the interior of the chamber to hold the V-spring to act on the heel of the clasp-hook, and the coiled spring to act on the slide-bolt, the tip-shell, ring-guard, walls of the chamber-head, and forwardly-sloping projection of the shell all made integral or forming one body, substantially as described, and for the purpose set forth.

2. In a safety pole-tip, a clasp hook having a heel to be pivoted behind the guard and within the forward end of the chamber, and a retroverted point having a concaved outer face to lie close to the shell of the tip, and an angular end to rest against the forwardly-sloping projection of the shell, the heel having the straight portion to receive the action of the curved arm of the V-spring, the rounded point to depress said arm, the radially-curved portion to oppose the forward end of the slide-bolt, the angular rearwardly-projecting lip to engage the forward end of said bolt to lock the clasp-hook, and the orifice through the heel, through which to pivot said heel, all substantially as described, and for the purpose set forth.

3. In a safety pole-tip, the herein-described slide-bolt to move on and to cover the chamber to the rear of the heel of the clasp-hook pivoted therein, having the forward edge *d* to enter the angular recesses a^2 and to engage the lip c^2 to lock the clasp-hook, the oblong orifice *d'* to receive the headed screw 2 to support the rear end of the bolt, the lug d^2 to support the forward end of the coil-spring to press the bolt forward, the walls d^3 to keep said spring laterally in place, and the handle or thumb-grip d^4 to draw the bolt back, all substantially as described, and for the purpose set forth.

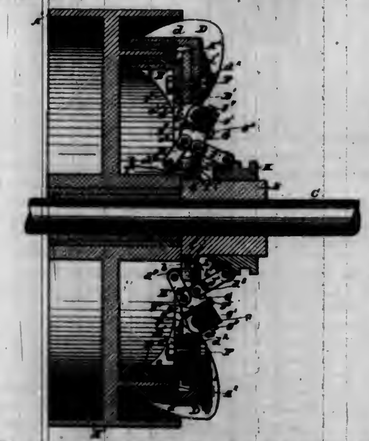
4. In a safety pole-tip, the herein-described V-spring B, folded closely at the heel, having the straight arm *b* to rest upon and to lie close to the shell of the tip within the chamber A^2, and the curved arm *b'*, having its forward portion to engage the portion *c* of the heel of the clasp-hook C to hold said hook closed and to engage the point *c'*, and the lip c^2 of said heel to hold said hook opened, all substantially as described, and for the purpose set forth.



481,792. FENCE-MEASURING MACHINE. FREDERICK HUTCHISON, Jefferson, Iowa. Filed Aug. 4, 1890. Serial No. 361,005. (No model.)

Claim.—1. A measuring-machine consisting of a drum or wheel over which the material to be measured passes, a projection on the side of said wheel adapted to engage the spring-controlled lever, the pawl pivoted to the end of said lever for actuating the indicator-wheel, and the spring engaging the projections on said indicator-wheel for preventing its return movement, substantially as described.

2. A measuring-machine consisting of a drum or wheel having a series of peripheral studs or pins thereon, a shoe arranged adjacent to the drum and connected at one end to a spring, said shoe being arranged to cause the material to be measured to bear upon the studs or pins on the periphery of said drum or wheel, a projection on the side of said wheel or drum engaging a lever for retaining it in its normal position, the pawl pivoted at the end of said lever engaging the projections of the indicator-wheel, and the spring for preventing the return movement of said indicator-wheel, substantially as shown and described.



481,793. CALENDAR ATTACHMENT FOR TIMEPIECES. PAUL J. JOHNSON and JOSEPH H. HAMIL, Globe, Ariz. Filed Nov. 16, 1891. Serial No. 412,101. (No model.)

Claim.—1. A calendar attachment for watches and clocks, consisting of a base-plate provided with a pointer and adapted to be secured to a dial, a notched and graduated disk mounted to turn on the base-plate, and a spring adapted to be secured to the boss of the hour-hand and provided with a finger to engage the notched disk, substantially as described.

2. In a calendar attachment for watches and clocks, the combination, with a base-plate adapted to be secured to a dial and provided with a central boss and an inwardly-projecting finger, of a graduated disk having a central aperture to receive the said boss and a notched periphery, a screw and washer for holding the graduated disk on the boss of the base-plate, and a curved spring adapted to be secured to the boss of the hour-hand and provided with a finger to engage the notches of the graduated disk, substantially as herein shown and described.

481,794. FRICTION-CLUTCH. WILLIAM KERSHAW, Cleveland, Ohio. Filed July 11, 1891. Renewed July 8, 1892. Serial No. 439,417. (No model.)

Claim.—1. In a friction-clutch pulley, the combination of an inner and an outer jaw provided with inwardly-extending radial arms, two toggle-arms pivoted to each other and respectively pivoted to the inner jaw and to the inner end of the outer jaw, means for bending and straightening the toggle-arms, and means for moving the pivotal connecting-point between one of the toggle-arms and one of the jaws, and thereby lengthening or shortening the relative distance between the pivotal points of the toggle-arms, substantially as set forth.

2. In a friction-clutch pulley, the combination of a spider having radiating arms, outer and inner jaws having arms sliding upon the faces of the spider-arms and having means for operating them, and balancing-pins having pivotal bearings in the spider-arms and forming pivotal bearings at their ends for the jaw-arms, substantially as set forth.

3. In a friction-clutch pulley, the combination, with sliding jaws, toggle-arms connected to slide said jaws, and a pivot-pin upon one of said jaws for one of said toggle-arms, of a disk eccentrically pivoted upon said pivot-pin and turning in one end of said toggle-arm and means for revolving said disk and securing it in its adjusted position, substantially as set forth.

4. In a friction-clutch pulley, the combination of a loose pulley having a friction-rim, a spider having radial arms, clutch-jaws having their arms sliding upon said spider-arms and having perforated ears at about the middles of the inner arms and at the inner ends of the outer arms, toggle-arms having holes at their outer ends and slits extending from said holes, pins through the ears of the inner arms, worm-disks in the holes of the toggle-arms and eccentrically pivoted upon said pins, worms engaging said disks, screws through the slitted portions of the toggle-arms, toggle-arms pivoted to said outer toggle-arms and to the ears of the outer-jaw arms, a sliding sleeve upon the spider-hub, and links between said sleeve and the joints of the toggle-arms, substantially as set forth.

481,795. VEHICLE SAND-BAND. WILLIAM KLOCKAU, Rock Island, Ill. Filed May 25, 1892. Serial No. 434,347. (No model.)

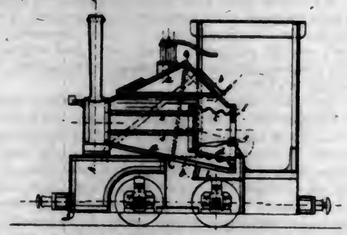
Claim.—The combination, with an axle, of a curved band encircling the same, flanges D on said band, projecting perforated lugs on the lower ends of said band, a device for filling the space between the said lugs, and a securing-bolt, substantially as shown and described.

2. The combination, with an axle, of a curved band which fits thereover formed of spring metal, perforated lugs at the ends of said band, a plate having a perforated head which fits between the said depending lugs, and a securing-bolt which extends through the said lugs and head, substantially as shown and described.

3. The combination, with an axle and a thill-clip thereon, of a curved spring-band which fits over said axle, inwardly-projecting lugs D on the sides of said band, depending perforated lugs at the ends of the band, plate F, adapted to be clamped to the under side of the axle by the thill-clip, depending portion G of said plate having a perforated head at its lower end, and a clamping-bolt, substantially as shown and described.

4. The combination, with an axle and a thill-clip therefor, of a band of spring metal curved around the axle, flanges D on said band, depending lugs on the ends of said band, plate F, of the same width as the axle and constructed with the depending portion G, having a perforated head at its lower end, projections G' and I, and a clamping-bolt, substantially as shown and described.

5. The combination, with an axle, a thill-clip therefor, and a curved band around said axle having depending perforated lugs at its ends, of a plate having a downward-projecting portion which fits between the said depending lugs, a clamping-bolt, a plate projecting from the upper side of the axle, and a curved head on the outer end of said plate having a groove in its periphery, for the purpose substantially as shown and described.



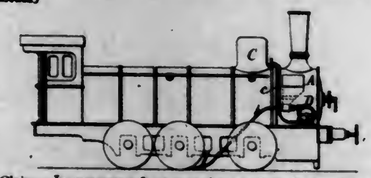
481,796. STEAM-BOILER. GUSTAV LENTZ, Dusseldorf, Germany. Filed Oct. 2, 1889. Serial No. 325,811. (No model.)

Claim.—1. In a steam-boiler having an internal fire-box or flue, an outer shell, the two end portions of which are formed as truncated conical or conoidal tubes coextensive in diameter where they are connected together and the smaller ends of which constitute the ends of the shell, substantially as described.

2. In the outer shell of a steam-boiler having an internal fire-box or flue, the combination of a cylindrical part forming the middle portion of the shell with two truncated conical or conoidal tubes coextensive in diameter where they are connected together and having their larger ends joined to the said cylindrical middle part, while their small

ends constitute the ends of the shell which receive the boiler-heads, substantially as described.

3. In a steam-boiler having an internal fire-box or flue, an outer shell consisting of the combination of a cylindrical part forming the middle portion of the shell with two truncated conical tubes coextensive in diameter at their larger ends, where they are joined to the said cylindrical part, while their small ends are directed toward the ends of the shell, substantially as described.



4. In the outer shell of a steam-boiler having an internal fire-box or flue, the combination of a cylindrical part forming the middle portion of the shell with two truncated conical or conoidal tubes coextensive in diameter at their larger ends, where they are joined to the said cylindrical middle part, while their small ends are connected to other cylindrical parts constituting the ends of the shell, substantially as described.

5. A steam-boiler having its outer shell composed of two end portions formed as conical or conoidal tubes to provide a steam-space which is confined to the middle portion of the shell, combined with an auxiliary steam-dome at the rear end of the boiler, which is connected with the said steam-space by a tubular connection, substantially as and for the purposes set forth.

6. In a boiler of the class described, a fire-box or flue constructed of one or more sections having substantially the form in cross-section of the rear end of the boiler, the rear section of the fire-box having an open bottom, in combination with the inner flue-sheet and rear end of said boiler, from which the opposite ends of the fire-box are supported, an ash-pan connected with the open bottom of said rear section of the fire-box, and a cross brace or bar connected with the opposite sides of the open fire-box section and ash-pan, substantially as and for the purposes specified.

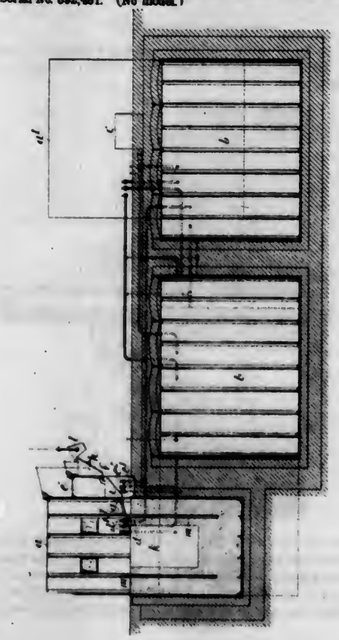
481,797. APPARATUS FOR SANDING RAILS. GUSTAV LENTZ, Duesseldorf, Germany. Filed Oct. 21, 1891. Serial No. 409,496. (No model.)

Claim.—In apparatus for use on locomotives for supplying sand to the rails, the combination, with the sand-box A, of a pipe *b*, passing through the same, into one end of which an air-blast is forced by a fan or other suitable means, while such blast is delivered under the wheels from the other end, the part of the pipe situated within the sand-box being provided with lateral holes *b' b'* and made rotatable, so as to bring the holes into any desired position, substantially as described.

481,798. DOOR-CLOSER. ADDISON D. LOUDY, Vandalia, Ohio. Filed May 16, 1892. Serial No. 433,415. (No model.)

Claim.—1. In a door-closer, the combination, with a frame on the casing having teeth, a U-shaped bracket within said frame, and aligned pins, their inner ends being separated and supported by said bracket and their outer ends being supported by said frame, of arms having cylindrical feet journaled on said pins adjacent the bracket and having notches in their outer ends, levers engaging said teeth and also journaled on the pins between said feet and the frame, a spring whose center stands in said notches and connects said arms, whose body passes down outside the arms and coils around their feet, and whose ends bear on the levers, a staple on the door, and a rod between the staple and the center of the spring, as and for the purpose set forth.

2. In a door-closer, the combination, with a frame on the casing and an inwardly-pressing spring therein, of a bar whose inner end is pivoted to the door and whose outer end moves under said spring, the body of this bar being slotted, a removable pin across this slot, and a rod pivoted at its inner end in the slot and having its outer end pivotally connected with the spring, as and for the purpose set forth.



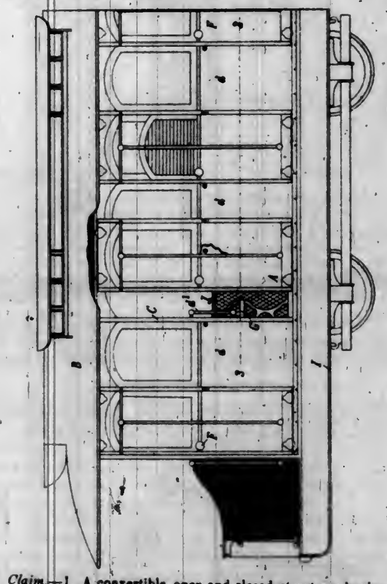
3. In a door-closer, the combination, with a frame on the casing and an inwardly-pressing spring therein, of a staple on the door, a bar whose inner end detachably engages said staple and whose outer end has a roller which moves under said spring, and a rod pivoted at its inner end to the bar and at its outer end detachably engaging said spring, as and for the purpose set forth.

4. In a door-closer, the combination, with a frame on the casing and an inwardly-pressing spring therein, of a staple on the door, a bar whose inner end detachably engages said staple and whose outer end has a roller which moves under said spring, the body of this bar being slotted, a removable pin across this slot, and a rod pivoted at its inner end in the slot in the bar and at its outer end detachably engaging said spring, as and for the purpose set forth.

5. In a door-closer, the combination, with a frame on the casing, having a vertical strip and an inwardly-pressing spring therein, of a staple on the door, a bar whose inner end detachably engages said staple, whose body moves over said strip, and whose outer end has a roller which moves under said spring, and a rod pivoted at its inner end to the bar and at its outer end detachably engaging said spring, as and for the purpose set forth.

6. In a door-closer, the combination, with a frame on the casing, having a vertical strip and an inwardly-pressing spring therein, of a staple on the door, a bar whose inner end detachably engages said staple, whose body moves over said strip, and whose outer end has a roller which moves under said spring, the body of this bar being slotted, a removable pin across this slot, and a rod pivoted at its inner end in the slot in the bar and at its outer end detachably engaging said spring, as and for the purpose hereinbefore set forth.

481,799. APPARATUS FOR USE IN CASTING AND WORKING METALS. WILLIAM E. MAY, London, England. Filed May 12, 1891. Serial No. 392,481. (No model.)



Claim.—1. The combination of a working chamber provided with an opening to admit molten metal, means for hermetically sealing the opening, a series of vacuum-chambers having independent valved connections with the working chamber, and means for separately removing the air from each vacuum-chamber.

2. The combination of a working chamber, a series of vacuum-chambers having independent valved connections with the working chamber, and means for separately removing the air from each vacuum-chamber, an auxiliary chamber having a receiving-opening, an opening in the working chamber, and doors for hermetically closing said openings, as set forth.

3. The combination of a working chamber, a vacuum-chamber having a valved connection with the working chamber, and means for removing the air from the vacuum-chamber, an auxiliary chamber having a receiving-opening, an opening into the working chamber, and doors for hermetically closing said openings, and means for conveying molten metal into and through the auxiliary chamber into the working chamber, all substantially as set forth.

481,800. STREET-CAR. JOHN A. MEELING, Cleveland, Ohio, assignor of one-half to S. D. Dodge, same place. Filed Apr. 8, 1892. Serial No. 428,271. (No model.)

Claim.—1. A convertible open and closed street-car having one side which is composed of vertical posts and removable panels, a foot-board along one side, one or more sliding doors in the side on which the foot-board is placed, an aisle next to said side and extending from one end to the other, and seats arranged transversely on the floor and extending from the aisle to the other side of the car, substantially as set forth.

2. In a convertible open and closed street-car, the combination of vertical posts arranged along one side of the car, removable panels having metallic frames, and bolts for securing said panels to said posts, substantially as set forth.

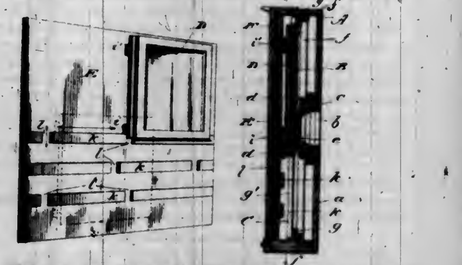
3. A panel for a convertible street-car having sides, which are formed of two vertical angle-irons and an interposed wood strip having a vertical tongue, metallic cross-pieces at top and bottom, wood facings to the lower parts of said panels, and a vertically-movable window and blind adapted to close the upper part of said panel and lying on opposite sides of said wood strip, substantially as set forth.

4. In a street-car, a sliding door in one side, having beveled vertical edges, combined with vertical posts having inclined vertical edges adapted to engage with the vertical edges on the door, substantially as and for the purpose specified.

481,801. BUTTER-BOX. GEORGE R. MELONEY and JOEL T. CRISWELL, Philadelphia, Pa. Filed Nov. 30, 1891. Serial No. 413,512. (No model.)

Claim.—1. The combination, with the box A, of the corner-piece G, formed of a strip of sheet metal bent through its length into angular form and having its ends inclosed or split and bent down at right angles to the body portion, the two leaves of each end crossing each other to form double end walls, as shown and described.

2. The combination, with the box A, of the corner-piece G, formed of a strip of sheet metal bent through its length into angular form and having its ends inclosed or split and bent down at right angles to the body portion, the two leaves of each end crossing each other, the upper end being inclosed laterally and the portion beyond the inclosure bent downward against the inner side of the box.



3. In a butter-box, the combination of an outer inclosing vessel, an inner vessel smaller than the inclosing vessel, with an open space between the two, a lid for the inner vessel, projecting horizontally to the walls of the inclosing vessel to retain and hold the inner vessel in proper position, and a series of superposed trays within the inner vessel, substantially as shown and described.

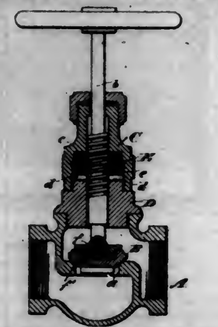
4. In combination with an inclosing vessel, a series of trays provided with angular corner-pieces having at their vertical edges ribs or projections *f'*, projecting against the walls of the inclosing vessel to hold the trays in proper position, substantially as shown and described.

5. In a butter-box, a tray having corner-pieces *f*, with their upper edges dropped below the top of the tray and their lower edges extended below the bottom of the tray.

481,802. PLATE ATTACHMENT FOR CAMERAS. GEORGE I. MINEAR, Ottumwa, Iowa. Filed Mar. 12, 1892. Serial No. 424,684. (No model.)

Claim.—1. An attachment for photograph-cameras, consisting of a movable frame carrying a plate-holder which is provided on its rear side with blocks *i' i*, a board E, supported within a casing, said board having strips with spaces *l* between them, through which the blocks are adapted to pass, and a frame having a marginal packing which is adapted to bear against the sensitised plate carried by the plate-holder, substantially as shown, and for the purpose set forth.

2. An attachment for photograph-cameras, consisting of a casing or frame A, constructed substantially as shown and provided with a board or plate E, having horizontal strips between which are spaces, a plate-holder having on its rear side blocks which are adapted to support the plate-holder upon the strips and pass through the spaces between the strips, for the purpose set forth.

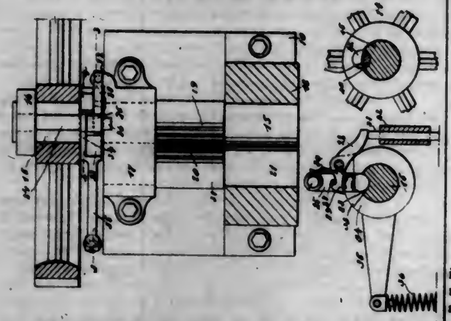


3. A camera attachment consisting of a frame A, having an aperture and movable slide adapted to cover said aperture, a light-excluding packing surrounding the aperture, and a movable slide carrying a plate-holder, the plate carried thereby being adapted to bear against the packing, substantially as shown, and for the purpose set forth.

4. An attachment for photographic cameras, consisting of a frame A, having an aperture with a slide operated by a rod, a plate-holder having blocks *i i* on its rear side, said plate-holder being supported by a board or plate E, having horizontal strips with spaces between through which the blocks *i i* can pass, said plate-holder being adapted to be moved by a horizontally-sliding frame operated by a rod, the plate-holder being held against vertical movement until the slide which moves

the same reaches the limit of its movement in one direction, substantially as shown, and for the purpose set forth.

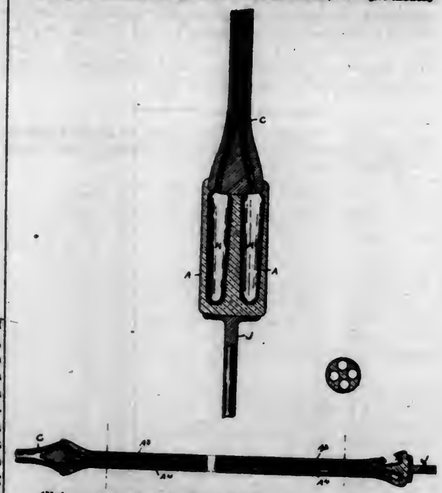
5. In an attachment for cameras, the combination of a horizontally-movable frame carrying a plate-holder with blocks *i i* and *i' i'* on the rear side thereof, a support for said plate-holder, having parallel strips with spaces between them, and cut-away portions in the strips through which the blocks *i i* pass for adjusting the plate-holder vertically, substantially as shown, and for the purpose set forth.



481,808. GLOBE-VALVE. FRANK M. MOORE, Spreckelsville, Hawaii. Filed Sept. 21, 1888. Serial No. 286,080. (No model.)

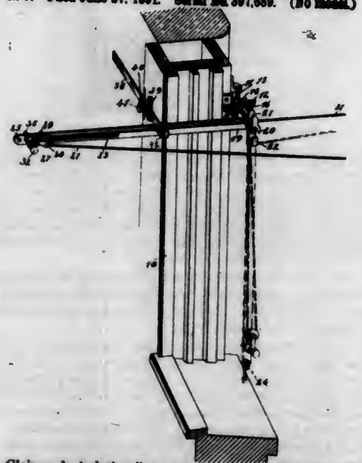
Claim.—1. In a globe-valve, the combination, with the shell, of the valve-stem guiding-bonnet D, screwed thereto, the casing C, screwed at its inner end to the outer end of the bonnet and having an internal chamber of greater diameter than the bore of the bonnet, a nut E beyond the outer end of the bonnet and lying entirely within the chamber in casing C, and means for preventing the nut from rotating, the valve-stem having a valve on its inner end and having a threaded section operating through the nut, the said stem where it passes through the bonnet being of a diameter to be firmly guided in the bore thereof and said stem being of a length to permit the casing to be moved outward thereon when the nut is to be disconnected from the bonnet to grind the valve, substantially as set forth.

2. In a globe-valve, the combination, with the shell and the partially-threaded valve-stem, of the valve-stem guiding-bonnet D, screwed to the shell and having transverse projections *d d* across its outer end, the nut E, wholly beyond and abutting at its inner end the outer end of the bonnet and transversely notched, as at *c c*, to receive said projections, the bore of the bonnet being of a diameter to form a guide to steady the valve-stem during the grinding of the valve, the casing C, screwed to the bonnet and having an internal chamber wholly inclosing the nut, and a gland on the outer end of the casing, the valve-stem being of a length to permit the casing and its gland to be moved outward sufficiently to disconnect them and the nut from the bonnet to grind the valve, the bonnet then serving to steady the spindle and prevent it from moving laterally, substantially as set forth.



481,804. KNIFE-BLADE MACHINE. THOMAS R. MOORE, Walden, N. Y. Filed Jan. 7, 1892. Serial No. 417,905. (No model.)

Claim.—1. The combination, with the frame having double bearings 17 18, of the two rolls geared together and mounted in said bearings to oscillate, the front ends of the rolls being provided within the bearing 18 with longitudinally-extending dies to receive the blank lengthwise between them and roll it transversely, and an operating mechanism, substantially as set forth.

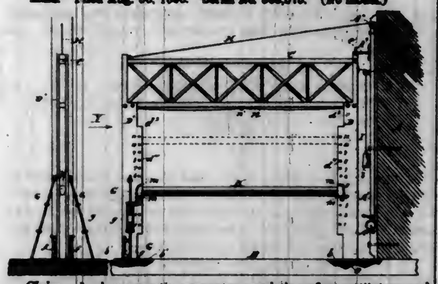


2. The combination, with the frame and the parallel oscillating rolls journaled in bearings thereon, geared together between their ends, and provided at their front ends within one bearing with the opposed dies, of a spring-actuated lever on the rear end of one roll to return the rolls to their normal positions, a gear-wheel loose on said lever-actuated roll, and a locking and tripping mechanism for locking and unlocking said gear and roll, substantially as described.

481,805. MULTIPLEX GLASS TUBE. PATRICK J. MCELROY, Cambridge, Mass. Filed May 20, 1890. Serial No. 353,085. (No model.)

Claim.—A continuous tube made of glass prepared first with separated chambers or cavities open at one end and then blown and drawn simultaneously, substantially as and for the purposes herein described.

481,806. CLOTHES-LINE SUPPORT. ROBERT MCNAB, Paterson, N. J. Filed June 27, 1891. Serial No. 397,669. (No model.)



Claim.—1. A clothes-line support comprising a horizontally-swinging supporting-arm pivoted at the outer side of a window-frame, a roughened curved blade extending through the supporting-arm and adapted to be clamped thereto, a swinging main arm journaled on the outer end of the supporting-arm, a guide and hook supported on the outer end of the supporting-arm, a pulley-carrier adjustably mounted on the swinging arm, and an inside cross-arm secured to the window-frame and adapted to support the swinging arm, substantially as described.

2. In a clothes-line support, the combination, with the swinging main arm pivoted at the outer side of a window-frame, of a laterally-adjustable cross-arm supported on the inner side of the window-frame and a swinging plate secured to the cross-arm and adapted to support the main arm, substantially as described.

3. The combination, with the swinging main arm having a longitudinal slot therein with notches on opposite sides of the slot, of a pulley-carrier held to slide on the main arm and provided with a spring-pressed button to engage the notches of the main arm, substantially as described.

4. The combination, with the horizontally-swinging supporting-arm, of a main arm having a series of holes therein adapted to fit the outer end of the supporting-arm and a pulley-carrier mounted on the main arm, substantially as described.

481,807. GYMNASTIC APPARATUS. CHARLES C. HEELY, Boston, Mass. Filed Aug. 30, 1890. Serial No. 363,575. (No model.)

Claim.—1. A gymnastic apparatus consisting of an oscillatory and axially-rotatable standard D, a horizontal beam C, secured to said standard and having at its outer end a standard D', a gymnastic appliance carried by the standards, a cable-supporting pulley A'', journaled above the upper end of the inner standard, and a cable H, secured to the outer end of the horizontal beam, passing over the cable-supporting pulley, and descending to a point in proximity to the floor for the purpose of lifting the horizontal beam, substantially as and for the purposes described.

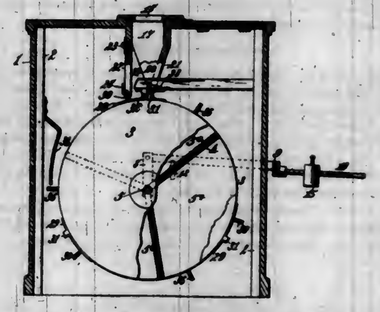
2. A gymnastic apparatus consisting of an oscillatory and axially-rotatable standard D, a horizontal beam C, secured to said standard and having at its outer end a standard D', a gymnastic appliance carried by the standards, a cable-supporting pulley A'', journaled above the upper end of the inner standard, a cable H, secured to the outer end of the horizontal beam, passing over the cable-supporting pulley, and descending to a point in proximity to the floor for the purpose of lifting the horizontal beam, a pulley A², and a cable I, secured to the inner standard and provided with a balance-weight *i* to aid in lifting the horizontal beam, substantially as described.

3. A gymnastic apparatus consisting of grooved standards, a vertically-movable rotary bar, adjustable bearings mounted on the standards and to which the ends of the bar are pivoted, weighted cords or ropes connected with the bearings for balancing the latter, and a releasing rope or chain attached to the balance-weights for relieving the downward pressure thereof, substantially as described.

481,808. TOY MORTAR. GRANT B. NICHOLS, Wapakoneta, Ohio. Filed Dec. 2, 1891. Serial No. 413,762. (No model.)

Claim.—A toy gun having a fire-cracker mortar at the muzzle end of its barrel and a mortise and tenon connecting the two, said mortar having a lateral fire-cracker opening and a swell or shoulder in its bore, substantially as set forth.

481,809. WATCH-CASE. VICTOR NIVOIS, Brooklyn, N. Y. Filed Feb. 2, 1892. Serial No. 420,071. (No model.)

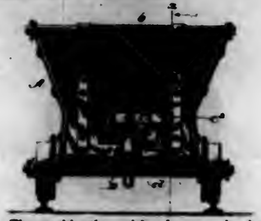


Claim.—In a gold watch-case, the combination, with the shell of the center and a backing or filling of baser metal corresponding strictly in cross-sectional contour to the cross-sectional contour of the shell, the said backing or filling being integrally attached to the shell through the medium of solder applied over its entire inner surface and

481,809.

provided at its lower portion upon its inner face with a recess, of a lift-spring adjustably secured to the backing or filling, the major portion of which lift-spring occupies a recess in the filling, and a catch or releasing spring forming a dust-band, constituting, essentially, a circle within the center and made of such width that it conceals the filling, its recess, and the lift spring, as and for the purpose specified.

481,810. AUTOMATIC GRAIN-WEIGHER. DANIEL J. O'CONNER, Columbus, Ga. Filed Apr. 21, 1892. Serial No. 430,051. (No model.)



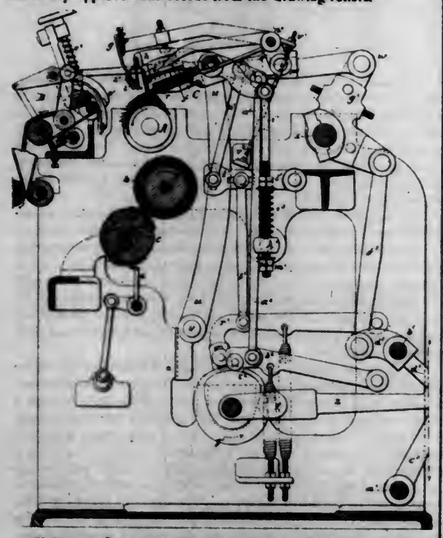
Claim.—1. In an automatic weighing mechanism, the combination, with a cylinder having sector-chambers, of a yoke-lever forming part of the scale-beam and having fulcra upon the side walls of the housing, its ends being connected by link-plates to the journals of the cylinder lying in slots in said housing, and a hopper having a spring-closed gate-valve provided with an arm the end of which lies in the path of a tripping-pin on the periphery of one of the cylinder-heads, substantially as described.

2. In an automatic weighing mechanism, the combination, with a cylinder having sector-chambers, of a scale-beam composed in part of a yoke-lever fulcrumed upon the outside of the housing, its ends connected by link-plates to the journals of the cylinder, a hopper having a spring-closed gate-valve provided with an arm extended in the path of a tripping-pin on the periphery of one of the cylinder-heads, and a stop-bar projected from the wall of the housing over the cylinder and having a lug lying in the path of a stop-lug on the cylinder-head, substantially as described.

3. In an automatic weighing mechanism, the combination, with a cylinder having sector-chambers, of a yoke-lever having its arms connected at their ends to the journals of the cylinder by link-plates, a hopper having a spring-closed gate-valve provided with an arm lying in the path of a tripping-pin on one of the cylinder-heads, a stop-bar projected from the wall over the cylinder and having a lug lying in the path of a stop-lug on the cylinder a little in rear of the tripping-pin, and an elastic friction-brake consisting of a plate on the wall of the housing having its free end converged toward the periphery of the cylinder-head, on which is a pin arranged to engage with and traverse said plate, passing off the same as the gate-valve is opened, substantially as described.

4. The combination, with a frame or housing, of a chambered cylinder having a tripping-pin, a yoke-lever forming part of a scale-beam fulcrumed on the frame or housing and having its ends connected with the journals of the cylinder, a register, devices actuated by the yoke-lever to operate the register, and a hopper having a spring-closed gate-valve provided with an arm the end of which lies in the path of the tripping-pin on the cylinder, substantially as described.

481,811. DUMP-CAR. JOSEPH OSGOOD, Trinidad, Colo., assignor to the Forbes Mine Car Appliance Company, same place. Filed Jan. 11, 1892. Serial No. 417,757. (No model.)



Claim.—1. The combination, with a dump-car having a draw-bar and a catch or lug *d*, of a suspended end door having a latch connected with a horizontal portion fulcrumed to the door and a vertical portion extending downwardly to engagement with said lug *d*, and a stop for maintaining the normal locking position of said latch, substantially as shown and described.

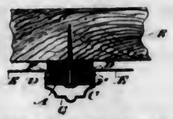
2. The combination, with a dump-car having a draw-bar and a catch or lug *d*, of a suspended end door having a latch constructed with a horizontal portion fulcrumed to the door, a vertical portion extending downwardly to engagement with said lug *d* and an offsetting handle, a stop for maintaining the normal locking position of the latch, and a retaining-spring for holding the latch against jolting loose, substantially as shown and described.

481,812. COMBING-MACHINE. HUBERT L. OTTERMANN, Leipsic, and GASPARD ZIEGLER, Mulhouse, Germany; the Land Title and Trust Company administrator of Gaspard Ziegler, deceased. Filed Aug. 1, 1888. Serial No. 281,611. (No model.) Patented in France May 28, 1888, No. 190,866; in Belgium June 1, 1888, No. 83,004; in England June 14, 1888, No. 8,714; in Germany June 17, 1888, Nos. 51,543 and 53,333; in Italy June 26, 1888, No. 23,713; in Switzerland Mar. 15, 1889, No. 601, and in Russia June 30, 1890, No. 6,665.

Brief.—The reciprocating movements of the drawing-rollers are dispensed with, and the finishing-comb, nippers, and feed mechanism alternately approach and recede from the drawing-rollers.

Claim.—1. In combing-machines, a comb-cylinder provided with circular rows of teeth of increasing fineness, substantially as set forth.

2. In a combing-machine, a comb cylinder having circular rows of teeth of increasing fineness in planes at a slight inclination to planes which are at right angles to the axis of the cylinder, substantially as and for the purposes set forth.



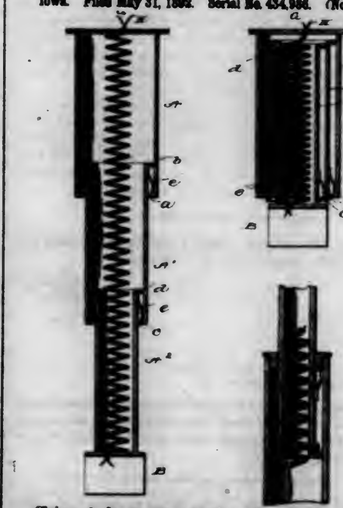
3. In a combing-machine, the combination of the finishing-comb with a cleaning device therefor, consisting of a brush and an angle-plate, and mechanism to reciprocate the brush and plate against the comb, substantially as set forth.

4. In the drawing mechanism of a combing-machine, the combination of an oscillating faller-arm with a counter-faller and mechanism whereby the counter-faller is actuated by the movement of the faller-arm, in the manner and for the purpose set forth.

5. In a combing-machine, the combination of a nipper, a feed mechanism and a finishing-comb having a combined reciprocating motion, with mechanism consisting of a crank in the main driving-shaft and a system of levers, connecting-rods, and bell-cranks whereby the speed of the reciprocating motion diminishes at each end of the stroke, substantially as and for the purposes set forth.

6. In a combing-machine, the combination of a stationary drawing apparatus having drawing-rollers, a faller-arm and a counter-faller, a combing-cylinder and stationary bearings therefor, and a nipper, a finishing-comb, a device for cleaning the finishing-comb, and feed mechanism having a combined reciprocating motion, and mechanism for independently reciprocating the cleaning device, the comb, the feed mechanism, and one of the jaws of the nipper, substantially as set forth.

481,813. METALLIC CEILING. WILLIAM W. OLD and ROBERT H. OLD, Louisville, Colo. Filed Feb. 24, 1892. Serial No. 422,616. (No model.)



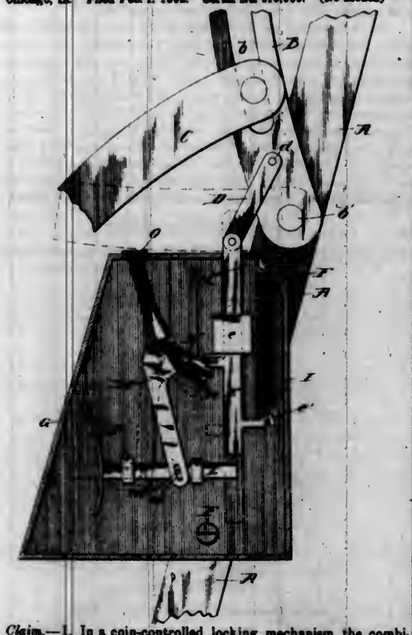
Claim.—1. In a device of the class described, the combination, with grooved furring-strips, of flanged panels engaging the grooves in the said furring-strips and covering-strips for covering the exposed parts of the furring-strips and interlocking with the flanges of the said panels, substantially as shown and described.

2. In a device of the class described, the combination, with grooved furring-strips, of flanged panels engaging the grooves in the said furring-strips, covering-strips for covering the exposed parts of the furring-strips and interlocking with the flanges of the said panels, and a rosette spanning the joint of the covering-strips, substantially as shown and described.

3. In a device of the class described, the combination, with furring-strips formed with grooves at their sides, of panels forming doubled-up flanges entering the grooves in the said furring-strips and covering-strips having flanges entering the doubled-up flanges of the panels in the grooves of the furring-strips, substantially as shown and described.

481,814. EXTENSION-CHANDELIER. FRANK OVERHOLT, Harlan, Iowa. Filed May 31, 1892. Serial No. 434,906. (No model.)

Claim.—1. In an extension-chandelier, the telescopic tubes, the lower one of which is provided with means for supporting a lamp or burner, said tubes having limiting-stops at their ends and one of said tubes carrying a lamp-socket, in combination with spirally-coiled wires within the tubes to be connected with the opposite poles of an electric circuit and to assist in supporting the weight of the tubes and maintain them in their adjusted positions, substantially as herein described.



2. In an extension-chandelier, the telescopic tubes having inwardly and outwardly turned flanges at their ends and a lamp-socket carried by the lower tube, in combination with conducting-wires within the tubes and to be connected with a source of electric supply, said wires being spirally coiled, whereby they are distended when the tubes are extended and contracted when the tubes are telescoped, substantially as herein described.

3. In an extension-chandelier having telescopic tubes with inwardly and outwardly turned end flanges, the spring-plates secured to the inner walls of the tubes, with their free ends bearing against the outer walls of adjacent tubes, and spirally-coiled wires extending through said tubes to assist the spring-plates in maintaining the tubes in their adjusted positions, substantially as herein described.

481,815. MEDICAL COMPOUND. THOMAS L. PAGE and JACOB APPEL, Victoria, Tex. Filed Feb. 15, 1892. Serial No. 421,631. (No specimens.)

Claim.—A medical composed compound of an aqueous solution of *Acacia constricta* and *Flourensia cornua* prepared in about the proportions herein set forth.

481,816. COIN-CONTROLLED MECHANISM. HOWARD H. PERRY, Chicago, Ill. Filed Feb. 1, 1892. Serial No. 419,969. (No model.)

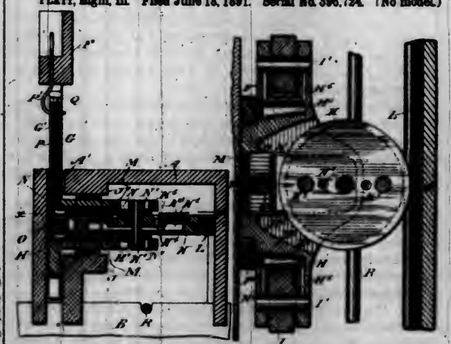
Claim.—1. In a coin-controlled locking mechanism, the combination, with the member to be locked, of a casing having a coin-slot, a pivoted bell-crank lever having a coin-support formed on one of its arms, and the outer edge of such support being at least as low as the pivot of said lever, a plunger connected to said member to be locked and adapted to oscillate said lever through the medium of a coin on said support, and a bolt arranged in the path of said plunger and connected with said lever, substantially as set forth.

2. In a coin-controlled locking mechanism, the combination, with the member to be locked, of a casing having a coin-slot, a pivoted lever having a coin receptacle or pan, a plunger connected to said member to be locked and adapted to oscillate said lever through the medium of a coin thereon, a sliding bolt arranged in the path of said plunger, and a pin-and-slot connection between said lever and bolt, substantially as set forth.

3. In a coin-controlled locking mechanism, the combination, with the member to be locked, of a casing having a coin-slot, a pivoted lever having a notched or slotted coin-support, a plunger connected to said member to be locked and having a portion adapted to rise and fall through said notch, so as to oscillate said lever through the medium of the coin thereon, a bolt arranged in the path of said plunger and connected with said lever, and springs for returning said plunger and bolt to their normal positions, substantially as set forth.

4. In a coin-controlled locking mechanism, the combination, with the member to be locked, of a casing having a coin-slot, a pivoted lever having a slotted pan for detaining a coin thereon, a plunger connected with the member to be locked and having a portion adapted to rise and fall through said slot in said coin-pan, and a bolt connected to said lever and arranged in the path of said plunger, substantially as set forth.

5. In a coin-controlled locking mechanism, the combination, with the member to be locked, of a casing having a coin-slot, a pivoted lever having a slotted inclined opened pan provided with lugs or stops for detaining a coin, a plunger connected with the member to be locked and having a portion adapted to rise and fall through said slot, and a bolt connected to said lever and arranged in the path of said plunger, substantially as set forth.



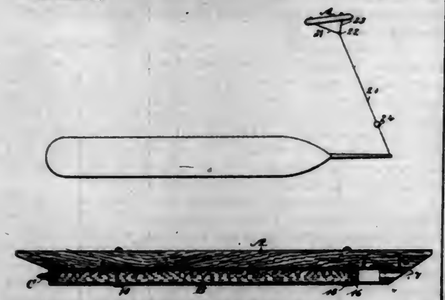
6. In a coin-controlled locking mechanism, the combination, with the member to be locked, of the casing having a coin slot or chute, a pivoted bell-crank lever having an inclined coin-pan on one arm thereof provided with a slot in its end, a sliding bolt connected to the other arm of said bell-crank, a spring for sliding said bolt in one direction, a plunger arranged to strike said bolt, having a nose adapted to pass through the slot in said pan, a link connecting said plunger with the member to be locked, and a spring fixed at one end and secured to said plunger at its other end, substantially as set forth.

7. In a coin-controlled mechanism, the combination, with the member to be locked, of a casing having a coin-slot, a pivoted lever having a flat coin-pan formed on one arm thereof, adapted to support a coin broad side uppermost, said pan being provided with stops on both sides for arresting the coin, a plunger connected with the member to be locked and adapted to oscillate said lever through the medium of a coin thereon and a bolt arranged in the path of said plunger and being operated by said lever, substantially as set forth.

8. In a coin-actuated locking mechanism, the combination, with the casing having a coin-slot and the member to be locked, of a lever having a coin pan or support, a plunger for oscillating said lever through the medium of a coin thereon, a sliding bolt for arresting the movement of said plunger, and a spring for holding said bolt normally across the path of said plunger, substantially as set forth.

9. In a chair, the combination of the frame and the pivoted seat having slotted edges, the entire support or brace C for the outer side of said seat being pivoted to said frame at *c* and having studs engaging in said slotted side edges of the seat, and a locking mechanism secured to said frame and connected to said seat, said braces C being adapted to fold up with the seat independently of the chair-frame, substantially as set forth.

481,817. TROLLEY-CARRIAGE FOR CONDUITS. STEPHEN L. PLATT, Elgin, Ill. Filed June 13, 1891. Serial No. 396,734. (No model.)



Claim.—1. In an electric conductor, the combination, with a carriage mounted on wheels and provided with an upwardly-projecting hollow arm, of a contact wire or plate extending upward through the arm, a U-shaped frame fitted to slide in the carriage, a contact-wheel mounted in the frame, and a spring arranged between the said frame and the contact wire or plate, substantially as described.

2. In an electric conductor, the combination, with a carriage mounted on wheels and provided with a horizontal recess, transverse slots, and a vertical and recessed arm, of a contact-plate extending up through the recess of the said arm, a U-shaped frame mounted in the horizontal recess of the carriage, a contact-wheel mounted in the frame and having its bearings projecting into transverse slots of the carriage, and a spring arranged between the frame and contact wire or plate, substantially as herein shown and described.

3. In an electric conductor, the combination, with a slotted conduit having upper and lower tracks and a conducting-wire secured to

one side of the conduit, of a forked hanger, a carriage mounted on wheels traveling on said tracks and provided with a recessed arm projecting up between the forks of the hanger, a contact plate or wire extending up through the arm, a U-shaped frame mounted to slide in the carriage, a contact-wheel mounted in the frame, and a spring arranged between the frame and the contact wire or plate, substantially as herein shown and described.

481,818. DEVICE FOR DISTRIBUTING OIL UPON WATER. SIDNEY I. PRESCOTT, Brooklyn, N. Y. Filed Jan. 6, 1892. Serial No. 417,161. (No model.)

Claim.—1. An apparatus for distributing oil on water, comprising a buoyant oil-chamber having an opening at each end and a piston in the oil-chamber, adapted to be acted upon by the waves and separating the oil from the water, substantially as described.

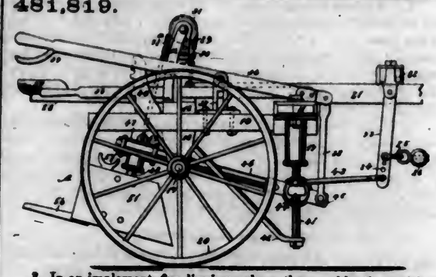
2. In an oil-distributing apparatus, the combination, with a float and an oil-chamber carried by the float, having openings for the ingress of water and for the egress of oil, of a valve regulating the outflow of the oil and a piston located within the oil-chamber to be acted upon by the waves and separating the oil from the waves or water, as and for the purpose set forth.

3. In an oil-distributing apparatus, the combination, with a float and an oil-chamber attached to the float, the forward end of the oil-chamber and the float being beveled, the said chamber being provided with a valve at one end regulating the outflow of the oil and a piston or plunger at the opposite end to be acted upon by the waves and separating the oil from the water, of a means, substantially as shown and described, for attaching the apparatus to a vessel, as and for the purpose set forth.

4. In an oil-distributing apparatus, the combination, with a float and an oil-chamber, the latter being provided with an egress-opening, of a plunger or piston located at one end of the oil-chamber, the said plunger or piston being adapted to be acted upon by the waves, as and for the purpose set forth.

5. In a device or apparatus for the distribution of oil upon the water, the combination, with an oil-chamber open at one end and having an egress-opening at the other end, of a piston located within the oil-chamber at the open end, separating the oil from the water and adapted to be acted upon by the waves, as and for the purpose set forth.

6. In an apparatus for distributing oil upon the water, the combination, with a float, an oil-chamber carried by the float and provided with a valve-controlled egress-opening, and a plunger to be acted upon by the waves and separating the oil from the water, of a tow-line and bridle connected with the apparatus, the tow-line being controlled by a weight-governor, as and for the purpose specified.

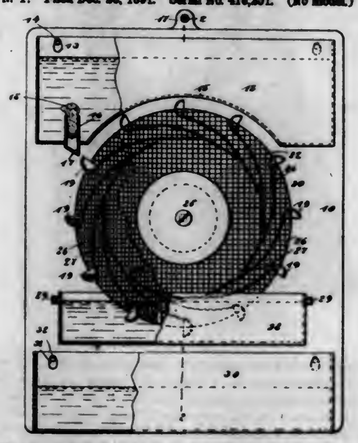


7. The combination, with an apparatus adapted to distribute oil upon the water, of a tow-line and bridle attached to the device, and a weight-governor secured to the tow-line between its point of attachment and the distributer, substantially as shown and described.

481,819. MACHINE FOR DIGGING CELERY. MAURICE M. RAPBET, Comstock, Mich. Filed Mar. 2, 1892. Serial No. 423,490. (No model.)

Claim.—1. In a machine for digging celery, a shovel comprising mold-boards having socket-blocks on their inner surfaces, said blocks being provided with flanges at their lower ends, and a bottom plate having a cutting-edge and adjustably secured to the flanges of the said blocks, substantially as described.

2. In a machine for digging celery, a shovel consisting of mold-boards having socket-blocks on their inner surfaces, said blocks having flanges at their lower ends, a slotted bottom plate having its front end sharpened to form a cutting-edge and provided with teeth projecting from the rear edge, and bolts passed through the slots of the bottom plate into the flanges of the said blocks, substantially as described.



481,819.

3. In an implement for digging celery, the combination, with a wheeled frame, standards projected down from the forward portion of the frame, rods capable of sliding and turning upon the standards at their forward ends, levers connected with the forward ends of the rods, and levers connected with the rear ends of the rods, of a shovel connected with the rear portions of the rods, the said shovel being given its draft by the manipulation of the rods at their forward ends and regulated as to depth by the manipulation of the rods at their rear ends, substantially as and for the purpose set forth.

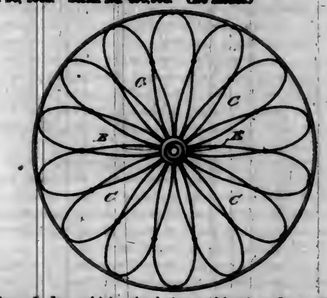
4. In an implement for digging celery, the combination, with a frame, standards projected downward from the forward portion of the frame, bearing-blocks capable of sliding upon and turning on the standards, and rods connected at their forward ends to the bearing-blocks, being carried in converging directions rearward, of levers connected with the bearing-blocks, whereby they may be raised and lowered, a second set of levers connected with the rear ends of the rods attached to the bearing-blocks, and a shovel removably attached to the rear ends of the rods, said shovel comprising a bottom plate, and mold-boards located at the side edges of the plate and laterally adjustable thereon, substantially as and for the purpose set forth.

481,820. MECHANICAL FLY-TRAP. EMIL RATTNER, New York, N. Y. Filed Dec. 26, 1891. Serial No. 416,251. (No model.)

Claim.—1. In a fly-trap, a hollow wheel provided with buckets on its periphery and with tangential passages leading from the periphery between the buckets to the interior of the same, as specified.

2. In a fly-trap, the combination, with a liquid-containing tank, of a hollow revolving wheel mounted to turn in said tank and provided with tangential passages leading from the periphery to the interior of the wheel, substantially as and for the purpose set forth.

3. A fly-trap comprising a hollow wheel provided with buckets on its periphery and with tangential passages between the buckets and leading from the periphery of the wheel to the interior of the same and a reservoir above the wheel and discharging into the buckets thereof, substantially as described.



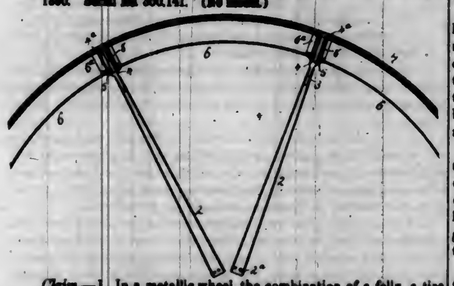
4. A mechanical fly-trap comprising a water-wheel held to turn in a liquid containing tank, said water-wheel having face-buckets with inwardly-extending arms, and a reservoir mounted above the wheel and having an outlet-pipe adapted to deliver upon the buckets, substantially as described.

5. A mechanical fly-trap comprising a hollow water-wheel having face-buckets with inwardly-extending arms which terminate in brushes and a reservoir mounted adjacent to the wheel and having an outlet-pipe to deliver upon the buckets, substantially as described.

6. A mechanical fly-trap comprising a base-board, a hollow water-wheel held to turn on the base-board and provided with face-buckets having inwardly-extending arms, a reservoir mounted above the wheel and having an outlet-pipe to deliver upon the buckets, a liquid-holding tank held to receive the lower portion of the wheel and having end outlets, and a main receiving-tank arranged beneath the wheel-tank, substantially as described.

7. The combination, with a water-wheel having face-buckets and inwardly-extending arms, of a reservoir mounted above the wheel, said reservoir having a concave middle portion to fit over the wheel and an outlet-pipe to deliver upon the buckets, substantially as described.

481,821. WHEEL. JONATHAN REES, Phœnixville, Pa. Filed Apr. 28, 1892. Serial No. 430,992. (No model.)



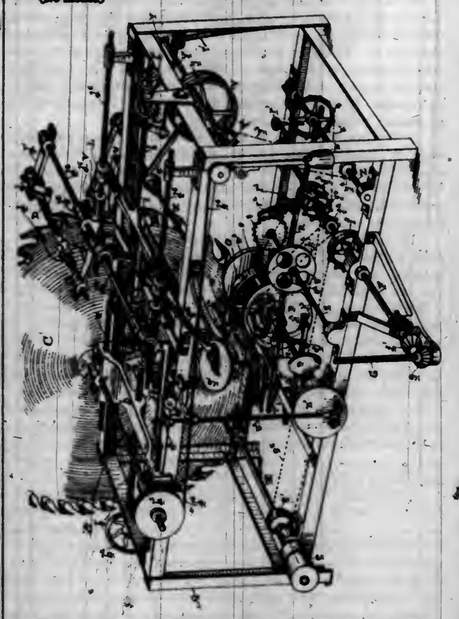
Claim.—1. In a vehicle-wheel, the combination of a mortised hub, spring-spokes C, having the terminal portions attached to a plate D, and bands for retaining said plates within the mortises in the hub, the loop portion of each spoke farthest from the hub being secured to the tire, substantially as shown.

2. In a vehicle-wheel, the combination of the spokes C, made up of bars of spring metal looped as shown, the terminal portions of said spokes being connected to a plate D, bands E E, adapted to encircle the hub and engage with said plates, a tire A, attached to the loop portion of the spokes, each spoke bearing against an adjacent spoke at a point between the tire and hub, and means for connecting the spokes at such points, substantially as shown, and for the purpose set forth.

3. In a vehicle-wheel, the combination of a hub having mortises to receive the ends of spring-spokes, said spokes being bent to form outer loops, which are attached to the tire at a point opposite the point where the ends are secured to the hub, and means, substantially as shown, for connecting the spokes to each other at an intermediate point between the hub and tire, for the purpose set forth.

481,822. WHEEL. JOHN W. REDDIN, Havana, Ill. Filed May 1, 1890. Serial No. 350,141. (No model.)

Claim.—1. In a metallic wheel, the combination of a felly, a tire encircling the same, a hub, and spokes provided with permanent tenons which project through the felly and tire and are riveted down upon the latter to hold the parts together.



2. In a carriage or wagon wheel, the combination of the rabbeted tire, the channeled felly having its edges seated in the rabbets of the tire, the hub, and the spokes having solid tenons extending through the felly and tire and riveted down upon the latter.

3. In a carriage or wagon wheel, the combination of the rabbeted tire, the felly concave convex in cross-section, having its edges seated in the rabbets of the tire, the hub, and the spokes having tubular bodies and solid tenons, the latter projecting through the felly and tire and riveted down upon the latter.

4. In wheels, in combination, a tire, a felly composed of interlocked sections, and spokes extending continuously through the conjoining ends of the felly-sections and through the tire, whereby the tire and felly are bound together.

5. In a metal wheel, the combination of the tire, the hollow felly, the spokes inserted through the tire and felly and binding them together, and independent struts 8, encircling the spokes within the felly to prevent the crushing of the latter.

481,823. SAW FILING AND SETTING MACHINE. JOHN RICHARDSON, San Francisco, Cal. Filed Dec. 28, 1891. Serial No. 416,262. (No model.)

Claim.—1. In a saw-filing machine, the combination of a file, mechanism for reciprocating it in contact with the tooth of the saw, and mechanism for automatically feeding said saw to present a fresh tooth to the action of the file, comprising a pawl adapted to engage the saw-teeth, a pivoted hanger for the pawl, and a crank-wheel and connection for operating the hanger, substantially as described.

2. In a saw-filing machine, the combination of a file for operating upon the tooth of the saw, mechanism for reciprocating said file, mechanism for feeding the saw to present a fresh tooth to the action of the file, comprising a pivoted hanger carrying a pawl for engaging the tooth of the saw, a crank-wheel, and an adjustable connection between the same and the hanger, and means for raising the file out from between the teeth during the movement of the saw and returning it to a succeeding tooth, substantially as described.

3. In a saw-filing machine, the combination of the file, the holder thereof, the sliding shaft carrying the holder, and the means for reciprocating said shaft, consisting of a transversely-movable cross-head engaging an arm on the shaft, a pitman connecting with the cross-head, the crank-shaft G for driving the pitman, the cross-shaft F, and gearing between said shaft and crank-shaft, and means for driving the cross-shaft, substantially as described.

4. In a saw-filing machine, the combination of the file, the holder therefor, the sliding and rocking shaft carrying the holder, the crank-arm d^6 of said shaft, the reciprocating cross-head I, and the slotted or grooved bearing *i* of said cross-head, into which the crank-arm d^6 fits, whereby the shaft d^5 may be both reciprocated and rocked, substantially as described.

5. In a saw-filing machine, the combination of the file, the file-holder, the sliding rock-shaft, to which said file-holder is connected, and the means for rocking said shaft, consisting of the crank-arm J of the shaft and the rotating cam *k*, operating under said crank-arm, substantially as described.

6. In a saw-filing machine, the combination of the file, the rock-shaft to which said file is attached, and the means for rocking said shaft at each stroke of the file, consisting of the crank-arm J, secured to the shaft, the cam *k*, operating under the crank-arm, the cross-shaft F, and power-transmitting connections between said cross-shaft and the cam-shaft, substantially as described.

7. In a saw-filing machine, the combination of the file, the sliding and rocking shaft d^3, carrying said file, the means for reciprocating said shaft, consisting of the sliding cross-head having the slotted or grooved bearing, the crank-arm of the shaft fitted in said bearing, the crank-shaft G and pitman g^3 connecting it with the cross-head, the counter-shaft F for driving the crank-shaft, and the means for rocking the file-holder shaft, consisting of the crank-arm J, secured thereto, the cam *k*, shaft K, and power-transmitting connections between the cross-shaft F and said shaft K, substantially as described.

8. In a saw-filing machine, the combination of the file, the holder therefor, the reciprocating shaft carrying the holder, the sliding sleeves and their bearings d^3, carrying the shaft, and the means for adjusting said shaft to regulate the position of the file with respect to the saw-tooth, consisting of the tracks on which the sleeves slide; the sliding cross-bar on said tracks, adapted to come in contact with the sleeves, a screw-stem of the cross-bar, and the wheel-nuts *l* for operating the screw-stem, substantially as described.

9. In a saw-filing machine, the means for feeding the saw at stated intervals, consisting of the pawl M, engaging the teeth of the saw, the vibrating hanger carrying the pawl, the crank-wheel m^2, connected with the hanger, and the periodically-moving shaft N, carrying the crank-wheel, and a connection from the crank wheel to the hanger, substantially as described.

10. In a saw-filing machine, the combination of an engaging mechanism for the saw for turning it and the means for periodically operating said mechanism, consisting of the shaft N, by which it is operated, the continuously-rotating wheel O, loose upon said shaft, the disk P, fast thereon, a pawl-and-ratchet mechanism between the wheel and disk, and means for throwing the pawl and ratchet into and out of engagement at stated intervals, substantially as described.

11. In a saw-filing machine, the combination of an engaging mechanism for turning the saw and a means for periodically operating this mechanism, consisting of the shaft N, the continuously-rotating wheel O, loose thereon, the disk P, fast thereon, the normally-engaged pawl-and-ratchet connection between the wheel and disk, the projecting pin of the pawl, and the stop-bar for limiting said pin and throwing the pawl and ratchet into and out of engagement at stated intervals, substantially as described.

12. In a saw-filing machine, the combination of an engaging mechanism for turning the saw, a means for periodically operating this mechanism, consisting of the shaft N, the continuously-rotating wheel O, loose thereon, the disk P, fast thereon, the normally-engaged pawl-and-ratchet connection between the wheel and disk, the projecting pin of the pawl, the stop-bar for limiting said pin and throwing the pawl out of engagement with the ratchet, and a tripping mechanism for throwing the stop-bar out of the way at stated intervals to permit the re-engagement of the pawl with the ratchet, substantially as described.

13. In a saw-filing machine, the combination of an engaging mechanism for turning the saw, a means for periodically operating this mechanism, consisting of the shaft N, the continuously-rotating wheel O, loose thereon, the disk P, fast thereon, the normally-engaged pawl-and-ratchet connection between the wheel and disk, the projecting pin of the pawl, the stop-bar for limiting said pin and throwing the pawl out of engagement with the ratchet, and a tripping mechanism for throwing the stop-bar out of the way at stated intervals to permit the re-engagement of the pawl with the ratchet, consisting of the drop-lever T, having the contact-arm *t'*, and means for operating the drop-lever, substantially as described.

14. In a saw-filing machine, the combination of an engaging mechanism for turning the saw, a means for periodically operating this mechanism, consisting of the shaft N, the continuously-rotating wheel O, loose thereon, the disk P, fast thereon, the normally-engaged pawl-and-ratchet connection between the wheel and disk, the projecting pin of the pawl, the stop-bar limiting said pin and throwing the pawl out of engagement with the ratchet, a tripping mechanism for throwing the stop-bar out of the way at stated intervals to permit the re-engagement of the pawl with the ratchet, consisting of the drop-lever T, having the contact-arm *t'*, and the rotating shaft S, having the wheel, with its pin, for operating the drop-lever, substantially as described.

15. In a saw-filing machine, the combination of an engaging mechanism for turning the saw, a means for periodically operating this mechanism, consisting of the shaft N, the continuously-rotating wheel O, loose thereon, the disk P, fast thereon, the normally-engaged pawl-and-ratchet connection between the wheel and disk, the projecting pin of the pawl, the stop-bar for limiting said pin and throwing the pawl out of engagement with the ratchet, and tripping mechanism for throwing the stop-bar out of the way at stated intervals to permit the re-engagement of the pawl with the ratchet, consisting of the drop-lever T, having the contact-arm *t'*, the rotating shaft S, having the wheel, with its pin, for operating the drop-lever, the ratchet on the shaft, the vibrating pawl-carrying bar R, the pawl of said bar engaging the ratchet, and the cam on the continuously-rotating wheel for operating the pawl-bar, substantially as described.

16. In a saw-filing machine, the combination of the reciprocating and swinging file, periodically-operating mechanism engaging the saw for turning it to present a fresh tooth to the file, and the means for lifting the file out from between the teeth during this movement, consisting of the periodically-rotating shaft N, the crank-wheel n' on its end, the vertical rod n^3, and the crank-arm J of the swinging file-frame, substantially as described.

17. In a saw-filing machine, the combination of the file, the reciprocating and rocking shaft d^3, to which the file is attached, the mechanism for feeding the saw to present a fresh tooth to the file and for raising the file out from between the teeth during the movement of the saw, consisting of the pawl M, engaging the teeth of the saw, the shaft N, and connections between said shaft for operating the pawl, connections between said shaft and the rock-shaft of the file-holder for raising the file, the continuously-rotating wheel O, loose on the shaft N, the disk P, fast thereon, a pawl-and-ratchet connection between said wheel and disk, the outwardly-projecting pin of the pawl, the stop-bar Q for breaking the connection between the pawl and ratchet, the drop-lever T, with its contact-arm *t'*, for relieving the pin of the stop-bar to re-establish the connection, the pin-wheel for operating the drop-bar T, the vibrating pawl-bar, and the pawl and ratchet for operating the pin-wheel, substantially as described.

18. In a saw-filing machine, the combination of a file and file-holder, means for reciprocating the same and raising the file out of engagement with the saw-teeth, a sliding carriage, a shaft journaled therein having a pulley at one end, and a cable connected with the pulley and carrying a weight at its outer end, whereby the saw is fed toward the file, substantially as herein described.

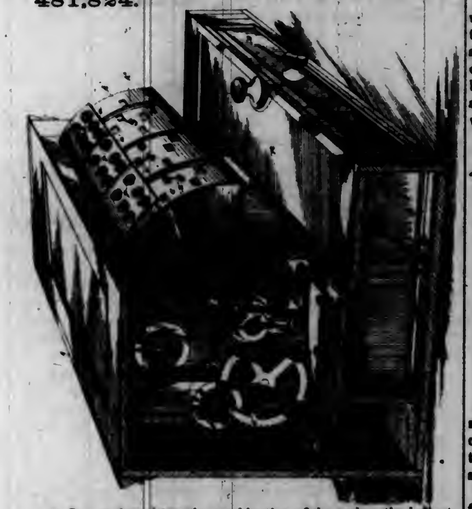
19. In a saw-filing machine, the combination of the reciprocating file, the shaft B, carrying the saw and having the pulley b^3, the weighted cable b^4 for keeping the saw tight against the file, the pawl M for turning the saw, the shaft N for operating the pawl, the disk P on the shaft, and the pawl p^2, engaging the disk, substantially as described.

20. In a saw-filing machine, the combination of the reciprocating file, the counter-shaft F, and power-transmitting connections between said shaft and file for reciprocating it, periodically-operating mechanism for turning the saw to present a fresh tooth, and a pawl-and-ratchet connection between said mechanism and the counter-shaft F, whereby said mechanism is operated at stated intervals, substantially as described.

21. In a saw-filing machine, the file D, with its reciprocating holder for sharpening the front of one tooth, the file d^{10} for sharpening the back of the succeeding tooth, and the arms d^7 and rods d^8, forming the holding-frame for said latter file, supported from the holding-frame of the former file, substantially as described.

22. In a saw-filing machine, the combination of the anvil-block, the vibrating hammer, and the means for operating said hammer, consisting of the oscillating shaft X, to which the hammer is secured, the crank-arm *x* of said shaft, the barred wheel operating on said crank-arm, and the spring connection for controlling the hammer, substantially as described.

481,824. CASH REGISTER AND INDICATOR. EDWARD F. ROBERTS, Rochester, N. Y., assignor, by direct and mesne assignments, to the Roberts Manufacturing Company, of Ohio. Filed July 16, 1889. Serial No. 317,679. (No model.)



Claim.—1. In a cash-register, the combination of the casing, the reciprocating indicating-strip, the telescoping lever, and the finger keys or plungers on the outer end of said lever, substantially as described.

2. In a cash-register, the combination of the actuating-lever, the curved shield having a slot through which said lever protrudes and perforations of graduated sizes, with suitable keys or plungers of corresponding sizes attached to the actuating-lever and adapted to engage with the said perforations, substantially as described.

3. In a cash-register, the combination of the actuating-lever, the curved shield having a slot through which said lever protrudes and perforations of graduated sizes arranged in rows parallel to the slot, a plate attached to said lever, and spring-controlled keys or plungers which on being pressed against the curved shield drop into certain of the perforations as the actuating-lever is vibrated, substantially as described.

4. In a cash-register, the combination of the indicating mechanism, the registering mechanism, the lever for operating the said mechanisms, the curved shield having a slot through which said lever protrudes, and perforations of graduated sizes, together with suitable keys or plungers of corresponding sizes attached to the lever and adapted to engage with the said perforations, substantially as described.

481,824.

5. In a cash-register, the combination of the casing, the indicating-strip moving before an opening in said casing, the telescoping lever for operating said strip, a shield having a slot through which said lever protrudes, and depressible keys or plungers connected with said lever, by which its vibrations in said slot are limited at the will of the operator, substantially as described.

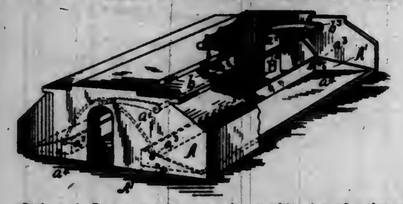
6. The combination, in a cash-register, of mechanism for registering the amount of each sale with a phonograph and mechanism whereby said phonograph is operated upon the shifting of the registering mechanism and announces the operation of the register, substantially as described.

7. The combination, in a cash-register and annunciator, of mechanism for indicating the amount of each sale and for registering the amount thereof with a phonograph and means whereby the phonograph is actuated when the indicating or recording mechanism is shifted and announces the operation of the register, substantially as described.

8. In a cash-register, the combination of the indicating devices and the lever for shifting the same with a phonograph adapted to announce each operation of the indicating device and mechanism for controlling the same, released upon the shifting of said lever, substantially as described.

9. In a cash-register, the combination of the indicating mechanism and registering mechanism and the levers for controlling the same with a prepared phonograph-record and a reproducer and the devices for controlling the same, released upon the shifting of either of said levers, and means for returning the same to normal position, substantially as described.

10. In a cash-register and annunciator, the combination of the indicating devices, the levers for shifting the same, and the sliding piece or drawer and the latch therefor operated by said levers, with a phonograph, its record-cylinder, and the actuating mechanism thereof released by the movement of said sliding piece when the latter is released, substantially as described, and means for returning the cylinder to normal position upon the return of said sliding piece to normal position, substantially as set forth.



11. The combination of the sliding drawer-top, its latch, and the lever for releasing the same with the phonograph, the mechanism for revolving the phonograph-record cylinder, and means, substantially as described, whereby the phonograph-cylinder revolves and its record is announced upon the movement of the top in one direction and the cylinder thrown back to normal position by the opposite movement of the top, substantially as described.

481,825. NECK-YOKE. LEWIS W. ROTHROCK, Morrisdale Mines, Pa. Filed Mar. 23, 1892. Serial No. 426,055. (No model.)

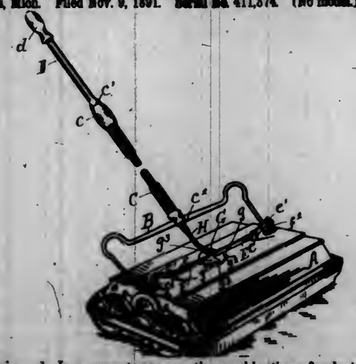
Claim.—As an improved article of manufacture, a harness attachment consisting of the continuous ring A, provided with the tangential parallel arms *a a*, projecting in the same direction from opposite sides of the ring, and the roller B, removably mounted between the extreme outer ends of the said arms, whereby the portion of the ring between the arms serves to strengthen the device and to prevent a strap passed between the roller and said partition from contacting with the neck-yoke or other connected part, as set forth.

481,826. CARPET-SWEEPER. GEORGE S. SANFORD, Mount Clemens, Mich. Filed Nov. 9, 1891. Serial No. 411,373. (No model.)

Claim.—1. In a carpet-sweeper, the combination of a dust-pan, means for opening and closing said pan, a flexible cable permanently connected therewith and running lengthwise of the handle, and an attachment whereby said cable may be operated to open the pan, substantially as described.

2. In a carpet-sweeper, the combination of a dust-pan, a lever for opening said dust-pan, a flexible cable permanently connected with said lever and running lengthwise of the handle, and means for operating said cable to open said pan, substantially as described.

3. In a carpet-sweeper, the combination of a dust-pan, means for opening said pan, a flexible cable permanently connected with said means for opening the pan and running lengthwise of the handle, and means whereby said cable may be operated to open said pan and to be locked at the extremity of its movement, substantially as described.



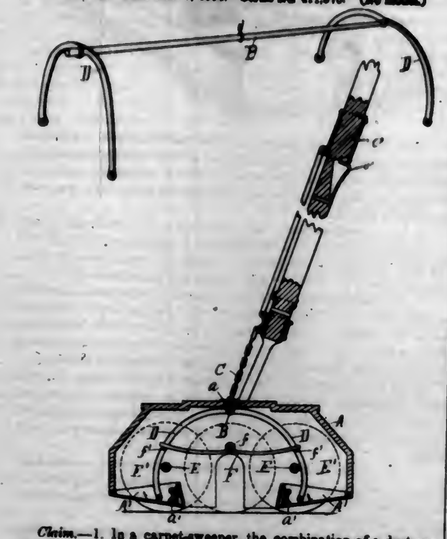
4. In a carpet-sweeper, the combination of a dust-pan, a flexible cable permanently connected with means for opening said pan and running lengthwise of the handle, means for operating said cable, and a spring-actuating mechanism for closing said pan, substantially as described.

5. In a carpet-sweeper, the combination of a dust-pan and a flexible cable permanently attached thereto and running lengthwise of and attached to the handle, adapted to open said dust-pan, substantially as described.

6. In a carpet-sweeper, the combination of a dust-pan and springs for closing the same, a lever for opening said dust-pan, a flexible cable permanently connected to said lever and extending lengthwise of the handle, and a hand-piece to operate said cable to open said pan, substantially as described.

7. In a carpet-sweeper, the combination of a dust-pan, means for opening and closing the same, and a flexible cable permanently connected therewith and extending outside of the case of the carpet-sweeper, whereby the same may be opened and closed, substantially as described.

481,827. CARPET-SWEEPER. GEORGE S. SANFORD, Mount Clemens, Mich. Filed Nov. 9, 1891. Serial No. 411,374. (No model.)



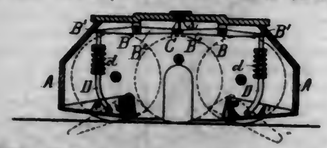
Claim.—1. In a carpet-sweeper, the combination of a dust-pan, means for dumping said dust-pan, and a rotatable handle adapted to operate the said means for dumping the pan, substantially as described.

2. In a carpet-sweeper, the combination of a dust-pan, a lever adapted to open said dust-pan, a disk G, provided with cam f', adapted to operate said lever, and a rotatable handle adapted to rotate said disk, substantially as described.

3. In a carpet-sweeper, the combination of a dust-pan, a lever adapted to open said dust-pan, a rotatable disk provided with a cam adapted to operate said lever, and a rotatable handle connected with said disk by a joint, substantially as described.

4. In a carpet-sweeper, the combination of a dust-pan, means for dumping said dust-pan, a bail provided with a sleeve, and a handle extending through said sleeve and adapted to operate the means for dumping said dust-pan, substantially as described.

481,828. CARPET-SWEEPER. GEORGE S. SANFORD, Mount Clemens, Mich. Filed Nov. 9, 1891. Serial No. 411,376. (No model.)



Claim.—1. In a carpet-sweeper, the combination of a dust-pan, a longitudinal bar, links connecting said bar with said dust-pan, and a cable attached to the said bar and extending out through the case and extending lengthwise of the handle, substantially as described.

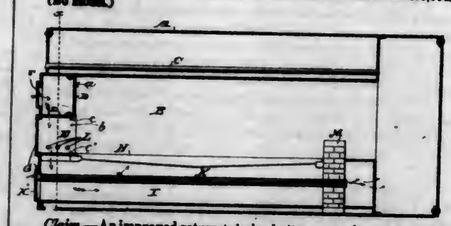
2. In a carpet-sweeper, the combination of a dust-pan, a longitudinal bar, links connecting said bar with said dust-pan, a cable connected to the said bar and extending out through an opening and lengthwise of the handle, and means mounted on said handle and connected with said cable for operating the same, substantially as described.

3. In a carpet-sweeper, the combination of a dust-pan, a longitudinal bar, links connecting said bar with said dust-pan, a spring engaged with said links and adapted to force said dust-pan open, and a cable connected with the said bar and extending lengthwise of the handle, substantially as described.

481,829. CARPET-SWEEPER. GEORGE S. SANFORD, Mount Clemens, Mich. Filed Nov. 9, 1891. Serial No. 411,376. (No model.)

Claim.—In a carpet-sweeper, mechanism for dumping the dust-pan, consisting of a vertical rod pivoted at its lower end to said dust-pan, a spring adapted to close said dust-pan, a rock-arm adapted to force said rod downward and open the dust-pan against the resistance of the spring, and means connected with said rock-arm and extending up the handle and movable longitudinally therewith for operating the same, substantially as described.

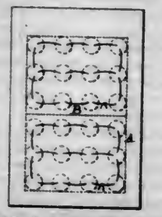
481,830. GAME APPARATUS. ANTON SIEGEL, Brooklyn, N. Y. Filed May 6, 1892. Serial No. 431,966. (No model.)



Claim.—1. A game apparatus provided with a handled plate having a central aperture forming a seat for a spinning-top, substantially as shown and described.

2. A game apparatus comprising a handled plate having a central aperture forming a seat for the spinning-top and an indicating device, substantially as described, for indicating the position of rest of the top in the said seat, substantially as set forth.

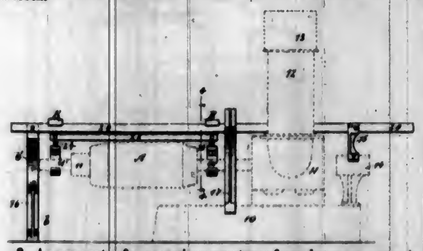
3. A game apparatus provided with a plate having a central aperture forming a seat for a spinning-top, a handle extending from the said plate, and a pointer held on the said handle and adapted to indicate on characters formed on the body of the spinning-top, substantially as shown and described.



4. In a game apparatus, the combination, with a spinning-top provided with characters on its body, of a handled plate having a central aperture forming a seat for the said top and a pointer held on the said plate and adapted to indicate on the characters on the top, substantially as shown and described.

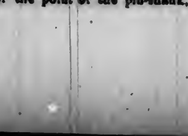
481,831. AIR-SUPPLY FOR BOILER-FURNACES. IRA V. SCHOFIELD, Jr., San Francisco, Cal. Filed July 24, 1891. Serial No. 400,991. (No model.)

Claim.—An improved return tubular boiler consisting of the combination of a main circular flue B, a casing D, consisting of a vertical plate or diaphragm a, surrounding the upper portion and sides of the front portion of the flue, and the plates or diaphragms b, c, and d', forming the walls of the opening through which the fuel is introduced, said plate d' having openings J, and the plates or diaphragms b and lower side portion of the plate or diaphragm a, having opening L for delivering heated air to the furnace, and the doors F and G, substantially as herein described.



481,832. SALE-CARD FOR BUTTONS. CHARLES F. G. R. SEWERIN, London, England. Filed Jan. 8, 1892. Serial No. 417,369. (No model.) Patented in England Nov. 11, 1891, No. 19,510; in France Nov. 26, 1891, No. 217,080; in Switzerland Jan. 22, 1892, No. 4,419, and in Italy Feb. 6, 1892. LXI. 127.

Claim.—A sale-card for buttons, having lines of perforations terminating remote from the edges of the card to provide a surrounding imperforate or solid rim, said perforations bounding groups of the buttons, and the buttons of each group being stitched to the card independently of the buttons in other groups, substantially as and for the purposes described.



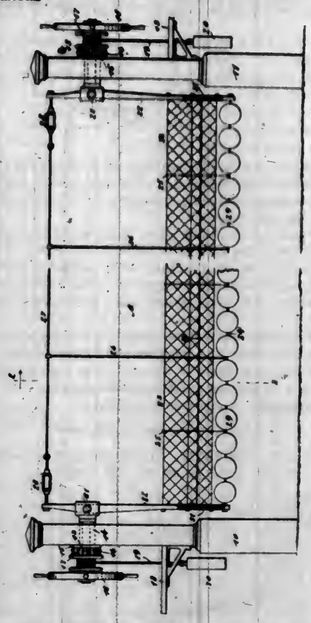
481,833. DEVICE FOR REMOVING ARMATURES. STEPHEN H. SHARPTHRE, Honesdale, Pa. Filed May 6, 1891. Serial No. 391,704. (No model.)

Claim.—1. An apparatus for removing armatures from dynamos, comprising a track extending through the dynamo between its field-magnets above and parallel with its armature, supports for said track at opposite sides of the dynamo, and two connected hangers mounted on said track to travel between the magnets and having depending vertically-adjustable hooks 22, projecting laterally in the same direction to hook under the ends of the armature-shaft, whereby said armature may be lifted and conveyed from the dynamo, substantially as set forth.

2. An apparatus for removing armatures from dynamos, comprising a short bracket 15 to rest on top of the rear armature-bearing box, a ⊓-shaped bracket 17 at the opposite side of the dynamo and provided with a recess 18 and a lug 19 at one side of the recess, an outermost bracket 16, formed with a lower shank-section b and an upper semicircular section b', a track-rail secured at its ends to the upper ends of brackets 16 16 and between its ends to the inner face of lug 19 and projecting at its upper edge above said lug, and a hanger traveling on the track between the field-magnets and having hooks to pass under the ends of the armature-shaft, whereby said armature may be readily removed from the dynamo, substantially as set forth.

481,834. SAFETY-PIN. ARTHUR T. SNELL, Ventura, Cal., assignor to Snell & Weldon, same place. Filed Apr. 12, 1890. Serial No. 347,625. (No model.)

Claim.—1. A safety-pin having its frame and pin-shank composed of a single piece of wire, the frame being composed of two parallel strands of wire constituting the sides of the frame and united at one end by a bend b and the pin-shank having position centrally between said sides, in combination with a shield for said pin made from a sheet-metal blank, the side edges of said shield being united to said frame by being bent around the same, and said shield having a portion k, which is bent around the bend b of the frame and constitutes the catch for the pin-point, substantially as set forth.



2. A safety-pin having its frame and pin-shank composed of a single piece of wire, the frame being composed of two parallel strands of wire constituting the sides of the frame and the pin-shank having position between said sides, in combination with a shield attached to said frame and comprising two side flanges e e and a catch composed of two oppositely-inclined guide-plates i i, said catch being located between said side flanges, whereby the pin-point must pass between one of said flanges e and one of said guide plates i, substantially as set forth.

3. A safety-pin having a shield comprising two side flanges e e, a base-plate f, connecting said side flanges, a tongue g, projecting centrally from said base-plate on the same side thereof that said side flanges project, and a catch composed of two oppositely-inclined guide-plates i i, said catch being located between said side flanges and straddling said tongue, so that each of said guide-plates i is located between said tongue and one of said flanges e, substantially as set forth.

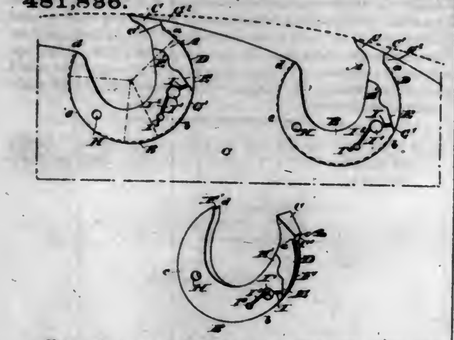
4. A safety-pin having its frame and pin-shank composed of a single piece of wire, the frame being composed of two parallel strands of the wire constituting the sides of the frame, and the pin-shank A having position centrally between said sides, in combination with a shield for the point of said pin-shank, said shield being supported by said frame and said shield comprising side flanges e e, which extend outwardly from the plane of said sides B and C, and a catch k for the point of said pin-shank, which is located between said flanges, substantially as set forth.

5. A safety-pin having its frame and pin-shank composed of a single piece of wire, the frame being composed of two parallel strands B C of the wire constituting the sides of the frame, and the pin-shank A having position centrally between said sides, in combination with a sheet-metal shield for the point of the pin-shank, comprising side flanges e e, which are attached to the sides B C, respectively, of the pin-frame, a base-plate f, which extends between the sides B C and substantially in the same plane therewith, a central fixed tongue g, extending at right angles from the center of the base of the plate f, and the catch composed of two oppositely-inclined guide-plates i i, which are located between the flanges e e and straddle the tongue g, substantially as set forth.

481,835. DEVICE FOR STARTING RACE-HORSES. JAMES J. SULLIVAN, New York, N. Y. Filed Dec. 18, 1891. Serial No. 415,512. (No model.)

Claim.—1. In a device for starting race-horses, a screen consisting of side pieces, network secured to the lower ends of the side pieces, cushions below the network, and a wire connecting the upper ends of the side pieces, substantially as described.

2. In a device for starting race-horses, the combination, with supports and shafts journaled therein, of a screen connected with the shafts and located between the supports, the said screen comprising a frame carrying cushioned panels, and a mechanism, substantially as described, for rotating the shafts, as and for the purpose set forth.



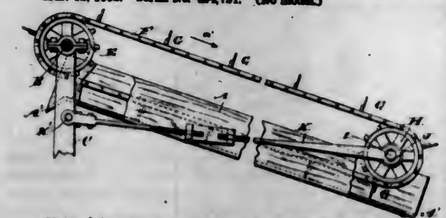
3. In a device for starting race-horses, a screen consisting of side pieces, network secured between the lower ends of the side pieces, a wire or rod connecting the upper ends of the said side pieces, a rod or wire secured to the lower ends of the side pieces below the network, cushions on the said rod or wire, and wires secured to the rod or wire carrying the cushions and to the network and the wire or rod between the upper end of the side pieces, substantially as described.

4. In a device for starting race-horses, the combination, with supports and shafts journaled in said supports and provided with hand-wheels, the shafts being provided at their inner ends with sockets, of a screen the side bars of which are pivoted in the sockets of the shafts, and a take-up device connecting the side bars of the screen, the lower portion of the screen consisting of cushioned panels, substantially as and for the purpose set forth.

5. In a device for starting race-horses, the combination, with supports, shafts journaled in said supports, provided at their inner ends with sockets and at their outer ends with rotating devices, drums secured upon the shafts, cables carried by the drums, and weights attached to the cables, of a screen the side bars of which are pivoted in the sockets of the shafts, the lower portion of the screen consisting of a network and the upper end being provided with a tension device or take-up whereby the screen may be tightened or stretched, all combined to operate substantially as and for the purpose specified.

481,836. SAW-TOOTH. JOHN W. TODD, Portland, Oreg. Filed Apr. 2, 1892. Serial No. 427,447. (No model.)

481,886.

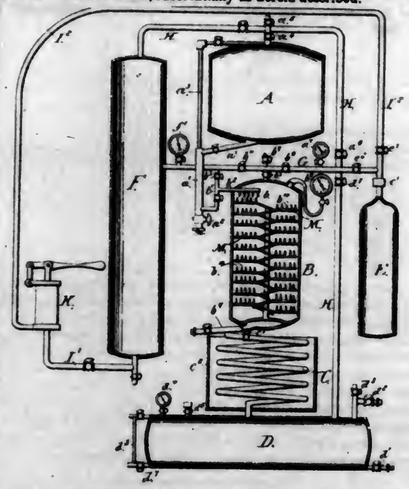


Claim.—1. A saw-tooth provided with a shank and a point seated in the saw-blade and having their outer edges formed partly on a segment of a different circle than the seat in the saw-blade, substantially as shown and described.

2. A saw-tooth provided with a shank and a point seated in the saw-blade and having their outer edges formed partly on a segment of a different circle than the seat in the saw-blade, the end of the shank adjacent to the point being provided with a spring part pressing on the point to hold the latter on its seat, substantially as shown and described.

3. An insertible saw-tooth comprising a shank and a separable point fitted one on the other, the joint being partly straight and partly S-shaped, the outer edges of the said shank and point being partly formed on a segment of a different circle than the seat in the saw-blade, substantially as shown and described

481,887. CONVEYER. PINKNEY C. WILSON, Patterson, La. Filed Mar. 12, 1892. Serial No. 424,721. (No model.)

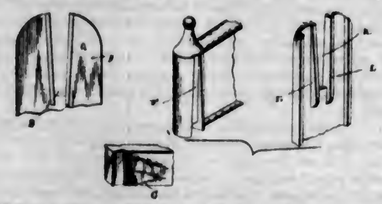


Claim.—A conveyer comprising a box or chute, uprights adjacent to one end thereof, one elevator-shaft being journaled in bearings on said uprights, longitudinally-adjustable arms pivoted to the said supports below the said shaft, extending toward the opposite end of the chute, and having the other elevator-shaft journaled in their free vertically-swinging ends, and the endless elevator mounted on the said shafts, whereby the outer end of the elevator may be set at any desired distance from the bottom of the chute and yet freely swing upward to prevent choking, substantially as described.

481,888. IMPREGNATING LIQUIDS WITH GASES. ULRICH RAGHEANS, Mission San José, Cal. Filed June 10, 1891. Serial No. 396,532. (No model.)

Claim.—1. An apparatus for charging liquid with gas, comprising liquid-supply and receiving vessels on different levels connected with each other and a gas-reservoir connecting with both vessels, whereby the flow of liquid into the receiving-vessel displaces the gas therein and balances the pressure in the supply-vessel to automatically check and regulate the flow of liquid between said vessels, substantially as herein described.

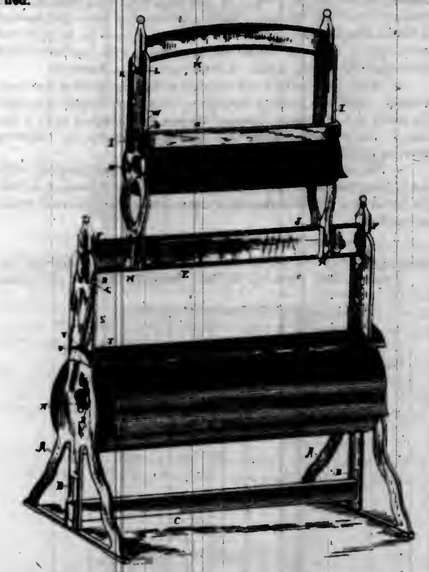
2. In an apparatus for charging liquids with gas, a receiving-vessel to which the gas to be absorbed is supplied, a spirally-wound conveyer-plate in said vessel having upon its surface a series of parallel channels, and a liquid-supply pipe entering the top of said vessel and having a series of nozzles adapted to discharge the liquid into the upper ends of the channels of the conveyer-plate, substantially as herein described.



3. In an apparatus for charging liquids with gas, a receiving-vessel to which the gas to be absorbed is supplied, said vessel having within it a spirally-wound conveyer-plate with a series of channels upon its surface, a liquid-supply pipe entering the top of the vessel and having a series of nozzles communicating with the upper ends of the channels, a liquid-reservoir vessel having an outlet-pipe, and a branch pipe connecting said outlet-pipe with the supply-pipe and forming a trap whereby the gas from the receiving-vessel is prevented from escaping into the reservoir-vessel, substantially as herein described.

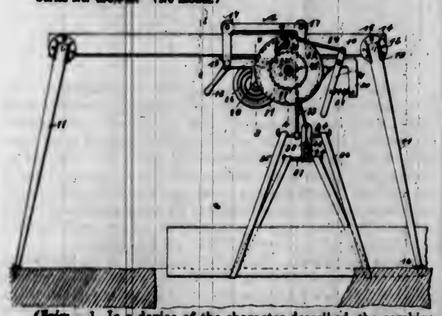
4. In an apparatus for charging liquids with gas, the reservoir-vessel containing the liquid, the receiving-vessel B, having the spirally-wound conveyer-plate with grooves or channels, the supply-pipe with nozzles by which the liquid from vessel A is supplied to the channels of the conveyer-plate, the coil-pipe C, communicating with the lower end of the receiving-vessel B, the liquid-storage vessel D, communicating with the lower end of the coil-pipe, and a gas-flask for supplying the gas to said vessels, substantially as herein described.

5. An apparatus for charging liquids with gas, consisting of the liquid-reservoir vessel A, the receiving-vessel B, having the spirally-wound conveyer-plate, the connection between the vessels A and B, by which the liquid is supplied to the vessel B, a coil-pipe C, communicating with the lower end of vessel B, the ice-box about said coil-pipe, the liquid-storage vessel D, communicating with the lower end of the coil-pipe, the gas-flask E, communicating with vessels A and B, the gas-storage vessel F, and suitable cocks controlling the connections, substantially as herein described.



481,839. KNOCKDOWN PAPER-ROLL HOLDER AND CUTTER. ARAD B. BEACH and ALVIN BOOTH, Groton, N. Y. Filed Apr. 5, 1892. Serial No. 427,904. (Model.)

Claim.—1. A knockdown paper-roll holder and cutter comprising side standards, a connecting-bar for their lower ends, a connecting-bar at their upper ends, upper side standards having vertical slots in their lower ends which fit over the said upper cross-bar, a bar connecting the upper ends of the said upper side standards, a paper-roll supported in both the upper and lower standards, and a cutter-bar for each, substantially as described.



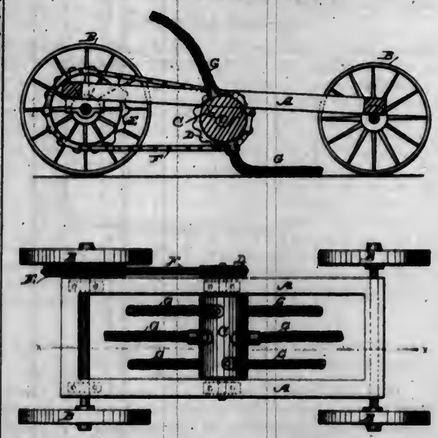
2. A knockdown paper-roll holder and cutter comprising side standards having wedge-shaped slots in their upper and lower ends, a cross-bar for the lower ends having wedge-shaped ends to enter the lower slots, and an upper cross-bar having side grooves which receive the walls of the upper slots, substantially as shown.

3. A knockdown paper-roll holder and cutter comprising side standards, a cross-bar connecting the lower ends thereof, vertical slots in the upper ends of the said side bars, and wedge-shaped beads at the edges of the said vertical slots, a cross-bar for the upper ends of the side bars, having vertical grooves which receive the walls of the said vertical slots and also the wedge-shaped beads, substantially as specified.

4. A paper-roll cutter consisting of a bar being concaved at its under side, slots in each end thereof, the outer wall of the said slots being thickened and provided with vertical slots at their inner sides, combined with vertical standards having beads or ribs at their outer sides which enter the said vertical grooves, substantially as described.

481,840. BURIAL APPARATUS. JOHN B. BRUGLER, Dayton, Tenn., assignor of one-half to Crawford Wilbur, same place. Filed June 4, 1892. Serial No. 435,540. (No model.)

Claim.—1. In a device of the character described, the combination, with a beam and legs supporting the beam, of a carriage held to travel upon the beam, a spring-controlled wheel journaled in the carriage, a shaft, also journaled in the carriage, carrying a guide-wheel fixed thereto, also a ratchet-wheel rigidly secured to the shaft, and a brake-wheel loosely mounted upon the shaft and provided with a pawl adapted for engagement with the ratchet, a lever controlling the brake-wheel, a band attached to the spring-controlled wheel and passing over the brake-wheel, a sling consisting of straps and united at its ends by bars, and a clamping device carried by the straps and adapted for engagement with one of the bars of the sling, the strap being secured to the other bar, as and for the purpose set forth.



2. In a device of the character described, the combination, with a beam, legs supporting the same, and a carriage adjustable upon the beam, of a spring-controlled wheel journaled in the carriage, a shaft also journaled in the carriage, a sprocket-wheel secured to the shaft, a ratchet-wheel fast to the shaft, a brake-wheel loosely mounted upon the shaft and provided with a pawl engaging with the ratchet, a brake-strap engaging with the brake-wheel, a lever attached to the strap, a sling consisting of straps and united at its ends by bars, a chain attached to the spring-controlled wheel, passed over the sprocket-wheel and attached to one of the bars of the sling, and a clamping device provided with a releasing-slide, the slide and clamping device being adapted for engagement with the other bar of the sling, substantially as shown and described.

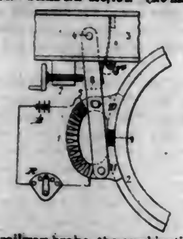
3. In a device for lowering coffins, the combination, with the lowering chains or ropes, of a sling consisting of straps and bars uniting the ends of the straps, one of the bars of the sling being attached to the rope or chain, a clamping-plate attached to the rope or chain and engaging with the other bar of the sling, and a spring-controlled releasing-slide carried by the plate engaging with the bar of the sling with which the clamping device engages, as and for the purpose specified.

4. In a device of the character described, the combination, with a supporting-beam, legs adjustably attached to the beam, and a carriage held to travel upon the beam, of a lowering mechanism carried by the carriage, a sling consisting of straps united at their ends by bars, one of which bars is connected with the lowering mechanism, a clamping-plate connected with the lowering mechanism and provided with claws or hooks to engage with the bars of the sling, and a releasing-slide, spring-controlled, carried by the plate and also adapted for engagement with the bar of the sling, as and for the purpose set forth.

5. In a device of the character described, the combination, with a supporting-beam, legs adjustably secured to the beam, a carriage held to travel upon the beam and provided with a brake-lever, a hoisting mechanism connected with the carriage, and a brake mechanism coacting with the hoisting mechanism, of a sling provided at its ends with bars, one of which is connected with the hoisting mechanism, a clamping-plate secured to the hoisting mechanism and adapted for engagement with the other bar of the sling, and a spring-controlled releasing-slide carried by the plate and adapted for engagement with the bar with which the plate engages, substantially as shown and described.

481,841. BEAN-THRASHER. PIERRE BOURSIN, Oakland, Cal. Filed Apr. 1, 1892. Serial No. 427,296. (No model.)

Claim.—1. A bean-thrashing apparatus consisting of the carriage mounted upon bearing-wheels, a rotary transverse drum journaled upon the carriage, and flexible thrashing-arms projecting radially from the surface of the drum, said arms yielding throughout their length when brought into contact with the material to be thrashed and automatically resuming their normal condition when removed from said contact, substantially as herein described.

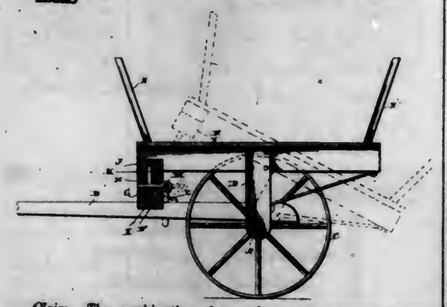


2. A bean-thrashing apparatus consisting of a framework mounted upon bearing-wheels, a drum journaled transversely across the framework, a sprocket-wheel upon the outer end of the drum-shaft, a corresponding sprocket-wheel upon one of the bearing-wheels, and an intermediate driving-chain, thrashing-arms composed of flexible material, adapted to yield to permit them to pass beneath the drum and to automatically straighten out again after being removed from contact with the thrashing-surface, said arms being arranged spirally around the drum in two rows projecting from opposite sides of the drum, substantially as herein described.

3. A bean-thrashing apparatus consisting of the framework mounted upon bearing-wheels, a drum journaled transversely across the framework, driven by power derived from the wheels, two oppositely-projecting series of arms fixed to the surface of the drum, con-

sisting of closely-coiled wire tubes, each row being arranged spirally around the drum, substantially as herein described.

4. A threshing drum or roller having arms composed of closely-coiled wire tubes adapted to yield upon contact with the threshing-surface, in combination with means for operating the drum or roller.



481,842. MAGNETIC BRAKE. ARMAND DE BOVET, Paris, France. Filed Oct. 24, 1891. Serial No. 409,751. (No model.)

Claim.—1. In a railway-brake, the combination, with a core having separate curved plates constituting pole-pieces, of a hanging support for the parts, a spring throwing the curved plates or pole-pieces off the wheel, an adjustable stop to hold said pole-pieces close to the tread of the wheel, a conducting-coil wound upon the core, and a circuit for said coil, substantially as described.

2. In a railway-brake, the combination, with a core having curved pole-pieces forming part of the extremities of said core, of a coil surrounding said core, a circuit for the coil, a link pivoted at one end upon a fixed support and at the other end pivotally connected to the core, an adjustable stop behind the link to hold the pole-pieces close to the tread of the wheel, and an adjustable cam-stop in front of said link to arrest the brake when the pole-pieces are magnetized and hold the latter out of contact with but close to the tread of the wheel, substantially as described.

481,843. DUMPING-CART. WILLIAM H. BOWLER and HARRY S. BOWLER, O'Fallon, Ill. Filed Apr. 26, 1892. Serial No. 430,697. (No model.)

Claim.—The combination of an axle, wheels mounted thereon, shafts projecting forward from the axle, vertical standards pivotally supported at their lower ends on the axle and which are of a length greater than the radius of the wheels, a platform supported by the standards which projects over the wheels, and a means for securing together the platform and the shafts, substantially as shown and described.

481,844. ANIMAL-SHEARS. CHARLES BURGON and HARRY BURGON, Malin Bridge, England. Filed May 5, 1892. Serial No. 431,984. (No model.)

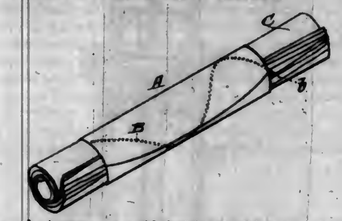
Claim.—1. In the herein-described shearing or clipping machine, the combination, with the vibrating lever, of a central spring bearing on the top cutter-plate and carried by a shank rigidly fixed on the end of the said lever, and a forked cross-head having two prongs adapted to bear on and engage with the ends of the top cutter-plate, and a central socket pivoting freely on the end of the vibrating lever, as described.

2. The combination, with the vibrating-lever spring-shank fitted therein, and a forked cross-head and socket pivoting thereon, of a cross-pin traversing the spring-shank and vibrating lever and received in circumferential slots in the cross-head socket so as to maintain the connection of both the spring and cross-head with the lever while permitting the pivotal motion of the cross-head, as described.

3. In the herein-described shearing or clipping machine, the combination, with the rocking base-plate, of a stud forged integrally therewith and of a sleeve screwed thereon and adapted to fit in the boss of, and to form the upward bearing-surface for, the vibrating lever, as specified.

4. The combination, with the screw-stud forged integrally with the rocking base-plate and with the sleeve screwing thereon, of a drift-pin forced into a hole in the end of the stud so as to expand the same, as specified.

481,845. LAUNDRY DRYING-ROOM. JOHN R. CRAPPELL, San Francisco, Cal. Filed July 13, 1891. Serial No. 399,377. (No model.)

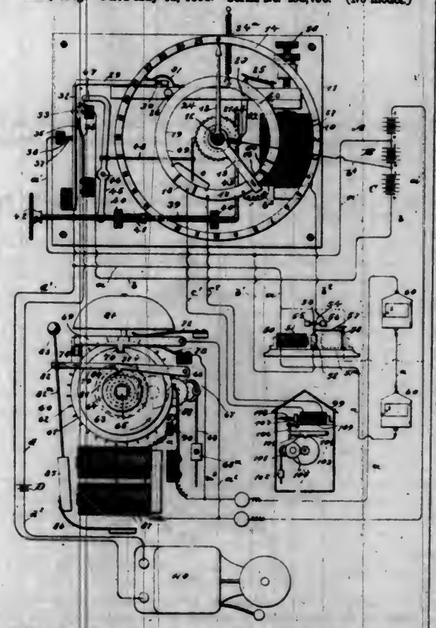


Claim.—1. In a drying-room, the sections consisting of the vertical metallic end plates having the non-conducting material between them and the angle-iron flanged pieces bolted thereto, rods connecting these end plates in pairs, suspending-rollers attached to the upper ends of the plates, and guide-rods upon which the rollers travel, whereby the sections may be drawn out, so that the inner end plate is advanced and closes the opening formed by the withdrawal of the outer end plate when the clothes are outside of the drying-room and the outer end plate closes and forms a portion of the outer end wall when the sections are pushed in, substantially as herein described.

2. In a drying-room, the sections composed of the vertical end pieces, with the non-conducting material between, the angle-iron plates bolted thereto, forming flanges thereon, drying-poles connecting said end pieces, suspending-rods extending above each of these sections in the upper part of the chamber, pulleys with angular suspending-yokes connecting them with the end plates of the sections, so that the pulleys travel upon the suspending-rails, and vertical angle-iron posts against which the flanges of the sections close, whereby the outer end plates of the sections form the outer wall of the room when they are closed in place, substantially as herein described.

3. In a laundry-room having permanent side and end walls, the combination of sections composed of vertical interspaced iron end pieces A and A', having the non-conducting material between them, the angle-iron plates B, bolted to said end plates, the plates C on said sections, having flanges against which the end plates abut, drying-rods extending from one end plate to the other, whereby when the front end plate is drawn out the rear end plate is advanced and closes the opening formed by the withdrawal of the front end plate, track-rods and travelers for suspending the sections, a non-conducting ceiling over the sections, means for supporting the same from the floor-girders above, so as to form an air-space, and means for supporting the track-rods, substantially as herein described.

481,846. WRAPPER. JOHN J. CONRAN, St. Louis, Mo., assignor of two-thirds to Alfred T. Serrano and Hiram A. Bridges, same place. Filed Dec. 14, 1891. Serial No. 415,074. (No model.)



Claim.—1. A wrapper provided with a flexible tearing device secured diagonally thereto, whereby the tearing device will encompass the article in a spiral manner, substantially as set forth.

2. A wrapper provided with a cord secured diagonally to one side thereof, said cord being upon the inside of the wrapper and encompassing the article in a spiral manner when in place upon an article, substantially as set forth.

3. A wrapper provided with an adhesive substance across one end and provided with a cord secured diagonally across the inner surface of the wrapper, one end of the cord projecting beyond the edge of the wrapper adjacent to the adhesive substance, substantially as set forth.

481,847. FIRE-ALARM TELEGRAPH. ANDREW J. COFFER, Portland, Oreg. Filed May 12, 1892. Serial No. 432,730. (No model.)

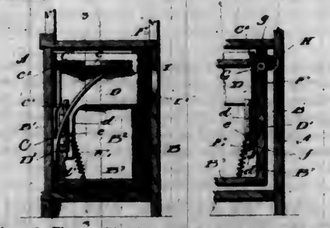
Claim.—1. In a fire-alarm telegraph, a controller having operative electrical connections with a signal-box, auxiliary boxes arranged in series and connected electrically with the controller, and an automatic and permanent lock for the auxiliary-box mechanism, substantially as described.

2. A fire-alarm telegraph comprising a controller having operative electrical connections with a signal-box, auxiliary boxes arranged in series and electrically connected with the controller, manually-operated means for setting the controller mechanism, and automatic locks to permanently lock said mechanism, substantially as described.

3. In a fire-alarm telegraph, a controller comprising a circular switchboard having insulated segments operatively connected with a signal-box, a switch-arm held to move over the switchboard, a magnet and a vibrating armature held adjacent to the switchboard, a ratchet connection between the armature and the switch-arm, and manually-operated means for throwing the ratchet out of gear, substantially as described.

4. In a fire-alarm telegraph, a controller comprising a circular switchboard having insulated segments operatively connected with a signal-box, a central shaft arranged within the switchboard, a numbered dial arranged concentric with the switchboard, an indicating-pointer carried by the shaft and adapted to move over the dial, a switch-arm secured to the shaft and held to move over the switchboard, a magnet and vibrating armature-lever arranged adjacent to the switchboard, a ratchet connection between the armature-lever and the shaft, and means for throwing the ratchet mechanism out of gear, substantially as described.

5. In a fire-alarm telegraph, a controller comprising a circular switchboard having operative electrical connections with a signal-box, a switch-arm held to move over the switchboard, a magnet and a vibrating armature-lever arranged adjacent to the switchboard, a ratchet connection between the armature-lever and the switch-arm, and a circuit-closer tripped by the first movement of the armature-lever and adapted to turn in an additional electric current, substantially as described.



6. In a fire-alarm telegraph, the combination, with the controller-switchboard having its segments operatively connected with the signal-box, of an electro-magnet adapted to connect with an auxiliary signal-box, a vibrating armature-lever held adjacent to the magnet, a ratchet connection between the lever and the switch-arm, a spring contact-lever adapted to close a circuit through a watch-bell and to turn an additional current through the controller, and means for tripping the contact-lever by the movement of the armature-lever, substantially as described.

7. In a fire-alarm telegraph, the auxiliary box comprising a clock-work-operated circuit-breaking wheel, a manually-tripped lever held to normally lock the wheel, a non-interfering lever having a lug thereon to engage a recess in a wheel of the clock work mechanism, a normally-short-circuited magnet and armature adapted to hold the non-interfering lever out of engagement with the clock work mechanism, and means for switching the current through the magnet by the lifting of the tripping-lever, substantially as described.

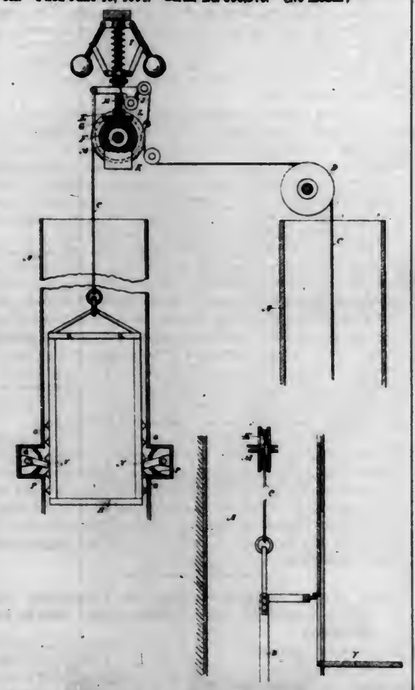
8. In a fire-alarm telegraph, an auxiliary box comprising a circuit-breaking wheel adapted to make and break connections with a controller, a manually-operated tripping-lever held to normally lock the circuit-breaking wheel, a recessed wheel connected with the circuit-breaking wheel, a non-interfering lever having a lug adapted to drop into the recess of the wheel, a normally-short-circuited magnet arranged within the box, an armature arranged opposite the magnet and having a bell-hammer connected therewith, a bell arranged in the path of the hammer, a stop secured to the hammer-rod and adapted to support the non-interfering lever, and means for putting in the magnet by the lifting of the tripping-lever, substantially as described.

9. In a fire-alarm telegraph, the combination, with the segmental switchboard of the controller and the signal-box operated by clock-work mechanism, of a swinging lever held to normally lock the signal-box mechanism, a magnet and armature arranged above the lever, a hook operated by the armature and adapted to raise the lever, and an electrically-operated switch-arm adapted to move over the switch-board and close the circuit through the signal-box magnet, substantially as described.

481,848. COMBINED BUREAU AND WASH-STAND. HUBERT COUILLARD, Jacksonville, Fla. Filed May 2, 1892. Serial No. 431,396. (No model.)

Claim.—1. The combination, with the main part of the case, of a swinging part adapted to support a wash-bowl and a splash-board slidingly arranged on said swinging part to be automatically operated by the movement of the said swinging part, as set forth.

2. The combination, with the main case and a swinging part arranged to support a wash-bowl, of a splash-board slidingly supported on said swinging part, guides for the said splash-board, and a spring and connections acting in opposition to the spring, whereby the splash-board is opened and closed by the opening and closing of the swinging part, as set forth.



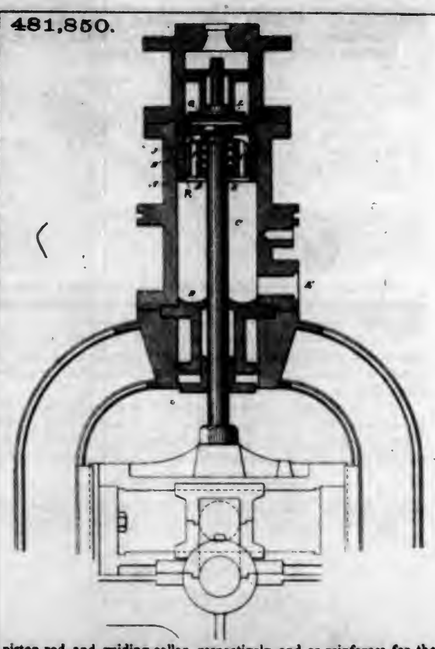
3. The combination, with the case and the swinging part, of a splash-board mounted to slide vertically in guides on the swinging

part, a spring for normally holding the said board closed, and a cord and connections with the said board and case for opening the splash-board as the swinging part is turned outward, as set forth.

4. The combination, with the swinging part, of the brackets thereon with offsets, the sliding splash-board having a depending portion, a guide for said depending portion, a spring connected with the splash-board to keep it closed, and a cord and connections for opening the splash-board or moving it vertically by the swinging of said swinging part, as set forth.

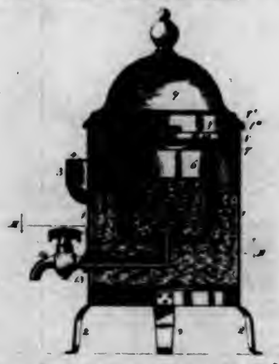
5. The combination, with the case and the swinging part, of the brackets on the swinging part, provided with offsets, the splash-board mounted to slide between the offset portions of the brackets and the adjacent portion of the swinging part and provided with a depending portion having a right-angled part, a guide for said right-angled part, a spring connected with the depending portion and with the bottom of the swinging part, and a cord connected with the splash-board and with some fixed part and run over pulleys, as shown and described.

481,849. FIRE-ESCAPE. ARTHUR R. CRUICKSHANK, San Francisco, Cal. Filed June 15, 1891. Serial No. 396,370. (No model.)



Claim.—A fire-escape consisting of the parallel vertical shafts, cages moving therein and connected with the single rope passing over guide-pulleys, an automatically-operating governor and brake, and supplemental checks whereby the speed of the downwardly-moving cage is regulated and checked, and the elastic or spring platform at the bottom, upon which the cage is received, substantially as herein described.

481,850. AIR-COMPRESSOR. MICHEL DILLENBURG, San Francisco, Cal. Filed Apr. 17, 1891. Serial No. 389,357. (No model.)

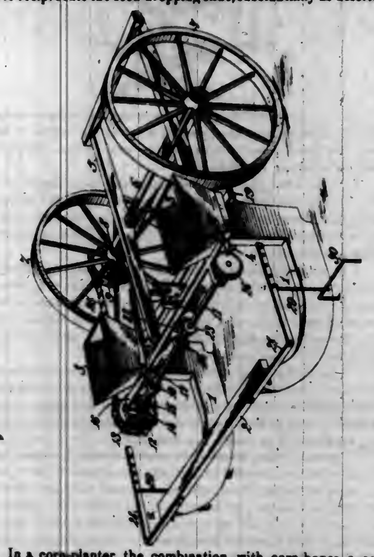


Claim.—An improved air-compressor consisting of a cylinder, a piston-rod, a piston having an exterior sleeve provided with an annular groove around its interior near the bottom and a beveled valve-seat around its interior near its top, said piston having a web whose lower end is smaller than its body, a ring between the web and sleeve and occupying the groove of the latter and the reduced portion of the former and serving as the means for locking the sleeve to the web, but allowing of the ready separation of these parts, said web having a central opening with openings I upon each side thereof, and a central chamber, a spring in said chamber, a valve at the upper end of the piston-rod and a guide-collar on said rod below the valve, said central opening and inner walls of the chamber serving as bearings for the

481,850.

piston-rod and guiding-collar, respectively, and as reinforces for the upper end of the piston-rod, all constructed, combined, and arranged to operate substantially as herein described.

481,851. COFFEE-URN. FREDERICK DOERING, St. Louis, Mo. Filed Feb. 16, 1892. Serial No. 421,744. (No model.)



Claim.—1. The combination, with the coffee-vessel and inclosing vessel, of the metal collar 8, secured to the upper rim of the coffee-vessel and fitting the upper rim of the inclosing vessel, substantially as set forth.

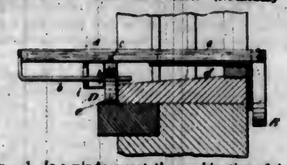
2. The combination, with the inclosing vessel and the coffee-vessel having a flange 7, of the collar 8, provided with a flange 8^a, by which it is supported, with a lower lip 8^b, having a flange 8^c, and with the upper lip 8^e, having a flange 8^d, substantially as described.

481,852. CORN-PLANTER. HARVY H. DOUGHERTY, Waverly, Ill., assignor of one-half to Albert F. Brown, same place. Filed Apr. 22, 1892. Serial No. 430,234. (No model.)

Claim.—1. In a corn-planter, the combination, with corn-boxes, a corn-dropping slide, and ground-wheels, one of which carries a chain-engaging wheel, of a transverse shaft provided at one end with a chain-engaging wheel, a chain trained over said chain-engaging wheels, a forked arm secured to the corn-dropping slide, a crank-arm, one member of which engages the fork of said forked arm and the other member of which is secured to a shaft carrying a gear-wheel, and gears on the transverse shaft meshing with said gear-wheel, substantially as described.

2. In a corn-planter, the combination, with corn-boxes, a corn-dropping slide, and ground-wheels, one of which carries a chain-engaging wheel, of a transverse shaft provided at one end with a chain-engaging wheel, a chain trained over said chain-engaging wheels, a forked arm secured to the corn-dropping slide, a crank-arm, one member of which engages the fork of said forked arm and the other member of which is secured to a shaft carrying a gear-wheel, and mutilated gears on said transverse shaft alternately meshing with said gear-wheel to reciprocate the seed-dropping slide, substantially as described.

3. In a corn-planter, the combination, with corn-boxes, a corn-dropping slide, and ground-wheels, one of which carries a chain-engaging wheel, of a transverse shaft, a chain-engaging wheel 12, having a lateral tooth or pin turning loosely on one end of said shaft, a chain trained over said chain-engaging wheels, a forked arm secured to the corn-dropping slide, a crank-arm, one member of which is secured to a shaft carrying a gear-wheel, mutilated gears on said transverse shaft alternately meshing with said gear-wheel, a cog-wheel on the transverse shaft, and a lever for throwing the same into and out of engagement with the lateral tooth or pin on the chain-engaging wheel 12, substantially as described.

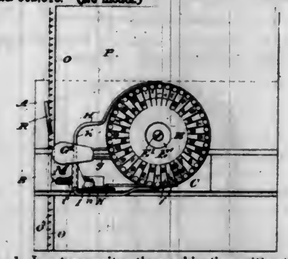


4. In a corn-planter, the combination, with the runners, corn-boxes, and corn-dropping mechanism, of pointer-arms 28, secured to the runners and extending rearward, the pins 29, suspended from and adjustable along the pointer-arms, the laying-out wires 30, and an indicator-wheel in operative connection with the corn-dropping mechanism, substantially as described.

481,853. DRAWER-PULL. ROMAN EICHSTAEDT, Michigan City, Ind. Filed Apr. 30, 1892. Serial No. 431,228. (No model.)

Claim.—In a drawer-pull, the combination, with an inside plate provided with integral perforated brackets stamped therefrom, of an outside plate having perforations for the reception of said brackets and a central opening, a tag or card denoting the contents of the box, secured by the brackets between the face of the box and the outside plate and in such position that it can be seen through the central opening, and a spring-handle provided with trunnions adapted to pass through said brackets to hold the plates in place, substantially as specified.

481,854. WINDOW-SEAT. WILLIAM ENGLER, Brooklyn, N. Y. Filed Feb. 13, 1892. Serial No. 421,419. (No model.)



Claim.—1. In a window-seat, the combination of the board A, the folding board B, hinged to the board A and arranged to open out at right angles to and shoulder against said board A, and the angled rods *b*, attached to the edge of the board A and extending parallel with the board A, and the support D, adjustable on the rods *b* and adapted to rest upon the window-sill, substantially as specified.

2. In a window-seat, the combination of the base-board A, the folding board B, hinged to the board A and arranged to open out at right angles to and shoulder against the said base-board, the angled rods *b*, attached to the edge of the base-board and extending underneath and parallel to the said base-board, the adjustable support D, placed on the rods *b* and adjustable along the length of the said rods, and spurs *c*, projecting from the adjustable support D and adapted to enter into and engage the under surface of the board A, substantially as specified.

3. In a window-seat, the combination of the board A, the board B, hinged to the board A and arranged to open out at right angles to the said board A, the yielding strips *d*, attached to the boards A B, the right-angled rods *b*, attached to the edge of the board A and extending parallel with its under surface, and the adjustable support D, placed on the rods *b* and provided with a yielding covering on its lower edge, substantially as specified.

481,855. TYPE-WRITING MACHINE. ANALDO M. ENGLISH, New York, assignor to Philip Becker, Brooklyn, N. Y. Filed May 15, 1891. Serial No. 392,818. (No model.)

Claim.—1. In a type-writer, the combination, with a table formed with a guide-groove, of a spring click or pawl secured to the table and extending over said groove and a notched paper-holding clip movable in said guide-groove beneath said clip, substantially as described.

2. In a type-writer, the combination, with a fixed rack, of a carriage, printing devices, including a printing-key, spacing mechanism, including a locking-pawl and an operating-frame, and a spiral propelling-spring for the carriage, said spring being mounted on and traveling with the carriage, and each depression of the said printing-key or operating-frame serving to distend said spring and the reaction of the spring serving to propel the carriage, substantially as described.

3. In a type-writer, a table, a carriage-way consisting of a plate having overhanging side edges and a rack provided in one side thereof, and a carriage mounted to travel in said way, in combination with printing mechanism and feed devices carried by said carriage, the latter engaging the aforenamed rack, substantially as described.

4. In a type-writer, the combination, with a rack, of a carriage carrying the following elements: a locking-plate having a pawl for engaging said rack, a detent also arranged to engage said rack, a lever for tripping said locking-plate, and a spring, substantially as described.

5. In a type-writer, the combination, with a carriage, of a horizontal printing-disk and an impression-frame carried thereby and a feed mechanism on the carriage, operating in conjunction with a fixed rack on the base and comprising a locking-plate having a pawl for engaging said rack, a detent movable independently of the said pawl and arranged to engage the rack for actuating the carriage, a lever

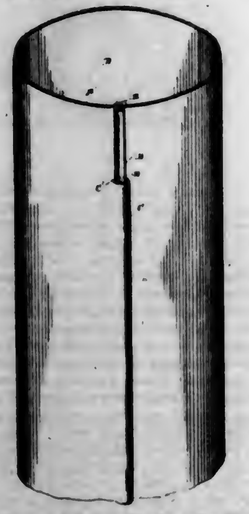
adapted to engage both the pawl and detent for tripping the same, a spring acting on said lever and serving, also, to actuate the carriage, and a frame connected with said lever and adapted to be operated by the impression-frame, substantially as described.

6. In a type-writer, the combination, with a carriage, of a feed mechanism comprising a rack, a locking-plate having a pawl that engages said rack, a detent separate from said plate, arranged to engage said rack and to be disengaged by said plate, and a spring-controlled feeding-lever engaging said locking-plate, substantially as described.

7. In a type-writer, the combination, with a carriage, of a feed mechanism therefor comprising a rack, a locking-plate having a pawl that engages said rack and having two slots, a detent passing through one of said slots to engage the rack, a feed-lever having a stud passing through the second slot of the locking-plate, a spring connected with the stud and with the carriage, and a lifting-bar for disengaging both the pawl and the detent, substantially as described.

8. As a new article of manufacture, a paper-holder for type-writers, consisting of a clip having a clamping-strip therein, substantially as described.

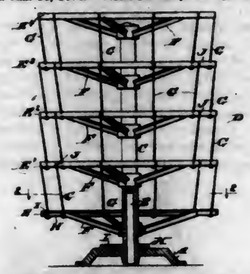
9. As a new article of manufacture, a paper-holder for type-writers, consisting of a clip having a clamping-strip provided with beveled projections which extend through slots in the clip, substantially as described.



10. In a type-writer, paper-holding devices consisting of a movable paper-holding clip having a clamping-strip and provided with notches and a click arranged in the path of the clip for engaging said notches, substantially as described.

11. In a type-writer, a feed or spacing mechanism comprising a rack, a pawl, and a detent, the said detent normally engaging the rack and also maintaining the pawl in engagement with the rack, substantially as described.

12. In a type-writer, a feed or spacing mechanism comprising a rack, a pawl, and a detent, the detent normally engaging the rack and maintaining the pawl in engagement with the rack, and a spring-acted tripping-lever for the pawl, substantially as described.



13. In a type-writer, a feed or spacing mechanism comprising a rack, a plate provided with a pawl that normally engages said rack and formed with two slots, a spring-detent extending into one of said slots and engaging the rack, a tripping-lever having a stud entering the second slot of the plate, and a spring connected with said lever and with the carriage or part to be moved, substantially as described.

481,856. STOVEPIPE. THOMAS S. EVANS, St. Louis, Mo. Filed Feb. 2, 1892. Serial No. 420,060. (No model.)

Claim.—In a stovepipe, the combination, with a blank, of an outturned lip formed on one edge of the same, the opposite edge of the blank being formed with a transverse slot, an inturned lip formed on said edge between the slot and one end of the pipe, and the portion of the said edge between the slot and the opposite end of the pipe bulged inward, substantially as and for the purpose shown and described.

481,857. REVOLVING PAPER-FILE. RALPH B. FERGUSON, Akron, Ohio. Filed Jan. 11, 1892. Serial No. 417,794. (No model.)

Claim.—1. A revolving paper-file comprising a frame mounted to turn and impaling-pins extending upward on the outside of the said frame, the lower ends of the pins being pivoted to the said frame, substantially as shown and described.

2. A revolving paper-file comprising a frame mounted to revolve and provided with rings or disks located one above the other, of impaling-pins pivoted on the said rings or disks and adapted to be swung into an outermost open or innermost closed position, substantially as shown and described.

3. A revolving paper-file comprising a frame mounted to revolve and provided with rings or disks located one above the other, of impaling-pins pivoted at their lower ends to the said rings or disks and extending when in a closed position between two adjacent disks or rings, the said pins being adapted to swing in an outermost open position, substantially as shown and described.

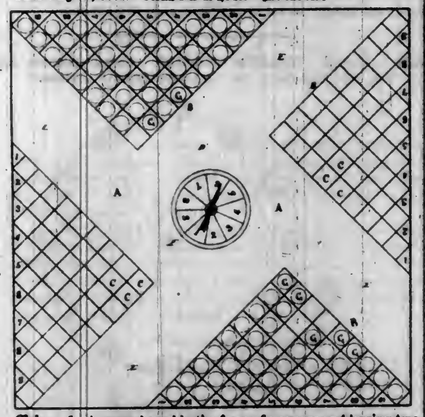
4. In a revolving paper-file, the combination, with a frame mounted to revolve and provided with rings or disks located one above the other, of spring-pressed impaling-pins hinged on the said rings or disks and adapted to engage with their free ends recesses in the next-following ring, substantially as shown and described.

5. In a revolving paper-file, the combination, with a frame mounted to revolve and provided with horizontally-extending rings arranged one above the other, of impaling-pins pivoted near the edges of the said rings and adapted to engage with their free ends recesses in the next-following ring, and springs pressing on the pivoted ends of the said pins to hold the same in an innermost or outermost position, substantially as shown and described.

6. A revolving paper-file comprising a frame mounted to revolve and provided with rings or disks located one above the other, of impaling-pins pivoted at their lower ends to the said rings or disks and extending when in a closed position between two adjacent disks or rings, the said pins being adapted to swing in an outermost open position, and a spring for each impaling-pin to hold the latter in an innermost closed or an outermost open position, substantially as shown and described.

7. A revolving paper-file comprising a revolvable frame and impaling-pins arranged in sets on the said frame, one set being located above the other, and the pins of one set arranged alternately with the pins of the next set, substantially as shown and described.

481,858. GUN-CLEANER. WILL H. FERRIS, Franklinville, N. Y. Filed Apr. 28, 1892. Serial No. 430,976. (No model.)



Claim.—1. In a gun-cleaner, the combination of a head having spring-arms or scraping portions formed integral therewith and an expanding bolt to which the cleaning-rod is adapted to be directly attached, substantially as shown, and for the purpose set forth.

2. In a gun-cleaner, the combination of a head having spring members integral therewith, a headed bolt for expanding said spring members, said bolt being adapted to slide in the head and pass beyond the same for engagement with a cleaning-rod, substantially as shown, and for the purpose set forth.

3. In a gun-cleaner, the combination of a head made up of a single piece and provided with longitudinal slits to provide expansible spring members, said head having a tapered aperture substantially circular in cross-section and a rectangular aperture, and a bolt having a rounded head and a rectangular portion adjacent thereto, substantially as shown, and for the purpose set forth.

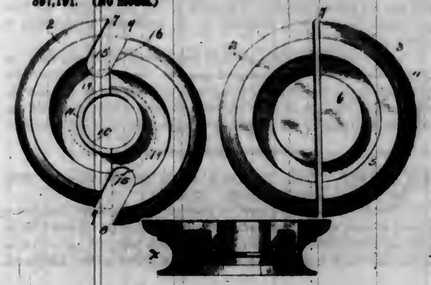
4. In a gun-cleaner, the combination of a head provided centrally with a tapered aperture, slits dividing the tapered portion of the head into spring members, the lower end of said members having outwardly-projecting flanges, an expanding bolt having a rounded head and a threaded end which projects beyond the end of the cleaner for engagement with the cleaning-rod, substantially as shown.

481,859. PARLOR GAME. STANSBURY GROSS, Williamsport, Pa. Filed May 27, 1892. Serial No. 434,649. (No model.)

Claim.—1. A game-board in the form of a square and having two or more triangular series of small squares or blocks arranged along its sides adjacent to the corners and numbers for each line of squares or blocks, substantially as set forth.

2. A square game-board having four triangular series of small squares or blocks arranged adjacent to its four corners, said small squares or blocks extending in parallel rows, with numbers for each row and each row having one less number of squares than the preceding row, substantially as set forth.

3. A square game-board having four triangular series of squares or blocks arranged along its four sides adjacent to the four corners, said squares or blocks extending in rows parallel with the diagonals of the square, substantially as set forth.

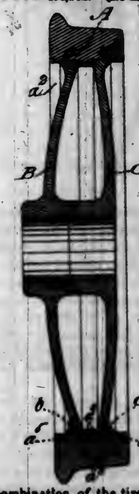


4. A square game-board having four triangular series of squares or blocks arranged in parallel lines along the four sides adjacent to the corners, a central open space and side open spaces between the said series of squares, and numbers for the rows of squares arranged along the outer edges of the triangular series, as set forth.

5. The combination, in an improved game, of a square board having two or more triangular series of small squares or blocks running in parallel rows, numbers for the rows of squares, suitable counters, and a twirling-disk, substantially as set forth.

481,860. SOAP. JOHN GRAY and ABNER SIMMONS, Corsicana, Tex. Filed Jan. 30, 1892. Serial No. 418,671. (No specimens.)

Claim.—A composition for soap, composed of the following ingredients in substantially the proportions specified, viz: sal-soda, borax, salts tartar, ammonia, turpentine, benzine, coal-oil, and soap, as set forth.



481,861. CUTTER-HEAD AND KNIFE. CHARLES GROVE, Ottumwa, Iowa, assignor to Cooper & Hampton. Filed June 23, 1891. Serial No. 397,191. (No model.)

Claim.—1. The combination, in a cutter-head, of the two equal parts having their semicircular peripheries grooved or patterned, with semicircular walls projecting from the side of the cutter-head and eccentric with the peripheries thereof, said walls having their outer surfaces tapered or coned, an annular ring having its internal surface coned to fit said walls, and thereby secure said parts in offset positions with respect to one another, and an opening concentric with said walls and ring to admit the arbor, and the projecting edges of said two parts being sharpened and parallel with the axis of the wheel, substantially as described.

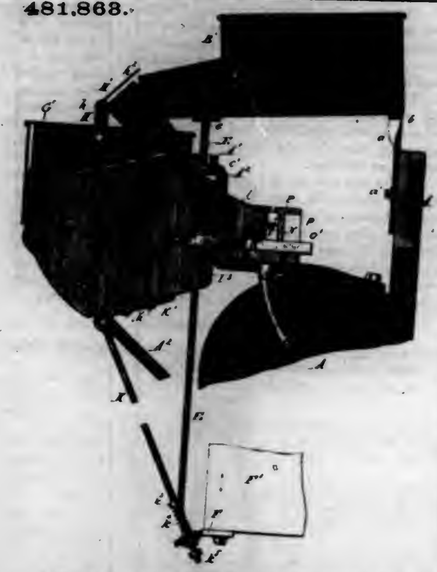
2. The combination, in a cutter-head, of the two parts 2 and 3, each of a semicircular form, having the patterned peripheries, and each provided with a tapering channel 10 and semicircular walls 11, said walls being tapered and eccentric with the peripheries of the two parts, with the webs between the said walls and the outer portion of the cutter-head, the annular clamping-ring to engage said tapering wall, and the sharpened edges 7 and 8, said parts being provided with slots 15 and the chambered ends 16, all substantially as described.

481,862. CAR-WHEEL. HERMAN GUELS, St. Louis, Mo. Filed Sept. 19, 1891. Serial No. 406,202. (No model.)

Claim.—1. The combination of the tire and the sides, said tire having the two circumferential grooves a a' formed with the outer engaging walls a^2 extending in an approximately radial direction and inclined slightly outward from the center of the tire and said sides being shaped at their peripheral portions so as to fit onto and engage said notches, substantially as described.

2. A car-wheel having its tire and central portion formed in separate parts, said tire having the inner circumferential grooves a a' formed with inner and outer walls a^2 a^3, both outwardly inclined from the center of the tire, and said central portion consisting of two disks, which at the periphery thereof are inserted in the notches in said tire, substantially as set forth.

3. A car-wheel having its tire and central portion in separate parts, said central portion consisting of two disks, which at the periphery thereof are inserted in notches in the inner face of said tire, said notches each having the inner line a^2 thereof parallel with the central axis of the wheel, the inner side a^3 inclined outward and the outer side a^2 inclined outward, and said peripheral disk portions being fitted to said notches, substantially as described.



481,863. BOX-NAILING MACHINE. BYRON M. GUSTON, Oswego, N. Y., assignor to Thomson Kingsford, same place. Filed Mar. 5, 1892. Serial No. 423,900. (No model.)

Claim.—1. The nail-pan herein described, provided with partitions pivoted at their lower ends and having devices at their front ends for securing them in the desired adjusted positions.

2. The nail-pan herein described, provided with partitions pivoted at their lower ends to the bottom of the pan and adjustably secured at their upper rear ends to a slotted cross-piece, substantially as described.

3. The combination of the nail-pan, the bolts carrying springs, on which the nail-pan is supported at its front end, and means for vibrating the pan.

481,868.

4. The combination of the nail-pan, the bolts carrying springs, on which the nail-pan is supported, and the vertically-reciprocating rod carrying a spring at its upper end, bearing against the nail-pan.

5. The combination of an inclined nail-pan, means for oscillating it vertically, an inclined hopper in front of and below the nail-pan, and adjustable retarders interposed between the hopper and the pan to deflect the nails to the upper end of the inclined bottom of the hopper.

6. The combination of the nail-pan, the hopper, the retarders having the downwardly and rearwardly inclined plates and the upwardly and rearwardly inclined plates, and a shaft on which the plates are mounted.

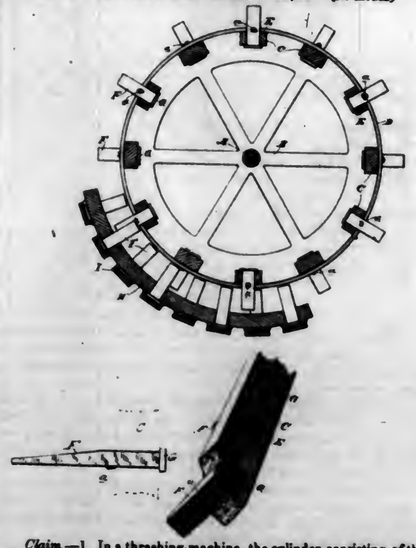
7. The combination of a nail-pan, a hopper having a forwardly and downwardly inclined bottom and located below the nail-pan and in front thereof, the oscillating nail-tracks working vertically through the hopper and inclined forwardly and downwardly at the end of the downward stroke, the stationary nail-tracks, with which the oscillating rearwardly-extending downwardly-inclined nail-tracks connect, and cut-off mechanism at the lower ends of the stationary tracks.

8. The combination of the hopper, a V-shaped trough therein, the oscillating track working vertically through the trough, and the hinged gate notched at its lower end and bearing on both tracks and which is raised and lowered by the oscillating track.

9. The combination of a hopper having an inclined bottom, a vertically-oscillating track therein, and a guard-plate I', carried by the lower end of the track and extending upwardly therefrom, for the purpose specified.

10. The combination, substantially as set forth, of an inclined hopper provided with a series of V-shaped troughs, an oscillating track, the inclined blocks at the lower ends of the hopper on opposite sides of the track, the upwardly-projecting guard-plate I' between the blocks, and the gate hinged to the upper end of the hopper and bearing against the track.

11. The inclined stationary track herein described, having the opening T, through which superfluous nails are delivered, connected at its upper end with means for feeding nails to the cut-off mechanism, in combination with cut-off mechanism at the lower end of the track, having devices for supporting a number of nails between the opening T and the lower end of the track, and a finger for picking off one nail at a time from the nails thus supported, substantially as set forth.



12. The combination, substantially as set forth, of the stationary track, the oscillating track, means for operating the oscillating track, the transversely-reciprocating spring-pressed block carrying the cut-off finger, and connections between the oscillating track and the spring-pressed block for moving the block against the force of the spring.

13. The combination of the finger-carrying spring-pressed block, the grooved uprights, between which the block is mounted, and the top piece or cover provided with an upright board working vertically in the grooves.

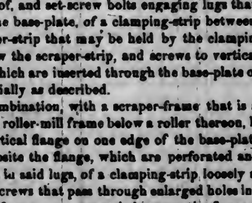
14. The combination, with the vertically-reciprocating cross-head, of cut-off devices, the vertically-oscillating track, connections between the track and the cut-off devices, by which the latter are operated, a rod adjustably secured to the track, and a yielding connection between the rod and the cross-head.

15. The combination of the hinged nail-pan, the hopper, the oscillating tracks extending into the hopper, the stationary tracks, the cut-off mechanism, the hammer-carrying cross-head, a rod adjustably connected thereto for oscillating or vibrating the nail-pan, connections between the oscillating nail-tracks and the cut-off mechanism, rods connecting the oscillating nail-tracks with the hammer-carrying cross-head, and springs carried by the lower ends of the rods.

481,864. **THRASHING-CYLINDER.** SAMUEL HAMILTON, King City, Cal. Filed Apr. 6, 1892. Serial No. 428,092. (No model.)

Claim.—1. In a thrashing-machine, the cylinder consisting of the shaft having the disks or spiders secured to it, the bars secured to the periphery of the disks or spiders parallel with the shaft and having rectangular slots made through them, and thrashing-teeth fitted to said bars and held therein by the centrifugal force of the cylinder, said teeth being of approximately rectangular shape in cross-section, having the front and rear edges parallel from end to end, and the sides parallel for a portion of their length from the base, and thence decreasing in diameter to the outer end, substantially as herein described.

2. In a thrashing-cylinder, a cylinder consisting of disks or spiders secured to a central rotary shaft having tooth-bars fixed to their peripheries parallel with the central shaft, rectangular slots made radially in the tooth-bars, teeth having heads upon their inner ends, rectangular in section, corresponding with the openings in the tooth-bars, and a wedge-shaped or tapering transverse section exterior to the bars with the front and rear faces parallel, and indentations made upon the sides of the teeth exterior to the tooth-bars, whereby the metal is raised above the surface around the indentations to prevent the teeth from falling out when the machine is at rest, substantially as herein described.



3. A thrashing-machine tooth of approximately rectangular shape in cross-section, having the front and rear edges parallel from end to end and the sides parallel for a portion of the length from the base and thence decreasing in diameter to the outer end, substantially as herein described.

4. A thrashing-machine tooth of approximately rectangular form in cross-section, having an integral head at the inner end, the edges which are in the line of travel being parallel from end to end and the sides parallel for a portion of the length outward from the head and thence converging to the outer end, substantially as herein described.

481,865. **TOOL.** CHARLES B. HARER, Saxton's River, Vt. Filed Oct. 7, 1891. Serial No. 408,056. (No model.)

Claim.—1. An attachment for hammers and hatchets, comprising a body portion having a threaded shank, a pointed prong, and a knife, all integral with the body, the prong and knife being on opposite sides of the said body, and an internally-screw-threaded socket adapted to be secured in the end of the handle, projecting through the head of the hammer or hatchet, substantially as described.

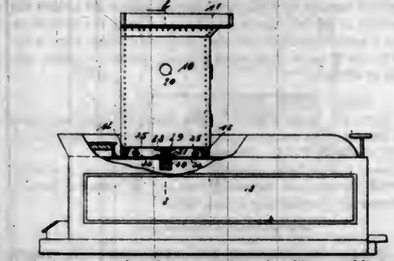
2. An attachment for hammers and hatchets, consisting of a body portion having a threaded shank, a pointed prong, and a knife, all integral with the body, the prong and knife being on opposite sides of the said body, and an internally-threaded socket having barbed flanges thereon, substantially as herein shown and described.

3. A hammer or hatchet provided with an internally-screw-threaded socket secured in the end of the handle, which projects into the eye of the hammer or hatchet, whereby the socket is made to serve as a means for attaching a tool thereto and for securing the handle therein, substantially as described.

4. The combination, with a hammer or hatchet, of a socket adapted to enter the handle of the hammer or hatchet within the hammer or hatchet head, said socket having barbed flanges thereon and an internal screw-thread therein, and a tool having a threaded shank to fit the socket and having on one side a pointed prong and on another side a knife, substantially as described.

481,866. **ADJUSTABLE SCRAPER FOR ROLLER-MILLS.** JOHN HARVEY, Brooklyn, N. Y. Filed May 21, 1891. Serial No. 393,532. (No model.)

Claim.—1. The combination, with a frame having a base-plate, an integral flange thereon at right angles thereto and aligning with one edge thereof, and set-screw bolts engaging lugs that are opposite the flange of the base-plate, of a clamping-strip between the lugs and flange, a scraper-strip that may be held by the clamping-strip, a follower-bar below the scraper-strip, and screws to vertically adjust the follower-bar, which are inserted through the base-plate of the scraper-frame, substantially as described.

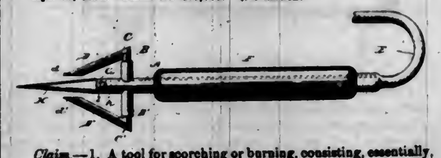


2. The combination, with a scraper-frame that is adapted to be secured upon a roller-mill frame below a roller thereon, having a base-plate and a vertical flange on one edge of the base-plate, lugs on the base-plate opposite the flange, which are perforated and tapped, and set-screw bolts in said lugs, of a clamping-strip loosely secured on the base-plate by screws that pass through enlarged holes in the base-plate of the scraper frame, a scraper-strip between the flange and clamping-strip, a follower-bar below the scraper-strip, and set-screw bolts which have a threaded engagement with the base-plate of the frame and bear on the lower edge of the follower, substantially as described.

481,867. **MESSENGER'S PICKET.** JAMES C. HAYS, Rusk, Tex., assignor of one-half to John J. Murray, same place. Filed Mar. 30, 1892. Serial No. 427,101. (No model.)

Claim.—1. The combination, with a locomotive-tender, of the messenger's picket consisting of a box-like structure mounted on wheels and having a side door and port-holes with closing shutters, and means for attaching it to the flat-top portion of the tender, as shown and described.

2. The combination, with the locomotive-tender having a threaded socket therein, of the revolvable picket having a depending bolt to enter the socket, the picket having also a door in one side with a fastening device therefor and port-holes in its sides, substantially as described.



3. The combination, with the tender having rings therein, of the movable picket having a door in one side, port-holes in its sides, and chains depending from its inner sides and terminating in hooks adapted to engage the tender-rings, substantially as described.

4. A messenger's picket comprising a box-like portable structure having a door in one side with a fastening device therefor, shutter-protected port-holes in its sides, cross-bars extending across the bottom, and a fastening-bolt extending downward through the cross-bars and adapted to secure the picket to a support, substantially as shown and described.

5. A messenger's picket comprising a box-like structure having a door in one side, port-holes in its sides, swinging shutters for the port-holes, a seat arranged within it, and fastening-chains secured within it near the top and extending downward through the bottom, the chains being adapted to be secured to a support, substantially as described.

481,868. **TOOL FOR ORNAMENTING THE SURFACES OF WOOD.** CHARLES M. HAYNES, Chillicothe, Ohio. Original application filed July 18, 1891, Serial No. 399,962. Divided and this application filed Apr. 11, 1892. Serial No. 428,686. (No model.)

Claim.—1. A tool for scorching or burning, consisting, essentially, of a tubular handle adapted to be connected with a suitable gas-supply and two Bunsen burners extending from said tubular handle and inclined toward each other so as to direct their flames to a common point, substantially as set forth.

2. A tool adapted for ornamenting wooden surfaces by burning, consisting, essentially, of a burning-stylus mounted upon a suitable handle and a pair of burners arranged on opposite sides of said stylus and carried by said handle, substantially as set forth.

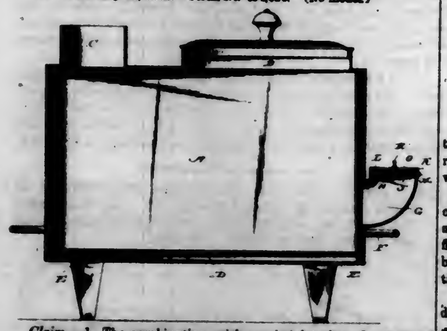
3. A tool adapted for ornamenting wooden surfaces by burning, consisting, essentially, of a short metal bar drawn to a point and having flattened sides, a tubular handle to which said bar is attached, and burners attached to said tubular handle and arranged on opposite sides thereof so that their flames will impinge on the flattened sides of said bar, substantially as set forth.

4. A tool adapted for ornamenting wooden surfaces by burning, consisting, essentially, of a short metal bar drawn to a point and having flattened sides, a tubular handle to which said bar is attached, and branch tubes attached to said tubular handle above the base of the bar C and carrying at their ends Bunsen burners, said tubes being so shaped that the Bunsen burners will extend toward the bar, substantially as set forth.

5. A tool for scorching or burning, consisting, essentially, of a tubular handle adapted to be connected to a suitable gas-supply, a burning-stylus supported from the forward end of said handle, and two burners extending from the handle and inclining toward the burning-stylus, the inner edges of said burners being beveled off substantially parallel to the faces of the stylus, substantially as set forth.

6. A tool for scorching or burning, consisting, essentially, of a tubular handle adapted to be connected with a suitable gas-supply, a burning-stylus detachably secured to said handle, branch tubes extending from said tubular handle, elbows in said tubes, and Bunsen burners extending from said elbows and converging toward the stylus, substantially as set forth.

7. A tool for scorching or burning, consisting, essentially, of a tubular handle, a burning-stylus attached to said handle and consisting of a bar having a broad flat head drawn to a thin edge, branch



tubes extending from said tubular handle, and Bunsen burners extending from said branch tubes and converging toward the flat sides of said stylus, substantially as set forth.

8. A tool for scorching or burning, consisting, essentially, of a tubular handle, a burning-stylus attached to said handle and formed with a broad flat head having its under edge drawn to a thin burning edge, and burners extending from the tubular handle toward the upper portion of the flat sides of said stylus, whereby the stylus is retained in a heated condition and the lower thin burning-edge is not exposed to the flame, so that a fine clear-cut line can be made, substantially as set forth.

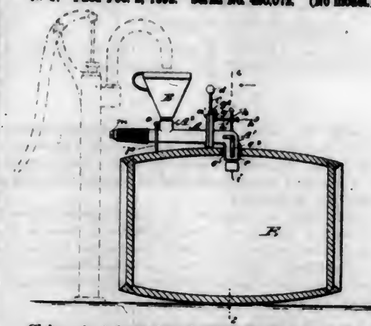
481,869. BASIC LINING. JACOB REESE, Pittsburg, assignor to the Bessemer Steel Company, Limited, Philadelphia, Pa. Filed Feb. 15, 1892. Serial No. 52,776. (No specimens.)

Claim.—A basic lining composed of a mixture of previously highly-dried, shrunk, and indurated lime and an adhesive carbonaceous substance, substantially as described.

481,870. HEATING-STOVE AND DRAFT-REGULATOR THEREFOR. FRITZ H. RIEPE, Jr., and CHARLES F. HILGEMAN, Metropolis City, Ill. Filed May 23, 1892. Serial No. 434,223. (No model.)

Claim.—1. The combination, with an air-inlet pipe of a stove, of a sleeve connected to said inlet-pipe and provided at its free end with a radial flange and an apertured regulating-plate fitted between said flange and a fixed head secured within and partially closing the outer end of the inlet-pipe, substantially as shown and described.

2. The combination, with an air-inlet pipe, of a sleeve fitted around the free outer end of said pipe and provided with a series of slots and having an inwardly-extending flange at its free end, bolts extending through said slots in the sleeve to hold it in position on the air-pipe, and an apertured regulating-plate arranged between the inwardly-extending flange on the sleeve, and a plate secured within and partially closing the outer end of the air-inlet pipe, substantially as described.



481,871. SPLIT PULLEY. DANIEL G. REITZ, Berlin, Pa., assignor to the Eureka Wood Pulley Company, same place. Filed Apr. 15, 1892. Serial No. 429,336. (No model.)

Claim.—1. In a split pulley, the opposite adjustable hub plates or sections having squared pockets or recesses, the spokes connected with each of said plates and the rim of the pulley, opposing clamping-blocks loosely fitting in said pockets or recesses and overlapping the open ends of the same, and adjusting strips or blocks removably inserted in said pockets or recesses back of said clamping-blocks, substantially as set forth.

2. In a split pulley, the opposite hub-plates having parallel projecting flanges in from the edges thereof, and a series of integral tubular spoke-sockets projecting outwardly therefrom, the registering half-rims removably clamped together, the spokes tenoned in said rims and having their inner ends fitted in said sockets, opposing clamping-blocks loosely and adjustably mounted between said flanges and provided with V-shaped clamping-grooves, and end flanges overlapping the ends of the plate-flanges, and clamping-bolts passing through the corners of said hub-plates outside of the flanges thereof, substantially as set forth.

481,872. LIQUID-MEASURING DEVICE. JACOB ROSS, Brooklyn, N. Y. Filed Feb. 2, 1892. Serial No. 420,072. (No model.)

Claim.—1. A faucet barrel or body having a branch opening between its ends, a closure adapted to close said opening and also the rear end of the barrel or body, and a float-operated valve in the forward end of the barrel or body, substantially as shown and described.

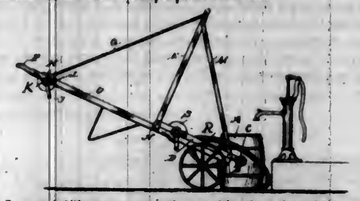
2. A faucet barrel or body having its rear end tapered to fit the outlet-aperture of a barrel and its opposite depending end longitudinally ribbed or corrugated to fit the filling aperture or bung, and a float-operated valve between the ends of said barrel or body, the float being adjacent to the depending end of the body or barrel, substantially as set forth.

3. The combination, with the barrel or body provided with a downwardly-projecting forward end and a vertically-extending slideway in rear of said forward end, of the vertically-sliding gate-valve in said slideway, a bell-crank lever pivoted on the barrel with its upper end constructed to loosely engage and support the gate when raised, a vertically-adjustable float-rod extending down alongside the said downwardly-projecting end, connections between the horizontal arm of the bell-crank lever and the upper end of the float-rod, and a float on the lower end of the rod, substantially as set forth.

4. The combination, with a draw-cock body having a depending nozzle, of vertical ribs thereon and a spring opposite one rib, substantially as described.

5. The combination, with a draw-cock body having a branch or inlet at right angles to its longitudinal passage, of a funnel securable thereto, means to stop the rear end of the body, and an automatically-dropping gate near the discharge end of the body, substantially as described.

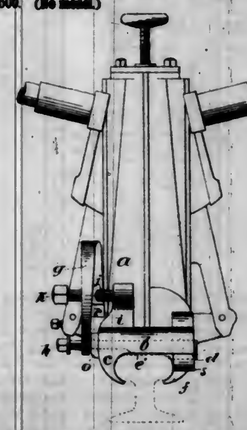
6. The combination, with a hollow elongated body having a depending nozzle that is adapted to be removably secured in a barrel bung-hole, of a pair of prop-legs secured to swing on the body near its rear end, a branch inlet-neck on the body, and a funnel securable therein, substantially as described.



7. The combination, with a hollow elongated body having a depending nozzle securable in a cask bung-hole, of a hollow cup thereon adapted to swing laterally with an upright trigger-rod, a lateral finger-bar on the rod, which is adjustable for height, a bell-crank lever having one limb engaged with the end of the finger-bar and the other limb engaged loosely with a notch in a vertical valve-rod, a sliding gate-valve, a notched rod thereon, and a weight on the rod, substantially as described.

8. In a liquid-measuring device, a gate-valve-trigger mechanism comprising a pivoted bell-crank lever having one limb loosely engaged with a notched rod on the gate-valve, a supported cup-shaped float, a trigger-rod engaging the cup-float below, and having an adjustable finger-bar above, which loosely engages the other limb of the bell-crank lever, substantially as described.

481,873. SPRINKLING DEVICE. JOHN L. HARDY, Pelham Manor, N. Y., assignor to Etta L. Hardy, same place. Filed Sept. 18, 1891. Serial No. 406,196. (No model.)

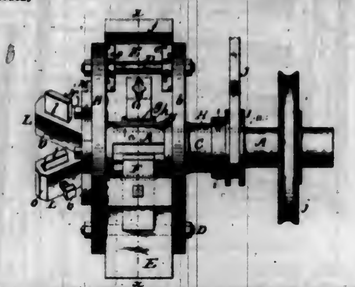


Claim.—1. In a water-sprinkling apparatus, the combination of the vehicle or carriage, the tilting frame pivoted thereto, the tank or water-barrel swiveled to said frame, and a hand-winch or other suitable mechanism for elevating the barrel, as and for the purpose set forth.

2. In a sprinkling apparatus, the combination of the vehicle or carriage, the tilting frame pivoted thereto, and the barrel or tank A, swiveled in the tilting frame, the parts being so arranged as that the barrels when in an elevated position can be retained at or just within the dead-center, as and for the purposes set forth.

3. In a sprinkling apparatus, the combination of a vehicle or carriage, the tilting frame D E, pivoted thereto, the barrel or tank A, swinging in the tilting frame, the said barrel being provided with a hose R and reel S, the rope or chain G, and winding-drum H, said drum being mounted on the main frame of the vehicle, substantially as and for the purposes set forth.

481,874. RAIL-SAWING MACHINE. EDWARD C. SMITH, New York, and JAMES BRADY, Brooklyn, N. Y., assignors to the Smith Portable Rail Saw Company, of New Jersey. Filed May 23, 1890. Serial No. 353,009. (No model.)



Claim.—1. A mechanism for clamping a rail-sawing machine to the flanged head of the rail to be cut, comprising fixed jaws of hooked form on the machine-base, a movable hooked jaw mounted in guides on the said base and provided with an operating-stem, a movable wedge arranged between a shoulder on said shank and the machine-base, and means, substantially as described, for guiding said wedge in its movements, substantially as set forth.

2. As a means for clamping a rail-sawing machine to the rail to be cut, the combination, with fixed jaws on the machine-base, having a hooked form to take under the flanged rail-head, and a movable jaw also of a hooked form and provided with an operating-shank and a clamping-nut, of a movable slotted wedge arranged between the nut on the jaw-shank and the bed of the machine, substantially as set forth.

3. In a rail-sawing machine, the combination, with the base of the machine provided with the pendent fixed jaws of the clamp, of the movable jaw of the clamp, mounted in guides in the base and provided with an operating-shank, a nut on the projecting end of said shank, and a movable wedge provided with a cam and a slot parallel therewith, said wedge being arranged within the base of the machine and the nut on said shank, which latter projects through the slot in the wedge, substantially as set forth.

4. As a means for clamping a rail-sawing machine to the rail, the combination, with fixed jaws on the machine, of a movable jaw having an operating-shank, a rotatable wedge having a small cam and a concentric slot through which the extremity of said shank projects, said wedge being loosely mounted on a stud projecting from the machine, and a clamping-nut on the end of said shank adapted to be set up to said wedge, substantially as set forth.

481,875. MACHINE FOR TURNING HANDLES. WILLIAM D. SNYDER, Wetzell, Mich. Filed Aug. 10, 1891. Serial No. 402,313. (No model.)

Claim.—1. The combination of the revoluble tubular arbor having openings near one end for the introduction of finishing-knives and the disks fixed on the arbor at the ends of said openings, with the oscillating equipoised finishing-knife holders pivotally suspended between the disks, and means for adjusting said holders, substantially as described.

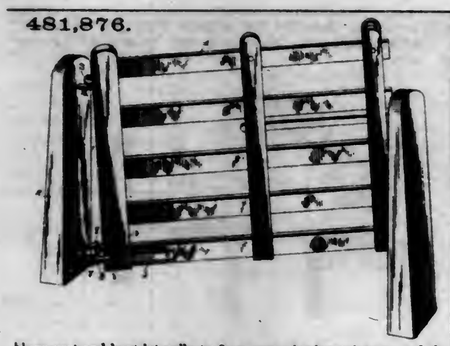
2. The combination of the tubular arbor, the opposed fixed disks thereon, the bolts uniting said disks, and the finishing-knife holders suspended between the disks and revolved therewith, with the finishing-knives and grooved gibs mounted on said holders and the sliding rods moving in guide-slots in the arbor and extending through one journal-bearing thereof, having inclined tongues engaging said gibs for adjusting the holders, all substantially as and for the purpose set forth.

3. The combination of the revoluble tubular arbor having openings near one end for the introduction of finishing-knives and longitudinal grooves, with the knife-holders pivotally supported on and revolved by the arbor, and the sliding rods lying in and protected by the grooves of the arbor, extending through one journal-bearing thereof and engaging the inner ends of the holders, and means for shifting said rods, substantially as specified.

4. The combination of the tubular arbor having openings and grooves, substantially as described, the disks secured thereto, the knife-holders pivotally mounted between the disks, the grooved gibs on the inner ends thereof, the movable rods lying in the grooves of the arbor, extending through one of the journal-bearings of the arbor and having inclined tongues engaging the gibs, and the devices for shifting said rods, substantially as described.

5. The combination of the tubular arbor, the opposed disks fixed thereon, the bolts uniting said disks, and the adjustable opposite oscillating equipoised finishing-knife holders suspended between the disks and revolved therewith, and means for simultaneously adjusting said holders, and the independently-adjustable gouging-knife holders L, attached to the outer disk, substantially as set forth.

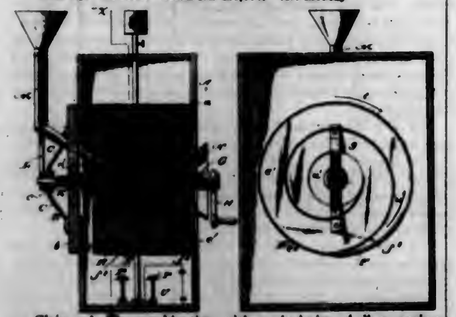
6. The combination of the revoluble tubular arbor having openings near one end for the introduction of finishing-knives and longitudinal grooves, and a journal-sleeve thereon near said openings, with the knife-holders pivotally supported on the arbor, and the sliding rods lying in the grooves of the arbor, passing through said sleeve and engaging the inner ends of the holders, means for shifting said rods, and the blank guide in the end of the arbor, substantially as described.



7. The combination of the tubular arbor having openings and grooves, substantially as described, the disks secured thereto, the knife-holders pivotally mounted between the disks, the grooved gibs on the inner ends thereof, the movable rods lying in the grooves of the arbor and having inclined tongues engaging the gibs, and the devices for shifting said rods, and the journal-sleeve slipped over the arbor and rods and adjoining the inner disk, substantially as specified.

8. The combination of the tubular arbor, the opposed disks fixed thereon, the bolts uniting said disks, and the oscillating equipoised finishing-knife holders suspended on said bolts between the disks and revoluble therewith, the gouging-knife holders attached to the outer disk, and the blank guide in the end of the arbor, with the grooved gibs on said holder, the movable rods extending through one journal-bearing of the arbor, having inclined tongues engaging said gibs, and the devices for shifting said rods, substantially as and for the purpose set forth.

481,876. GATE. GEORGE W. SNIDER, Baker's Corners, Ind., assignor of one-half to H. L. Covode, same place. Filed Feb. 9, 1892. Serial No. 420,914. (No model.)



Claim.—The combination, with a gate and a hinge-post, of a hinge connecting the upper portion of the gate to the hinge-post, the pintle-loops arranged a suitable distance apart near the lower end of the

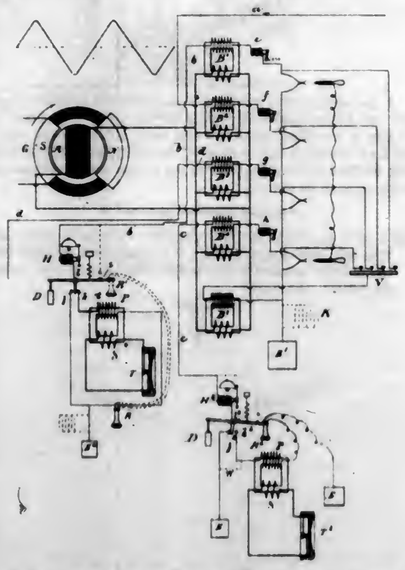
481,876.

hinge-post and bent laterally to form upper horizontal stops, and the bars secured at opposite sides of the gate and extending rearward therefrom and having their rear ends provided with recesses and arranged to engage the pintle-loops, substantially as described.

481,877. CORN-POPPER. DANIEL SWENSON, Kansas City, Mo. Filed Apr. 11, 1892. Serial No. 428,697. (No model.)

Claim.—1. The combination, with an inclosing shell or casing provided with openings in its front and rear walls, of a tubular support or sleeve attached to the rear wall of the casing, a shaft extending into said sleeve and adjustable thereon in the direction of its length, and a drum carried by said shaft and fitting loosely around the sleeve and provided with openings in its heads and side wall, substantially as described.

2. The combination, with an inclosing case or shell provided with suitable openings in its front and rear walls, of a tubular support or sleeve rigidly attached to the case or shell, a shaft extending into said sleeve and movable longitudinally thereon, a drum carried by said shaft and fitting loosely around the tubular support, said drum being provided with an opening in each head and with a V-shaped aperture in its side wall, and a spiral reticulated conduit arranged within the drum between the openings in the heads thereof, substantially as described.



3. The combination, with an inclosing case or shell provided with openings in its front and rear walls, a bracket attached to the rear wall of the casing, a tubular support or sleeve rigidly attached to said bracket, a shaft extending through said sleeve and having the polygonal end thereof fitted in a polygonal socket formed in a hub or short sleeve carried by the bracket at the rear of the casing, connections between said hub and supply-pipe, and a drum rigidly attached to said shaft, substantially as described.

481,878. SYSTEM OF TELEPHONY. ELIHU THOMSON, Swampscott, Mass. Filed Feb. 15, 1892. Serial No. 421,511. (No model.)

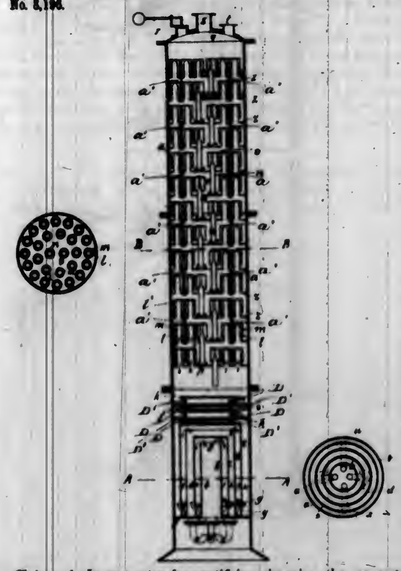
Claim.—1. In a system of telephonic transmission, a generator of alternating or varying currents of little or no audible effect in the receiving-instruments, inductive devices or induction-coils operated by said currents whereby similar induced currents are supplied to the separate lines, means, such as switches, for connecting such separate lines, receivers in the said lines, and transmitters also in said lines having inductive coils, one in the line and one in a local circuit, including a resistance-varying or current-varying device responsive to sound-waves.

2. In a system of telephonic transmission, a set of transformers or inductive devices the primaries of which are fed by alternating or varying currents of low period and the secondaries of which are connected into the circuit upon which speech is to be conveyed, receivers in said lines, devices or induction-coils with primaries connected to line, and secondaries connected to current-varying transmitters responsive to sound-waves.

3. In a system of telephonic transmission, a set of transformers or inductive devices the primaries of which are fed by alternating or varying currents of low period and the secondaries of which are to be connected into the circuit upon which speech is to be conveyed, condensers in shunt relation to such secondaries, receivers in said lines, devices or induction-coils with primaries connected to line, and secondaries connected to current-varying devices or transmitters responsive to sound-waves.

4. In a system of telephonic transmission comprising a number of lines, means for generating and transmitting alternating or varying current impulses of comparatively low period through the lines, and means for modifying such waves of current, consisting of an induction-coil one of the coils of which is in the line and the other of which is in a local circuit including the transmitter, substantially as described.

5. In a system of telephonic transmission comprising a system of lines normally fed by alternating or varying impulses of currents, signaling devices in said lines responsive to calling-currents and unresponsive to the normal pulsations or alternations, telephone-receivers for said lines, and transmitting mechanism consisting of a line coil in inductive relation to a local coil, in the circuit of which latter is placed a current-varying device, such as a variable resistance, said current-varying device or transmitter being responsive to vocal or other sounds.



6. In a system of telephonic transmission, a system of lines normally fed by alternating or varying impulses of current, signaling devices in said lines responsive to calling-currents, switch stations or exchanges, annunciators at said stations individually responsive to the opening of their respective lines, receivers adapted to be connected into said lines by the operation of suitable switch mechanism, and transmitters likewise adapted to be connected to such lines, said transmitters having a local circuit including a resistance or current-varying device responsive to sounds, said local circuit being in inductive relation to a coil in the line-circuit while the transmitter is in use.

7. In a telephone system, a line or circuit connecting the exchange with a subscriber's station and normally on closed circuit, a generator for feeding to said current alternating or varying impulses of current suitable for the operation of transmitters, a signal device at the subscriber's end of the line unresponsive to the alternating or varying current which operates the transmitters, but responsive to special calling-currents, and an annunciator at the exchange operative upon the opening of said circuit.

8. In a closed-circuit system of telephonic transmission, lines on closed circuit or through condensers, means in each of said lines for generating or conveying to it alternating or varying impulses of current of low period, transmitters and mechanism for keeping said transmitters in circuit in said lines when in use, comprising a coil in the line with a local coil in inductive relation thereto, and resistance or current-varying devices responsive to vocal or other sounds.

9. A telephone-exchange system comprising a generator of alternating-current impulses, means for conveying individually such impulses of varying current to the individual lines leading from the exchange, annunciators or signal devices in said lines, signal apparatus in said lines at the subscriber's or user's part of the line responsive to currents sent out from the exchange, switching devices for interconnecting the lines at the exchange, transmitters and receivers connected into the lines when in use, said transmitters consisting substantially of induction-coils, one coil being in the line and another in inductive relation thereto when connected to mechanism for varying current or resistance in the circuit of said coil in correspondence with sound-waves reaching the transmitter.

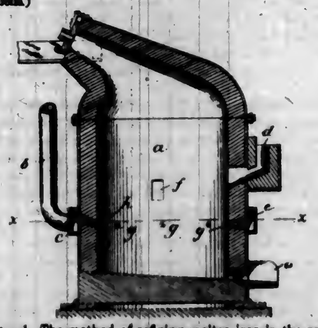
481,879. APPARATUS FOR RECTIFYING GLYCERINE. ROBERT O. UNSWORTH, Pendleton, near Manchester, England. Filed Oct. 31, 1891. Serial No. 410,503. (No model.) Patented in England May 16, 1889, No. 8,196.

Claim.—1. In apparatus for rectifying glycerine, the concentric nested cylinders *b c d e*, forming chambers 1 2 3 4 and open alternately at the top and bottom, the cylinder *a*, bottom *f*, and the pipes *u v w x*, connected with their respective chambers, for carrying off the collected impurities through and from the bottom, substantially as described.

2. In apparatus for rectifying glycerine, the baffle-plates *h i j k*, consisting of alternate disks and annular rings connected together by channel-section rings *D'*, having spaces *D* between their ends, substantially as described.

3. An apparatus for rectifying glycerine, consisting of the cylindrical column *a*, vertically divided into chambers by partitions *s*, provided with two or more concentric rows of pipes *l*, fitted with bonnets or covers *m*, bonneted overflow-pipes *n*, and traps, in combination with a series of concentric cylinders *b c d e*, open alternately at the top and bottom, and baffle-plates *h i j k*, all substantially as set forth.

481,880. FENCE-WIRE TIGHTENER. BARNEY C. WICKERS, Lebanon, Ind., assignor of one-half to Adolph Wysong, same place. Filed Mar. 31, 1892. Serial No. 427,201. (No model.)

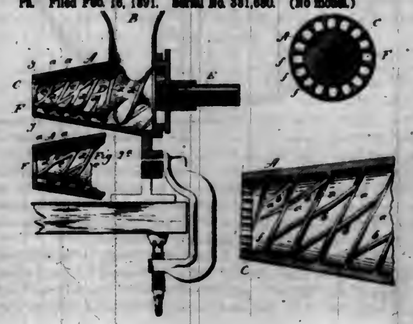


Claim.—1. In a fence-wire tightener, a double bracket providing bearings for a turning-key, a key adapted to rotate in such bearings and provided with a removable ratchet-wheel and a spool, and a lug adapted to engage with the ratchet, formed on each side of the bracket, substantially as shown and described.

2. In a wire-fence tightener, a double bracket having bearings formed therein, lugs formed on the inside of each bracket, one on either side, a turning-key having a squared head and a bobbin formed thereon, such key adapted to fit loosely and be turned in such bearings, and a removable ratchet-wheel adapted to be keyed on such turning-key within the bracket in line with either of the lugs formed on the same, whereby such turning-key is adapted to fit in the brackets from either side, and the ratchet to engage with either lug, substantially as shown and described.

3. The combination of a bracket providing bearings for a turning-key, a key adapted to rotate in such bearings and carrying a removable ratchet-wheel and a spool, a fence-wire adapted to be secured to and tightened by such spool, and a lug adapted to engage with the ratchet, formed on each side of the bracket, the turning-key being retained within its bearings and the ratchet in engagement with the lug by the tension of the fence-wire, substantially as shown and described.

481,881. MANUFACTURE OF IRON AND STEEL. JAMES P. WITHEROW, Allegheny, Pa. Filed Jan. 2, 1889. Serial No. 295,171. (No specimens.)



Claim.—1. The method of refining molten iron in the pneumatic process, which consists in simultaneously agitating and subjecting the charge of metal to a blast of air on or near the surface in such manner as to produce an upward circulation of the metal and bring every portion of the charge successively under the oxidizing influence of the blast, substantially as and for the purposes described.

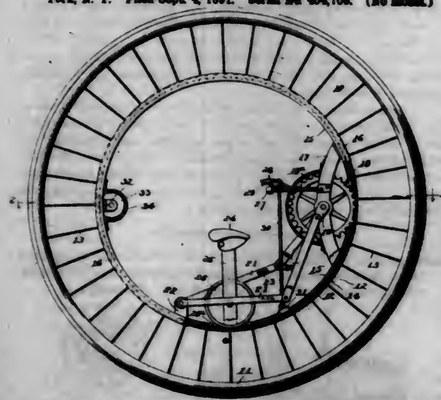
2. The within-described improvement in converting crude iron into malleable iron or steel, consisting in imparting to limited portions in succession of a bath of molten metal violent agitation in the presence of a converting agent, separating the impurities and the metal, returning the latter to the body of the metal in the bath and back from the body of metal in the bath to the area of agitation, and repeating these operations until all the metal has been acted on, the impurities are separated therefrom, and the conversion is complete, substantially as set forth.

3. The process of converting crude iron into malleable iron or steel, which consists in imparting to successive limited portions of a bath of molten metal a violent atomic agitation and separating the metal and the impurities, returning the metal to the body of the bath and maintaining the eliminated impurities in their separated state, and repeating these operations until the entire body has been repeatedly operated upon, substantially as set forth.

481,882. MEAT-CUTTER. OLIVER D. WOODRUFF, Southington, Conn., assignor to the Enterprise Manufacturing Company, Philadelphia, Pa. Filed Feb. 16, 1891. Serial No. 381,680. (No model.)

Claim.—1. In a meat-cutter in which the meat is delivered from one end of the case, and the case containing cutting mechanism to cut the meat, the discharge end having one or more series of notches through which the cut meat is discharged, the said notches formed in the edge of the part which contains them and so as to leave one side open, that side being closed by the adjacent part and so as to complete the openings, substantially as described.

2. The combination, in a meat-cutter, of the casing, a series of spiral ribs on the interior of the casing, said spiral ribs inclining from the entrance to the discharge end of the machine and having the second series of spiral ribs intersecting the first-mentioned ribs and running from near the entrance to the discharge end, but at a greater pitch than that of the first-mentioned series, with a forcer adapted to revolve in the casing, said forcer being constructed with one or more spiral ribs to work in direct contact with the spiral ribs of the casing, and whereby said spiral rib of the forcer, while serving to force the meat through the case, operates as a cutter in connection with the two series of spiral ribs in the case, substantially as specified.



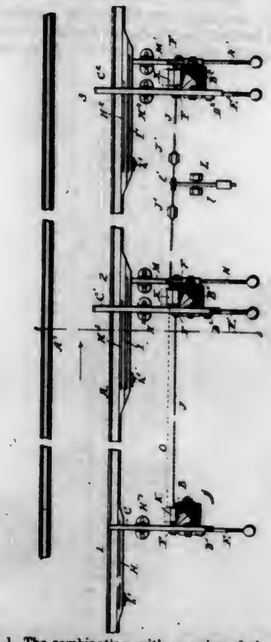
3. The combination, in a meat-cutter, of the casing having internal spiral ribs *a* and *b*, the ribs *b* being of a greater pitch than and intersecting with the ribs *a*, with a forcer having spiral ribs *d* and *c*, the ribs *c* being of a greater pitch than the ribs *d*, the ribs of the forcer being in direct contact with those of the case, whereby the said ribs, while serving to force the meat through the case, operate, in conjunction with the ribs of the case, to cut the meat, substantially as described.

4. The combination of a meat-cutter case having at its discharge end an annular series of notches, suitable cutting mechanism, and at the delivery end of the shaft or central member a solid end that fills the space inside of and so as to close that side of said notches and form discharge-openings, substantially as and for the purpose described.

5. In a meat-cutter, the combination of the crank-shaft E, having dovetailed recess J, with overhanging spiral sides, and a crank-head K, having an internal dovetailed projection M, fitted to said recess, substantially as described, and for the purpose specified.

6. The combination, in a meat-cutter, of the casing, a hopper at the enlarged end of the casing, an opening in the smaller end of the casing, a series of projections at the end of the casing, forming notches, two sets of spiral ribs on the interior of the casing, one set being of a greater pitch than the other set, the said ribs intersecting, a tapered forcer adapted to the casing and having two sets of spiral ribs, one set being of a greater pitch than the other, the said ribs intersecting, said forcer having a solid end which closes the opening in the smaller end of the casing, leaving only the notches for the discharge of meat, substantially as described.

481,883. UNICYCLE. ABRAHAM YOST and FERNANDO YOST, New York, N. Y. Filed Sept. 4, 1891. Serial No. 404,709. (No model.)



Claim.—1. A unicycle comprising a main wheel having an inner band with teeth therein, a stationary band mounted within the toothed band and having side flanges to overlap the latter, a gear-wheel journaled in a frame-work secured to the stationary band and projecting through a slot in the said band so as to engage the teeth in the toothed band, a seat supported on the stationary band, handle-bars secured to the framework in front of the seat, and a pedal mechanism for driving the gear-wheel, substantially as described.

2. A unicycle comprising a main wheel having an inner toothed band, a stationary band mounted within the toothed band and having overlapping side flanges, a gear-wheel journaled in a suitable frame-work supported by the stationary band and extending through a slot to engage the teeth of the toothed wheel, a frame supported on anti-friction rollers held to contact with the toothed band, a seat carried by the frame, and handle-bars supported in front of the seat, substantially as described.

3. In a unicycle of the character described, the combination of the main wheel having an inner band, a stationary band adapted to ride upon the revolving band, a brake-shoe projecting through the stationary band and adapted to impinge upon the revolving band, and a lever mechanism for operating the shoe, substantially as shown and described.

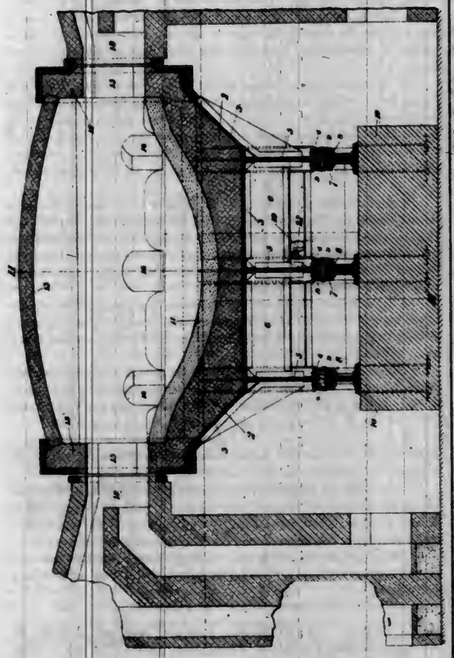
481,884. AUTOMATIC MECHANICAL BLOCK RAILROAD-SIGNAL. GEORGE C. YOUNG and GEORGE O. WILLEVER, Phillipsburg, N. J., assignors of one-third to John M. R. Shimer, same place. Filed Dec. 5, 1891. Serial No. 414,143. (No model.)

Claim.—1. The combination, with a series of signals arranged along the track, of two series of rail-levers pivotally mounted on the rails, one series being arranged within the tread of the ordinary wheel to be operated by the engine and the other series being arranged beyond the tread of the ordinary wheel to be operated by the passage of the rear car of the train, substantially as described.

2. The combination, with a series of signals arranged along the track, of two series of rail-levers pivoted to the rails, one series being arranged within the tread of an ordinary wheel to be operated by the engine to set the adjacent section to "danger" and the other series of levers being arranged without the tread of the ordinary wheel and connected to the signal at the beginning of the block through which the train has passed to operate the signal to "safety" as the rear car of the train moves over said levers, substantially as described.

3. The combination, with the rail, of two series of rail-levers mounted on the same pivot and connected directly to the side of the rail and each having curved portions projecting above the tread of the rail and a tongue or projection extending below the flange of the rails, one of the levers of each pair being longer than the other, substantially as described.

4. The combination, with the rail, of two series of rail-levers pivotally attached directly to the rail, but at different distances therefrom, a series of signal-posts arranged along the track, connections between the inner rail-lever and the signal upon the post adjacent to said lever, and connections between the signal on the next preceding post and the outer lever, substantially as described.

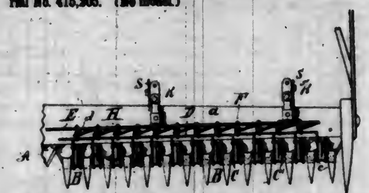


5. The combination, with a series of signal-posts arranged along the track, of two series of rail-levers pivotally connected to the track, one series being within the tread of an ordinary wheel and the other series beyond the tread, connections between the inner lever and the signal on the adjacent post, and connections between the outer lever and the signal of the next preceding post, the respective connections being on opposite sides of the post adjacent to the levers, substantially as described.

6. The combination, with a series of signal-posts arranged along the track, of two series of rail-levers pivotally connected directly to the rail, a lever G, connected to the signal adjacent to the track and arranged to be operated by the inner track-lever, and a lever M, arranged to be operated by the outer track-lever and connected to the signal on the next preceding post, the arrangement being such that the inner rail-lever will be operated by the passing of an ordinary wheel, while the outer lever will be operated only upon the passing of a special wheel projecting beyond the tread of the ordinary wheel, substantially as described.

7. The combination, with the rail, of a track-lever pivotally mounted on said rail, a filling-piece between said lever and the web of the rail, the lever being within the tread of an ordinary wheel, and another track-lever mounted upon the same pivot and arranged outside the tread of an ordinary wheel and adapted to be operated by a wheel having an extended tread, substantially as described.

8. The combination, with the signal-posts carrying semaphores arranged along the track, of the track-levers H and I, pivotally connected to the rail, one of the levers being longer than the other and outside the tread of the ordinary wheel, the levers G and M respectively operated by the track-levers, connections between the lever G and the semaphore C adjacent to the track-levers, and flexible connections between the lever M and the next preceding semaphore, and a take-up device for said flexible connections, substantially as described.



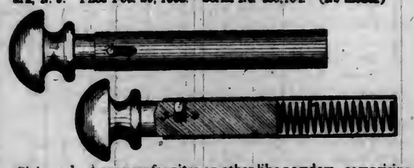
481,885. OPEN-HEARTH FURNACE. HENRY AIKEN, Pittsburg, Pa., FREDERICK W. WOOD, Baltimore, Md., and HARRY H. CAMPBELL, Steelton, Pa. Filed Jan. 29, 1892. Serial No. 419,965. (No model.)

Claim.—1. A metallurgical furnace having rockers on which it can be tipped, a supporting-cradle, laterally-movable antifriction-rollers between the rockers and cradle, and a discharging-spout at the end of the furnace toward which it is oscillatory, substantially as and for the purposes described.

2. A metallurgical furnace having rockers on which it can be tipped, a supporting-cradle comprising curved rails having lateral confining-plates, antifriction-rollers set on the rails between said plates, and means for tipping the furnace, substantially as and for the purposes described.

481,886. MACHINE FOR GRINDING MOWING-MACHINE KNIVES. MICHAEL BALNES, Detroit, Mich., assignor to the Acme Safety Emery Wheel Company, same place. Filed Dec. 16, 1891. Serial No. 415,205. (No model.)

Claim.—1. In combination with the cutting-knives and cutter-bar of a mowing-machine, a holding-bar and a grinding-block movably secured thereto by a clamping-arm adapted to have vertical movement and to hold said grinding-block with its grinding-surface constantly parallel to itself or to a given surface, substantially as and for the purposes described.



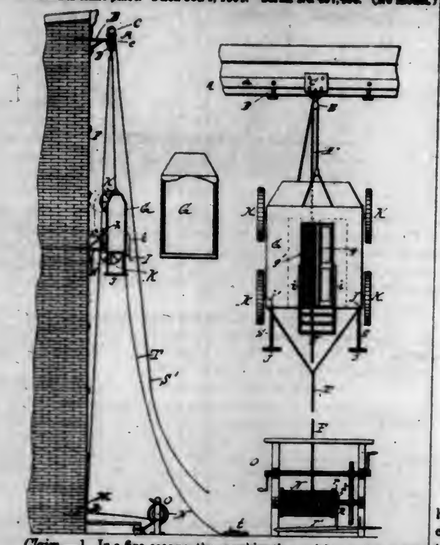
2. In combination with the cutting-knives of a mowing-machine, a grinding-block secured to an arm adapted to turn on a journal having its axis at right angles to the line of movement of the cutting-knives, substantially as and for the purpose described.

3. In a machine for sharpening the knives of mowing-machines, the combination of a holding-rod secured to the cutter-bar, a block of grinding material and a clamp securing the same, a journal secured to said holding-rod and having journaled upon it the said block-holding clamp, and a tension-spring adapted to hold said grinding-block downward, said journal having its axis at right angles to the line of movement of the cutter-knives, substantially as and for the purposes described.

4. In a machine for grinding the knives of mowing-machines, the combination of the holding-rod E, clamps C C', arm D *d*, journal F, and adjusting-pin *f*.

5. In a grinding-machine for mowing-machine knives, the combination of a grinding-block and a holding-clamp therefor adapted to hold said block with its lower or grinding surface constantly in contact with the beveled edge of the knife beneath it and with its line of contact constantly parallel to said beveled edge, substantially as and for the purpose described.

481,887. CARTRIDGE-LOADING TOOL. WILLIAM H. BEARDSLEY and ALVIN D. MOULTON, Bridgeport, Conn., and LOUIS J. WURTH, Newark, N. J. Filed Feb. 29, 1892. Serial No. 423,104. (No model.)

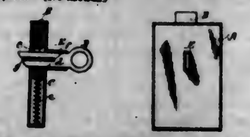


Claim.—1. A rammer for nitro or other like powders, comprising, in combination, shell-rammer 1, having closed end 20 to engage the wad, handle 3, having plunger 2 placed in the open end of said shell-rammer and arranged to operate in the direction of its length, pressure-spring 4, placed between the end of said plunger and the closed end of the shell-rammer, adjustable stop 10, arranged, substantially as shown, so as to regulate the travel of the plunger with reference to the pressure of the spring against which said plunger operates and by so doing regulate the pressure of the shell-rammer upon the powder through the medium of the overlying wad, and means, substantially as shown, to keep the plunger and shell-rammer in operative engagement with each other.

2. A rammer for nitro or other like powders, comprising, in combination, handle 3, having plunger 2 projecting therefrom, shell-rammer 1, mounted on said plunger, in which said plunger operates in the direction of its length, and means, substantially as shown, to maintain them in such operative engagement, pressure-spring 4, placed between the end of the plunger and the closed end of the shell-rammer, and adjustable stop 10, arranged, as shown, to regulate the travel of the plunger, for the purpose set forth, combined with a scale arranged substantially as shown, said scale graduated to indicate the different pressures represented by the spring, as described.

3. A rammer for nitro-powder, comprising, in combination, the wooden section 2, metal shell 1, operatively mounted thereon, having elongated slot 8 therein, spring-pin 6, having point 7 to engage with such slot, said pin operatively located in the wooden section, pressure-spring 4, arranged substantially as shown, and handle 3, all combined and arranged substantially as shown, and for the purpose set forth.

481,888. FIRE-ESCAPE. THELESPHORE J. BERGERON and FERNIE BEDARD, Minneapolis, Minn., assignors to Aurelie Bergeron and Clarissa Bedard, same place. Filed Oct. 1, 1891. Serial No. 407,462. (No model.)



Claim.—1. In a fire-escape, the combination, with a railway permanently attached to the building, a traveler mounted upon said railway, an elevator constructed with hollow walls and having its front and rear openings each provided with a solid door and a woven-wire door, and a cable connecting the elevator with the traveler for raising and lowering said elevator, substantially as specified.

2. In a fire-escape, the combination, with a railway permanently attached to the building, of a traveler mounted upon said railway, an elevator constructed with hollow walls and provided at each of its openings with two doors of the kind described and with guide wheels, and a suitable raising and lowering cable connecting the traveler with the elevator, substantially as specified.

3. In a fire-escape, the combination, with a railway permanently attached to the building, a traveler moving thereon, and suitable raising and lowering tackle, of an elevator constructed with hollow walls and provided with a solid and an open work door at each opening, with guide-wheels at the inner or rear side corners, and with a yielding platform at the bottom thereof, substantially as specified.

4. In a fire-escape of the character described, the combination, with the railway, traveler, and hoisting-cable, of an elevator provided with a solid and an open-work door at each opening, with guide-wheels and a hinged gangway, a yielding platform, and with a suitable guy-rope for guiding the elevator in its ascent and descent, and a guy-rope for moving the traveler across the side of the building, substantially as specified.

481,889. LOCK. WILLIAM H. BLANEY, Attleborough, Mass., assignor to himself and Edwin R. Bullock, same place. Filed July 3, 1891. Serial No. 398,401. (No model.)

Claim.—1. The combination, with the case provided at one side with a fixed outwardly-projecting key-guiding tube and at the opposite side with a perforation adapted for the passage of the end of the key, of the spring-actuated bolt provided with the inclined face adapted for the action of the end of the key and the transverse pin in the fixed key-guiding tube, substantially as described.

2. The combination, with the case provided at one side with the key-guiding tube and at the opposite side with a perforation adapted for the entrance of the end of the key, of the sliding bolt provided with the inclined face adapted for the action of the end of the key, the transverse pin in the key-guiding tube, and the gravitating lever arranged loosely upon the pin, substantially as described.

481,890. CARRIER ATTACHMENT FOR BICYCLES. MAURICE R. ROOD, Kalamazoo, Mich., assignor to the Kalamazoo Cycle Company, same place. Filed Oct. 26, 1891. Serial No. 409,889. (No model.)

Claim.—1. In a mail carrier attachment for bicycles or like vehicles, a frame attached to the handle-bar or forward part of the bicycle, having horns or hooks which are adapted to receive and carry the mail-bag by placing the rings of said bag over the said horns or hooks, in combination with such bag and rings, substantially as set forth.

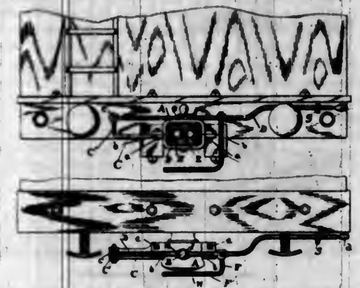
2. In a mail-carrier attachment for bicycles or like vehicles, a frame for carrying the mail-bag formed of spring wire or rod having two horns or hooks to receive the rings of the mail-bag, and an inclined U-shaped loop or part to come against the side of said bag below the said rings to hold the bag in an inclined position, in combination with such bag and ring, substantially as and for the purposes specified.

3. In a carrier attachment for bicycles or like vehicles, the wire or rod frame C C, having the loops *h h* for hanging the bag on, and the inclined U-shaped loop for holding the bag in an inclined position, while the opposite end of the frame forms the arms to support the bag and attach to the bicycle, in combination with a bag suspended on such frame, substantially as set forth.

4. In a carrier attachment for bicycles, the combination and arrangement of the handle-bar B, upper clip D, frame C C, having horns or loops *h h*, and the bag H, substantially as and for the purposes specified.

5. In a carrier attachment for bicycles or like vehicles, the combination and arrangement of the handle-bar B, upper clip D, finger *a* to rest on top of the handle-bar, finger *f'* to rest on the post, frame C C, and bag H, substantially as and for the purposes specified.

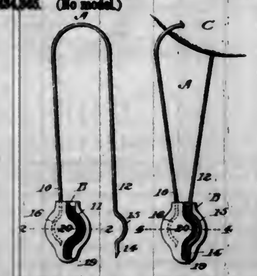
6. In combination with the handle-bar B and post A, the clips D and *f*, finger *f'*, frame C C, having horns or loops *h h*, and a bag H, all arranged and adapted for use, substantially as specified.



7. In a carrier attachment for bicycles, the upper clip D, formed and constructed, as shown, to have a concaved part on its rear end to receive the handle-bar, and a finger *a* to rest on top of the handle-bar, while at its opposite or front end are the bearings or holes *e e* to receive the arms for supporting and holding a bag suspended over the front wheel of the bicycle, in combination with such bag, substantially as set forth.

481,891. CAR-COUPLING. THOMAS J. BOOS, Baltimore, Md., assignor of one-half to John H. Vieweg, same place. Filed Apr. 11, 1892. Serial No. 428,560. (No model.)

Claim.—1. An attachment for link-and-pin car-couplers, comprising a clamp to fit on the draw-head and a lever pivoted to said clamp and having an arm adapted to extend in front of the draw-head and below the coupling-link, substantially in the manner and for the purpose described.



2. An attachment for link-and-pin car-couplers, comprising a clamp to fit on the draw-head and a lever pivoted to said clamp and constructed to connect with the coupling-pin and having an arm adapted to extend in front of the draw-head and below the coupling-link, in the manner and for the purpose described.

3. An attachment for link-and-pin car-couplers, comprising a clamp made in two parts to fit on opposite sides of the draw-head and a lever pivoted to said clamp and constructed for connection with the coupling parts.

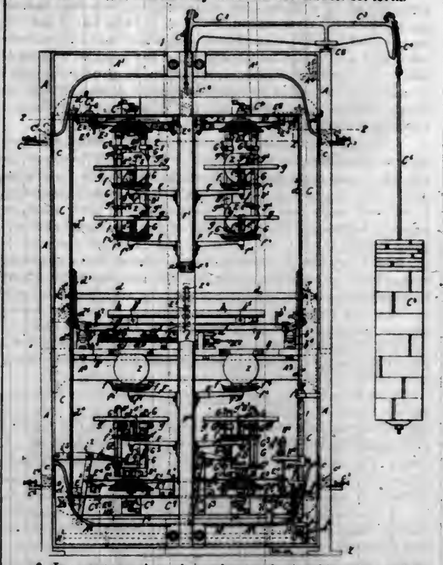
4. An attachment for link-and-pin car-couplers, comprising a clamp to fit on the draw-head and a lever pivoted to said clamp and adapted to extend across the top of the draw-head and having an opening through it to receive the coupling-pin, substantially as and for the purpose described.

481,892. SEAL. EDWARD J. BROOKS, East Orange, N. J., assignor to the E. J. Brooks & Company, New York, N. Y. Filed May 25, 1892. Serial No. 434,265. (No model.)

Claim.—1. A seal for meat, composed of a flexible shackle of wire and a compressible seal-disk to unite the ends of said shackle, the shackle having a spear end which is constructed with a sharp-pointed extremity and with an anchoring device in the form of a short re-entrant bend adapted to be thrust through the meat, substantially as hereinbefore specified.

2. In combination with a flexible shackle of wire having a spear end comprising a sharp-pointed extremity and an anchoring device in the form of a short re-entrant bend, a compressible seal-disk fast on the other end of the shackle and having a recess in its face conformed to and which admits said spear end and closed at one end to mask said sharp-pointed extremity, substantially as hereinbefore specified.

481,893. PANTOGRAPH TRACING AND ENGRAVING MACHINE. JOHN BRYCE and ADAM KIDD, Glasgow, Scotland, assignors to the Glass and Metal Engraving Company, Limited, same place. Filed June 17, 1891. Serial No. 396,569. (No model.) Patented in England Sept. 12, 1888, No. 13,173.



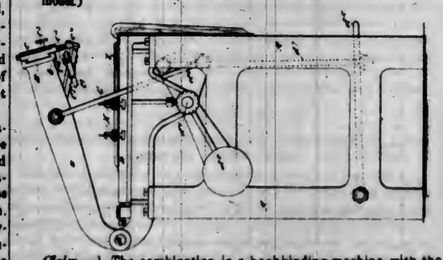
Claim.—1. A pantograph-machine for tracing and engraving objects, comprising a stationary frame on which the objects are mounted, in combination with cylindrical cages carried and rotated in a balanced frame moved vertically, said cages being turned by a laterally-moving frame within the balanced frame, these frames being moved in their respective directions by and proportionally to the motion of the ordinary pantograph pointer and mechanism, substantially as set forth.

2. In a pantograph tracing and engraving machine, the combination comprising a stationary frame and bracketed arms carrying the objects, with open cylindrical cages rotated and moved vertically and carrying vertical and hoop bars outside, and tracing points or diamonds secured on said bars to engrave the designs in both directions on the stationary objects, substantially as and in the manner set forth.

3. In a pantograph tracing and engraving machine, a vertically-moving balanced frame, in combination with rotating open-barred engraving-cages mounted on said frame, substantially as and for the purposes set forth.

4. In a pantograph tracing and engraving machine, the combination comprising a balanced raising and lowering vertical frame with open-barred vertical rotating cylindrical cages, and spring-clip shifting and setting levers with tracing points or diamonds attached to said bars, the frame and cages being actuated by and proportional to the motion of the ordinary pantograph pointer and mechanism, substantially as and for the purposes set forth.

5. In a pantograph tracing and engraving machine, the combination comprising rotating cylindrical cages carrying tracing points or diamonds, a vertically-moving balanced frame on which said cages are mounted, and a vertical wheeled frame traversing horizontally and laterally on the vertical balanced frame and having bands and pulleys to rotate the cages, substantially as and in the manner set forth.



6. In a pantograph tracing and engraving machine, the combination comprising rotating cage-bars and vertical shifting ring-bars, levers with tracing points or diamonds, and reciprocating frame for putting the points and levers into or out of action, substantially as and for the purposes set forth.

7. In a pantograph tracing and engraving machine, the combination comprising rotating cylindrical cages with a clutch having rigid lateral arms and gripping-pawl clips and a scroll-grooved disk for securing the objects to be treated, substantially as and in the manner set forth.

8. In a pantograph tracing and engraving machine, the combination comprising a fixed frame and vertical and transverse moving balanced frames having flat surfaces or objects secured to the fixed frame and parallel to the moving frames, with adjustable lateral arms carrying the levers of tracing points or diamonds on the lateral traversing frame, substantially as and in the manner set forth.

481,894. BOOKBINDING-MACHINE. ROBERT BURNET, East Orange, N. J., assignor, by mesne assignments, to The Burnet Machine Company, same place. Filed Dec. 22, 1890. Serial No. 375,536. (No model.)

Claim.—1. The combination, in a bookbinding-machine, with the main supporting-frame and a sliding table supported thereon, of a secondary frame located above and hinged at one end to the said main supporting-frame and provided with staple feeding and driving mech-

anism supported thereby at or near its opposite end, and means for raising and lowering said hinged frame, substantially as described, and for the purpose set forth.

2. In a bookbinding-machine, the combination, with a main supporting-frame, of a sliding table supported in suitable ways thereon, a secondary frame located above and hinged to said main supporting-frame and provided with staple feeding and driving mechanism supported thereby, and means for operating said hinged frame and mechanism supported thereby and the said sliding table in unison, substantially as described, and for the purpose set forth.

3. In a bookbinding-machine, the combination, with a main supporting-frame, of a sliding table supported in suitable ways thereon and provided with teeth or projections on its under side, a pawl for engaging and operating the said table, a secondary frame located above and hinged to said main supporting-frame and provided with staple feeding and driving mechanism supported thereby, an adjusting device for regulating the feed of said table, and means connected with the hinged frame for operating the pawl and moving the sliding table in unison with the hinged frame, substantially as set forth.

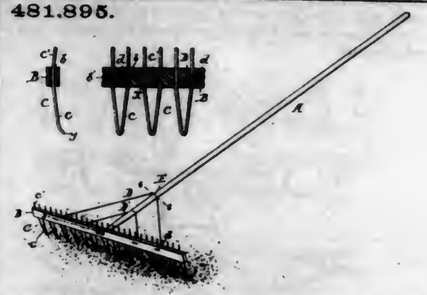
4. In a bookbinding-machine, the combination, with the supporting-frame, of a table supported in suitable ways on said frame and provided with teeth or projections thereon, an operating-pawl, and a stationary pawl or catch for engagement with the teeth or projections on said table, and a cam for throwing both of said pawls out of engagement with said table, substantially as described, and for the purpose set forth.

5. In a bookbinding-machine, the combination, with a supporting plate or frame, of a secondary plate provided with a guideway therein adjustably supported in its relation to said supporting-plate on a sliding rod or rods and provided with a staple-feeding rod secured thereto adjacent to the said guideway therein, a device supported on said feed-rod for automatically feeding or releasing the staples on said feed-rod, and a device secured on said supporting-plate for driving the staples, substantially as described, and for the purpose set forth.

6. In a bookbinding-machine, the combination, with a supporting plate or frame, of a secondary plate adjustably supported in its relation to the former on a sliding rod or rods and provided with a feed-rod secured thereto, a feeding device secured on said feed-rod, consisting of a roll or wheel having teeth or projections thereon, and a hinged frame carrying a pawl adapted to engage and operate said feeding-roll, substantially as described, and for the purpose set forth.

7. In a bookbinding-machine, the combination, with a supporting plate or frame, of a secondary plate provided with a guideway therein and adjustably supported in its relation to said supporting-frame on a sliding rod or rods and provided with a staple-feeding rod secured thereto adjacent to the said guideway therein, a cover or guard located on said feed-rod, and a device secured upon said supporting-plate for driving the staples, substantially as described, and for the purpose set forth.

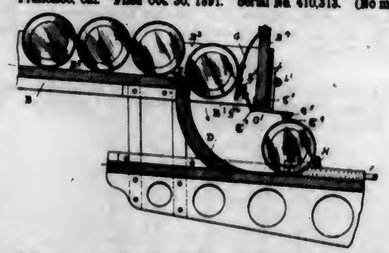
8. In a bookbinding-machine, the combination, with a feed-rod, of a feeding device secured thereto, consisting of a supporting-rod provided with a wheel or roll having teeth or projections thereon adapted to engage or contact with the said feed-rod, and a hinged frame attached to said supporting-rod, provided with a pawl for engagement with said toothed feeding-roll, and means for operating said hinged frame, substantially as and for the purpose set forth.



9. In a bookbinding-machine, the combination, with a feed-rod, of a supporting rod pivotally secured thereto and provided with a toothed feeding-roll supported at one end thereof adjacent to the feed-rod, a frame hinged to said supporting-rod and provided with a pawl for engagement with said feeding-roll, springs for engaging with and adjustably holding said supporting-rod in a normal position, with the feeding-roll adjacent to the feed-rod, and means for operating the said hinged frame, substantially as described, and for the purpose set forth.

10. In a bookbinding-machine, the combination, with a feed-rod, of a supporting-rod secured thereto, provided with a feeding-roll supported thereby adjacent to the feed-rod, a frame hinged to said supporting-rod and provided with a pawl for engagement with said feeding-roll, adjusting screws located in the engaging or contacting ends of said supporting-rod and hinged frame, and means for operating said hinged frame, substantially as described, and for the purpose set forth.

481,895. HAND-RAKE. THOMAS COLDWELL, Newburg, N. Y. Filed Sept. 22, 1891. Serial No. 406,436. (No model.)

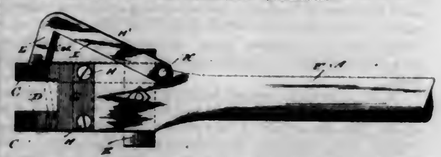


Claim.—The herein-described rake, which consists of a handle, a wooden rake-head, and a series of wire-teeth substantially V-shaped and having the two arms of the V diverging from the point for a portion of their length and for the remainder of their length being parallel to each other, the wires from which the teeth are formed being tightly driven through the head and extending beyond the opposite faces thereof and the projecting portions of the wire on each side of the rake-head being bent slightly toward the handle at the points where they emerge from the rake, whereby the rake-teeth are secured in the head and at

481,895.

the same time given the proper inclination, substantially as set forth.

481,896. CAN-LABELING MACHINE. PARKER GRITTENDEN, San Francisco, Cal. Filed Oct. 30, 1891. Serial No. 410,313. (No model.)



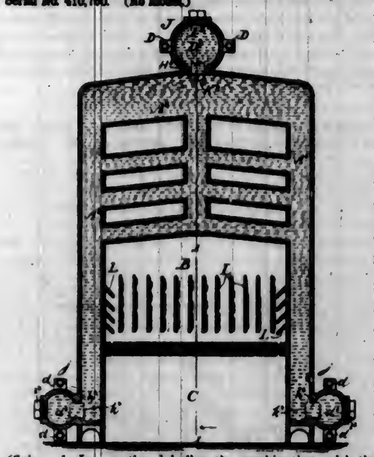
Claim.—1. An inclined track or runway for feeding cylindrical cans and packages by gravity to labeling-machines or other apparatus, consisting of two inclined troughs or tracks arranged on different levels, one over the other, the upper track having an outlet at the lower end to discharge the cans singly upon the lower track, a gate or yielding part adapted to hold a can in said outlet, a lever or part controlling said gate and being itself controlled by a can on the lower track, releasable stops on the lower track adapted to hold the can thereon, tripping-stops in the path of the rolling cans on the lower track, connected with the holding-stops and located at a distance below the same, and a stop or check behind the outlet in the upper track, controlled by the can suspended in the said outlet and adapted to hold back the can until the suspended can is released, combined for operation as set forth.

2. The combination, with an inclined trough or track for rolling cans, having an outlet for discharging the cans at the lower end, of a yielding gate or stop to hold a can suspended in said outlet and a check at the back of said outlet, which is held in position to stop the next can in the trough from dropping into the outlet by the can suspended in the outlet and is adapted to yield and release the can behind it as the suspended can is discharged through the outlet, substantially as described.

3. The combination of the two inclined tracks or runways A B, one above the other, the upper one having an outlet in the bottom, the yielding gate G, pivoted lever G', stops H and K on the lower track, and the yielding check at the back of the outlet, substantially as described.

481,897. SPROUT-PULLER. GEORGE T. CULL, Wickliffe, Ky. Filed Apr. 2, 1892. Serial No. 427,541. (No model.)

Claim.—1. An implement for the purpose described, consisting of a lever having one end bifurcated and an angular arm pivotally connected to said lever and adapted to extend across the slot in the end thereof, substantially as described.



2. In an implement for the purpose described, the combination of a lever having a fulcrum or block attached thereto at an intermediate point of its length and having one end bifurcated, and an angular arm

pivotally connected to the lever and adapted to extend across the slot in the end thereof, substantially as described.

3. The combination of a lever having one end bifurcated, a metallic plate secured to one face of the lever and projecting beyond the solid portion thereof, and an angular arm pivoted at one end to the lever and adapted to pass across the slot in the lever beyond the free edge of the protecting-plate, substantially as described.

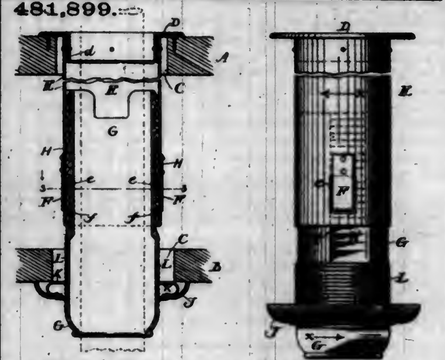
4. The combination of a lever having one end bifurcated, a fulcrum-block on the lever, a plate attached to the lever and provided with a slot which aligns with the slot in the lever, the central portion of said plate being cut away on its under surface to form a cutting-edge, and an angular arm pivoted to the lever and having one of its members provided with a cutting-edge and adapted to extend across the aligned slots in the protecting-plate and lever, substantially as described.

481,898. BOILER. GEORGE B. DIXON, Chicago, Ill., assignor of one-half to Robert Webster Caldwell, Sr., same place. Filed Nov. 2, 1891. Serial No. 410,780. (No model.)

Claim.—1. In a sectional boiler, the combination, with the several sections thereof, of a header having a number of openings through which it communicates with the several sections of the boiler and a second set of openings or hand-holds affording access to the openings aforesaid, a plug for closing at will any of the openings through which the header and any of the boiler-sections communicate, and removable plugs closing said hand-holes, substantially as set forth.

2. In a sectional boiler, the combination of a number of sections, a header formed in sections corresponding with the boiler-sections, openings through which the several sections of the boiler and header communicate, openings affording access to the interior of the several sections of the header, removable plugs closing the latter openings, and means for closing the former openings, substantially as set forth.

3. In a sectional boiler, the combination of a number of sections A', &c., a header formed in sections D', &c., corresponding with the boiler-sections, opening H', &c., through which the boiler-sections and header-sections communicate, a second series of openings larger than the openings H', &c., for affording access to the interior of the header, removable plugs I', &c., closing said openings, and plugs for closing at will any of the openings H', &c., substantially as set forth.



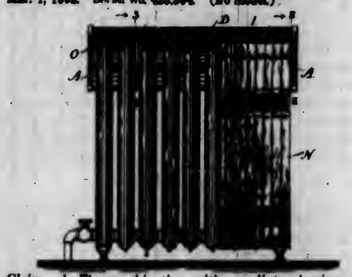
481,899. PIPE-INSULATOR. GEORGE B. DIXON, Chicago, Ill., assignor of one-half to Robert Webster Caldwell, same place. Filed Mar. 1, 1892. Serial No. 423,398. (No model.)

Claim.—1. In a pipe-insulator, the combination of two sleeves, a detent carried by one of said sleeves, and a rack extending only partly around the other, said sleeves being capable of relative rotation and said detent being adapted to be forced outward, and thereby disengaged from the rack, by the relative rotation of the sleeves, substantially as set forth.

2. In a pipe-insulator, the combination of two sleeves, a detent carried by one of said sleeves, and a rack extending only partly around the other, the surfaces between the teeth of the rack merging with the surface of the sleeve, substantially as set forth.

3. In a pipe-insulator, the combination of two sleeves, a detent carried by one of said sleeves, and a rack extending only partly around the other, the notches or depressions between the teeth of said rack terminating abruptly at one end, forming shoulders adapted to engage

481,899.



said detent and limit the relative rotation of said sleeves, and at the other end merging with the surface of the sleeve, substantially as set forth.

4. In a pipe-insulator, the combination of a pair of sleeves, a rack on one of said sleeves, a detent carried by the other and adapted to engage said rack, a second rack on one of the sleeves, and a collar adjustable on said second rack, the teeth of the second rack being closer together than the teeth of the first-named rack, substantially as set forth.

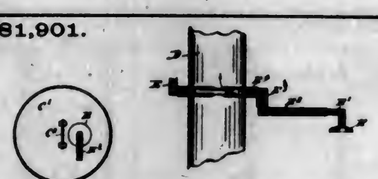
5. In a pipe-insulator, the combination of the floor-ring D, the sleeve E, secured thereto, a detent carried by said sleeve, the sleeve G, having racks H and L, and the ring J, adjustable on the rack L, substantially as set forth.

481,900. SHIELD FOR RADIATORS. GEORGE B. DIXON, Chicago, Ill., assignor of one-half to Robert Webster Caldwell, same place. Filed Mar. 1, 1892. Serial No. 423,394. (No model.)

Claim.—1. The combination, with a radiator having a number of loops, of a shield having brackets extending down between said loops and means between said loops for supporting said brackets, substantially as set forth.

2. The combination, with a radiator having a number of loops and struts between said loops for maintaining them at proper distances apart, of a shield having brackets extending down between the loops of the radiator and engaging said struts, substantially as set forth.

3. The combination, with a radiator having a number of loops, of a shield having brackets extending down between said loops and means between said loops for engaging said brackets, said brackets being adjustable longitudinally with respect to the shield, substantially as set forth.

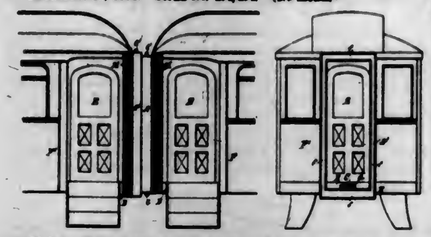


4. In a shield for radiators, the combination of the shield proper D and the brackets I, secured to said shield and having the cross-arms K, substantially as set forth.

5. A shield for radiators, having the shield proper D bent at its edge into a tube *d*, in combination with the castings A, having the flanges B, terminating in the C-shaped portions *b* and secured to the ends of said shield, and means for supporting it, substantially as set forth.

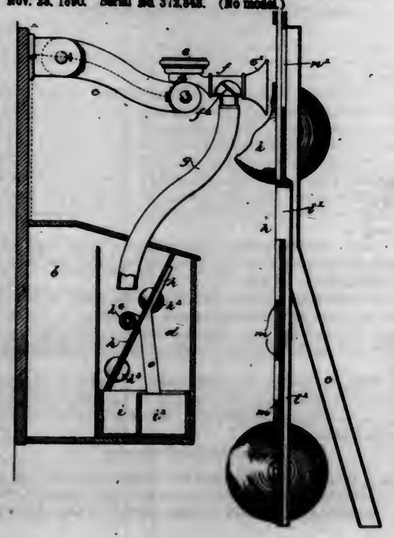
6. The combination of the shield proper D, the end castings A, secured to the ends of said shield, the pole N, supported at its ends by said end castings, and the curtain O, depending from said pole, substantially as set forth.

481,901. FUME-DRAINER FOR COOKING-VESSELS. BENJAMIN F. FOWLER, Minneapolis, Minn., assignor of one-half to Clarence R. Waterman, same place. Filed Mar. 19, 1892. Serial No. 425,542. (No model.)



481,901.

Claim.—1. The fume-drainer consisting of the pipe E^4, tapping the outlet-flue pipe D, and the telescoping sections F and F^3, connected with the said pipe E^4 by means of the double thimble-joint F^2, substantially as described.

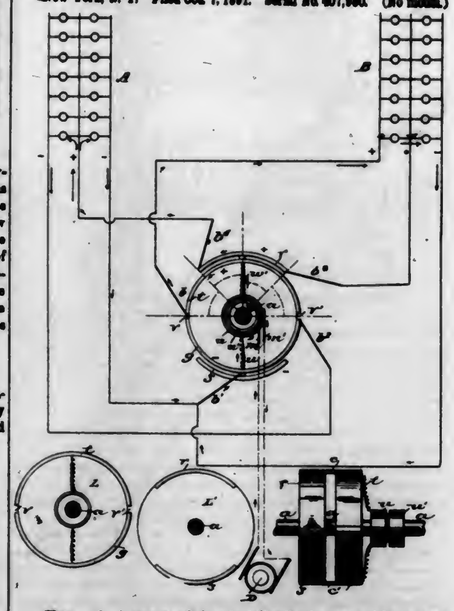


2. The fume-drainer consisting of the pipe E^4, tapping the outlet-pipe D and passing through the same, the pair of telescoping sections having secured to their outer ends the cups E and connected at their inner ends to the opposite ends of the said pipe E^4 by means of the double thimble-joints F^2, substantially as described.

481,902. VESTIBULE-CAR. GEORGE HADDON, Providence, R. I. Filed Mar. 10, 1892. Serial No. 424,494. (No model.)

Claim.—The combination, with the adjoining cars of a railway-train, of the connecting-frames, the one provided with a continuous edge and the other with a continuous groove adapted to receive the continuous edge of the opposite frame, the said groove being narrow at the sides of the frame and much wider at the top and bottom, the fixedly-pivoted bars arranged to support the upper and lower edges of the frames and provided with the studs extending in opposite directions loosely through the top and bottom portions of the frames, the springs arranged at opposite sides of the pivoted arms to hold the same in a central position, and the flexible material for connecting the frames to the vestibules of their respective cars, substantially as described.

481,908. COIN SIGNAL-SOUNDING DEVICE. CHARLES W. HOLBROOK, Windsor Locks, assignor, by mesne assignments, to the Gray Automatic Telephone Pay Station Company, Hartford, Conn. Filed Nov. 23, 1890. Serial No. 372,842. (No model.)



Claim.—1. In a telephone-toll collector, in combination, a signal-plate having a series of coin channels or guides located side by side across the plate, a trap for the passage of the false coins formed in the walls of the coin-channel and an outlet-channel extending from such traps, and a coin-box having separate receptacles appurtenant to the serviceable and the false coins, respectively, all substantially as described.

2. In a telephone-toll collector, a signal-plate having a series of coin-channels arranged in succession across the plate and the signal-bells projecting into one or more of the separate coin-channels, all substantially as described.

3. In a telephone-toll collector, a coin-channel having an irregular surface forming the coin-retarding device, and two or more signal-bells projecting into the path of movement of the coin and between which the retarding device is located, all substantially as described.

4. In a telephone-toll collector, in combination, a transmitter borne on an adjustable arm, an extensible tubular connection having a deflector at the upper end and extending from the transmitter to the signal-box, the signal-box containing the coin-plate and coin-receiving drawer, and the coin-plate having a series of coin-channels arranged across the plate with traps and a separate outlet for false coins, the several bells secured to the signal-plate, and the money-drawer divided into compartments to receive the separate classes of coins, all substantially as described.

481,904. SYSTEM OF ELECTRIC LIGHTING. ERNST HUBER, New York, N. Y. Filed Oct. 7, 1891. Serial No. 407,980. (No model.)

Claim.—1. A system of electrical distribution comprising two or more work circuits, a generator continuously supplying said circuits, and means for varying the current in each circuit, the arrangement being such that each work circuit successively receives its maximum current from the generator, while in the other circuits the current is diminished, but not interrupted, substantially as and for the purposes hereinbefore set forth.

2. The combination of two or more circuits and translating devices included therein, a generator continuously supplying the same, and means whereby the translating devices in the successive circuits are placed alternately in multiple and in series, substantially as and for the purposes hereinbefore set forth.

3. The combination of a revolving shaft carrying a series of ring-segments and a series of electrodes, the ring-segments being arranged in insulated pairs in the same circumferential plane, connections between a segment of one pair and a segment of another pair, a series of collecting mediums, a source of electric energy, connections between the source of energy and the electrodes and between the electrodes and segments, and a series of distributing-wires complemental to the collecting mediums.

4. The combination of a revolving shaft carrying a series of insulated ring-segments and a series of insulated electrodes, the segments being arranged in insulated pairs in the same circumferential plane, connections extending from a segment of one pair to a segment of another pair, the electrodes being arranged in pairs, connections between the electrodes and segments, a source of electric energy and connections between each source and the electrodes, and current-collecting mediums from which extend distributing-wires.

5. The combination of a revolving shaft carrying a series of insulated ring-segments and a series of insulated electrodes, the segments being arranged in insulated pairs in the same circumferential plane, the pairs being arranged relatively to each other in different vertical planes, connections extending from a segment of one pair to a segment of another pair, the electrodes being arranged in different vertical planes in proximity to each other and to the segments, connections between the electrodes and the segments, a source of electric energy and connections between each source and the electrodes, and current-collecting mediums from which extend distributing-wires.

6. The combination of a revolving shaft carrying a series of electrodes and a series of disks of insulating material, each disk being provided with a series of ring-segments, a segment of one series being connected to a segment of another series, a source of electric energy, current-collecting mediums, connections between the source of energy and the electrodes and between the electrodes and ring-segments, and a series of distributing wires.

7. The combination of a revolving shaft carrying a series of insulated electrodes and a series of disks of insulating material, each disk being provided with a series of insulated ring-segments, a segment of one series being connected to a segment of another series, a source of electric energy, current collecting mediums, connections between the source of energy and the electrodes and between the electrodes and ring-segments, and a series of distributing-wires.

8. The combination of a revolving shaft carrying a series of insulated electrodes and a series of disks of insulating material, each disk being provided with a series of insulated ring-segments arranged in the same circumferential plane, a segment of one series being connected to a segment of another series, a source of electric energy, current-collecting mediums, connections between the source of energy and the electrodes and between the electrodes and ring-segments, and a series of distributing-wires.

9. The combination of a revolving shaft carrying a series of insulated electrodes and a series of disks of insulating material, each disk being provided with a series of insulated ring-segments, a segment of one series being connected with a segment of another series, a source of electric energy, current-collecting mediums, connections between the source of energy and the electrodes and between the electrodes and ring-segments, and a series of distributing-wires.

10. The combination of a revolving shaft carrying a series of electrodes insulated from the shaft and from each other and arranged in parallel vertical planes, a series of insulating-disks carried by said shaft and each provided with a series of insulated ring-segments, a segment of one series being connected to a segment of another series, current-collecting mediums, a source of electric energy and connections extending from the source of energy to the electrodes and from the latter to the segments.

11. The combination of a revolving shaft carrying a series of electrodes and also a series of disks of insulating material, the disks being insulated from each other and arranged in parallel vertical planes and each disk carrying a pair of ring-segments arranged in the same circumferential plane, a segment of one series being connected to a segment of another series, current-collecting mediums, a source of electric energy, and connections extending from the source of energy to the electrodes and from the electrodes to the segments.

12. The combination of a revolving shaft carrying a series of electrodes insulated from the shaft and from each other and arranged in parallel vertical planes, a series of disks of insulating material insulated from each other and carried by said shaft, each disk being provided with a series of insulated ring-segments arranged in the same circumferential plane, a segment of one series being connected to a segment of another series, current-collecting mediums, a source of electric energy, and connections extending from the source of energy to the electrodes and from the electrodes to the segments.

481,905. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Sept. 21, 1891. Serial No. 406,406. (No model.)

Claim.—1. In an electric railway, the combination of a main track and a branch track, a conductor arranged along the main track and having its under side exposed or unobstructed, a conductor arranged along the branch track and having its under side exposed or unobstructed and separated from the main conductor at the junction of the tracks a distance sufficient to allow a downwardly-extending collector to pass, an electrically-propelled vehicle, and a downwardly-extending collector carried by and connected to said vehicle above the conductors and having a vertically-adjustable contact making a traveling electrical connection with the under side of either of the conductors of the main line or branch.

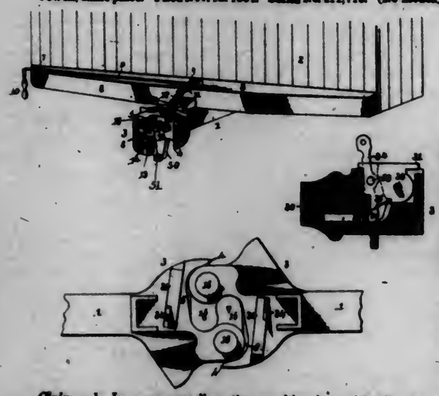
2. In an electric railway, the combination of a main track and a branch track, a conductor arranged along the main track and having its under side exposed or unobstructed, a conductor arranged along the branch track and having its under side exposed or unobstructed and separated from the main conductor at the branching point a distance sufficient to allow the collector to pass, an electrically-propelled vehicle, a branch, and a current-collecting device carried by the vehicle, formed of a rearwardly-extending arm pivoted upon a transverse axis and having a grooved contact device at its free end, adapted to make an underrunning contact with the under surface of the conductor of the main line or branch.

3. In an electric railway, the combination of a main track and a branch track, a conductor arranged along the main track and having its under side exposed or unobstructed, a conductor arranged along the branch track and having its under side exposed or unobstructed and separated from the main conductor at the branching point a distance sufficient to allow a downwardly-extending collector to pass, an electrically-propelled vehicle, a downwardly-extending collector carried by and connected to said vehicle above the conductor and having a vertically-adjustable contact making a traveling electrical connection with the under side of either of the conductors of the main line or branch, and a mechanical connection between said arm and the forward part of the vehicle to control the raising and lowering of said contact.

4. In an electric railway, the combination of a main track and a branch track, a conductor arranged along the main track and having its under side exposed or unobstructed, a conductor arranged along the branch track and having its under side exposed or unobstructed and separated from the main conductor at the branching point a distance sufficient to allow a downwardly-extending collector to pass, an electrically-propelled vehicle, a downwardly-extending current-collecting device carried by and connected to the vehicle above the conductor and formed of a downwardly-extending and rearwardly-extending arm pivoted upon a transverse axis and having a grooved contact device at its free end, adapted to make an underrunning contact with the under surface of the conductor of the main line or branch, and a mechanical connection between said arm and the forward part of the vehicle to control the raising or lowering of said contact.

5. In an electric railway, the combination of a main track and a branch track, a conductor arranged along the main track and having its under side exposed or unobstructed, a conductor arranged along the branch track and having its under side exposed or unobstructed and separated from the main conductor at the branching point a distance sufficient to allow a downwardly-extending collector to pass, an electrically-propelled vehicle, and a downwardly-extending current-collecting device carried by and connected to the vehicle above the conductors and consisting of a rearwardly-extending spring-actuated arm pivoted upon a transverse axis and having a grooved contact device at its free end, adapted to make an underrunning contact with the under surface of the conductor of the main line or branch.

6. In an electric railway, the combination of a main track and a branch track, a conductor arranged along the main track and having its under side exposed or unobstructed, a conductor arranged along the branch track and having its under side exposed or unobstructed and separated from the main conductor at the branching point a distance sufficient to allow the collector to pass, an electrically-propelled vehicle, a collector carried by said vehicle, having a vertically-adjustable contact making a traveling electrical connection with the under side of either of the conductors of the main line or branch, and a short section of electrical conductor arranged partly below the conductors of the main line and branch at the branching point of the railway for supplying current to the collector when passing the separation between the conductors of the main line and branch.



7. In an electric railway, the combination of a main track and a branch track, a conductor arranged along the main track and having its under side exposed or unobstructed, a conductor arranged along the branch track and having its under side exposed or unobstructed and separated from the main conductor at the branching point a distance sufficient to allow the collector to pass, an electrically-propelled vehicle, a current-collecting device carried by the vehicle, formed of a rearwardly-extending arm pivoted upon a transverse axis and having a grooved contact device at its free end, adapted to make an underrunning contact with the under side of the conductor of the main

line or branch, a mechanical connection between the said arm and the forward part of the vehicle to control the raising or lowering of said arm, and a short section of electrical conductor arranged partly below the conductors of the main line and branch at the branching point of the railway for supplying current to the collector when passing the separation between the conductors of the main line and branch.

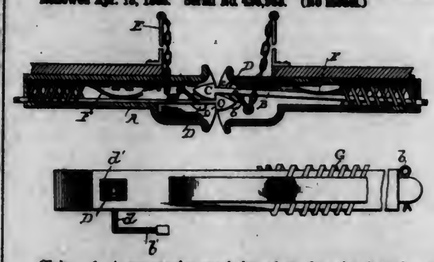
8. In an electric railway, a slotted conduit arranged along a railway, a suspended conductor arranged within the slotted conduit and insulated therefrom, an electrically-propelled vehicle, and a current-collecting device carried by the vehicle, extending through the slot of the conduit, and having a rearwardly-extending pivoted arm provided with a contact making an undermunning electrical connection with the suspended conductor, and a spring arranged above the slot of the conduit to hold the contact in connection with the conductor.

9. In an electric railway, a slotted conduit arranged along a railway, a suspended conductor arranged within the slotted conduit and insulated therefrom, an electrically-propelled vehicle, and a current-collecting device carried by the vehicle and consisting of a frame extending through the slot of the conduit and having a rearwardly-extending pivoted arm provided with a contact making an undermunning electrical connection with the suspended conductor, a spring to hold the contact in connection with the conductor, and a mechanical device leading to the front end of the car for moving the said contact device away from the conductor.

481,906. CAR-COUPLING. DELBERT W. JEWELL and GEORGE JEWELL, Alexander, N. Y., assignors of one-half to Jasper B. Lewis and John Jewell, same place. Filed Nov. 12, 1891. Serial No. 411,718. (No model.)

Claim.—1. In a car-coupling, the combination, with the draw-head and a catch therein, the body of the draw-head having a horizontal cavity and a pin in the bottom thereof, of a jaw mounted on a vertical pivot, an arm projecting from said jaw and moving in the cavity, and a recess in the arm, moving over said pin.

2. In a car-coupling, the combination, with the draw-head having a horizontal cavity and a vertical recess, a lug rising from the bottom of said cavity, a catch mounted on a horizontal pivot in said recess, and a pin pivoted to the catch and adapted to rest on the upper end of the lug when the catch is raised, of a jaw mounted on a vertical pivot, an arm projecting from said jaw and moving in the cavity of the draw-head, the rear end of said arm having an arc moving past said lug and pin, and a projection on the face of this arc adapted to strike the pin as the device is uncoupled.



3. In a car-coupling, the combination, with the draw-head having a horizontal cavity and a vertical recess, a lug rising from the bottom of said cavity, a catch mounted on a horizontal pivot in said recess, and a pin pivoted to the catch and adapted to rest on the upper end of the lug when the catch is raised, of a jaw mounted on a vertical pivot, an arm projecting from said jaw and moving in a cavity of the draw-head, the rear end of said arm having an arc moving past said lug and pin, and a heel projecting from the face of this arc at a point to move over said lug.

4. In a car-coupling, the combination, with the draw-head having a horizontal cavity and a vertical recess, a pivoted jaw having an arm moving in said cavity, a lug rising from the bottom of the latter in rear of said arm, a catch pivoted in said recess, and a pin pivoted to the catch, of an oscillating rod on the end of the car, a crank projecting therefrom above the catch, and a chain connecting this crank with the head of the pin, so as to move the lower end of the latter onto the lug as the catch is raised.

5. In a car-coupling, the combination, with the draw-head having a horizontal cavity and a vertical recess, a lug rising from the bottom of said cavity, a catch mounted on a horizontal pivot in said recess, and a pin pivoted to the catch and adapted to rest on the upper end of the lug when the catch is raised, of a jaw mounted on a vertical pivot, an arm projecting from said jaw and moving in the cavity of the draw-head past said lug and pin, and a projection on the arm adapted to strike the pin as the device is uncoupled.

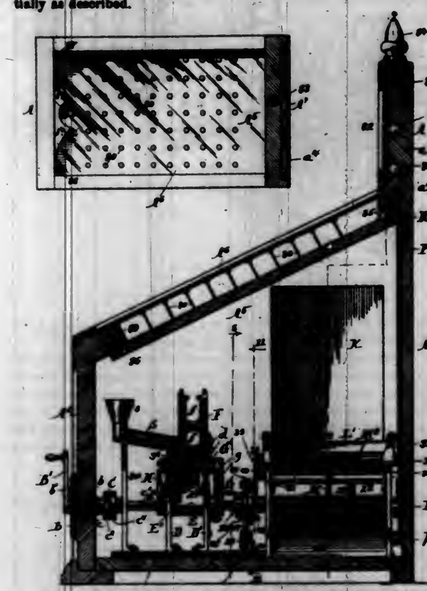
6. In a car-coupling, the combination, with the draw-head having a horizontal cavity, a lug within the same, and a V-shaped spring, one foot of which bears against the lug, of a jaw mounted on a vertical pivot and having a notch in its body, within which the other foot of said spring rests, a stop for limiting the outward movement of the jaw, and a pin pivotally mounted for holding said jaw in closed position.

481,907. CAR-COUPLING. JEFFERSON KNUDSEN, San Diego, Cal., assignor to Milton S. Babcock, same place. Filed May 27, 1892. Renewed Apr. 13, 1892. Serial No. 430,962. (No model.)

Claim.—1. A car-coupler consisting of the draw-head A, the arrow-headed tongues secured therein, the cams mounted in said tongues and operated by the arm d', the spring F, secured to the upper side of the draw-head and arranged to hold the tongue against the lower side of the draw-head, substantially as described.

2. The combination of the draw-head, the tongues passing through the same and secured at its inner end by the bolt b, as shown, while the other end thereof is provided with the pointed ends having the shoulders c, the cams mounted in the tongues near the head thereof, the arm b', connected with the standard E by the operating-chain, and the spring F, secured to the upper side of the draw-head, as set forth.

3. The combination, with a railway-car, of the draw-head A, provided with the tongue B, the spiral spring G, the oblong cam D, pivotally mounted in the tongue and adapted to press against the head of the other tongue and thus separate the heads thereof, the spring F, secured to the inner side of the draw-head and pressing downwardly against the tongue, the transverse shaft d, and the arm b', adapted to actuate the cam, substantially as described.



481,908. APPARATUS FOR DISPENSING ARTICLES OF MERCHANDISE. ROBERT H. LITTLE, Chicago, Ill., assignor to John G. Saxe, same place. Filed May 7, 1891. Serial No. 391,867. (No model.)

Claim.—1. In apparatus of the class described, the combination, with a coin-controlled mechanism, of a supplemental carrier provided with a seat to receive a ball or sphere, operative connections between said supplemental carrier and said coin-controlled mechanism, suitable means for delivering a ball or sphere to the seat of said supplemental carrier, and a handle for operating said supplemental carrier, whereby when a ball is within the seat of said supplemental carrier the movement of said carrier will serve to actuate the coin-controlled mechanism, substantially as described.

2. In apparatus of the class described, the combination, with suitable coin-controlled mechanism, of a supplemental carrier adapted to receive a rolling body, suitable operative connections between said supplemental carrier and the coin-controlled mechanism, and a plate provided with means for deflecting the rolling body before its passage into said supplemental carrier, substantially as described.

3. In apparatus of the class described, the combination, with suitable coin-controlled mechanism, of a supplemental carrier adapted to receive a rolling body, a handle for shifting said supplemental carrier, suitable operative connections between said supplemental carrier and the coin-controlled mechanism, and a plate provided with plan for deflecting the rolling body before its passage into said supplemental carrier, substantially as described.

4. In apparatus of the class described, the combination, with a coin-carrier, and means for delivering the coin thereto, and suitable operative connections between said carrier and the mechanism to be actuated thereby, of a supplemental carrier adapted to receive a rolling body, and suitable operative connections between said supplemental carrier and the mechanism actuated by the coin-carrier, means for delivering a rolling body to said supplemental carrier, and mechanism for actuating said coin-carrier and said supplemental carrier, substantially as described.

5. In apparatus of the class described, the combination, with a coin-carrier, and means for delivering the coin thereto, and suitable operative connections between said carrier and the mechanism to be actuated thereby, of a supplemental carrier having a seat to receive the rolling body, suitable operative connections between said supplemental carrier and the mechanism to be operated by the coin-carrier, means for delivering a rolling body to the seat of the supplemental carrier, and a suitable handle connected with said coin-carrier and said supplemental carrier for actuating the same, substantially as described.

6. In apparatus of the class described, the combination, with a coin-carrier and means for delivering the coin thereto, of an operating-bar adapted to be engaged by said coin-carrier when a coin is carried thereby, a movable part connected to said operating-bar, a supplemental carrier having a seat to receive a ball or sphere and adapted to actuate said operating-bar, means for delivering a ball or sphere to the said seat of the supplemental carrier, and suitable means for actuating both said coin-carrier and said supplemental carrier, substantially as described.

7. In apparatus of the class described, the combination, with a coin-carrier and means for delivering the coin thereto and suitable operative connections between said coin-carrier and the mechanism to be actuated thereby, of a supplemental ball-carrier, and suitable operative connections between said supplemental carrier and the mechanism actuated by the coin-carrier, means for delivering a ball or sphere to the said supplemental carrier, suitable means for actuating said coin-carrier and said supplemental carrier, and a perforated plate over which the ball will roll, said plate being provided with means for deflecting the ball before its delivery to the supplemental carrier, substantially as described.

8. In apparatus of the class described, the combination of a coin-carrier having a seat adapted to receive a coin, means for delivering a coin to said coin-carrier, a handle connected with said coin-carrier whereby it may be shifted, an operating-bar extending into position to be engaged by a coin within said coin-carrier, a shaft for sustaining said operating-bar separate from the coin-carrier, a segment-rack mounted upon said shaft, a discharge-plate provided with a rack for engagement with said segment-rack, a spring for retracting said segment-rack and said operating-bar and said discharge-plate, a table above said discharge-plate having an opening therein, a box for sustaining the articles to be dispensed, said box being mounted above said table, and a stationary false bottom or plate below said table and serving to support the articles to be dispensed, substantially as described.

9. In apparatus of the class described, the combination of a suitable coin-carrier and means for shifting the same, an operating-bar extending into position to be engaged by a coin within the seat of said coin-carrier, a shaft whereon said operating-bar is sustained separate from said coin-carrier, a segment-rack mounted upon said shaft, a discharge-plate provided with a rack for engagement with said segment-rack, a table beneath which said discharge-plate is sustained, said table being provided with an opening through which the articles to be dispensed may pass one at a time, a false bottom or plate beneath said opening for sustaining the articles to be dispensed, a spring for retracting said shaft and its connected parts, and a suitable discharge chute or apron beneath said false bottom to receive the articles discharged therefrom, substantially as described.

10. In apparatus of the class described, the combination of a carrier for receiving a body whereby the mechanism will be rendered operative and means for operating said carrier, of a discharge device, suitable operative connections between said discharge device and said coin-carrier, a box for sustaining the articles to be dispensed, said box being divided into compartments, and suitable means for shifting said box, substantially as described.

11. In apparatus of the class described, the combination of a carrier for a coin or other body and means for operating the same, of a discharge device, suitable operative connections between said discharge device and said coin-carrier, a box for sustaining the articles to be dispensed, said box being divided into compartments, a shifting frame for advancing said box, and suitable intermittently-actuating mechanism for advancing said box to bring its successive compartments into position to be emptied, substantially as described.

12. In apparatus of the class described, the combination, with a suitable delivery device and mechanism for operating the same, of a box having compartments for containing the articles to be dispensed, a spring for advancing said box, an escapement for controlling the action of said spring, and a pawl and ratchet for operating said escapement mechanism, said pawl and ratchet being operatively connected with said delivery devices, whereby after a certain number of articles have been delivered the escapement will be operated to effect the advance of the compartment-box, substantially as described.

13. In apparatus of the class described, the combination, with suitable delivery mechanism comprising a table having a space therein through which the articles to be delivered may pass, of a false bottom or plate beneath said delivery-space of said table, a series of compartments mounted above said table, a shifting frame connected to said series of compartments, a spring for advancing said shifting frame, and an escapement for controlling the action of said spring, substantially as described.

14. In apparatus of the class described, the combination, with suitable coin-controlled mechanism, of a carrier adapted to receive a rolling body, a plate over which said rolling body may pass, said plate being provided with projections for deflecting said rolling body, and a device connected with the coin-controlled mechanism for delivering said rolling body onto said plate, substantially as described.

15. In apparatus of the class described, the combination, with suitable coin-controlled mechanism, of a carrier adapted to receive a rolling body, a plate over which said rolling body may pass, said plate being provided with projections for deflecting said rolling body, a suitable receptacle for the rolling bodies, a suitable releasing device—such, for example, as a slide-block—for deflecting the rolling bodies successively onto said plate, and suitable connecting mechanism between said slide-block and the coin-controlled mechanism, whereby the operation of the coin-controlled mechanism will serve to release said rolling bodies, substantially as described.

16. In apparatus of the class described, the combination of a coin-carrier, an operating-shaft, and suitable connections whereby said operating-shaft may be suited with said coin-carrier, an arm upon said operating-shaft, a shifting rod adapted to be moved by said arm, a discharge device—such, for example, as a slide-block—connected with said shifting rod, a receptacle for rolling bodies, the discharge from which is controlled by said slide-block, an inclined plate provided with projections for deflecting said rolling bodies, a supplemental carrier beneath said inclined plate, and suitable means for conducting the rolling bodies from said inclined plate to said supplemental carrier, substantially as described.

17. In apparatus of the class described, the combination of a coin-carrier having a seat adapted to receive a coin, means for delivering the coin to said coin-carrier, a handle connected with said coin-carrier whereby it may be shifted, a pivoted operating-bar extending into position to be engaged by a coin within said coin-carrier, means for shifting said pivoted bar to release said coin, and a shaft whereon said pivoted operating-bar is mounted, said shaft being movable independently of the coin-carrier and serving to actuate suitable mechanism to be controlled by the coin-carrier, substantially as described.

18. In apparatus of the class described, the combination of a coin-carrier having a seat adapted to receive a coin, means for delivering the coin to said coin-carrier, a handle connected with said coin-carrier whereby it may be shifted, a pivoted operating-bar extending into position to be engaged by a coin within said coin-carrier, a frame for said operating-bar, a shaft to which said frame is connected, said shaft be-

ing movable independently of the coin-carrier, a cam-plate with which said operating-bar is engaged, and suitable connections between said shaft and the mechanism to be operated thereby, substantially as described.

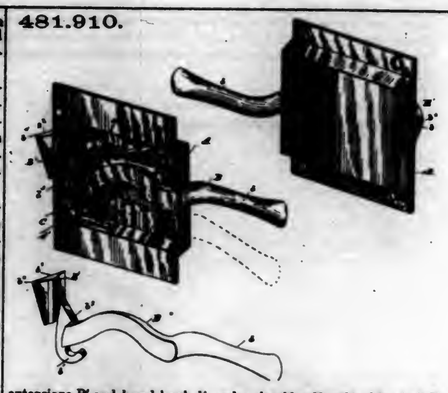
19. In apparatus of the class described, the combination of a carrier having a seat to receive a rolling body, means for delivering a rolling body to said carrier, a handle for shifting said carrier, a plate provided with projections for deflecting said rolling bodies, suitable means for delivering the rolling bodies to said carrier, and connections between the said carrier and the mechanism to be operated thereby, substantially as described.

20. In apparatus of the class described, the combination of a carrier having a seat to receive a ball or sphere, a shaft-section whereon said carrier is mounted, a suitable handle for operating said shaft-section, an operating-bar adapted to be engaged by a ball or sphere within said carrier, a shaft-section to which said operating-bar is attached, suitable connections between said shaft-section and the mechanism to be operated thereby, a plate provided with projections for deflecting the rolling body, a suitable conduit for delivering the balls or spheres from said plate to said carrier, and suitable mechanism for delivering the balls or spheres ceto said plate, substantially as described.

21. In apparatus of the class described, the combination of a carrier having a seat to receive a ball or sphere, means for delivering the ball or sphere thereto, a handle for shifting said carrier, an inclined plate provided with projections for deflecting the balls or spheres delivered thereto and having its bottom perforated to permit the balls or spheres to pass through said plate, an operating-bar adapted to be engaged by a ball or sphere within said carrier, and suitable connections between said operating-bar and the mechanism to be actuated thereby, substantially as described.

481,909. SOLE. HOLLIS W. MERRILL, Lynn, assignor to the American Shoe Tip Company, Boston, Mass. Filed Nov. 24, 1891. Serial No. 412,943. (No model.)

Claim.—1. An intermediate sole for boots or shoes, consisting of a central portion or body *g*, skived at its edge around the toe and sides, and an edge finish *f*, consisting of a reversely-skived strip of finished leather folded upon itself, the beveled inner edge of the piece *f* being joined to the reversely-beveled edge of the portion *g*, substantially as shown and described.

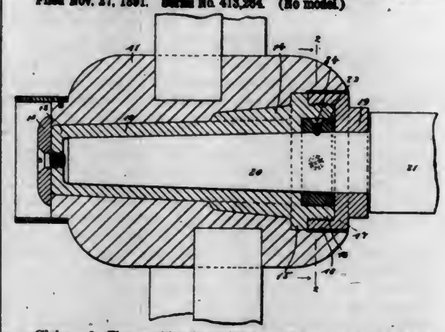


2. An intermediate sole for boots or shoes, consisting of a central portion or body *g*, provided around its toe and sides with an edge of finished material, composed of a reversely-beveled strip of finished leather folded upon itself and having a molded projection outside the line of the upper, whereby when the intermediate sole is in position in the shoe the lower edge of the upper is protected, substantially as shown and described.

481,910. LATCH. CHARLES W. MONROE, Cleveland, Ohio. Filed Sept. 21, 1891. Serial No. 406,233. (No model.)

Claim.—1. The combination of a latch-case A, provided with a short latch-opening on one edge and a slotted opening on the opposite side and an interior corner lug A', a latch-bolt extending through the openings in the case on either side, one extremity being beveled to form a latch, the other forming a handle and the central portion forming approximately a right angle and provided with hook *b'*, substantially as described.

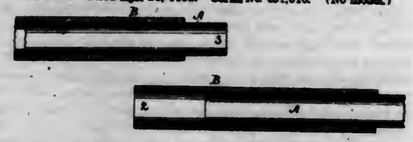
2. A case provided with long and short openings *a* and *a'*, and a corner lug A', in combination with the angular latch-bolt B, extending through the openings in said case and provided with the long and short



481,910.

extensions *B'* and *b* and hook *b'*, and a shoulder *b²* and locking-bolt E, with the corner spring C, substantially as described.

3. The combination of a case provided with long and short side openings and a corner lug integral with the case, a latch-bolt pivotally connected with the corner lug and provided with long and short extensions arranged to meet angularly at the pivoted point, and a hook *b'*, a beveled latch-head on the short extension, the said beveled head being cut away at its lower portion to form a pointed wedge, substantially as set forth.

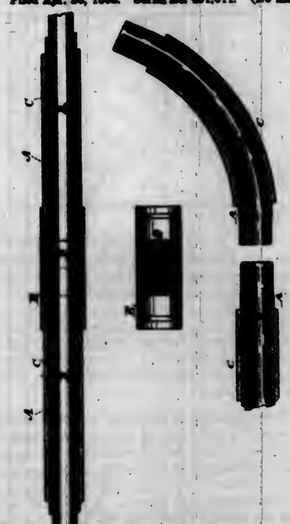


481,911. AXLE-BEARING. THOMAS J. MCGEE, Hattiesburg, Miss. Filed Nov. 27, 1891. Serial No. 413,264. (No model.)

Claim.—1. The combination, with the axle-box closed at its outer end and provided in said closed end with a threaded aperture, of the fastening-plate of greater diameter than said closed end and provided with a retaining-screw entering said aperture, substantially as set forth.

2. The combination, with the axle-box having a closed outer end provided with a threaded aperture and an annular recess in the inner end of the box to receive the axle-collar, of the plate 13, of greater diameter than the closed end of the box, having a screw entering said aperture, and a nut screwed upon the inner threaded end 16 of the box and closing the outer side of the said annular recess, substantially as set forth.

481,912. CONDUIT FOR ELECTRIC CONDUCTORS. AUGUSTUS HOLL, Mount Vernon, N. Y., assignor to Abner J. Tower, trustee, Boston, Mass. Filed Apr. 28, 1892. Serial No. 431,010. (No model.)



Claim.—1. The conduit for electric conductors, composed of metallic-tube sections inclosed in tubular coverings of insulating material, there being tubular insulating material forming the connection between one metallic-tube section and the next, substantially as specified.

2. A conduit for electric conductors, composed of metallic-tube sections and a tubular covering of insulating material upon each tube-section, the insulated tubular covering projecting at one end of each

section, so as to receive into it the projecting metallic tube of the next section, the parts being secured together, substantially as set forth.

3. The conduit for electric conductors, composed of metallic-tube sections, each tube-section being inclosed in a tubular covering of insulating material, the metal tube of one section passing into the end of the tubular covering of the next section, there being an insulating-washer between the ends of the metallic tubes, substantially as set forth.

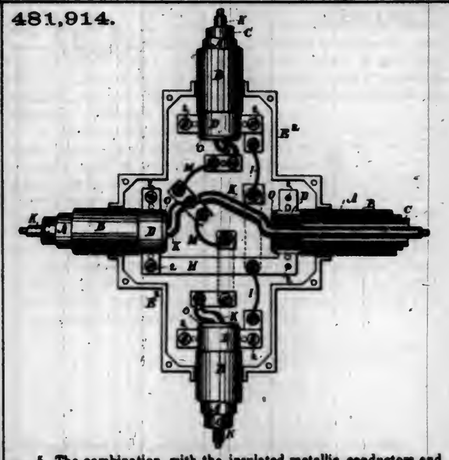
481,918. CONDUIT FOR ELECTRIC CONDUCTORS. AUGUSTUS HOLL, Mount Vernon, N. Y., assignor to Abner J. Tower, trustee, Boston, Mass. Filed Apr. 28, 1892. Serial No. 431,011. (No model.)

Claim.—1. The conduit for electric conductors, composed of a metal tube with a lining of insulating material adhering to the inside of the metal tube and a casing or covering of insulating material, substantially as set forth.

2. The combination, in a conduit for electric conductors, of metallic tubes lined with insulating material that adheres to the metal of the tubes and coated with insulating material and metallic couplings connecting the metallic-tube sections, substantially as set forth.

3. The combination, in a conduit for electric conductors, of metallic-tube sections lined with an insulating material and covered with an insulating-coating, and metallic screw-couplings for uniting the metallic-tube sections and an insulating-covering upon the outside of each screw-coupling, substantially as set forth.

481,914. ELECTRIC-CIRCUIT CONNECTION. AUGUSTUS HOLL, Mount Vernon, N. Y., assignor to Abner J. Tower, trustee, Boston, Mass. Filed Apr. 28, 1892. Serial No. 431,012. (No model.)

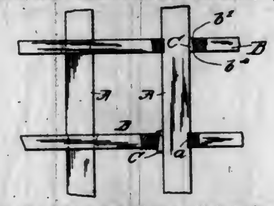


Claim.—1. The combination, with the insulated metallic conductors, of tubular metallic conduits inclosed in insulating material, junction-boxes and metallic clips for receiving the ends of the tubular metallic conduits, and electric connections to such clips, substantially as set forth.

2. The combination, with the insulated metallic conductors and the tubular insulated metallic conduits, of a junction-box into which the ends of the conduits pass, metallic clips for receiving and holding the exposed ends of the metallic tubular conduits, metallic connections between the respective clips and blocks, and clamp-screws for the metallic conductors, substantially as set forth.

3. The combination, with the conduit formed of a metal tube having an insulating-covering, of an insulated conductor within the conduit, a movable perforated plug through which the conductor passes, and a clamp around the metallic tube where the plug is applied for holding the tube, substantially as specified.

4. The combination, with a tubular conduit formed of a metal tube having an insulating-covering, of an insulated conductor within the conduit, and a movable perforated plug through which the insulated conductor passes and which plug is received into the open end of the conduit, and metallic clips adapted to receive and clamp the exposed ends of the metallic tubes of the conduit, and metallic connections to the clips, whereby the metallic tubes of the conduits can be used for the exterior circuit connections, substantially as set forth.



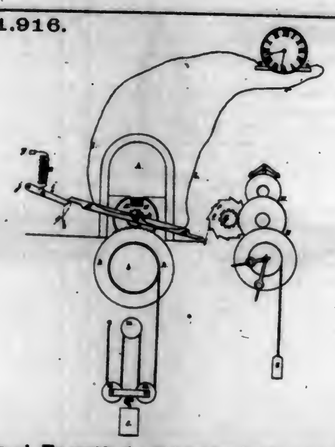
481,914.

5. The combination, with the insulated metallic conductors and the metallic conduit-tubes inclosed in insulating material and having exposed ends, of metallic clips receiving and holding such exposed ends, porcelain blocks to which such clips are attached, and circuit-connecting plates or strips in grooves in the porcelain and fusible cut-out connections, substantially as set forth.

6. The combination, with the rosettes or junction-boxes, of tubular conduits and conductors passed into the notched edges of such junction-boxes and clips for holding the ends of the conduits within the boxes, so that they may be detached without removing the junction-boxes, substantially as set forth.

481,915. JAIL-GRATING. GODFREY L. NOREMAN, Atlanta, Ga. Filed Apr. 13, 1892. Serial No. 429,058. (No model.)

Claim.—1. In a device of the class specified, the bars B, horizontally arranged and slotted, bars A, inserted in said slots and being notched to engage said bars B, and wedge-shaped keys C, adapted to be driven into the recesses beside the said bars A, for the purpose specified.

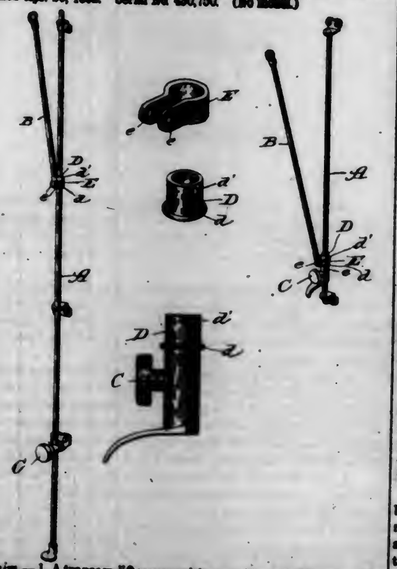


2. In a device of the class specified, bars B, having slots therein, one end of each of said slots having inclined faces *b'* and *b²*, bars A, notched and adapted to be inserted in said slots, and tapering keys driven into the said slots beside the bars A and being upset to fill the openings completely, for the purpose specified.

3. In a device of the class specified, bars B, having slots therein, one end of each of said slots having inclined faces *b'* and *b²*, bars A, notched and adapted to be inserted in said slots, and tapering keys driven into the said slots beside the bars A and being upset to fill the openings completely and being cut off flush with the top and bottom of the bars B, substantially as and for the purpose specified.

4. In a device of the class specified, bars B, having slots therein, one end of each of said slots having inclined faces *b'* and *b²*, one of which faces is longer than the other, bars A, notched and adapted to be inserted in said slots, and tapering keys driven into the said slots beside said bars A and being upset to fill the openings completely and being cut off flush with the top and bottom of the bars B, substantially as and for the purpose specified.

481,916. ELECTRIC CENTRAL CLOCK. NICOLAUS PROKOSCHOFF, Kiev, Russia, assignor of one-half to Nicolaus Fahlberg, same place. Filed Sept. 4, 1891. Serial No. 404,756. (No model.) Patented in Germany Mar. 27, 1890, No. 54,622; in Belgium Oct. 28, 1890, No. 92,510; in France Nov. 3, 1890, No. 209,264, and in England Nov. 22, 1890, No. 18,998.

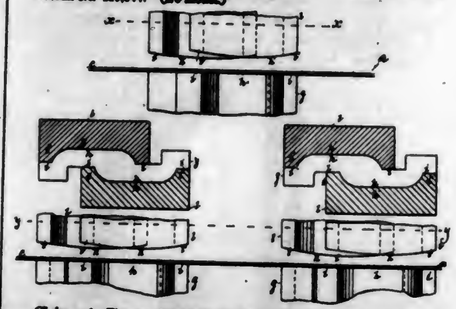


481,916.

Claim.—1. The combination, with primary and secondary clocks having, respectively, a toothed wheel *f* and a suitable electro-magnetic escapement, of an induction mechanism comprising an intermittingly-revolving induction-coil and a doubled-armed lever, the latter revolving in unison with said coil and coacting with said toothed wheel, and an electric circuit connecting said induction-coil and said electro-magnetic escapement, substantially as hereinbefore specified.

2. In combination with the intermittingly-revolving double-armed lever *d* and toothed wheel *f*, the spring-suspended lever *e*, which co-acts with and arrests or partially arrests said lever *d* before it has performed half a revolution for the purpose of causing the respective ends of said lever *d* to engage alternately with said toothed wheel *f* without any jar or shock, substantially as hereinbefore specified.

481,917. TRANSOM-LIFTER. JOHN F. WOLLESEN, Chicago, Ill. Filed Apr. 26, 1892. Serial No. 430,750. (No model.)



Claim.—1. A transom-lifter comprising a guide-rod sliding in guide-plates and a lifter-arm rotatably secured to said guide-rod through a swivel connection, substantially as described.

2. In a transom-lifter, the combination of a guide-rod, a sleeve secured thereto, a collar encircling said sleeve and adapted to rotate thereon, means whereby the collar is prevented from slipping up or down, and a lifting-arm secured to said collar, substantially as described.

3. In a transom-lifter, a guide-rod, a sleeve moving longitudinally along said rod and adapted to be locked at the proper point thereon, a set-screw to effect such locking, a collar encircling said sleeve and adapted to rotate thereon, means whereby the collar is prevented from slipping up or down, and a lifting-arm secured to said collar, substantially as described.

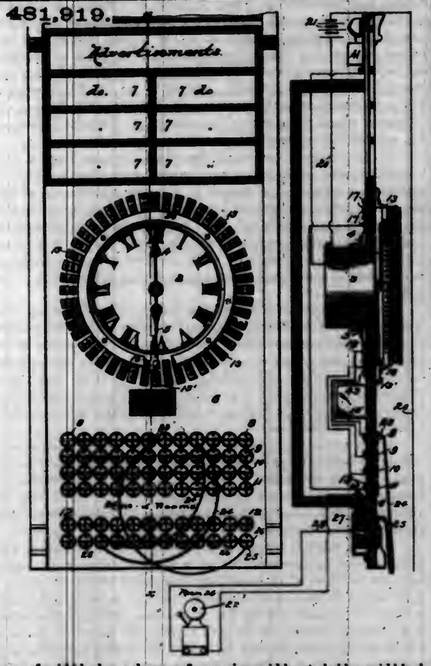
481,918. DIE FOR USE IN MACHINES FOR MAKING METALLIC FENCING. THOMAS V. ALLEN, New York, N. Y. Filed Jan. 27, 1892. Serial No. 419,377. (No model.)

Claim.—1. The combination of the duplex bed-die consisting of two notch-cutting edges *h*, one at each side at a predetermined distance apart laterally and each overlapping the other in the lengthwise direction of the die-face, so that each of said edges terminates opposite the center of the other and being converse to each other suitably for notching the opposite edges of the intermediate plain strip, and the punches or movable dies having the counterpart edges *h'* and respectively arranged for co-operation with said edges of the bed-die, substantially as described.

2. The combination of the duplex bed-die consisting of two notch-cutting edges *h* and slit-cutting edges *i*, one on each side at a predetermined distance apart laterally and each overlapping the other in the lengthwise direction of the die-face, so that parts *h* each terminate opposite the center of the other and being converse to each other suitably for notching the opposite edges of the intermediate plain strip, and the punches or movable dies having the counterpart edges *h' i'* and respectively arranged for co-operation with said edges of the bed-die, substantially as described.

3. The combination of dies for producing two barbed strips and one notched strip from one blank, consisting of two sets of duplex bed and movable dies having notch and slit cutting edges *h i* and *h' i'* to cut the strip in two slits, making points on the barbed strips and notches on the other, said two sets of dies being located apart the length of three notches of the barbed strips in the line of the feed movements of the strip, substantially as described.

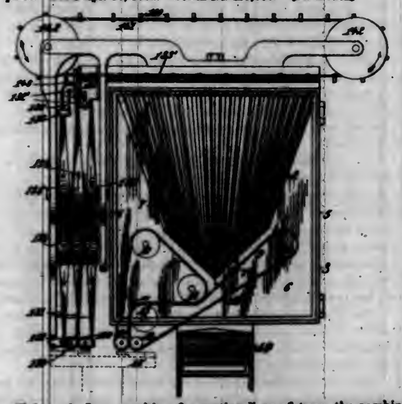
481,919. ELECTRIC GUEST-CALL. FRANKLIN BENNER, Minneapolis, Minn. Filed Oct. 26, 1891. Serial No. 409,806. (No model.)



Claim.—1. The combination, in a guest-call, of a clock and an hour-hand for the same, provided with a contact brush or spring 16, with contact-bracket segments 13 arranged about the dial of said clock, movable pins 16, arranged in said brackets and adapted to be pushed through the same into the path of the end of said spring 16, said segments being insulated from one another, and means for connecting the same with call-bells arranged in the several rooms of the building, as described.

2. The combination, with the clock provided with the hour-hand having the contact-spring 16, of the contact-segments 13, having the form of brackets and provided with pins 16, binding-posts for said segments on the back of the insulating-board on which the same are placed, and means for preventing the removal of said pins from said brackets, substantially as and for the purpose specified.

3. The combination, in a guest-call, of a clock having an hour-hand, with insulated contact-segments arranged about the same and representing the various time-divisions of the clock, contact-pins slidably arranged in said sections, a brush on said hour-hand to engage the same when pushed in, time-plates 8, 9, 10, and 11, arranged upon the face of the call, plug-sockets therein, room-number plates arranged thereon, plugs and cords connected therewith, said plugs adapted to be placed in said sockets, connection from said room-number plates to call-bells, and connections between the time-plates and corresponding contact-segments, substantially as described.

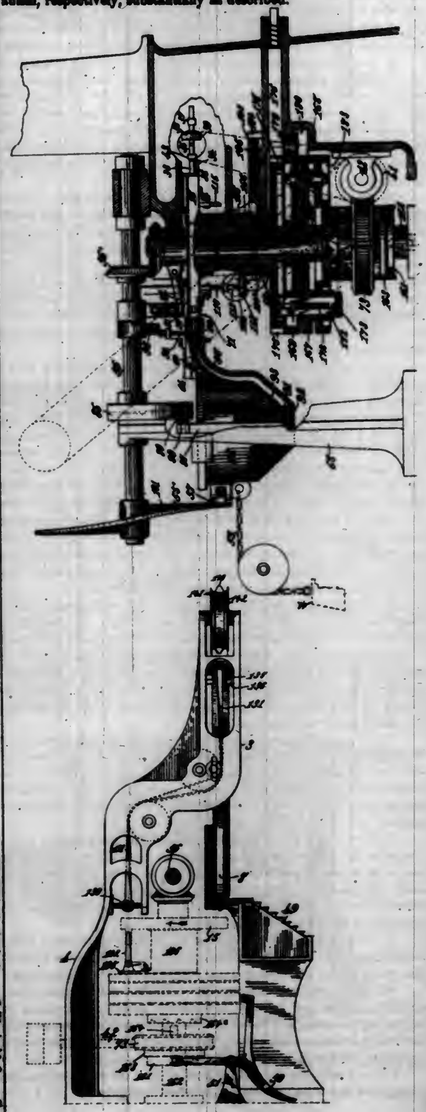


4. The combination, with the room-number plate, of a bar 32, blocks 33, insularly arranged thereon, back plates 37, screws 30, connecting the same with said number-plates, means for holding said blocks or back plates in contact, springs 34 and 39, said spring 34 connected with

481,919.

one of said blocks, and means for moving said bar to bridge said blocks and plates, substantially as described.

481,920. MACHINE FOR PRODUCING TYPE-BARS. JOSEPH C. FOWLER, Washington, D. C., assignor of one-half to L. G. Hine, same place. Filed Apr. 16, 1892. Serial No. 429,266. (No model.)



Claim.—1. In a machine for casting lines of type, the combination, with a keyboard and magazine, of a machine table or platform having a series of devices for receiving and retaining a line of matrices and means for giving said table an intermittent fractional revolution to advance the line set up to a second position and bring a succeeding matrix-receiving device into position to receive a line of matrices while a further operation is carried out with the line previously set, substantially as described.

2. In a machine for casting lines of type, the combination, with a magazine and suitable means for selecting and assembling a line of matrices, of a rotating machine table or platform provided with a plurality of matrix receiving and retaining devices and means for rotating said table to bring the lines of matrices set up to a mold and then to distributing mechanism, substantially as described.

3. In a machine for casting lines of type, the combination, with suitable means for selecting the matrices and for casting a type-line from the same when assembled, of a machine-table having a series of assembling spaces or chambers arranged thereon and means for rotating the table to bring a line of matrices into position to co-operate with the casting mechanism and at the same time bring a succeeding assembling-chamber into position to receive the matrices from the magazine, substantially as described.

4. The combination, with a magazine for containing matrices and spacers, of a series of devices for obtaining matrices from the magazine-cells in any desired orderly arrangement, a table mounted on a central shaft and provided with a series of assembling chambers or devices, suitable casting devices arranged to co-operate with a line of matrices contained in a matrix-assembling space or chamber, distributing mechanism so arranged as to operate upon a line of matrices in another space or chamber, and means for rotating the table to bring one empty matrix space or chamber into position to receive a line of matrices and at the same time bring a second and third preceding chamber or device to the casting devices and to the distributing mechanism, respectively, substantially as described.

5. In a machine for casting lines of type, the combination of a rotatable table or platform, with means for assembling matrices thereon, casting devices, and means for rotating the table, substantially as described.

6. In a machine for casting lines of type, the combination of a support and a rotatable table arranged on the support and having a plurality of matrix-assembling spaces, with means for assembling matrices in said spaces, casting devices, and means for rotating the table on the support, substantially as described.

7. In a machine for casting lines of type, the combination of a square rotatable table having a matrix-assembling space at each side portion and devices for advancing and supporting the matrices in each space, with means for delivering the matrices into and discharging them from the spaces, casting devices, and means for rotating the table, substantially as described.

8. In a machine of the kind specified, a revolubie machine table or platform of rectangular form, having upon each side a matrix-assembling space or chamber provided at one end with entrance and exit openings and a spring-retracted pusher and justifier and at the other end with a movable follow-block, and having beneath the exit-opening of each space or chamber an ejector adapted to drive the matrices upward out of said space or chamber, substantially as described.

9. In a machine of the character specified, a rotating machine table or platform mounted upon a central support and provided upon each side with a matrix-assembling space or chamber, having at one end transverse extensions, constituting matrix-entrance openings and exits, the latter having such size as to permit the passage of lips on the edges of the matrices, and thereby constituting a gage to avoid the ejectment of more than one matrix at the same moment, substantially as described.

10. In a machine of the kind described, the combination, with a magazine composed of individual cells having their exit ends arranged in two downwardly-converging lines meeting at a central point, of matrix-carrying belts beneath said exit ends, a pulley upon which said belts are brought in contact, guide-rolls, one of which is yielding, between which the belts pass and beneath which they separate, and a revoluble machine table or platform having a plurality of matrix-assembling spaces or chambers adapted to be brought by the partial revolution of the table beneath the said guide-rolls successively, substantially as described.

11. In a machine of the type set forth, the combination, with a magazine composed of individual cells, of belts and pulleys arranged to receive the matrices as they are obtained from the magazine, a pair of guide-rolls between which the belts pass and beneath which they separate, a machine table or platform having a series of matrix-assembling spaces or chambers so arranged as to be brought successively beneath the guide-rolls by the partial revolution of the table, casting mechanism arranged to register with one of said assembling-spaces after each partial revolution, distributing devices so arranged as to register simultaneously with another of said assembling-spaces, means for operating said casting mechanism and distributing devices automatically while the operator sets up a line of matrices by the selecting and assembling mechanism, and means for giving a partial revolution to the machine-table, substantially as described.

12. In a machine of the type set forth, the combination, with a magazine for the matrices and spacers, of selecting and assembling mechanism to carry the matrices to the point where the line is formed, a machine-table having matrix-assembling spaces or chambers to receive the selected and assembled matrices, casting devices, a distributing-bar arranged above the magazine-cells, and a belt mechanism engaging the matrices and carrying them successively to the distribution-bar, substantially as described.

13. In a machine of the type set forth, the combination, with a magazine and matrix selecting and assembling devices, of a machine-table having one or more matrix-assembling spaces or chambers, a distribution-bar, and a belt mechanism engaging the matrices successively and carrying them upward to said distribution-bar, substantially as described.

14. In a machine of the type specified, the combination, with a magazine, of matrix-assembling mechanism, a machine-table having one or more matrix-assembling spaces or chambers, and a belt mechanism engaging the matrices as they are separately removed from the line and carrying them successively to the distributing mechanism, substantially as described.

15. In a machine of the type set forth, the combination, with a matrix-magazine, of a belt mechanism to carry the matrices from the line set up to the distributing apparatus, substantially as described.

16. In a machine of the type set forth, the combination, with a matrix-magazine and suitable distributing apparatus, of means for supporting the assembled line of matrices, and a belt mechanism which receives the matrices successively and delivers them to the distributing apparatus, substantially as described.

17. In a machine for casting lines of type, the combination, with a magazine and suitable selecting and assembling devices, of a table having matrix-assembling spaces or chambers arranged at intervals thereon, means for rotating said table, a casting mechanism with which one of said assembling-spaces is caused to register by means of said rotary movement, a distribution apparatus with which a preceding and separate space is caused to register, a belt mechanism having continuous movement to convey the matrices to the distribution apparatus, an ejector to drive the matrices out of the assembling-space, and automatic means for operating the casting and distributing mechanism, substantially as described.

18. In a machine for casting lines of type, the combination, with a machine-table having one or more spaces or chambers in which the matrices are assembled, of ejectors to drive the matrices out of said chamber, a belt receiving the ejected matrices and carrying them to the distributing apparatus, and two pulleys arranged at different points, one being elastically movable beneath the end of the distribution-bar, said pulleys carrying the belt by which the matrices are removed from the assembling-spaces to the distributing devices, substantially as described.

19. In a machine for casting lines of type, the combination, with an intermittently-rotating table having a plurality of assembling-spaces or selected matrices, assembling devices to carry said matrices to the space where they are set up, a distributing mechanism, a continuously-moving belt by which the matrices are carried to the distribution mechanism, and pulleys driving said belt and having their axes of revolution parallel with each other, a half-twist being given to the belt, substantially as described.

20. In a machine for casting lines of type, the combination, with a machine-table having a series of assembling-spaces, of a matrix-magazine, a casting mechanism, a distribution apparatus, a belt mechanism between the same and the machine-table, an ejector for driving the separate matrices out of the assembling-space, and means for rotating the table and reciprocating the ejector, substantially as described.

21. In a machine for casting lines of type, the combination, with a rectangular machine-table having a plurality of spaces for assembling the matrices, of an assembling mechanism, means for giving a quarter-turn to the machine-table at intervals, a casting mechanism arranged to register with the line of matrices after the first quarter-turn, means for moving the crucible to avoid the angles of the table and to lock up the matrices in the mold, a distributing apparatus with which the same line registers after the second quarter-turn of the table, and a belt mechanism which conveys the matrices from the machine-table to the distribution-bar, substantially as described.

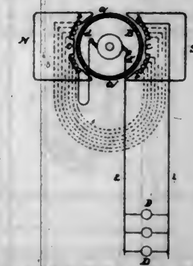
22. In a machine for casting lines of type, the combination, with a table having an assembling space or chamber for a line of matrices, of a mold having jaws which open upon a pivotal connection in such manner as to separate the interior faces of the jaws one from another, one of said faces being provided with intaglios for the formation of longitudinal ribs or raised surfaces in low relief projecting from one face of each line when cast, substantially as described.

23. In a machine for casting lines of type, a mold composed of two jaws connected by a pivotal joint to enable said jaws to separate from each other in opening and approach in closing, one of said jaws being provided with intaglios for the formation of longitudinal ribs or raised surfaces in low relief upon one face of the cast line, substantially as described.

24. In a machine for casting lines of type, the combination, with a table having assembling-spaces for the assembled matrices, of a follow-block arranged in one end of said space, a forcer with which said follow-block is brought in contact as the table turns, means for rotating said table at intervals to advance the line to a distribution mechanism, a pusher at the other end of the assembling-space to advance the assembling matrices as they enter and push them against the follow-block, which forms a support for the end of the line, a reciprocation-bar, and means for operating the same, substantially as described.

25. The combination of a rotatable table, means for assembling matrices thereon, casting devices, means for rotating the table, and mechanism for taking the matrices from the table and distributing the same, substantially as described.

26. The combination, with a table or platform, means for assembling matrices thereon, casting apparatus, and distributing devices, of belt mechanism for taking the matrices from the table or platform and delivering them to the distributing devices, substantially as described.



27. The combination, with a magazine for the matrices and spacers and with an assembling chamber or space, of a pair of coacting belts arranged beneath the two inclining series of exit ends of the cells of the magazine, and an elastic plate hanging from a support at or near the point where the two inclining series of exit ends meet, substantially as described.

28. The combination, with a magazine, a machine-table, and means for selecting and obtaining matrices and spacers from the cells of the magazine, of a casting mechanism, a distributing mechanism having a distribution-bar, a belt receiving the matrices and spacers from the machine-table and carrying them to the distributing mechanism, and a pair of rolls adjacent to the end of the distribution-bar, over which the belt runs, one of said rolls being above the other and mounted on a journal-support, which is pressed toward the other roll and the end of the distribution-bar, whereby the matrices and spacers are allowed to pass and are automatically placed upon the end of the distribution-bar, substantially as described.

29. The combination, with a distribution-bar and with a flexible belt carrying the matrices and spacers thereto, of a pair of rolls adjacent to the end of the bar to carry the belt, one roll being elevated above the other and having a spring-support adapting it to yield in a direction away from the end of the bar, a pivoted spring-actuated guard mounted on a frame having a matrix-opening into which the end of the guard normally projects, and a series of travelers carried by duplex belts in parallelism with the distribution-bar, the beveled ends of said travelers being adapted to engage the beveled end of the guard and retract it to allow passage for a matrix or spacer, substantially as described.

REISSUES.

11,266. DYNAMO-ELECTRIC MACHINE. WILLIAM S. ANDREWS, New York, N. Y., and THOMAS SPENCER, Philadelphia, Pa., assignors, by direct and mesne assignments, to Herbert C. Wirt, Boston, Mass. Filed July 11, 1882. Serial No. 430,711. Original No. 408,415, dated July 9, 1889.

Claim.—1. In a dynamo-electric machine, the combination of the armature, the generating-coils thereon, the field-magnet, and the external stationary coils supported upon said field-magnet and wound so as to oppose the magnetizing effect on the armature-core of said generating-coils, substantially as set forth.

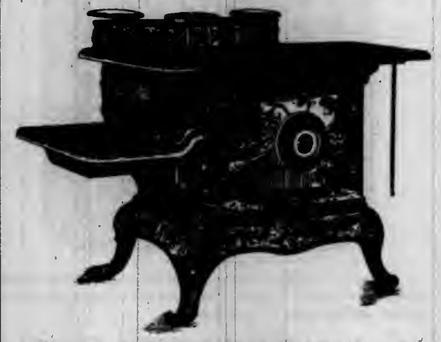
2. In a dynamo-electric machine, the combination of the armature, the generating-coils thereon, the field-magnet having grooves in its pole-pieces, and the coils wound in said grooves, so as to oppose the magnetizing effect on the armature-core of said generating-coils, substantially as set forth.

DESIGNS.

21,802. TABLE. ZELIA NUTTALL, Dresden, Germany. Filed Aug. 5, 1892. Serial No. 442,263. Term of patent 3½ years.

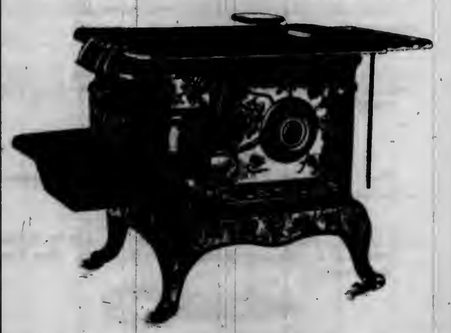
Claim.—The design for a table, stool, or similar article, substantially as herein shown and described.

21,803. TABLE. ZELIA NUTTALL, Dresden, Germany. Filed Aug. 5, 1892. Serial No. 442,264. Term of patent 3½ years.



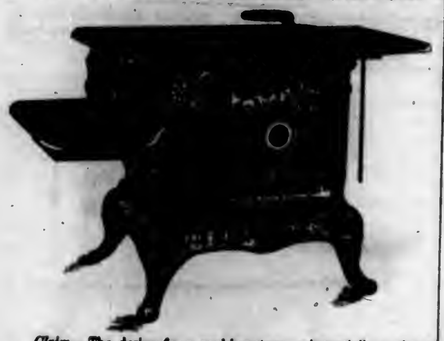
Claim.—The design for a table, stool, or similar article, substantially as herein shown and described.

21,804. COOKING-STOVE. GEORGE H. HOLLAND, St. Louis, Mo., assignor to the Bridge & Beach Manufacturing Company, same place. Filed July 30, 1892. Serial No. 441,769. Term of patent 14 years.



Claim.—The design for a cooking-stove, substantially as shown and described.

21,805. COOKING-STOVE. GEORGE H. HOLLAND, St. Louis, Mo., assignor to the Bridge & Beach Manufacturing Company, same place. Filed July 30, 1892. Serial No. 441,770. Term of patent 14 years.



Claim.—The design for a cooking-stove, substantially as shown and described.

21,806. COOKING-STOVE. GEORGE H. HOLLAND, St. Louis, Mo., assignor to the Bridge & Beach Manufacturing Company, same place. Filed July 30, 1892. Serial No. 441,771. Term of patent 14 years.

Claim.—The design for a cooking-stove, substantially as shown and described.

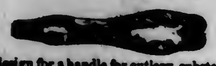
21,807. COOKING-STOVE. GEORGE H. HOLLAND, St. Louis, Mo., assignor to the Bridge & Beach Manufacturing Company, same place. Filed July 30, 1892. Serial No. 441,772. Term of patent 14 years.

Claim.—The design for a cooking-stove, substantially as shown and described.

21,808. STOVE-BOARD. ALBERT LEBERARDT, Jersey City, N. J. Filed July 21, 1892. Serial No. 440,894. Term of patent 3½ years.

Claim.—The design for the ornamentation of a stove-board, herein shown and described, the same comprising the border A, the centerpiece B, and the points C, as set forth.

21,809. HANDLE FOR CUTLERY, &c. WILLIAM W. HAYDEN, Newark, N. J. Filed July 20, 1892. Serial No. 440,677. Term of patent 3½ years.



Claim.—The design for a handle for cutlery, substantially as herein shown and described.

21,810. HANDLE FOR CUTLERY, &c. WILLIAM W. HAYDEN, Newark, N. J. Filed July 20, 1892. Serial No. 440,678. Term of patent 3½ years.

Claim.—The design for a handle for cutlery, substantially as herein shown and described.

21,811. HANDLE FOR CUTLERY, &c. WILLIAM W. HAYDEN, Newark, N. J. Filed July 20, 1892. Serial No. 440,679. Term of patent 3½ years.

Claim.—The design for a handle for cutlery, substantially as herein shown and described.

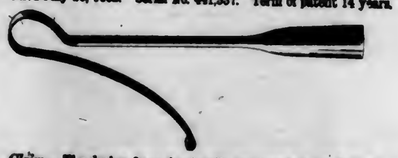
21,812. HANDLE FOR CUTLERY, &c. WILLIAM W. HAYDEN, Newark, N. J. Filed July 20, 1892. Serial No. 440,680. Term of patent 3½ years.

Claim.—The design for a handle for cutlery, substantially as shown and described.

21,813. WATCH-CASE. JOHN C. DUBBEE, Canton, Ohio. Filed July 18, 1892. Serial No. 440,412. Term of patent 14 years.

Claim.—The design for a watch-case, as herein described and shown.

21,814. CAMPAIGN-BADGE. HOWARD W. WELLIS, Poughkeepsie, N. Y. Filed July 19, 1892. Serial No. 440,541. Term of patent 3½ years.



Claim.—The design for a campaign-badge, as herein shown and described.

21,815. CAMPAIGN-BUTTON. WOODBURY S. HOW, Philadelphia, Pa. Filed July 23, 1892. Serial No. 441,057. Term of patent 3½ years.

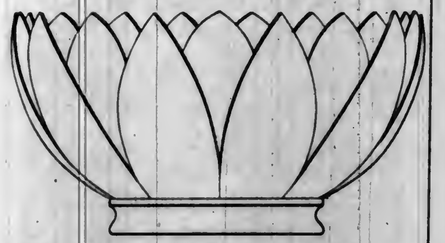
Claim.—The design for a campaign-button, as herein shown and described.

21,816. SHEPHERD'S CROOK. ALBERT L. BABCOCK, Billings, Mont. Filed July 26, 1892. Serial No. 441,337. Term of patent 14 years.

Claim.—The design for a shepherd's crook, substantially as herein shown and described.

21,817. WHIP. JULIAN POMEROY, Springfield, Mass. Filed Aug. 3, 1892. Serial No. 442,077. Term of patent 14 years.

Claim.—The design for a whip, herein shown and described.



21,818. LAMP-BRACKET. ALFRED KOSER, New York, N. Y. Filed June 27, 1892. Serial No. 438,218. Term of patent 3½ years.

21,818.

Claim.—The design for a bracket, substantially as herein shown and described.

21,819. LAMP GLOBE OR SHADE. JOSEPH WEBB, Sewickley, Pa. Filed Aug. 1, 1892. Serial No. 441,573. Term of patent 7 years.

Claim.—The design for a globe or shade, substantially as herein shown and described.

21,820. LAMP-STANDARD. ALFRED KOSER, New York, N. Y. Filed June 27, 1892. Serial No. 438,219. Term of patent 3½ years.

Claim.—The design for a lamp-standard, substantially as shown and described.

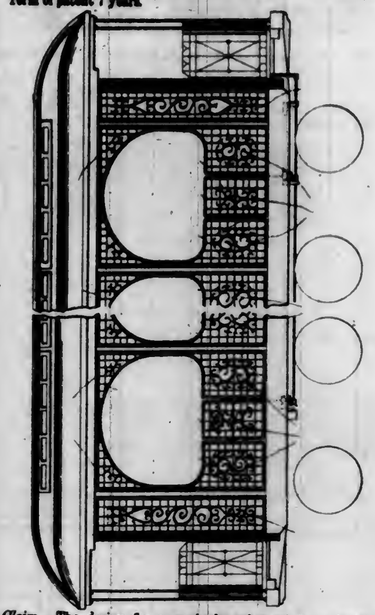
21,821. PADLOCK-CASE. EDWARD A. JUDD, New Britain, Conn., assignor to the Corbin Cabinet Lock Company, same place. Filed July 21, 1892. Serial No. 440,838. Term of patent 7 years.

Claim.—The design for a padlock-case, substantially as shown and described.

21,822. PISTOL-CHEEK. JOSEPH H. WINSOR, Springfield, Mass. Filed Apr. 2, 1892. Serial No. 427,544. Term of patent 14 years.

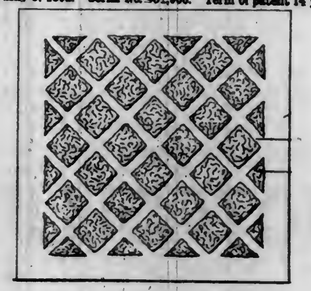
Claim.—The design for a pistol-cheek, substantially as shown and described.

21,822.



Claim.—The design for the cheek-piece of a pistol-grip, substantially as shown and described.

21,823. PISTOL-CHEEK. DANIEL B. WESSON and JOSEPH H. WINSOR, Springfield, Mass. Filed Apr. 2, 1892. Serial No. 427,547. Term of patent 14 years.

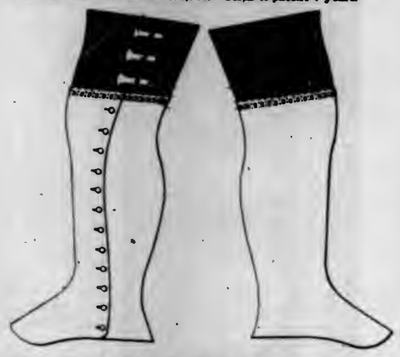


Claim.—The design for the cheek-piece of a pistol-grip, substantially as herein shown and described.

21,824. RAILWAY-CAR BODY. ROBERT I. SLOAN and RICHARD D. GALLAGHER, Chicago, Ill. Filed July 23, 1892. Serial No. 441,056. Term of patent 7 years.

Claim.—The design for a car-body, substantially as herein described and shown.

21,825. SIDING-PLATE. PHILIP A. DELAURIERS, St. Paul, Minn. Filed May 5, 1892. Serial No. 431,968. Term of patent 14 years.

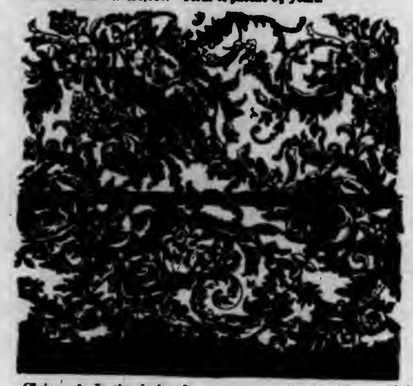


Claim.—The design for a siding-plate, as shown and described.

21,826. BOTTLE. JOHN B. GROSSER, Chicago, Ill. Filed Apr. 12, 1892. Serial No. 428,800. Term of patent 14 years.

Claim.—The design for a bottle, as herein shown and described.

21,827. LEGGIN. SAMUEL BORCHARDT, New York, N. Y. Filed June 16, 1892. Serial No. 436,963. Term of patent 7 years.



Claim.—The design for a leggin, herein shown and described.

21,828. CLOAK. ABRAHAM POPKIN, New York, N. Y. Filed July 21, 1892. Serial No. 440,936. Term of patent 3½ years.

Claim.—The design for a cloak, substantially as shown.

21,829. CARPET. PIERRE C. CHAMBELLAN, West Hoboken, N. J., assignor to the Bigelow Carpet Company, Clinton, Mass. Filed July 2, 1892. Serial No. 439,067. Term of patent 3½ years.

Claim.—1. In the design for a carpet as herein shown and described, the body A.

2. In a design for a carpet as herein shown and described, the border B.

3. The design for carpets, consisting of the body A and the border B, substantially as shown.

TRADE-MARKS

REGISTERED AUGUST 30, 1892.

21,692. LAGER-BEER. F. A. POTH BREWING COMPANY, Philadelphia, Pa. Filed May 7, 1892.

Essential feature.—The representation of an ermine robe having thereon a shield and a goblet of beer. Used since January, 1887.

21,693. MINERAL WATER. ST. LEON MINERAL WATER COMPANY, LIMITED, Toronto, Canada. Filed July 1, 1892.

Essential feature.—The representation of the face of a lion with the name "ST. LEON" printed thereon. Used since March, 1890.

21,694. SOCIETY JOURNAL. THE TOWN TOPICS PUBLISHING COMPANY, New York, N. Y. Filed Aug. 3, 1892.

TOWN TOPICS

Essential feature.—The words "TOWN TOPICS." Used since 1884.

21,695. ALE AND BEER. GEORGE W. WIEDENMAYER, Newark, N. J. Filed May 9, 1892.

JERSEY

Essential feature.—The word "JERSEY" with an underscored line below the same. Used since March 1, 1892.

21,696. RIDER-DOWN CLOTH OF A WAVY APPEARANCE. HENRY H. BELL'S SONS, Milton and New York, N. Y. Filed July 29, 1892.

Waverly

Essential feature.—The word "WAVERLY." Used since March, 1892.

21,697. CORDOVAN LEATHER. WILLIAM N. BIENSTRATH, Chicago, Ill. Filed July 15, 1892.

COLUMBIAN

Essential feature.—The word "COLUMBIAN." Used since January 1, 1892.

21,698. VETERINARY POWDERS. A. MITCHELL & Co., Calhoun, La. Filed July 13, 1892.

MAC

Essential feature.—The letters "A M C C." Used since April 1, 1892.

21,699. GIN. ROBERT BURNETT & Co., London, England. Filed Apr. 12, 1892.

Essential feature.—The representation of a mural crown surmounted by a branch of grape-vine and an extended hand bearing a pruning-knife, with a fac-simile of the firm-signature. Used since 1887.

21,700. GINGHAMS. JOHN FARNUM & Co., Philadelphia, Pa. Filed July 27, 1892.

FRANKFORD

Essential feature.—The word "FRANKFORD" and the representation of an eagle. Used since June 1, 1892.

21,701. MATTRESSES AND OTHER UPHOLSTERY. GEORGE W. GILL, Jacksonville, Fla. Filed Apr. 8, 1892.

P.P.

Essential feature.—The letters "P. P." inclosed between the representations of a pine and a palmetto tree. Used since March 1, 1892.

21,702. FOOD FOR INFANTS AND INVALIDS. F. B. BENGER & Co., LIMITED, Strangeways, Manchester, England. Filed Aug. 5, 1892.

BENGER'S

Essential feature.—The word "BENGER'S." Used since January 27, 1882.

21,703. OIL OR GAS STOVES. CENTRAL OILGAS STOVE COMPANY, Northampton and Boston, Mass. Filed Apr. 29, 1892.

Central

Essential feature.—The word "CENTRAL." Used since November 15, 1890.

21,704. PLATE OR CATHEDRAL GLASS. JEFFERSON GLASS CO., Washington, Pa. Filed Apr. 20, 1892.

ALLIGATOR

Essential feature.—The word "ALLIGATOR." Used since January 1, 1892.

21,705. TIN AND TERNE PLATES. MERCHANT & Co., Philadelphia, Pa. Filed Aug. 6, 1892.

MERCHANT'S
OLD METHOD.

Essential feature.—The words "MERCHANT'S OLD METHOD." Used since July 6, 1892.

21,706. DETERGENT COMPOUNDS IN LIQUID FORM. PETERSON & RUSH, St. Louis, Mo. Filed July 23, 1892.

RENOVENE.

Essential feature.—The word "RENOVENE." Used since August, 1891.

21,707. SPECIFIC FOR GOUT, RHEUMATISM, AND KINDRED DISEASES. RENZ & HENRY, Louisville, Ky. Filed July 23, 1892.

HENRY'S
TRI-IODIDES.

Essential feature.—The words "HENRY'S TRI-IODIDES." Used since January 30, 1892.

21,708. ANTIFRICTION METAL. THE ELECTRICON METAL COMPANY, Newark, N. J., and New York, N. Y. Filed July 23, 1892.

ELECTRICON

Essential feature.—The word "ELECTRICON." Used since March 15, 1892.

21,709. BABBITT METAL. ASA W. DAY, St. Louis, Mo. Filed May 4, 1892.

GOLD-LEAF

Essential feature.—The word "GOLD-LEAF." Used since March 1, 1892.

21,710. ALE. SUSSE & WHEELER, Peoria, Ill. Filed May 16, 1892.

Essential feature.—The representation of a deer surrounded by a landscape view. Used since February 17, 1892.

21,711. SATIN AND VELVET RIBBONS. PASSAVANT & CO., New York, N. Y. Filed Aug. 4, 1892.

2020

Essential feature.—The number "2020." Used since February, 1884.

21,712. DRIED CURRANTS. WILLIAM H. DOBLE, Quincy, Mass. Filed Aug. 8, 1892.

PURITY WASHED

Essential feature.—The words "PURITY WASHED." Used since July 1, 1891.

21,713. RUBBER BELTING. BOSTON WOVEN HOSE AND RUBBER COMPANY, Boston, Mass. Filed Aug. 8, 1892.

BULL DOG

Essential feature.—The words "BULL DOG." Used since July 1, 1890.

21,714. CORN PRODUCTS USED FOR BREWING PURPOSES. BENJAMIN G. HUDNUT, Terre Haute, Ind. Filed Apr. 20, 1892.

MAIZELINE

Essential feature.—The word "MAIZELINE." Used since March 20, 1892.

21,715. ANALGESIC PREPARATIONS. ESEN B. SMITH, Ipswich, Mass. Filed July 16, 1892.

PHENODYNE

Essential feature.—The word "PHENODYNE." Used since November 11, 1888.

THE NORRIS PETERS CO. PHOTO-LITH. WASHINGTON, D. C.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

WEBSTER *v.* PARKHURST AND HAM.

Decided July 20, 1892.

PRACTICE—SUGGESTIONS BY EMPLOYÉ.

Where one has conceived of an invention and discloses the essence of it to another whom he employs to develop and perfect it, suggestions from the employé in the course of experiments and dependent upon the main idea will not ordinarily give the employé any rights as an inventor. (Citing *O'Reilly v. Morse*, 15 How., 62, and *Agawam Co. v. Jordan*, 7 Wall., 583.)

APPEAL from Examiners-in-Chief.

CASH-REGISTER.

Application of Jerome J. Webster filed January 2, 1889, No 295,137. Application of Edward B. Parkhurst and Foster Ham filed July 5, 1888, No. 279,049.

Mr. A. M. Moore and *Mr. V. D. Stockbridge* for Webster.

Messrs. Peck & Rector and *Messrs. Church & Church* for Parkhurst and Ham.

SIMONDS, *Commissioner:*

This is an appeal from the decision of the Examiners-in-Chief awarding priority of invention to Webster.

Counsel for Parkhurst and Ham contend in argument that since Parkhurst and Ham were the first to make both actual and constructive reduction to practice of the invention in controversy, therefore Webster, in order to prevail, should offer such proof as establishes his case beyond a reasonable doubt, contending that the underlying principle which requires that degree of proof to overturn a patent granted applies with equal force to the case of him who is first to reduce to practice.

It is the general rule in civil cases that a reasonable preponderance of evidence is sufficient to establish the case of him who is able to furnish that degree of proof, and that rule of evidence applies here in the present case; but, as was said in *Hunter* v. *Jenkin*, (56 O. G., 1705:)

> The issue of a patent is an event that is deliberate, certain, and official in a high sense. It ought not to be lightly set aside. The courts have agreed that in all attacks upon it of this same general nature—*i. e.*, on the ground of public use, prior use, abandonment, or prior invention—a case, in order to succeed, must be made out beyond a reasonable doubt.

A patent granted furnishes an exception to the general rule, and that exception is based largely upon the deliberate, certain, and official nature of the act.

Webster was having manufactured by the hands of the Boston Cash Register Company a certain form of cash-register. It was not wholly satisfactory in operation. Webster and the company undertook to have Ham produce a new model in accordance with this contract:

JAMES H. WRIGHT, *President.* W. W. DREW, *Treasurer.*
OFFICE OF THE BOSTON INDICATOR & RECORDER CO.,
No. 98 Cambridge street, Boston, April 7, 1888.

Proposal to draft and examine thoroughly and reduce machine to a further practical basis, if possible.

The results of examination to be submitted to your company within one week for approval.

A new set of patterns for a two-bank machine to be built with a metallic base—$55.00.

Patterns to be owned by your company.

Your company to give an extra sum for drafting and examination not to exceed $55 00.

A first machine to be built from these patterns as a model to build from hereafter, this machine or model to be perfect working in all its mechanical parts, and is built by Wm. Wood & Co., subject to further contract.

This first machine not to exceed $38.00 and to be completed within four weeks from this date and no change in plans to be made after plans have been approved by your company that may affect the construction of the machine materially. This model to be accepted when completed, if satisfactory. The whole to be paid for when model has been accepted by your company.

WM. WOOD & CO.,
Per F. HAM.

J. H. WRIGHT, *Pres.*

This was the first that Parkhurst or Ham had to do with the cash-registers. Previous to the making of this contract Webster possessed a model which embodied in a crude and imperfect way the issue in controversy. Webster says that he communicated the basic idea of this improvement to Ham and that the machine subsequently produced by Parkhurst and Ham was simply the embodiment of the mechanical ideas of the old cash-register amended by the new ideas which Webster communicated to Ham. For instance, a certain interview at which such communication was made is contended by Webster to have taken place on the 10th day of April, 1887, and with reference thereto Webster testifies as follows:

Webster's testimony, (Rec., p. 10:)

> Interrogatory 37. What did you next do about your invention after the model "Exhibit A" had been completed?
>
> Answer. In the spring of 1888 some of the officers of our company had heard of a Mr. Ham, of Woburn, as being a very good mechanic. Some of the officers were dissatisfied with the class of work we were getting in Boston from the people who were manufacturing for us and had mooted the idea of making a change. Mr. Ham came to us about the middle of March, 1888, and met Mr. Wright, president of the company, Mr. Drew, the treasurer, and myself at Mr. Drew's store, Cambridge street Boston. He then said that he had the control of a large shop well supplied with good machinery adapted to the manufacture of cash-registers, except special tools, and that he would like to make a bid on the manufacture of our machines. It was then agreed that we would give him an opportunity to examine one of our machines and see what he thought he could do. Two or three days afterward, I think on the 17th of March, we sent him one of our machines similar to "Exhibit B." Early in April, I think on the 7th, Mr. Ham came to Boston and met us again at Mr. Drew's store, and a contract was entered into with him to make one model machine for a stated price. At that time I told him that there were several changes to be made in the machine which had been sent him and which he told us he had taken all apart and knew all about; but at that interview I did not fully explain what the changes were; but about three or four days later, I think on the 10th of April, Mr. Ham again visited Boston and met Mr. Drew, Mr. Wright, and myself, as before, although

Mr. Drew was busy a large part of the time waiting upon customers in the front store. Consequently Mr. Wright and myself did most of the talking with Mr. Ham on that occasion. Mr. Ham reminded me that I had said several changes were to be made and he had come from Woburn to find out exactly what those changes consisted in. I then made a sketch of the key having the rack or wing with projection at its lower extremity in the presence of Mr. Wright, who was sitting by our side, and generally instructed Mr. Ham, as well as I could in a short time, what changes were necessary to carry out my ideas.

Wright's testimony, (Rec., p. 52:)

Interrogatory 24. Do you remember any of the instructions which Mr. Webster gave Mr. Ham during that interview?

Answer. I do remember several of them. First, the new Webster key and the long pawl were to be introduced into it, so as to dispense with the grid on the back of our machine as then constructed. The latch was to be provided to hold the long pawl out of engagement with the key after its full depression, thus allowing the key to return to its place, and the latch just named was to be tripped by the fall of the rocker-plate, thus permitting the long pawl to return to engagement with the keys. I think, also, hooks were to be provided to fall onto the rocker-plate after the registration, so that the machine would remain locked until the drawer was closed or the hooks pushed away from the rocker-plate. I also recall that at this time Mr. Webster marked out for Mr. Ham the form of the key. This he did because it differed from the key in the machine which Mr. Ham had examined.

Drew's testimony, (Rec., p. 42:)

Interrogatory 29. What did the building of that model by Mr Ham have to do with this invention?

Answer. Mr Ham came to us and wished to make a bid on building our machines. After having some talk with him, he asked to have a machine (one of our old machines) sent to him at Woburn for examination, which we sent him on the 17th of March, 1888. After that there was a contract made between Mr. Ham and our company to build one model machine. It was stated to him at that time that there was to be several changes made in the machine. I do not remember whether he was told just what those changes should be at the time when the contract was made; but a few days later—say two or three—he met Mr. Webster, Mr Wright, and myself at my store on Cambridge street. Mr. Webster then explained, as nearly as he could, what changes it was thought best to make. The changes spoken of at this interview, as I remember the conversation, were in the keys, a device for preventing the depression of two keys at the same time, also a different device for ringing the bell from what we had been using, and, I think, a slight change in the locking device for the wheel. There might have been other changes talked of which I do not remember.

Int. 30. What was the change "in the keys" which was spoken of at this interview with Mr. Ham?

Ans. The change was from using the back grid to a rack on the keys, as near as I can remember.

Int. 31. What was said about it, and who said it?

Ans. I think it was Mr. Webster. I do not know just what was said, as I was not with Mr. Webster and Mr. Ham and Mr. Wright all of the time, for the reason that I had to attend to customers in the store part of the time while this conversation was going on

Ham denies squarely the communication herein referred to; but the preponderance of evidence is clearly against him, and it is found as a fact in the case that Webster did thus communicate to Ham the basic idea of the improvement in controversy. Ham (perhaps with the assistance of Parkhurst) took the crude ideas thus conveyed to him by Webster and embodied them very perfectly and skillfully, possibly producing new details which of themselves and apart from the state of facts which exists here might be patentable to Parkhurst and Ham; but the Supreme Court has twice, at least, passed upon questions very similar to this—once when the Morse telegraph patent was under consideration, and then that Court said:

Neither can the inquiries he made nor the information or advice he received from men of science in the course of his researches impair his right to the character of an inventor. (*O'Reilly* v. *Morse*, 15 How., 62.)

In the other case the Supreme Court said:

Where a person has discovered an improved principle in a machine, manufacture, or composition of matter, and employs others to assist him in carrying out that principle, and they, in the course of experiments arising from that employment, make valuable discoveries ancillary to the plan and preconceived design of the employer, such suggested improvements are in general to be regard ed as the property of the party who discovered the original improved principle, and may be embodied in his patent as a part of his invention. Suggestions from another, made during the progress of such experiments, in order that they may be sufficient to defeat a patent subsequently issued, must have embraced the plan of the improvement and must have furnished such information to the person to whom the communication was made that it would have enabled an ordinary mechanic, without the exercise of any ingenuity and special skill on his part, to construct and put the improvement in successful operation. Persons employed, as much as employers, are entitled to their own independent inventions; but where the employer has conceived the plan of an invention and is engaged in experiments to perfect it, no suggestions from an employé, not amounting to a new method or arrangement, which, in itself, is a complete invention, is sufficient to deprive the employer of the exclusive property in the perfected improvement. But where the suggestions go to make up a complete and perfect machine, embracing the substance of all that is embodied in the patent subsequently issued to the party to whom the suggestions were made, the patent is invalid, because the real invention or discovery belonged to another. (*Agawam Co.* v. *Jordan*, 7 Wall., 583.)

It may be that except for the aid given by Parkhurst and Ham the crude ideas of Webster would never have been developed into practical mechanism. But that point is immaterial in view of the principle which the Supreme Court has laid down.

The decision of the Examiners-in-Chief awarding priority of invention to Webster is affirmed.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court of Appeals—Ninth Judicial District.

NORTON *et al. v.* JENSEN *et al.*

Decided March 10, 1892.

1. PATENTS FOR INVENTIONS—INFRINGEMENT—CAN ENDING AND HEADING MACHINES.

Claims 1 and 2 of Letters Patent No. 267,014, to Edwin Norton, November 7, 1882, for a machine for putting on the ends of fruit and other cans, and claims 6 and 7 of Letters Patent No. 274,363, to Norton and Hodgson, March 20, 1883, for a can-ending machine, and claim 14 of Letters Patent No. 294,065, to Norton and Hodgson, February 26, 1884, for a can ending and seaming machine, and Letters Patent No. 322,060, to Edmund Jordan, July 14, 1885, being an improvement on the original Norton machine, sustained and *Held* infringed by the "Jensen machine" made under Letters Patent No. 376,804, to Mathias Jensen, January 24, 1888, for a can crimper and capper. Letters Patent No. 307,197, to Edmund Jordan, October 28, 1884, and No. 307,491, to Norton and Hodgson, November 4, 1884, for machines of the same class, *Held* not infringed.

2. CONSTRUCTION OF PATENTS.

It is the duty of courts to construe a patent by a reference to the language of its claims and an examination of the specifications and drawings accompanying the same.

3. ORIGINAL INVENTORS—INFRINGEMENT.

Where an invention is of a primary character and stands at the head of an art, it is entitled to a liberal construction of its claims and all persons who make devices or machines operating on the same principle and performing the same functions by analogous means or equivalent combinations, even though the machine may be an improvement of the original and patentable as such, are to be treated as infringers.

4. WHAT IS AN INFRINGEMENT.

An infringement takes place whenever a party avails himself of the invention of the patentee without such a variation as constitutes a new discovery.

5. COMBINATION CLAIM—EQUIVALENTS.

When a combination patent covers a new arrangement of old elements, producing a new and useful result, the same may be protected by invoking the doctrine of equivalents, as against the substitution for any particular element of a different device known at the date of the patent as a means of performing similar work; and the fact that the substitute performs some additional functions does not prevent it from being an infringement.

6. INFRINGEMENT.

There cannot be any infringement of a combination claim unless every element of the combination or a mechanical equivalent of an omitted element is used.

7. EXPERT EVIDENCE.

The opinions of experts are admissible in evidence in patent cases; but they are not conclusive upon the courts.

APPEAL from the Circuit Court of the District of Oregon.

Bill by Edwin Norton and Oliver W. Norton against Mathias Jensen and John Fox for infringement of a patent. Decree for complainants. Defendants appeal. Modified and affirmed.

Before HANFORD, HAWLEY, and MORROW, Judges.

Mr. C. W. Fulton and *Messrs. Wheaton, Kalloch & Kierce* for the appellants.

Mr. John W. Munday and *Mr. Edmund Alcock* for the appellees.

HAWLEY, *J.*:

This is a suit in equity for the infringement of certain Letters Patent. The circuit court entered a decree adjudging that the defendants have infringed claims 1 and 2 of Letters Patent No. 267,014, dated November 7, 1882, granted to Edwin Norton, for a machine for putting on the ends of fruit and other cans; claims 6 and 7 of Letters Patent No. 274,363, dated March 20, 1883, granted to Edwin Norton and John G. Hodgson, for a can-ending machine; claim 14 of Letters Patent No. 294,065, dated February 26, 1884, granted to Edwin Norton and John G. Hodgson, for a can ending and seaming machine; claim 1 of Letters Patent No. 307,197, dated October 28, 1884, granted to Edmund Jordan, for a can ending machine; claims 1, 2, 3, 8, and 9 of Letters Patent No. 307,491, dated November 4, 1884, granted to Edwin Norton and John G. Hodgson, for a can-ending machine, and claims 1, 2, 6, 7, 11, 12, and 13 of Letters Patent No. 322,060, dated July 14, 1885, granted to Edmund Jordan, for a heading-machine. The inventions specified in these Letters Patent were designed to produce cans having tight exterior-fitting heads, and relate to the particular operation in the manufacture of sheet-metal cans which consists in putting the exterior tight-fitting heads on the cylindrical portion of the can. It is admitted that no machine exactly like the drawings in Letters Patent No. 267,014 has ever been constructed; but machines have been built embodying the essential principles outlined in this patent. The other Letters Patent are for various improvements to the primary patent.

Appellants claim that the state of the art at the time of Norton's first invention is represented by Letters Patent No. 235,700, dated December 21, 1880, granted to George H. Pierce, for mechanism for placing and soldering heads and cans. This machine seems to have been constructed for an entirely different character of work from that performed by any of appellees' patented machines, and to be essentially different in its mechanism and modes of operation. The patent specifies a mechanism for making cans the bodies of which are flared outwardly at their ends in order to enable a loose inside-fitting head to be dropped or placed on and within such outwardly-flared body, and then soldered in place. But there is another reason why the Pierce patent has no particular bearing upon any of the inventions or machines in controversy. The testimony clearly shows that Norton's original invention was prior in point of time to Pierce's application for Letters Patent. Norton testifies that he never saw or heard of Pierce's patent until after he considered his invention and built and used experimentally his first experimental can-heading machine, which was made and used by him for the purpose of experiment alone as early as July 15, 1880; that his invention of the machine, as claimed in claims 1 and 2 of Letters Patent No. 267,014, was, in fact, made prior in time to the date of the Pierce patent and to the date of filing of the application for the Pierce patent; that after making his experimental machine he, in the early part of 1881, made a complete set of working drawings for the patterns of a machine like the drawings of Patent No. 267,014; that before his machine was completed Mr. Hodgson and himself had made further improvements, as shown in Letters Patent No. 274,363, and that for this reason the first complete and working automatic machine was made like the drawings and specifications of said patent, instead of like the drawings in the Patent No. 267,014. The first complete machine was made and put in public use in 1882. Norton's invention must therefore be considered as being of a primary character, standing at the head of the art as the first machine ever invented for applying tight exterior-fitting can-heads to can-bodies automatically, and appellees are entitled to a broad and liberal construction of the claims of their patent.

Where an invention is one of a primary character and the mechanical functions performed by the machine are, as a whole, entirely new, all subsequent machines which employ substantially the same means to accomplish the same result are infringements, although the subsequent machine may contain improvements in the separate mechanisms which go to make up the machine. (*Machine Co.* v. *Lancaster*, 129 U. S., 273; 9 Sup. Ct. Rep., 299.)

Appellants contend that Jensen's invention was brought about by the necessities of the salmon-canning industry; that his machine is specifically adapted to putting the final heads on cans filled with fish or other substance; that it is the only machine for heading cans that can practically be used for this purpose; that the Norton machines cannot be successfully used to accomplish this result; that the Jensen machine carries the can and heads it in a vertical position; that its claim to superiority over all other heading-machines is the peculiarity of its construction, so as to head hand-made cans, which are used almost exclusively in the salmon-canning business; that appellees have not been injured by the Jensen machine, because it has simply met a want that Norton's machine did not and could not supply. It appears from the testimony that Jensen prior to the construction of his machine visited Norton's factory in San Francisco and saw and examined his machines. There is some controversy in the testimony as to whether or not appellee's machines will operate successfully upon hand-made cans. Mr. Norton testifies that the automatic can-heading machine manufactured under his patents "will work successfully upon hand-made cans;" that he worked them exclusively upon hand-made cans for nearly two years prior to building his automatic can-body machines, and that they worked "with perfect success."

The fact that Jensen's machine, as constructed, is an improvement, in some respects, upon appellees' machines must be admitted; but this does not relieve it of the character of an infringing machine. Norton being the original inventor, he, and those claiming under him, would have the right to treat as infringers all persons who make devices or machines—

operating on the same principle and performing the same functions by analogous means or equivalent combinations, even though the infringing machine may be an improvement of the original, and patentable as such.

(*McCormick* v. *Talcott*, 20 How., 405. See, also, *Wells* v. *Gill*, 1 Ban. & A., 77; *Kendrick* v. *Emmons*, 2 Ban. & A., 208; *Turrell* v. *Spaeth*, 3 Ban. & A., 458; *Colt* v. *Arms Co.*, 1 Fish. Pat. Cas., 108; *Winans* v. *Railroad Co.*, 4 Fish. Pat. Cas., 2; *Whipple* v. *Manufacturing Co.*, *Id.*, 29; *Fruit Co.* v. *Curran*, 7 Sawy., 270; 8 Fed. Rep., 150.)

The real question to be determined is whether or not the Jensen machine—Letters Patent No. 376,804, dated January 24, 1888, granted to Mathias Jensen, for a can crimper and capper—contains the several inventions and improvements covered by the several claims of appellees' patents, as heretofore enumerated, and thereby infringes the same. Before proceeding to review the several claims in the respective patents which the decree finds to have been infringed it is proper to notice some of the general differences which it is claimed exist between the elements and methods of construction in appellees' machines from the Jensen machine.

First, as to the mold found in all the patents, it is claimed by appellants that the Jensen mold is vitally different from the mold of the other patents; that it is not only different in form, but that its mode of operation, as well as construction, is different, and that it acts upon entirely different principles. On the other hand, the contention of appellees is that the mold found in all the patents, though different in construction, is substantially identical in principle; that the mode of operation is the same, and that the differences existing in the Jensen mold from appellees' machines are of the most formal and immaterial character. Upon the oral argument of this case models of the respective molds, as well as of other portions of the machinery, were brought into court, by means of which the respective counsel were enabled to fully and clearly illustrate and explain their views as to the construction, purpose, operation, and effect of the different molds. The conclusions to be arrived at in this case depend to a great extent upon the proper solution of this question, and necessarily involve the careful consideration and weighing of the voluminous evidence offered by the respective parties, which in this case in several of its features presents many questions of much embarrassment and difficulty. The testimony upon both sides is principally that of experts skilled in the science and operation of machinery which they were called upon to explain, and in their testimony they not only state the facts concerning the difference in the construction of the respective machines, but give their opinions whether or not there is any difference in the operation of the machines or in the effects produced thereby. Expert testimony is admissible to explain the several drawings, models, and machines that are exhibited upon the trial, their operation, purpose, and effect, and the differences which exist in the various devices involved in their construction. The opinion of an expert is, in certain cases, admissible in evidence, but it is not conclusive upon the courts. It is to be considered as the judgment and opinion of a person who has had extensive practice, education, and knowledge in relation to the particular subject upon which his testimony is given. If the reasons given by the expert witness are deemed reasonable and satisfactory, the court may adopt them; but if they are unsatisfactory the court will discard the testimony and act upon its own knowledge and judgment. It is always the duty of the courts to construe the patents by a reference to the language of the claims and an examination of the specifications and drawings accompanying the same. It satisfactorily appears from the evidence that Norton discovered that by rounding and sizing the can-body by external pressure and by centering and guiding the can-head accurately in line with the can-body the entire circumference of the can-body could be entered simultaneously into the can-head by forcing its two parts squarely together. His invention which embodied this mode of operation consisted in a device designated as a "mold", which was adapted, as stated by appellees' counsel, to receive and encircle the can body and can-head, to size and true up the can-body, and to register and guide the head and body together when thus held and guided by the mold. The mold was constructed of two diameters having a difference between them of the thickness of the tin, the smaller one corresponding to the interior diameter of the can-head flange to the exterior diameter of the can-body, the larger one corresponding to that of the exterior of the can-head flange. The function of the larger diameter is to give room for the annular flange of the can-head outside of the can-body in the mold and to center the can-head accurately in line with the can-body as the head and body are forced together by the piston. The function of the smaller diameter is to size and round the can-body by external pressure. The can-head and the can-body are both simultaneously contained in this mold, and are brought together by a square linear movement by means of a piston, so that the tight-fitting exterior head is applied with precision, all sides at once, the entire circumference passing to place simultaneously. The mold is then opened to discharge the headed can by a lateral separation of its segments or parts.

The first claim of Letters Patent No. 267,014 reads as follows:

1. In a machine for applying to can-bodies heads fitting outside the same, the combination of a device for sizing the exterior diameter of the can-body to conform to the interior diameter of the can-head and holding the same so sized while the head is applied, said sizing and holding device having its end enlarged to fit the exterior diameter of the can-head, so as to leave an annular space between it and the can-body for the reception of the flange of the can-head, with a device for forcing the can-head into said annular space, and thereby applying the head outside the can-body, substantially as specified.

The Jensen mold, though different in form, possesses all the general features of the Norton mold which we have mentioned and is in all respects substantially the same in principle as the Norton mold. The mode of operation is certainly the same. True, the Jensen machine puts on only one head at a time, and the plunger or piston in his machine is placed in such a manner as to move the can-body toward the can-head instead of the can-head toward the can-body, as is the case in the Norton machine. Jensen cut a slot or notch in the end of his mold, so that the

can-head could be slipped in sidewise instead of at the end of the mold. In the Norton machine the can-body is delivered into the mold laterally or sidewise and the can-head endwise with the mold, while Jensen, having cut the notch in the end of the mold for the purpose of delivering the can-head in laterally or sidewise, delivers the can-body to the mold endwise.

There are other minor differences in relation to the molds that were discussed by counsel which we deem it unnecessary to here refer to in detail. It is sufficient to state that after a careful examination of all the testimony, the specifications, and drawings, and an inspection of the molds, our conclusion is that the differences pointed out between the respective molds are mostly formal and do not present any substantial difference in the principle of the operation of the respective machines. The patentee in his specifications refers to the fact that changes may be made in the form without departing from the essential characteristics of his invention:

I have shown duplicate chutes for the can-caps and pistons at each end of the molds.

It will be understood that the invention may be used to cap one end at a time or both ends, as desired. Nor do I wish to be limited to arms C, arranged in pairs, nor to the precise manner of opening the molds, nor to the precise operating mechanism therefor, because these features may obviously be varied in many respects.

* * * I do not wish to limit myself to any particular form or construction of can-mold or means of operating said mold to clamp or release the can, nor to any particular devices for forcing the can end upon the can-body when secured in said mold, as all these features or devices may be greatly varied without departing from the principle or essential characteristic of my invention.

It may also be observed that the molds may be mounted upon a reciprocating slide or an endless belt or other device instead of the revolving wheel shown in the drawings.

No one can avoid infringement simply by means of ingenious diversities of form and proportion presenting simply the appearance of something unlike the patented machine. It is well settled that a copy of the principle or mode of operation described in the prior patent is an infringement of it. If the patentee's ideas are found in the construction and arrangement of the subsequent device, no matter what may be its form, shape, or appearance, the parties making or using it are deemed appropriators of the patented invention and are infringers. An infringement takes place whenever a party avails himself of the invention of the patentee without such a variation as constitutes a new discovery.

Jugde Nelson in *Blanchard* v. *Beers* (2 Blatchf., 416) said that—

the sure test, and one the jury should be guided by in all cases of this kind, is whether or not the defendant's machine, whatever may be its form or mechanical construction, has incorporated within it the principle or the combination or the novel ideas which constitute the improvement to be found in the plaintiff's machine. If it does, then, no matter what may be its mechanical construction or its form, it is an infringement—an appropriation of the ideas of another, simply in a different form.

The same learned judge in *Tatham* v. *Le Roy* (2 Blatchf., 486) said:

Formal changes are nothing. Mere mechanical changes are nothing. All these may be made outside of the description to be found in the patent, and yet the machine after it has been thus changed in its construction is still the machine of the patentee, because it contains his invention, the fruits of his mind, and embodies the discovery which he has brought into existence and put into practical operation.

(See, also, *Winans* v. *Dunmead*, 15 How., 343; *Potter* v. *Schenck*, 1 Biss., 518.)

Claim 2 of the Norton patent, No. 267,014, reads as follows:

2. In a machine for applying to can-bodies heads fitting outside the same, the combination of a chute or device for delivering the can-bodies to the machine, with a movable device for clamping the can-body and sizing its exterior diameter to conform to the interior diameter of the can-head, said clamping and sizing device having its end or mouth enlarged to leave an annular space between the same and the can-body clamped therein for the reception of the flange of the head, a chute or device for delivering the can heads to the machine, and a device for forcing the can-head into said annular space at the end of said clamping and sizing device, substantially as specified.

The elements contained in this claim, in addition to claim 1, are a chute or device for delivering the can-heads to the machine and a device for forcing the can-head into the annular space at the end of the clamping and sizing device. These elements are not limited either by the claim or the specifications of the patent to a can-head-feed chute, but cover any equivalent or form of feed device that is suitable for conveying the can-head to the machine. In the Norton machine the arrangement is such that the can-bodies will move along by their own gravity. The Jensen machine contains a chute or device for delivering the can-bodies to the machine, arranged in such a manner that the can-bodies will not propel themselves by their own gravity, but it contains a supplemental device for moving the can-bodies along the same. The essential fact is the existence of the chute or device in the Jensen patent for delivering the can-bodies to the machine. This can-head pusher found in the Jensen machine is simply an addition to the can-head-feed chute of the Norton patent.

As Norton was the first inventor to produce a machine having the combination with the can-mold having a recess or enlarged diameter at its end, and the piston with a can-body-feed device, and a can-head-feed device, he is certainly entitled to claim it in its entirety. The witness Dayton testifies that the Jensen machine employs the same means, to wit:

A chute for delivering the can-heads and a strictly equivalent means for delivering the can-bodies. The traveling belt and a rotary or reciprocating feeder, both of which are used by Jensen to carry in the can-bodies, have long been well-known for such purposes, and seem to have been selected by Jensen from a wide range of familiar mechanisms adapted to set on the can while standing in an upright position. The addition of the feed-fingers at the lower end of the can-head chute in the Jensen machine, for pushing the can-heads into place with respect to the clamp-mold, was also within the range of well-known mechanical means for such purposes.

Claims 6 and 7 of the Norton and Hodgson patent, No. 274,363, for a new and useful improvement in can-ending machines, read as follows:

6. The combination of the can-body-clamping device or mold with a chute for the can-heads, a reciprocating head or piston at the base of said chute for automatically feeding the can-heads to the mouth of the mold and applying the same to the can-body, and a spring pin or device for holding the can-head in position at the mouth of the mold, substantially as specified.

7. The combination of the delivery-chute wheel having half-molds upon its periphery, reciprocating half-mold, chute for the can-heads, piston for applying the same to the can-bodies, and discharging-chute, substantially as specified.

The spring device mentioned in claim 6 constitutes an important element in the machine. There is some controversy with reference to its use in the Jensen machine. It is not described in the specifications or drawings of the Jensen patent, and Jensen in his testimony denies that he now uses it or any equivalent device. Norton testifies that it was in the Jensen machine which he examined. Jensen admits that it was placed in a few of his machines, but claims that when used it was for an entirely different purpose from that in the Norton and Hodgson machine. The action of the circuit court in finding an infringement of claim 6 is justified by the testimony of appellees' witnesses to the effect that the spring pin or device in appellees'

machine and in the Jensen machine, when used, performs substantially the same functions, and operates to hold the can-head in position at the mouth of the mold, and is combined in both machines with the mold, piston, and can-head chute. The action of the court in finding an infringement of claim 7 is justified by testimony showing that the reciprocating and revolving bar F, having the fingers H, as shown in Fig. 3 of the Jensen patent, is an equivalent for the can-body-feeding wheel of the Norton and Hodgson patent. The testimony shows that in both machines there is a reciprocating half-mold mounted on the frame of the machine.

Appellants contend that, inasmuch as the claims of this patent are for improvements upon combination claims, the patentees should be restricted to the particular form of their improvements, and that they are not entitled to invoke the doctrine of equivalents. This same contention is relied upon as an answer to the charge of infringement to most of the claims in all of the subsequent patents.

Mr. Justice Clifford, in delivering the opinion of the Court in *Imhaeuser* v. *Buerk*, (101 U. S., 655,) clearly states the principles of law upon this subject, as follows:

> Equivalents may be claimed by a patentee of an invention consisting of a combination of old elements or ingredients, as well as of any other valid patented improvement, provided the arrangement of the parts composing the invention is new, and will produce a new and useful result. Such a patentee may doubtless invoke the doctrine of equivalents, as against an infringer of the patent; but the term "equivalent," as applied to such an invention, is special in its signification, and somewhat different from what is meant when the term is applied to an invention consisting of a new device or an entirely new machine.

In explanation of the term "equivalent," after citing illustrations, he says:

> Patentees of an invention consisting merely of a combination of old ingredients are entitled to equivalents, by which is meant that the patent in respect to each of the respective ingredients comprising the invention covers every other ingredient which, in the same arrangement of the parts, will perform the same function, if it was well known as a proper substitute for the one described in the specification at the date of the patent. Hence it follows that a party who merely substitutes another old ingredient for one of the ingredients of the patented combination is an infringer if the substitute performs the same function as the ingredient for which it is so substituted, and it appears that it was well known at the date of the patent that it was adaptable to that use.

The mechanical substitute—

> may perform some other functions, but this does not prevent it from being an infringement. (*Norton* v. *Can Co.*, 45 Fed. Rep., 638.)

In *Carter* v. *Baker* (1 Sawy., 516) Judge Sawyer defines an "equivalent" in the following language:

> When in mechanics one device does a particular thing or accomplishes a particular result, every other device known and used in mechanics which skillful and experienced workmen know will produce the same result or do the same particular thing is a known mechanical substitute for the first device mentioned for doing that thing or accomplishing that result, although the first device may never before have been detached from its work and the second one put in its place. It is sufficient to constitute known mechanical substitutes that when a skillful mechanic sees one device doing a particular thing he knows the other devices whose use he is acquainted with will do the same thing.

(See, also, *Seymour* v. *Osborne*, 11 Wall., 556; *Machine Co.* v. *Murphy*, 97 U. S., 125; *Wicke* v. *Ostrum*, 103 U. S., 469.)

Keeping in view these principles of law, and also bearing in mind that there can be no infringement of a combination claim unless every element or a mechanical equivalent of an omitted element is used, we proceed to a consideration of the claims in the subsequent patents.

Claim 14 of the Norton and Hodgson patent, No. 294,065, for a new and useful improvement in can ending and seaming machines, reads as follows:

> 14. The combination, with a can-body-clamping mold, of a chute or device for delivering the can-bodies thereto, a chute or device for delivering the can-heads at the mouth of said mold, mechanism for applying the can-head to the can-body, and mechanism for bending and compressing into a seam the flanges uniting the can head and body, substantially as specified.

This patent shows the first combined can heading and crimping machine which operated to automatically apply the can-heads to the can-bodies and to crimp the same. The patentees are therefore certainly entitled to claim the combination of the devices which enabled them to accomplish these purposes, as set forth in the claim under consideration. The can-heading device in this patent is substantially the same as in the appellees' other patented machines, with the mechanical addition providing for crimping the heads while the can is still held in the clamping-mold. The can-body chute is also substantially the same as in the other patents. The drawings accompanying this patent have the squeezing-jaw form of crimper. The Jensen machine employs the rotary form, and for this reason, among others, it is claimed that it does not infringe claim 14; but the testimony of both parties shows that both forms of crimpers are old and well known and could readily be used one for the other. As the substituted device in the Jensen machine is the well-known mechanical equivalent of the device used in this patent, the combination remains the same under the law, and the use of the substituted device must be treated as an infringement of the prior machine.

Claim 1 of the Jordan patent, No. 307,197, for an improvement in can-ending machines for automatically putting the ends of sheet-metal cans onto the bodies, reads as follows:

> 1. In a machine for automatically putting the ends of sheet-metal cans on the bodies, a segmental clamp-chuck and mounted to be capable of performing the following operations: first, to receive and retain a can end; second, to grasp and hold the body of the can in a proper position; third, to force the end of the can on the body of the same; fourth, to release the end and body of the can when these operations are completed, combined with suitable means for actuating the same to effect these operations.

Appellants earnestly argue that this claim has not been infringed by them. They contend that, whatever views may be entertained as to the claims of certain other patents, this claim for the segmental clamp chuck or mold must be limited to the particular form of the improvement in the machine as shown in the drawings accompanying the patent; that appellees cannot under this claim invoke the doctrine of equivalents; that the machine itself has never been used and is impracticable; that the underlying principle of the Jensen machine is in every respect essentially different from this patent and does not in any respect accomplish its work by the same mode of operation; that the elements of each machine are essentially different and the mode of operation clearly distinct. A majority of the members of this court are of opinion that this claim has not been infringed for the reasons given by them in a separate opinion. I shall therefore, with reference to this claim, only express my individual views.

The contention of appellants with reference to the limitation of this claim is directed to some extent to the particular method of mounting the mold, as shown and described in the Jordan patent, by which the mold is made to swing first to one side and then to the other, so that the can-heads and can-bodies may be delivered into it. This particular feature of the Jordan patent, as to the vertically-moving and horizontally-swinging manner of mounting the mold, is covered by claims 2 and 3 of the Jordan patent, which are not claimed to have been infringed by the Jensen machine. The essential improvement of the Jordan patent covered by claim 1 is in the construction of the mold itself. This claim, it will be observed, is not limited to any particular method of mounting the mold. The claim is for—

> a segmental clamp-chuck and mounted to be capable of performing the following operation, etc.

By an examination of the specifications it will also be seen that the patentee did not limit himself to the particular method of mounting the mold as shown in the drawings accompanying the patent:

> At present my invention relates to and is employed in a machine the features of which are fully shown in the accompanying drawings and described in this specification, but is adapted to and can be operated in a press or machine of any suitable construction.

Under the rules already announced it is clear to my mind that the patentee is entitled to the doctrine of equivalents. Norton testified that he had one of the Jordan machines in one of his factories fitted up for several sizes of cans; that it was not at present running, but that it had run successfully, and was a successful and operating machine. This testimony, in my opinion, disposes of the objections raised as to the alleged impracticability of the machine.

What is the proper construction to be given to the patents under consideration? Do the molds of each machine, notwithstanding their difference in construction, perform substantially the same function, in substantially the same way, to obtain the same result, or do they perform different functions or operate in a different way, producing, substantially, a different result? In *Machine Co.* v. *Murphy*, *supra*, as well as in the other cases heretofore quoted from or referred to, the Supreme Court of the United States very clearly lays down the rule by which all courts should be governed in determining questions of this character. It is there declared that in all cases, except where form is of the essence of the invention, it is not—

> safe to give much heed to the fact that the corresponding device in two machines, organized to accomplish the same result, is different in shape or form the one from the other, as it is necessary in every such investigation to look at the mode of operation or the way the device works, and at the result, as well as at the means by which the result is attained. Inquiries of this kind are often attended with difficulty, but if special attention is given to such portions of a given device as really does the work, so as not to give undue importance to other parts of the same which are only used as a convenient mode of constructing the entire device, the difficulty attending the investigation will be greatly diminished, if not entirely overcome. (*Watson* v. *Ring*, 1 Cliff., 620.) Authorities concur that the substantial equivalent of a thing, in the sense of the patent law, is the same as the thing itself; so that if two devices do the same work in substantially the same way, and accomplish substantially the same result, they are the same, even though different in name, form, or shape. (Curt. Pat., 310.)

Jensen, after speaking in relation to the difference in the mounting of the respective molds, which has been already noticed, testifies that the can-mold in his machine also differs from the segmental clamp-chuck in the Jordan machine in this: that it is so constructed that it has one passage for receiving the can-head and another passage for receiving the can-body, so that the can-head may be entered therein, while the can-body is shaped and rounded, guided and forced into the can-head with one and the same stroke, without any performance whatever with the can-mold, as all these operations take place while the can-mold is closed and at rest, and that his machine differs from the combination in claim 1 of the Jordan patent in having omitted the segmental clamp-chuck with but one passage. These differences, in addition to others previously noticed, are relied upon to establish the fact that there has been no infringement of this claim.

The testimony upon the part of appellees is very lengthy and in some respects materially in conflict with the testimony of Jensen. From an examination of all the testimony bearing upon the question under consideration, and the principles of law applicable thereto, my conclusion is that Jensen obtained the idea and copied the feature of feeding or inserting the can-head in the recessed mouth of the mold before the can-body is inserted in the mold and of forcing the body endwise or longitudinally into the mold after the mold has been closed to support the can-head in the recess of the mold from the Jordan patent. That he likewise copied the feature of beveling or tapering the lower mouth of the mold, so as to facilitate the endwise insertion of the can-body in its sizing or clamping mold. That these features of the machine are covered by the claim under consideration, and that the element of this claim is found in the Jensen machine. That, although the clamp-chuck in the Jordan patent is divided into six parts or segments, and the mold in the Jensen machine is only divided into two parts, the molds in both machines open and close substantially in the same manner and for substantially the same purpose. That the purpose of the Jensen mold, as well as the segmental clamp-chuck in the Jordan patent, is, first, to hold and retain the can-head in the recess of the mold; second, to grasp and size up the can-body; third, to force the can-body longitudinally into the mold and apply the head to it, and, fourth, to release the end and body of the can. That the Jensen mold is specially adapted to accomplish these purposes and is combined with suitable mechanism for operating it, so as to bring about the results above mentioned, and that, notwithstanding the differences in the mode of construction, the dissimilar contrivances and devices for actuating the parts in the two machines, and the improvements in the Jensen machine, as testified to by the respective witnesses and pointed out by counsel in the oral argument, it contains the invention of Jordan as set forth in claim 1, and therefore, under the principles of the law as hereinbefore announced, infringes the same.

Claims 1, 2, 3, 8, and 9 of the Norton and Hodgson patent, No. 307,491, for a new and useful improvement in can-ending machines, read as follows:

> 1. The combination of an inclined clamp or mold for holding the can with a reciprocating piston or device for applying the head or cover thereto while held in such inclined position, substantially as specified.
>
> 2. The combination of an inclined clamp or mold for holding the can with a plate or support for the bottom of the can to rest against, and a reciprocating piston or device for forcing the head upon the can, substantially as specified.
>
> 3. The combination of an inclined clamp or mold with a plate or support at the lower end of said mold, an inclined chute for delivering the can-heads at the mouths of said mold, and a reciprocating piston for applying said heads to the can, substantially as specified.
>
> 8. The combination of an inclined device for holding the can with an inclined chute for delivering the cans thereto in an inclined position, and a device for applying the cover or head to the can while held in such inclined position, substantially as specified.
>
> 9. The combination of an inclined device for holding the can with an inclined chute for delivering the cans thereto in an inclined position, and a device for applying the cover or head to the can while held in such inclined position, and a spirally twisted or curved discharge-chute to receive the can in an inclined position and deliver it in a horizontal position to the carrier, substantially as specified.

The machine described in this patent is substantially the same as the machine in Patent No. 274,363, with the exception that it is so arranged as to hold the can at an incline, instead of horizontally, for the purpose of operating on filled cans. It will be noticed that each of the claims refers to the incline. This patent, with these improvements, stands at the head of the art, as providing for the first machine to automatically put the final head upon a filled can. The essentials of a machine to accomplish this purpose are, first, some means for taking the can into the machine and into the mold in such an upright position as that the contents of the can will be retained; second, a mold for applying the head to the can while in this position, and, third, some suitable means for discharging the can after it is headed, which will cause it to turn down into the proper position to roll through the solder bath, with the head applied undermost. These elements are found in both machines. The only point seriously urged against the infringement of the several claims in this patent is that the Jensen machine holds the can at an angle of ninety degrees, while in the machine described in this patent the can is held at a less angle. With reference to this patent, a majority of the members are of opinion that the claims thereof have not been infringed. My individual views, briefly expressed, are that if the inclination is sufficient to prevent the spilling of the contents of the can it does not make any essential difference in what particular angle it is employed. If the angle employed in the Norton and Hodgson machine safely accomplishes the result

of preventing the spilling of the contents of the can, and the testimony of appellees' witnesses is that it does, then it seems to me clear that appellants cannot avoid infringement upon the ground that their machine operated at a greater angle.

Claims 1, 2, 6, 7, 11, 12, and 13 in the Jordan patent, No. 323,060, for a new and useful invention in heading-machines for automatically applying the heads on the bodies of sheet-metal cans, read as follows:

1. In a can-heading machine, the combination, with two reciprocating part-molds, of a reciprocating device for conveying the can-body to a position between said part-molds and holding it there while said molds move forward to clamp the can-body, substantially as specified.

2. The combination, with two part-molds, of a reciprocating device for conveying the can-body to a position between said part-molds and holding it there until clamped thereby, substantially as specified.

6. The combination, with a pair of molds for clamping the can-body, of a plunger-head and a slide to adjust the can-head opposite the mold, substantially as specified.

7. The combination, with a pair of can-body-clamping molds, of a plunger-head, a reciprocating slide to move the can-head opposite the mold, and a chute for delivering the can-heads to said slide, substantially as specified.

11. The combination, with a pair of can-body-clamping molds, of a chute for the can-heads, a slide for moving the can-head opposite said molds, and a lever and cam for operating said slide, substantially as specified.

12. The combination, with two part-molds, of a can-head chute, a slide to move the can-head opposite the mold, a lever and cam for operating said slide, a plunger and plunger-head, and a cam and lever for operating said plunger, substantially as specified.

13. The combination, with two part-molds, of a reciprocating conveyer to convey to and hold the can-body between said molds and a cam and lever for reciprocating said conveyer, substantially as specified.

This patent is simply for an improvement upon the original Norton machine. The mold is substantially the same in both patents, the principal difference between the patents being in the manner of mounting the mold and in feeding the bodies and heads of the cans to the mold. If we are correct in the conclusions reached as to the infringement of the other patents, it necessarily follows that these claims have been infringed, and it would serve no useful purpose to again discuss the points and reiterate the reasons for our conclusion.

In my opinion the decree of the circuit court should be affirmed.

HANFORD, *J.*, (concurring:)

The opinion in this case, written by Judge Hawley, is concurred in by Judge Morrow and myself, and adopted as the opinion of the court as to the principal invention of Mr. Norton of a "machine for putting on the ends of fruit and other cans," and the several improvements and combinations of the parts of said machine with additional devices for doing all the work of bringing together cylindrical can-bodies and the disks or caps for closing the ends thereof and joining them by a series of harmonious automatic movements covered by the several patents issued to E. Norton, Norton and Hodgson, and Edmund Jordan, respectively, and numbered 267,014, 274,363, 294,065, and 322,060. We are of the opinion, however, that for some kinds of work the machine contrived by the appellant Jensen is an improvement upon any machine previously constructed and a very useful invention, and that it is not an infringement of any rights of the appellees under the patent issued to Edmund Jordan, No. 307,197, or the Norton and Hodgson patent, No. 307,491. While we are willing to protect the complainants to the full extent of their lawful claims under the patent laws, we have not failed to notice that, by his own testimony, Mr. Norton has manifested a disposition to restrict the use of his patented machinery to the heading of cans manufactured by a particular corporation, thereby imposing a grievous burden upon important industrial enterprises, from which they cannot escape unless other machinery can be lawfully employed. For this reason we are not inclined to enlarge their rights by any strained construction of the law, nor by presuming in their favor facts not clearly proven by legal evidence. We hold that the Jordan "can-ending machine," Patent No. 307,197, by reason of being cumbersome and slow in its operations is not a practicable machine for putting heads on tin cans of the size required for use in putting up fruits, vegetables, meats, fish, and similar materials for individual and family use, and therefore it cannot be infringed by the use of a different machine which will do such work well at a reasonable cost. It is true that Mr. Norton has testified that a Jordan machine set up in his factory has been operated successfully; but this is only the conclusion of an interested witness. It states no particulars as to the time during which the successful operation of the machine continued, nor the number of cans, whether one or a dozen or more, that were successfully operated upon, and he does not say whether or not the expense attending the successful operation was or was not the cause of discontinuing the same, and, besides this, same witness admits that this machine is too slow in its operation to be profitably employed in heading cans of the size required in the largest numbers. The most that he claims for it is that it is a splendid-working machine for putting covers on gallon or other large cans, a class of work for which, so far as the evidence discloses the facts, the Jensen machine has not been used. Mr. Jordan is not the inventor of the mold or discoverer of the principle of the segmental clamp described in the specifications for his patent. His invention consists of a new use of these appliances, in combination with others, to produce certain results. This is a sufficient reason for limiting the patent to the particular use mentioned in the specifications. The "can-ending machine" described in Patent No. 307,491 is simply the machine covered by the Patents Nos. 267,014, 274,323, and 322,060, tilted up by being bedded upon a table the top of which is an inclined plane of about forty-five degrees from a horizontal, combined with a spirally-twisted discharge-chute, so constructed as to receive cans in the inclined position in which they are held by the clamp when the heads are applied and deliver the same in an horizontal position. The object of setting the machine in such inclined position is to make it operate upon filled cans. It is obvious that to move and operate upon well-filled cans, especially of liquid or semi-liquid substances, the cans must be in true vertical positions, and the movement must be so free from jarring or concussion as to not disturb the contents, whereas one of the essentials of the "can-ending machine" is a carrier or feeding chute so constructed as to bring the cans into such a position that by force of gravity they will drop into the half-molds upon the periphery of the intermittently-revolving wheel. The machine will not operate upon filled cans in an upright position without some additional device or substitute for gravity to force the cans into the revolving half-molds, for the clamp or mold has no attraction for the cans or means of seizing them without the aid of an extraneous force. The contrivance of setting the can-ending machine in an inclined position and the adjustment of the feed and discharge chutes to work with it in that position can scarcely be considered to involve the exercise of inventive genius or anything more than ordinary mechanical skill, and being, at best, but partially successful in the accomplishments of its object, we cannot, under the law as we understand it, hold that any rights of the patentees have been infringed by the Jensen machine, which the evidence shows to be in its operation upon filled cans a complete success. The patent laws were not designed for the benefit of the man who attempts to originate a useful thing, but rather to reward the one who first achieves success in the production of it. It would be a perversion of the law to hold a machine which can do certain kinds of work to be an infringement of a patent for a different machine, which cannot do the same work. The decree of the circuit court should be so modified as to declare that the Patents Nos. 307,197 and 307,491 are not infringed by use of the Jensen machine, and in all other respects affirmed, and it is so ordered.

Costs of the appeal are awarded to the appellants.

OPINION OF THE ATTORNEY GENERAL	1481

World's Columbian Exposition.

To the inventors and manufacturers of the United States:

It is the intention of the Patent Office to make at the World's Columbian Exposition at Chicago in 1893 an exhibit which will show that great advance in the several arts which is due, in large measure, to the encouragement and support afforded by our patent system. This exhibit is to consist of models of patented inventions, which will be carefully selected, to show as far as is possible the inception of each art, the stages through which the art has advanced, and the final development reached at the present time. This display of typical inventions, embodied in concrete form and properly arranged, will, it is believed, constitute a grand historical exhibit of the progress of the useful arts and one which will be of great interest not only to inventors and manufacturers, but to the public generally.

The Office collection of models has been seriously impaired by fire, and is further incomplete by reason of the fact that models have not generally been required or received during the last ten years. The Office is not, therefore, in possession of the models of many valuable inventions which might properly be included in such an exhibit, and without which, indeed, the exhibit would be incomplete. The limited appropriation for this exhibit will not permit the Office to make such models. An urgent appeal is therefore made to all inventors and manufacturers to come to the assistance of the Office in this matter, either by loans of models already built or by the construction of such models not in the possession of the Office as should properly be placed in such a collection. Of course, where models are loaned to the Office all proper credit will be given both in labels and catalogues to the parties by whom the loans are made, and such disposition will be made of the models after the close of the exhibit as the owners shall direct. Many inventors and manufacturers have already indicated a willingness to co-operate with the Office in this matter, and it is confidently expected that such a response will be made to this general appeal as will assure the unparalleled success of this attempt to graphically and concretely show the developement of American invention.

W. E. SIMONDS,
Commissioner.

Protection of Foreign Exhibitors.

DEPARTMENT OF STATE,
Washington, D. C., July 30, 1892.

To the Diplomatic and Consular Officers of the United States:

GENTLEMEN: I subjoin a transcript of the act of Congress approved April 6, 1892, Public No. 20, entitled "An act to protect foreign exhibitors from prosecution for exhibiting wares protected by American patents and trade-marks," which reads as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That no citizen of any other country shall be held liable for the infringement of any patent granted by the United States, or of any trade-mark or label registered in the United States, where the act complained of is or shall be performed in connection with the exhibition of any article or thing at the World's Columbian Exposition at Chicago.

You will transmit copies of this circular to the government of the country to which you are accredited, and ask that it be given the widest possible circulation for the information of those directly concerned.

I am, gentlemen, your obedient servant,

JOHN W. FOSTER,
Secretary of State.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., August 4, 1892.

Official copy to the Commissioner of Patents for his information and guidance.

E. M. DAWSON,
Chief Clerk.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

Powers of Attorney.

(ORDER No. 766.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., June 25, 1892.

The attention of Examiners and the Application Clerk is called to Rule 18. General powers of attorney cannot be considered. In each application the written authorization must be filed. A power of attorney purporting to have been given to a firm or copartnership will not be recognized, either in favor of the firm or any of its members, unless all its members shall be named in such power of attorney.

The provisions of this rule must be strictly enforced as to all applications hereafter filed.

W. E. SIMONDS,
Commissioner.

Issue of September 6, 1892.

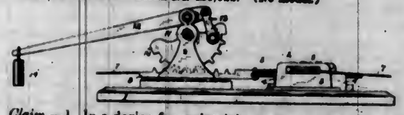
PATENTS

GRANTED SEPTEMBER 6, 1892.

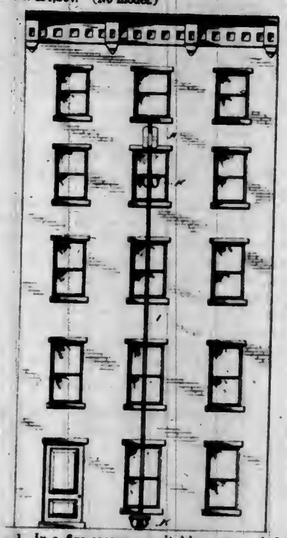


481,921. APPARATUS FOR CUTTING MINERALS. LLEWELYN B. ATKINSON and HENRY W. RAVENSHAW, London, and FREDERICK MORI, Leeds, England. Filed Aug. 13, 1891. Serial No. 403,071. (No model.) Patented in England Oct. 13, 1887, No. 14,090.

Claim.—1. In a machine for cutting coal or other minerals, an electrical motor carrying a cutter-bar on the axis of its armature and provided with trunnions formed from magnet-yoke c, journaled in bosses *d d* in frames A A′ upon a traveling carriage, in combination with a rack segment or quadrant G, keyed to the said trunnions and operated by a pair of worms J K, geared by bevel-wheels to hand-wheel L to adjust the motor and the cutter-bar to any desired height, the motor and bar being adapted to clamp in such position by bolt-heads and nuts traveling in fixed radial slots H I, substantially as described.

2. In a machine for cutting coal or other minerals, an automatic rope-feed for the traveling cutting-machine and cutter, consisting of a rope-drum 15, operated by a ratchet-wheel 8, driven by a pawl 9, receiving reciprocating movement by an eccentric motion 11 12 from a shaft rotated from the motor axis, and a disengaging electro-magnet 16, to which the pawl-arm 18 forms an armature adapted so as to lift the pawl out of gear when there is excess of electrical current passing through the motor, the feed being thus automatically stopped until the cutter is relieved, substantially as described.

481,922. COMPENSATOR FOR SIGNAL-WIRES. SAMUEL W. BABCOCK, Avon, N. Y., assignor of one-half to E. H. Babcock, same place. Filed Feb. 15, 1892. Serial No. 421,622. (No model.)



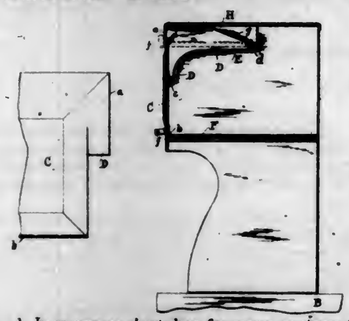
Claim.—1. In a device for maintaining an even tension on wires or cables, the combination, with the movable slide having the pulley thereon and the rack connected thereto, of the pivoted segmental gear, the weighted lever, and the link connecting said lever with the gear, substantially as described.

2. In a device for maintaining an even tension on wires or cables, the combination, with the base having the guides and the stationary pulley thereon, of the slide, the pulley thereon, the rack, the pivoted segmental gear, the pivoted lever having the weight thereon, and the link connecting the lever with the gear, substantially as described.

3. In a device for maintaining an even tension on wires or cables, the combination, with the movable slide having the pulley, of the lever having a weight thereon, a connecting-piece pivoted on a stationary support and operating on the slide, and a link connecting said piece with the lever, substantially as described.

481,923. FIRE-ESCAPE. ARGALUS A. BADGER, Windsor, Mo., assignor of one-half to Silvester J. Cotton, same place. Filed Apr. 30, 1892. Serial No. 431,267. (No model.)

Claim.—1. In a fire-escape, a suitably-supported frame or box, opposite pairs of friction wheels or pulleys arranged on opposite sides of said box, and an endless escape-rope passing over said opposite pairs of pulleys or wheels, substantially as set forth.



2. In a fire-escape, a frame or box adapted to be suspended from a building, opposite horizontal pairs of grooved rope wheels or pulleys arranged pair above pair in opposite sides of the said box or frame, and an endless escape-rope passing continuously around each horizontal pair of wheels or pulleys, substantially as set forth.

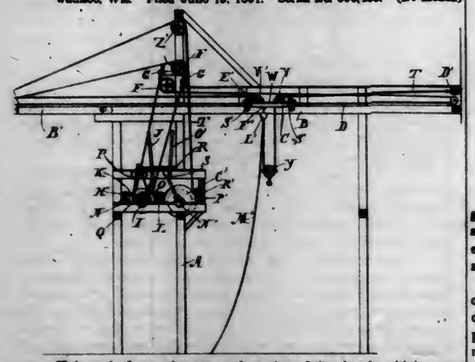
3. In a fire-escape, a box or frame having a longitudinal central opening, a supporting-bolt passing through the top of said box or frame, a central supporting-pulley suspended from said bolt within said opening at the top of the box or frame, opposite horizontal pairs of rope wheels or pulleys mounted within said box or frame on opposite sides of the central opening therein and arranged pair above pair, and an endless escape-rope passing over the said supporting-pulley and passed continuously around each opposite horizontal pair of wheels or pulleys, substantially as set forth.

4. In a fire-escape, the combination, with a friction-retarded endless escape-rope, of body-supporting attachments secured to said rope

and comprising a main front securing-ring, a waistband connected to said ring and adapted to be buckled thereto, and opposite crotch-straps secured to opposite sides and back of the waistband and provided at their ends with snap-hooks designed to engage the front securing-ring, substantially as set forth.

481,924. OVEN AND CLOSET DOOR FOR RANGES. MARY BORN, Cleveland, Ohio, administratrix of F. W. Born, deceased. Filed Nov. 9, 1891. Serial No. 411,361. (No model.)

Claim.—1. In an oven or closet door for ranges or stoves, the combination of the door having the projecting ends *a* and spring-bearings D, with the ways E and the guides H, arranged substantially as and for the purpose specified.



2. In an oven or closet for ranges or stoves, a door C, having a spring-bearing at each end, in combination with the ways E and guides H, said bearings resting on the lower terminals of the ways when the door is closed, arranged as described, whereby the closet may be opened or closed by the automatic movement of the door, in the manner substantially as set forth.

481,925. PROCESS OF MAKING WHISKY. WILLIAM E. BRADLEY, Frankfort, Ky. Filed July 9, 1889. Serial No. 316,973. (No specimens.)

Claim.—1. The process herein described of drawing off thin beer from the top of the fermenter at the end of the fermenting period and before distillation, separately distilling the same, and using the slop from this separated beer in subsequent repetition of the process of whisky-making, substantially as described.

2. The process herein described of drawing off thin beer from the top of the fermenter at the end of the fermenting period and before distillation, separately distilling the same, rapidly cooling the slop, and using the slop from this separated beer in subsequent repetition of the process of whisky-making, substantially as described.

481,926. ELEVATOR AND CARRIER. PETER H. BRODBECK, Milwaukee, Wis. Filed June 15, 1891. Serial No. 396,408. (No model.)

Claim.—1. In an elevator and carrier of the class in which a carriage actuated by an endless belt travels on a tramway, the combination, with the frame and two parallel shafts journaled in boxes fixed on the frame, which shafts are connected mechanically so as to revolve in opposite directions, one shaft being the driving-shaft connected mechanically to the power-supply, of a drum interposed between the shafts, about which drum the endless carriage-actuating cable is wound, a friction-wheel on the axle of the drum near one extremity of the drum, adapted to contact severally with corresponding wheels on the shafts, and a cylindrical box provided with a lever-handle, in which box the axle of the drum at that end on which the friction-wheel is fixed is journaled eccentrically, the box itself being journaled revolubly in a bearing on the frame, substantially as described.

2. In an elevator and carrier, the combination, with a tramway and a carriage actuated thereon by an endless cable, of a truck mounted and arranged to travel laterally on the carriage, pulleys journaled in the truck at right angles to its line of motion, a hoisting-cable running on and depending between the pulleys in the truck, and a sheave-block at the end of the tramway, supported and traveling laterally parallel with the truck on a rod-bracket, to which sheave-block the extremity of the hoisting-cable is attached, substantially as described.

3. In an elevator and carrier, the combination, with a tramway and a carriage adapted to travel thereon, of a truck adapted to travel laterally of the tramway on the carriage, pulleys in the truck, over which a hoisting-cable runs, and a sheave, to which the extremity of the hoisting-cable is attached, which sheave is supported and travels laterally parallel with the truck on a bracket therefor, substantially as described.

4. In an elevator and carrier, the combination, with a hoisting-cable, of a brake for clutching and locking the cable independently of the location of the carrier on its track, comprising a suitable relatively fixed beam through which the cable runs in an aperture therefor, a wedge-shaped key arranged to slide in ways therefor alongside the cable-aperture, an oscillating lever pivoted on the beam at one side of the cable aperture, a pin projecting from the key through a slot in the beam into an arm of the lever, a weight suspended from one arm of the lever, adapted to tilt the lever and hold the key normally out of engagement with the cable, and a hand-rope attached to the other arm of the lever, by which the lever can be tilted against the action of the weight and in the other direction, whereby the key is put into engagement with the cable and the cable is locked to the beam, substantially as described.

481,927. CABLE LOGGING-MACHINE. JOHN BUCKLEY, Eureka, Cal. Filed Mar. 8, 1892. Serial No. 424,225. (No model.)

Claim.—1. In a cable logging-engine, the combination of a frame, grooved pulleys carried thereby, one of which is the driving-pulley, a stationary cable, and reversely-situated tension devices at opposite ends of the engine for taking up the slack of the cable, substantially as described.

2. In a cable logging-engine, the combination of a frame mounted on wheels, grooved pulleys carried by said frame, one of which is the driving-pulley, a stationary cable, and a spring-actuated sheave or pulley through which said cable passes movable across the longitudinal direction of said cable to take up the slack therein, substantially as described.

3. In a cable logging-engine, the combination of a frame mounted on wheels, pulleys carried by said frame having grooves therein and one of which is the driving-pulley, a stationary cable secured at its opposite ends, leads at each end of said frame through which said cable passes, and reversely-situated tension devices at opposite ends of the engine adjacent to said leads for taking up slack in the cable, substantially as described.

4. In a cable logging-engine, the combination of a frame or support mounted on flanged wheels to engage a track, grooved pulleys differing in diameter and carried by said frame or support, one of which forms the driving-pulley, a lead at each end of said frame or support having pulleys therein over which the cable passes, and a spring-actuated movable sheave mounted in said lead to take up the slack of said cable, substantially as described.

5. In a cable logging-engine, the combination of a frame or support mounted on wheels, grooved pulleys carried by said frame or support, one of which is the driving-pulley, a stationary cable, and an automatically-operating sheave or pulley movable transversely across the line of and engaging said cable, substantially as described.

6. In a cable logging-engine, the combination of a frame or support mounted on wheels, grooved pulleys carried by said frame or support, one of which is larger than the other and forms the driving-pulley, a stationary cable engaged by said pulleys, tighteners in connection with said pulleys for taking up the slack of the cable passing thereover, a lead at each end of said frame or support having pulleys therein over which the cable passes, and a spring-actuated sheave mounted in said lead and engaged by said cable, substantially as described.

481,928. FREIGHT AND GRAIN CAR. JOHN F. BUTZ, Fort Worth, Tex. Filed Apr. 21, 1892. Serial No. 429,968. (No model.)

Claim.—1. A combined dead-freight and grain car comprising a car-body provided with a longitudinally-slotted bottom, vertically and outwardly movable lateral bottom sections, and vertically-movable end bottom sections hinged to the ends of the car-body, substantially as set forth.

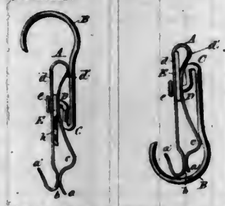
2. A combined dead-freight and grain car comprising a longitudinally-slotted bottom, a chute or trough located beneath the bottom and communicating with the slot and also provided with a suitable discharge-slide and vertically and outwardly-movable lateral bottom sections, and vertically-movable end sections located within the car-body above its bottom, substantially as set forth.

3. A combined dead-freight and grain car having a longitudinally-slotted bottom and provided, also, with a chute or trough extending externally of and longitudinally beneath said bottom and communicating with the slot and having a downwardly-converging bottom, and a discharge-slide mounted in the middle of said chute, the chute being wholly external from the car-bottom, substantially as set forth.

4. A combined dead-freight and grain car provided with outwardly and vertically movable lateral bottom sections, said sections being recessed and extended at their outer margins to receive the side standards of the car-body and also to enter the side door-openings, substantially as set forth.

5. A combined dead-freight and grain car provided with a pair of vertically and outwardly movable lateral bottom sections, a revoluble winding-shaft journaled in the upper part of the car-body and carrying oppositely-disposed winding-drums, and flexible connections leading from said drums and connected to the outer portions of the lateral bottom sections, substantially as set forth.

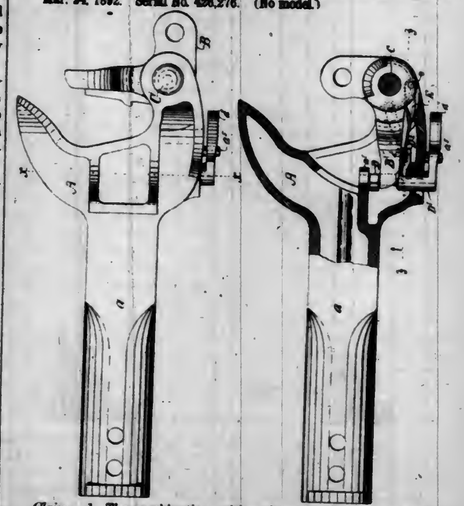
6. A combined dead-freight and grain car comprising outwardly and vertically movable lateral bottom sections, guiding-studs mounted at the ends of said sections, and guide-grooves at the ends of the car-body and serving to receive the said studs, substantially as set forth.



7. A combined dead-freight and grain car comprising end bottom sections hinged to the ends of the car-body, staples also secured to ends of the car-body, staples secured to the free ends of the end sections, and pins engaging said staples when the sections are raised, substantially as set forth.

8. A combined dead-freight and grain car comprising outwardly and vertically movable lateral bottom sections, a revoluble winding-shaft, flexible connections between said shaft and the bottom sections, and a pawl-and-ratchet opening to retain the shaft in its desired position and to release the same for reversed rotation, substantially as set forth.

9. A combined dead-freight and grain car comprising outwardly and vertically movable lateral bottom sections, a winding-shaft, flexible connections between the shaft and the bottom sections, a worm-wheel carried by said shaft and the bottom sections, a worm-wheel carried by said shaft, and a vertical operating-shaft having crank-handles at its upper and lower ends and also provided with a worm to engage the worm-wheel, substantially as set forth.



10. A combined dead-freight and grain car comprising a car body having its bottom or floor longitudinally slotted and grooved, a pair of lateral bottom sections the inner margins of which are arranged to engage the grooves, a revoluble shaft mounted in the car-body, and flexible connections from said shaft to the bottom sections near their inner margins, substantially as set forth.

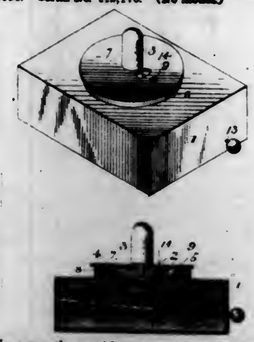
481,929. COMBINED HAT AND COAT HANGER AND CIGAR-CUTTER. WILLIAM R. COLE, Pottsville, Pa. Filed Aug. 8, 1891. Serial No. 402,157. (No model.)

Claim.—As an improved article of manufacture, the combined hat and coat hanger and cigar-cutter herein described, comprising the spring-clamp A, having near its upper end the curved knife-edge *d*, the suspension-hook B, bent at its lower end and journaled in the members of the spring-clamp, and the blade E, rigidly attached to said suspension device between the members of the spring-clamp, substantially as set forth.

481,930. CAR-COUPLING. CHARLES H. DALE, New York, N. Y., assignor to the Empire Car Coupler Company, Weehawken, N. J. Filed Mar. 24, 1892. Serial No. 426,276. (No model.)

Claim.—1. The combination, with a draw-head and a knuckle pivotally connected thereto, of a retaining dog or block, mechanism comprising an arm movable in a vertical plane for operating the dog or block, and means for swinging said knuckle open after it is released from the dog or block by the vertical movement of the dog or block operating arm, substantially as specified.

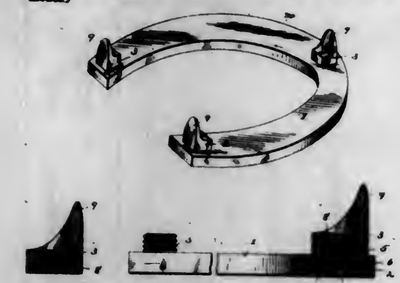
2. The combination, with a draw-head and a knuckle pivotally connected thereto, of the retaining dog or block, operating mechanism therefor, and means extending from the dog or block operating



mechanism and having a lost-motion action with the knuckle for swinging the knuckle open, substantially as specified.

3. The combination, with a draw-head and a knuckle pivotally connected thereto, of a dog or block for locking the knuckle, an arm having an oscillating movement relatively to the draw-head, and a rod connected pivotally with the knuckle and also connected with said arm for swinging said knuckle open after it is unlocked, substantially as specified.

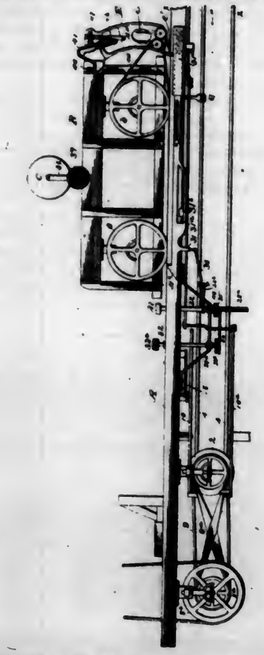
4. The combination, with a draw-head and a knuckle pivotally connected thereto, of a movable dog or block for locking the knuckle when closed, a rock-shaft supported in the draw-head, an arm extending from the rock-shaft, and a rod pivotally connected with the knuckle and having a loose connection with the arm extending from the rock-shaft, substantially as specified.



5. The combination, with a draw-head and a knuckle pivotally connected thereto, of a dog or block consisting of an arm, a rock-shaft supported in the draw-head and having the said arm connected with it, a second arm extending from said rock-shaft, and a rod pivotally connected with the knuckle and having a loose connection with the second-mentioned arm, substantially as specified.

481,931. TOY. CHARLES W. DELANEY, Hammond, Ind. Filed Dec. 15, 1891. Serial No. 415,170. (No model.)

Claim.—In a toy, the combination, with the box having apertures therein and the inclined barrel provided with a spring-actuated plunger, of the rotatable disk having an aperture therein adapted to register with the aperture in the box, the housing having a corresponding aperture, and the tube communicating with the barrel and the aperture in the box, substantially as described.



481,932. HORSESHOE. CHARLES R. DEVINE and GEORGE LA CHAPELLE, Williamsport, Pa. Filed May 7, 1892. Serial No. 432,184. (No model.)

Claim.—1. The herein-described improved shoe, the same being provided with a perforation flared from the center toward each end, the tapered stud inserted into the perforation, the rear end of the stud being spread, and the toe-calk threaded on the stud, substantially as specified.

2. The herein-described improved shoe, the same being provided with a perforation flared from the center toward each end, the tapered stud inserted into the perforation, the rear end of the stud being spread and the outer end of the stud being threaded, and the hollow calk having its outer end inclined from front to rear and its inner end internally threaded and removably mounted on the stud, substantially as specified.

481,933. CLOTH-PILING MACHINE. FRANK H. DOBSON, Omaha, Nebr., assignor of two-thirds to James T. Robinson and George E. Stokes, same place. Filed Mar. 3, 1891. Serial No. 383,540. (No model.)

Claim.—1. In a piling-machine, the combination, with the piling-table, of a vibrating fold-laying arm adapted to swing in a plane parallel with and over said table and means for actuating said fold-laying arm, substantially as and for the purposes specified.

2. In a piling-machine, the combination, with a piling-table, of a fold-laying arm arranged at one end thereof, a cloth-truck adapted to travel on the piling-table, and means for actuating the fold-laying arm from the cloth-truck, substantially as and for the purposes specified.

3. In a piling-machine, the combination, with a piling-table, of a cloth-carrying truck mounted on the table, a cable for actuating said truck, reversing mechanism for said cable, levers at the feed end of the table for actuating the reversing mechanism, and means on the truck for actuating the reversing mechanism independently of the levers, substantially as and for the purposes specified.

4. In a cloth-piling machine, the combination, with the power-driven cable and its power driving mechanism, of reversing mechanism composed of the pivoted levers 10, 10^a, and 22, hand-levers 12 and 12^a, arranged near the feed end of the table, and suitable intermediate connections, substantially as and for the purposes specified.

5. In a piling-machine, the combination, with the power-driven cable and the power driving mechanism, of automatic shifting mechanism composed of shifting-levers 10, 10^a, and 22, the bell-crank levers 14, 15, and 16 and 24, 25, and 26, and suitable intermediate connections, substantially as and for the purposes specified.

6. In a piling-machine, the combination, with the piling-table, of a vertically-adjustable vibrating fold-laying arm arranged at one end of the piling-table and means for actuating said arm, substantially as and for the purposes specified.

7. In a piling-machine, the combination, with a piling-table, of a vibrating fold-laying arm, a post for the same, and a slide for actuating the post and its arm, substantially as and for the purposes specified.

8. In a piling-machine, the combination, with a piling-table, of a vibrating fold-laying arm, a post therefor, and a spring-retracted slide for actuating the post and its arm, substantially as and for the purposes specified.

9. In a piling-machine, the combination, with a piling-table and a truck arranged to travel thereon, of a vibrating fold-laying arm, a slide for actuating the vibrating arm, said slide having a catch adapted to engage a projection on the truck, substantially as and for the purposes specified.

10. In a piling-machine, the combination, with a piling-table and a truck arranged to travel thereon, of a vibrating fold-laying arm, a slide for actuating the vibrating fold-laying arm, said slide provided with a catch for engaging a projection on the truck, and a cam-slot for disengaging the catch from said projection on the truck, substantially as and for the purposes specified.

11. In a piling-machine, the combination, with a piling-table and a truck arranged to travel thereon, of a fold-laying arm, a spring-retracted slide for actuating said fold-laying arm, said slide provided with a catch for engaging the truck, and a cam for disengaging the catch of the slide from the truck, substantially as and for the purposes specified.

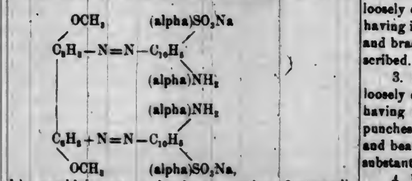
12. In a piling-machine, the combination, with a piling-table and a truck arranged to travel thereon, of a fold-laying arm having a threaded post, a ratchet-nut, a second post arranged in the path of the truck to be rotated thereby, and a ratchet actuated from said second post and which engages the ratchet-nut on the post of the fold-laying arm, substantially as and for the purposes specified.

13. In a piling-machine, the combination, with a piling-table and traveling truck therefor, of cloth-laying rolls mounted on the traveling truck and means for actuating the rolls from the axle of the truck, substantially as and for the purposes specified.

14. In a piling-machine, the combination, with a piling-table and a traveling truck therefor, of adjustable cloth-laying rolls mounted in housings on the truck, said rolls being adjustable in an arc of a circle described from the front axle of the truck, substantially as and for the purposes specified.

15. In a piling-machine, the combination, with a piling-table and a truck arranged to travel thereon, of cloth-laying rolls adjustably journaled in housings on the truck and means for automatically elevating said rolls from the piling-table, substantially as and for the purposes specified.

16. The combination, with a truck for piling-machines, of movable roll-bearings, cloth-laying rolls journaled therein, a rack and pinion for moving said bearings, and a pendent arm and ratchet mechanism for actuating the pinion which moves the rack, substantially as and for the purposes specified.

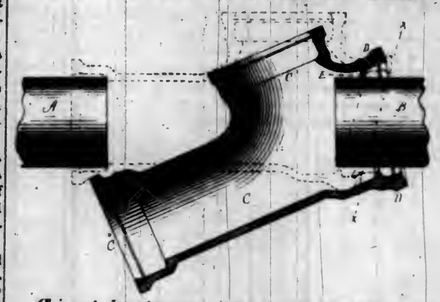


17. The combination, with a truck for piling-machines, of movable roll-bearings, cloth-laying rolls journaled therein, a rack and pinion for moving said bearings, and a knuckle-jointed pendent arm and ratchet mechanism for actuating the pinion which moves the truck, substantially as and for the purposes specified.

18. In a cloth-piling machine, the combination, with the piling-table and a cloth-truck arranged to travel thereon, of cloth-laying rolls adjustably journaled in juxtaposition to the front wheels of said truck, and belts for driving said cloth-laying rolls from the axle of the truck, substantially as and for the purposes specified.

19. The combination, with the truck of a piling-machine, of movable roll-bearings arranged segmentally thereon, cloth-laying rolls journaled in said movable bearings, and belts for driving said cloth-laying rolls from the axle of the truck, substantially as and for the purposes specified.

481,934. RED DYE AND PROCESS OF MAKING THE SAME. CARL DUISBERG, Elberfeld, Germany, assignor to the Farbenfabriken, vormals Fr. Bayer & Co., same place. Filed July 16, 1891. Serial No. 399,696. (Specimens.) Patented in Germany Nov. 19, 1885, No. 33,302; in England Nov. 24, 1885, No. 14,424; in France Dec. 19, 1885, No. 173,042; in Austria-Hungary May 7, 1886, No. 2,432 and No. 2,587, and in Italy May 26, 1886, No. 19,967.

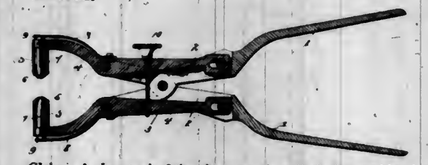


Claim.—1. The dye-stuff hereinbefore described, which has the formula:

and is obtained by combining one molecular proportion of tetrazodiphenol ether with two molecular proportions of alpha-naphthylamine monosulpho-acid and which forms in dried state a dark-brown amorphous powder that easily dissolves in water with bluish-red color and which is dissolved by concentrated sulphuric acid to a deep-blue liquid from out of which by the addition of water flakes of the same color are separated, while the supernatent fluid becomes colorless, and unmordanted cotton is dyed by it in a soap-bath magnificently bluish red.

2. The process for the production of a new substantive tetrazo dye-stuff by combining one molecular proportion of the tetrazo compound of dianisidine with molecular proportions of alpha-naphthylamine alpha-monosulphonic acid, (naphthionic.)

481,935. WATER OR GAS MAIN. HERBERT F. DURHAM, New York, N. Y. Filed Feb. 24, 1892. Serial No. 422,601. (No model.)



Claim.—1. In a pipe system of the character described, a special or branch, as C, one of whose bell ends is enlarged horizontally, so that its diameter in horizontal section is greater than its diameter in vertical section, said special being provided with a branch or side discharge-opening C' near said enlarged bell end, whereby space is provided for the end of the main pipe during the application of the special without recourse to a pocket, substantially as described.

2. In a pipe system of the character described, an enlarged bell end, as D, whose face or end is beveled off at an oblique angle with the axis of the special, substantially as described.

3. In a pipe system of the character described, an enlarged bell end, as D, provided on its inner surface with the oblique bead or rib E, substantially as set forth.

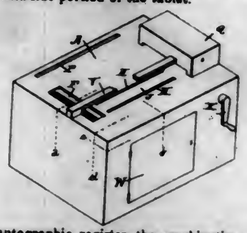
4. In a pipe system of the character described, the special or branch herein specified and consisting, essentially, of the round pipe C, provided with the ordinary round bell end C", the enlarged elliptical bell end D, having an oblique face, as described, the oblique bead or rib E, and the branch or side discharge-opening C', placed near the enlarged bell end, substantially as specified.

481,936. BALANCE-WHEEL PLIERS AND CALIPERS. JACOB E. ECKERT, Marengo, Iowa. Filed Apr. 7, 1892. Serial No. 428,176. (No model.)

Claim.—1. In a tool of the character described, the combination of the jaws, handles to which said jaws are pivoted and having a loose connection with the rear portions of said jaws, so that the latter can have a sliding movement at their rear ends in said handles, and a gage-screw extending through the said jaws intermediate of the rear ends and the pivotal points thereof, substantially as described.

2. In a tool of the character described, the combination of jaws loosely connected at their rear ends to have a sliding movement and having inwardly-extending posts with centers fixed to the ends thereof and brass punches movably mounted in said posts, substantially as described.

3. In a tool of the character described, the combination of jaws loosely connected at their rear ends to have a sliding movement and having hollow posts extending inward from the ends thereof, brass punches mounted in said posts, and spring-arms secured to said jaws and bearing on the ends of said punches to hold the same in position, substantially as described.



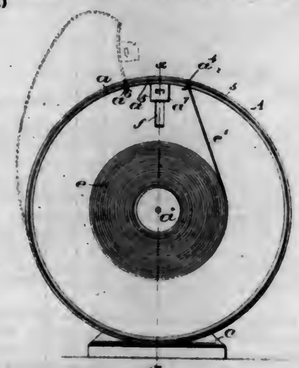
4. In a tool of the character described, the combination of the handles with their front portions bifurcated to form arms which receive and are pivoted to each other and jaws pivotally connected to the front ends of said arms and having their rear ends moving in and through said bifurcated portions of the handles, substantially as described.

481,937. AUTOGRAPHIC REGISTER. WILLIAM L. EGRY, Hamilton, Ohio. Filed Mar. 16, 1892. Serial No. 425,066. (No model.)

Claim.—1. In an autographic register, the combination, substantially as set forth, of a writing tablet, a pair of feed-rolls arranged to feed a strip of paper longitudinally over the tablet, a pair of feed-rolls arranged to draw a strip of paper transversely over the tablet, and a rigid surface interposed between a portion of the two papers, whereby

writing done upon certain portions of the top paper will not be transferred to the lower paper.

2. In an autographic register, the combination, substantially as set forth, of a writing-tablet, a pair of feed-rollers arranged to feed a strip of paper longitudinally over the tablet, a longitudinal slot in said tablet under said strip at a distance from its edge and dividing said tablet into a main portion and a side portion under said strip, and a pair of feed-rolls arranged to draw a strip of paper through said slot and over said side portion of the tablet.



3. In an autographic register, the combination, substantially as set forth, of a writing-tablet, feed-rolls arranged to draw a strip of paper over said tablet, and a rigid bar disposed over an intermediate portion of the tablet at right angles to said feed-rolls and parallel with the line of travel of said strip.

4. In an autographic register, the combination, substantially as set forth, of a writing-tablet divided by a slot into a main portion and a side portion, a support arranged to hold a roll of paper at one side of said tablet parallel with said slot, a pair of feed-rolls at the other side of the tablet parallel with said slot, a support arranged to hold a roll of paper at right angles to said slot, and a pair of feed-rolls disposed at right angles to said slot to operate upon the last-mentioned paper.

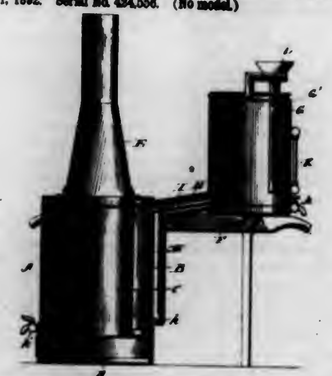
5. In an autographic register, the combination, substantially as set forth, of a writing-tablet having a dividing-slot and a rigid bar disposed above the surface of the tablet over said slot, and mechanism, substantially as described, for drawing a strip of paper over and parallel with said slot and under and parallel with said bar and for drawing a second strip through said slot under the first-mentioned strip.

481,988. SANDPAPERING-ROLL. JOHN A. EVERETT and JOHN FINN, Jr., Natick, Mass. Filed Feb. 3, 1892. Serial No. 420,673. (No model.)

Claim.—1. A sandpapering-roll capable of receiving an abrasive strip in coil form, said roll having a central support integral with it and upon which said coil is placed, and an opening in the periphery of the roll through which the outer or free end of the strip may be drawn, substantially as described.

2. A sandpapering-roll capable of receiving an abrasive strip in coil form, said roll having a central support integral with it and upon which said coil is placed, a socket in said central strip at one end of the roll to receive the driving-shaft, and a clamping device secured to the said central support at the opposite end of the roll to act upon and retain said coil in position, and an opening in the periphery of the roll through which the free end of the paper strip may be drawn, substantially as described.

3. A sandpapering-roll capable of receiving an abrasive strip in coil form and having an opening in its periphery through which the free end of the strip may be drawn, combined with a clamping device, and means to clamp the same against the edges of the strip in the coil and press the latter against the end plate of the roll to thereby hold the coil in position clamped edgewise between the roll and clamping device, substantially as described.

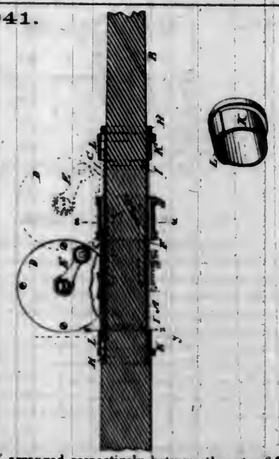


481,989. PRESERVING-JAR. JOHN E. FARER, St. Louis, Mo. Filed Apr. 21, 1892. Serial No. 430,159. (No model.)

Claim.—1. The combination, in a preserving jar or can, of a jar or can having the neck thereof inclining from the mouth of the vessel downwardly and inclining inwardly, substantially as set forth, with a lid or stopper consisting of a disk, of tin or other elastic metallic substance, having the edge thereof turned downward and forming an acute angle with the bottom of the lid or stopper and having a band, of rubber or elastic substance, stretched around the side of the lid or stopper, substantially as set forth.

2. The stopper or lid consisting of a disk, of tin or other elastic metallic substance, having the edge thereof turned downward and forming an acute angle with the bottom of the stopper or lid and having a band, of rubber or elastic substance, stretched around the side of the stopper or lid, in combination with a jar or can having a neck inclining downwardly and inwardly from the month, substantially as set forth.

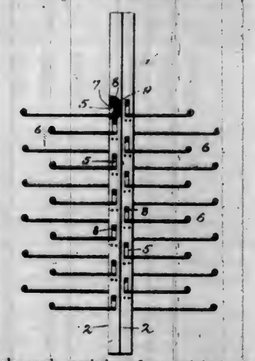
481,940. STEAMER. VOLENTINE F. FAGG, Avilla, Mo. Filed Mar. 11, 1892. Serial No. 424,556. (No model.)



Claim.—The combination of a boiler having an annular water-space, an adjacent water-supplying and steam-distributing vessel or tank located adjacent to and above said boiler, a feeding-tube extending from the lower end of said tank to the upper end of said boiler, passing down outside of said boiler, which latter forms a wall of the tube, to a point near to the lower end of the boiler and opening into the same at each point, and a smaller discharging-tube leading from said tank and opening into the extreme upper end of the boiler water-space, said discharging-tube being inclosed within the upper portion of the feeding-tube, substantially as set forth.

481,941. HOLDER FOR FISHING-LINE REELS. JEREMIAH FALVEY, New York, N. Y. Filed Jan. 14, 1892. Serial No. 418,040. (No model.)

Claim.—1. A reel-holder for a fishing-rod, consisting of a tube or support A, having at each end a revoluble ring provided with a laterally-projecting recessed portion adapted to receive the end of a reel-base and adjustable transversely by turning the ring on the tube or support, and a longitudinally-sliding ring arranged on the tube or support between the revoluble end rings, substantially as described.

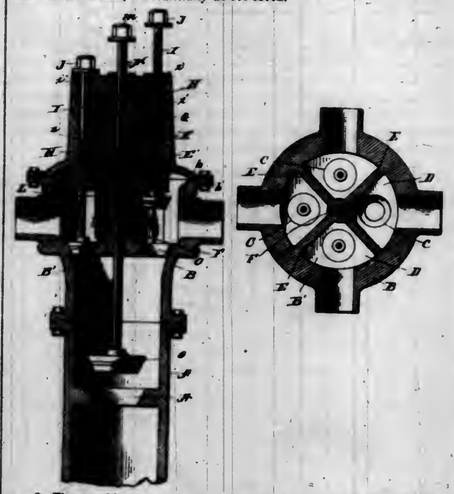


2. A reel-holder for a fishing-rod, consisting of a tube or support A, having a set of flanges H and I at each end portion, the revoluble

481,941.

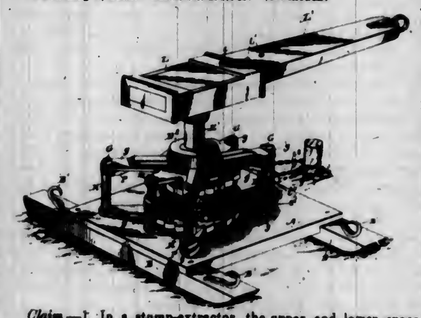
rings K and K', arranged, respectively, between the sets of flanges and provided with laterally-projecting recessed portions L, adapted to receive the end of a reel-base and adjustable transversely by turning the rings, and a longitudinally-sliding ring G, arranged on the tube or support between the revolable end rings, substantially as described.

481,942. RACK FOR DISPLAYING GOODS. EPHRIAM A. FOSTER, Port Clinton, Ohio. Filed Feb. 16, 1891. Serial No. 381,575. (No model.)



Claim.—A display-rack consisting of an upright having vertical slots and outwardly-projecting arms having their inner ends bent upwardly at right angles, forming short arms provided with eyes, the said bent portions located in and extending from the lower to the upper walls of the slots, and pivot-pins located in the upper parts of said slots and passing through said eyes, whereby the bent portions are held in said slots against the rear walls thereof, thus distributing the pressure between the pivot rear and bottom walls of said slot when the rods are in use and permitting the rods to lie close to the sides of the support when not in use.

481,943. DISTRIBUTING-VALVE. SAMUEL GOWIN, Sing Sing, N. Y. Filed Apr. 15, 1892. Serial No. 429,334. (No model.)



Claim.—1. The combination, with the main supply-pipe, of a distributing-valve casing having a series of partitioned valve-chambers and valve-seats within each of said chambers, of an inclosing cap secured to said casing to form an air-chamber and provided with a series of interiorly-threaded hubs projecting into each of said valve-chambers, threaded valve-stems working in said hub and terminating above the cap in squared operating-heads, and valves swiveled to the lower ends of said stems within said chambers, substantially as set forth.

2. The combination, with the main supply-pipe having a valve-seat, of a distributing-valve casing mounted upon said supply-pipe and having a series of partitioned valve-chambers and valve-seats within each of said chambers, an inclosing cap secured to said casing and provided with a central interiorly-threaded hub extending to the valve-seats within said casing, and a surrounding series of shorter interiorly-threaded hubs projecting into each of said valve-chambers, threaded valve-stems working through the several hubs and terminating above the cap in squared operating-heads, and valves swiveled to the lower ends of said stems, substantially as set forth.

3. The combination, with a valve-stem, of a valve having an upper valve-disk provided with a central recessed portion having a top perforation, a swiveled collar secured to the end of the valve-stem projecting within said recessed portion, a lower valve-disk provided with an upwardly-extending flange fitting within the recessed portion of the upper disk and inclosing the collar thereon, and a beveled washer also fitting over the flange of the lower disk and clamped between both of said disks, substantially as set forth.

481,944. STUMP-EXTRACTOR. PETER HANSEN, Antigo, Wis. Filed May 3, 1892. Serial No. 431,645. (No model.)

Claim.—1. In a stump-extractor, the upper and lower spaced plates having a series of front and rear extended arms and bearing-collars, clamping-bolts passing through said arms, spacing-sleeves mounted upon the front pair of bolts between said arms, guide-rollers loosely mounted upon said front spacing-sleeve, a chain-wheel revolving between said plates and provided with integral hubs bearing in said collars and an upwardly-extending integral squared portion, a chain-parting plate loosely supported between the front guide-rollers and at the front of the chain-wheel, and a sweep removably connected with the squared portion of said wheel extension, substantially as set forth.

2. In a stump-extractor, the upper and lower frame-plates having integral eccentric flanges, a chain-wheel mounted to revolve between said plates, opposite guide-rollers arranged at the front of said wheel, opposite wedge-shaped anchor-chain blocks having eccentric ends resting in said eccentric flanges, chain-rings mounted upon said wedge-shaped blocks, and a single anchoring-chain having its ends connected to said rings, substantially as set forth.

3. In a stump-extractor, the combination, with the upper and lower spaced plates, the lower of which is provided with opposite

notches and the chain-wheel mounted to revolve between said plates, of the swinging bolts depending from opposite sides of the upper plate and provided with lower projecting ends adapted to be sprung into and out of the notches in the lower plate, and chain-relieving rollers loosely working upon said bolts and designed to receive the chain to relieve the same from the wheel, substantially as set forth.

4. In a stump-extractor, the upper and lower frame-plates, a chain-wheel mounted to rotate between said plates and provided with upper and lower projecting flanges having a peripheral series of reversely-disposed ratchet-teeth, opposite dogs pivoted to suitable points of attachment and adapted to engage and be disengaged from their respective ratchets, and movable leaf-springs pivoted to the upper and lower frame-plates adjacent to said dogs and adapted to be moved over and away from the latter, substantially as set forth.

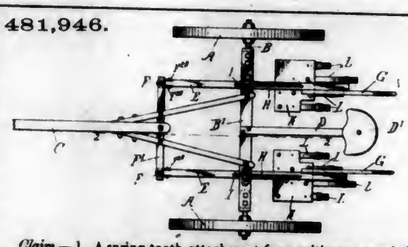
481,945. RIDING-SADDLE. VERNON D. HART, Addison, W. Va. Filed Dec. 16, 1891. Serial No. 415,945. (No model.)

Claim.—1. The herein-described improved saddle, the same comprising a cantle, cantle sections or extensions hinged at their front upper corners to the front lower corners of the cantle and depending therefrom, and springs for normally supporting the extensions in line with the cantle, substantially as specified.

2. The herein-described improved saddle, the same comprising the opposite side bars, the arched cantle embracing and secured to the same, the cantle sections or extensions, the leather hinges connecting the sections at their upper front corners to the lower front corners of the cantle, and the V-shaped metal springs interposed between the meeting edges of the cantle and the sections, substantially as specified.

3. The herein-described improved saddle, the same comprising the opposite side bars, the pommel-arch connecting the side bars, and the inverted-U-shaped pommel removably mounted on the arch and provided with a horn, substantially as specified.

4. The herein-described improved saddle, the same consisting of the opposite sides, the recessed pommel-arch connecting the two, the inverted-U-shaped metal straps embracing the recess and having the central threaded opening and its ends terminating in loops, prongs mounted on the metal strap with which the loops engage, a horn perforated longitudinally and rising from the pommel, and a pin passed removably through the horn and threaded in the pommel-arch embracing metal strap, substantially as specified.



5. The combination, with the saddle comprising the inverted-U-shaped cantle, of the described improved side-saddle attachment, the same consisting of an L-shaped horn, a curved guard secured at its front end to the horn, and devices for removably connecting the rear end of the curved guard to the cantle of the saddle and the horn to the side of the same, substantially as specified.

6. The combination, with the saddle, the stud located at the rear end thereof and the eye at the front end, of the herein-described attachment, consisting of the bar 18, recessed at its rear end to embrace the cantle, the L-shaped supporting-horn 20, connected to the front end of the bar, the hook pivoted to the horn and adapted to engage the eye of the saddle, the curved guard 21, secured at its front end to the horn, the pintle connected to the rear end of the guard, and the V shaped eye 23, pivoted at its terminals to the pintle and at its angle provided with the reduced neck for engaging the stud of the saddle, substantially as specified.

7. The combination, with the saddle comprising the inverted-U-shaped cantle, the side attachment connected to the pommel and cantle and consisting of a curved guard, and an L-shaped supporting-horn at the front end of the same, of the shield 29, secured to the front of the saddle, substantially as specified.

481,946. SPRING-TOOTH ATTACHMENT FOR CULTIVATORS. DEXTER R. HERRINGTON, Greenwood, Ill. Filed May 31, 1892. Serial No. 434,947. (No model.)

481,946.

Claim.—1. A spring-tooth attachment for a cultivator, consisting of the shovel block or bar K and four spring-teeth mounted thereon, said teeth being arranged with three in an oblique line and the fourth in transverse line with one of the three, to which it is not adjacent, the adjacent tooth being not located in the next space to the rear of said fourth tooth, substantially as set forth.

2. A spring-tooth attachment for a cultivator, consisting of the block K, having suitable fore-and-aft channels or grooves on its inner face and the spring-teeth lodged in such grooves, the block being provided with bolt-holes for securing the teeth, respectively, each in either of two positions on the block, substantially as and for the purpose set forth.

3. A spring-tooth attachment comprising the block K and the spring-teeth secured to its under side, provided with the bolt-hole k' at the forward part and the two bolt-holes k^2 k^2 laterally separated toward the rear part, substantially as and for the purpose set forth.

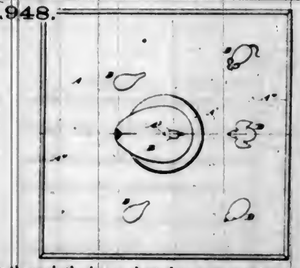
4. A spring-tooth attachment for a cultivator, consisting of the block K and the four spring-teeth secured to its under side, said block being provided with bolt-holes for securing each of said teeth in two positions fore and aft and having the recess K' at the inner rear corner, substantially as set forth.

481,947. GAME-COUNTER. PAUL H. HILLARD, Westerly, R. I. Filed Feb. 6, 1892. Serial No. 420,533. (No model.)

Claim.—1. A game-counter composed of a recessed base, a series of pivoted indices arranged in the recesses, operating-springs for said indices, and a slab or plinth overlapping the indices at their pivoted ends, arranged to form an abutment to the raised indices and a finish over their inner ends when the indices are down, substantially as described.

2. A game-counter composed of movable indices in the form of hinged levers provided with springs, and a base provided at the edges with small recesses to receive said levers and in the middle with a large recess back of said lever-indices, adapted to form a receptacle to receive the game apparatus, substantially as described.

3. A game-counter composed of a base provided with small recesses of rectangular form therein, a series of pivoted indices in said recesses at the upper part thereof, leaving vacant spaces below, the leaf-springs of U form confined in said spaces, with one member bearing against the indices and the other resting on the bottom of said recesses, and the plinth or slab overlapping the indices at their pivoted ends, arranged to form an abutment to the raised indices and a finish over their inner ends when the indices are down, substantially as described.



481,948. TOY. PAUL H. HILLARD, Stonington, Conn. Filed Mar. 5, 1892. Serial No. 423,832. (No model.)

Claim.—1. A toy device having a hollow shell with a ball inclosed and protruding through the base adapted to support the shell by rolling on a surface below and to allow it to move easily in all directions, as herein specified.

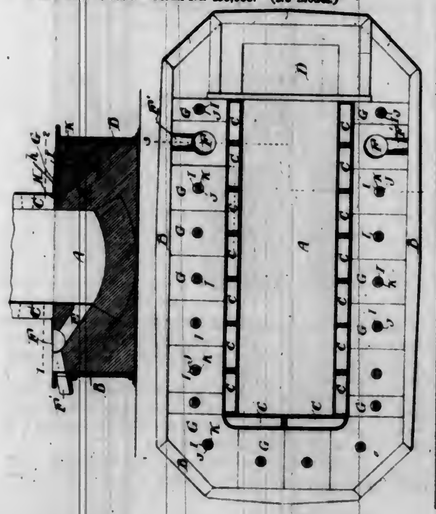
2. A toy device having a hollow shell with a ball inclosed and

481,948.

protruding through the base adapted to support the shell by rolling on a surface below and allowing it to move easily in all directions and having a surface D^2 in its base allowed to bear frictionally on the floor or surface below and to effect the turning of the device axially with each change in the direction of its motion, as herein specified.

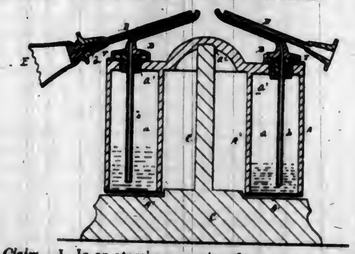
3. A toy device composed of a hollow shell with its interior prepared to offer but slight friction and inclosing one or more spheroids allowed to protrude through the bottom, so as to impart a wriggling motion as it moves by the rolling of such support or supports on a surface below, as herein specified.

4. The board A, with its dome A', central post A^3, pin A^4, and rim A^5, in combination with a set of movable devices composed each of a hollow shell with a spheroid inclosed and protruding through the base adapted to support the shell by rolling on a surface below and allowing it to move easily in all directions and having a surface D^2 in its base allowed to bear frictionally on the floor or surface below and to effect the turning of the device axially with each change in the direction of its motion, as herein specified.



481,949. COMPOSITION OF MATTER FOR JOURNAL-BEARINGS. PHILIP H. HOLMES, Gardiner, Me., assignor to the Holmes Fibre-Graphite Manufacturing Company, Chicago, Ill. Filed Jan. 2, 1892. Serial No. 416,807. (No specimens.)

Claim.—1. A composition of matter consisting of plumbago, carbonized fiber, deposited carbon, and an uncarbonized oil binder.



2. The process herein described of making a composition of matter, said process consisting in, first, making a composition of plumbago, fiber, and a carbonizable oil; second, subjecting the composition to such a heat as to carbonize the fiber and oil; third, subjecting the composition to a treatment with an oil binder, and, fourth, drying or heating the composition, so as to cause the oil to set or resinify, substantially as described.

481,950. BLAST-FURNACE. MALVERN W. ILES, Denver, Colo. Filed June 7, 1892. Serial No. 435,833. (No model.)

Claim.—In combination with the crucible-walls of a blast-furnace, cover-plates G, anchored to the top of the crucible-walls and having a depressed flange H on their edges next to the crucible, and water-jackets C, set on the depressed flanges H, substantially as and for the purpose specified.

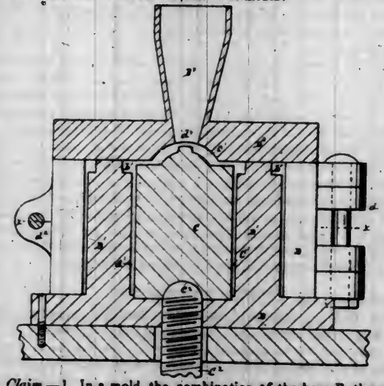
481,951. ATOMIZER. FREDERICK F. INGRAM, Detroit, Mich. Filed Mar. 12, 1892. Serial No. 424,668. (No model.)

Claim.—1. In an atomizer, a series of receptacles, each provided with atomizer-tubes, and a bulb or pump having a detachable connection with any and all of said tubes, substantially as described.

2. In an atomizer, a body or case having a series of integral receptacles, each provided with atomizer-tubes, and a bulb or pump to engage and operate any and all of said tubes, substantially as described.

3. In an atomizer, a body or case constructed of an integral casting having a series of receptacles therein, each receptacle provided with atomizer-tubes, and a bulb or pump to operate said tubes, substantially as described.

4. In an atomizer, a metal body or case constructed with a series of cells or receptacles closed at the base and each formed with a neck at the upper end, stoppers engaged in said necks, said stoppers each provided with atomizer-tubes, and a bulb or pump to operate said tubes, substantially as described.



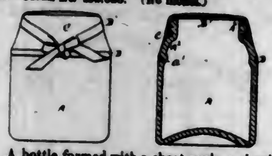
5. In an atomizer, a revolving body or case provided with a series of receptacles, said receptacles each provided with atomizer-tubes, and a bulb to operate said tubes, substantially as described.

6. In an atomizer, a cast-metal body or case provided with a series of receptacles formed integral therewith, the interior of the body formed hollow, and a standard supporting said body, substantially as described.

7. In an atomizer, a body or case provided with a series of receptacles, stoppers provided with atomizer-tubes engaged in said receptacles, a pump or bulb to operate said tubes, and labels held in place by said stoppers, substantially as described.

8. The case or body herein described, consisting of a casting provided with a series of cells cast integral therewith, said cells arranged in an annular series about the outer portion of said body, said casting provided with a hollow center open at the base and covered at the top, substantially as described.

481,952. MOLD. FREDERICK F. INGRAM, Detroit, Mich. Filed Mar. 12, 1892. Serial No. 424,667. (No model.)



Claim.—1. In a mold, the combination of the base B, the cores B' thereupon, a central vertically-movable core, and an inclosing case, substantially as described.

2. In a mold, the combination of the base B, cores B', central

movable core C, screw C^3, having a threaded engagement with the base and carrying said movable core, and an inclosing case, said core having a detachable engagement with said screw, substantially as described.

481,953. BOTTLE. FREDERICK F. INGRAM, Detroit, Mich. Filed May 6, 1892. Serial No. 432,083. (No model.)

Claim.—1. A bottle formed with a short neck, a shoulder, a fastening-flange to retain a tie cord or band, located below the shoulder at the top of the body of the bottle, said shoulder flaring from the base of the neck outward to said flange, substantially as and for the purpose set forth.

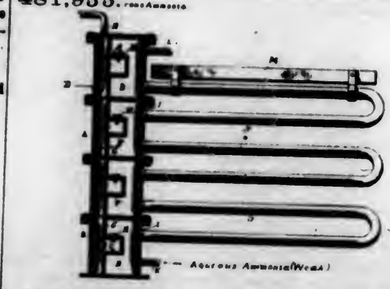
2. A bottle formed with a short neck threaded on its exterior, a shoulder, a fastening-flange to retain a tie cord or band, located below the shoulder at the top of the body of the bottle, said shoulder flaring outward from the base of the neck to said flange, substantially as and for the purpose set forth.

3. A bottle formed with a neck, a shoulder, a retaining-flange below the shoulder at the top of the body of the bottle, a stopper engaging the neck, a covering applied over the stopper and extending downward over the shoulder to the top of the body of the bottle, and a tie cord or band engaged over the edge of the covering below said retaining-flange, said shoulder and neck forming a backing in close proximity to said covering, substantially as set forth.

4. A bottle formed with a wide-mouthed neck of only sufficient length for stoppering, a shoulder, a retaining-flange below the shoulder at the top of the body of the bottle, a cap having a screw-threaded engagement upon the neck, a covering applied over the cap and extending downward over the shoulder to the top of the body of the bottle, and a tie cord or band engaged over the edge of the covering below said retaining-flange, said shoulder and capped neck forming a backing in close proximity to said covering, substantially as described.

481,954. TOBACCO-CURING BARN. JOHN R. JEWEL, Jewel, N. C. Filed Nov. 13, 1891. Serial No. 411,831. (No model.)

Claim.—1. The tobacco-supporting frame, in combination with the skeleton frame having alternate doors of canvas and wood, the canvas roofing secured to the ridge-pole of the skeleton frame, and the roll-rod to which the free end of the said canvas roofing on one side of the roof is attached, substantially as shown and described, and for the purpose set forth.

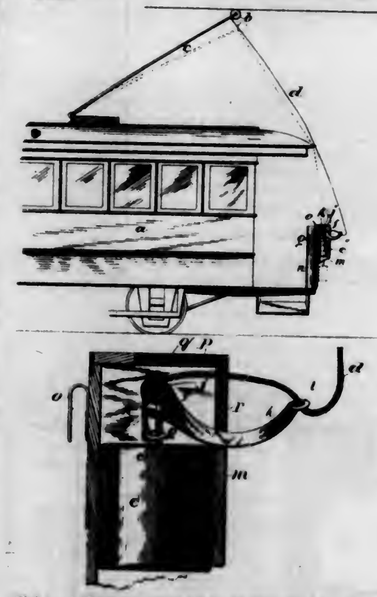


2. The roll-rod, the ridge-pole, the drums H, secured to the ends of said rod, and the canvas roofing having one end secured to the ridge-pole and the other end attached to the roll-rod, in combination with the ropes *f*, secured to the said drums and wound thereon by means of the canvas roof unrolling from the roll-rod, substantially as and for the purpose set forth.

3. In a tobacco-curing barn, the skeleton frame and the tobacco-supporting frame surrounded by the skeleton frame, but not attached thereto, said skeleton frame having upon each side and end two hinged doors, one of canvas and one of wood, in combination with the canvas roofing and means, substantially such as described, for rolling the said roofing so that it will cover or uncover one or both sides of the barn-roof separately or together, for the purpose set forth.

481,955. AMMONIA-ABSORBER. FREDERICK KAMER, Knoxville, Tenn. Filed Jan. 28, 1892. Serial No. 419,197. (No model.)

Claim.—1. In an ammonia-absorber, the combination of a cylinder or receiver having an inner gas-space having an upper inlet, interior valve-chambers leading from said space into the body of the receiver, cooling circulating-pipes connected with said receiver, and inlet and discharge solution pipes connected to said receiver, substantially as set forth.



481,955. AMMONIA-ABSORBER.

2. In an ammonia-absorber, the combination of a cylindrical vessel comprising a series of independent chambers, one above the other, a continuous gas-space running the entire length of said vessel and through said chambers and provided with valved escape-openings, cooling-pipes connecting said chambers with each other, and inlet and discharge pipes located at the bottom and top of said vessel, substantially as set forth.

3. In an ammonia-absorber, the combination of a vessel comprising a series of independent chambers, one above the other, a continuous gas-space having an upper inlet and running the entire length of said vessel through said various chambers, offstanding valve-chambers projecting within each chamber from said space and provided with valved escape-openings, horizontal cooling-pipes having return-bends and connecting said chambers in series with each other, and inlet and discharge pipes located at the bottom and top of said vessel, respectively, substantially as set forth.

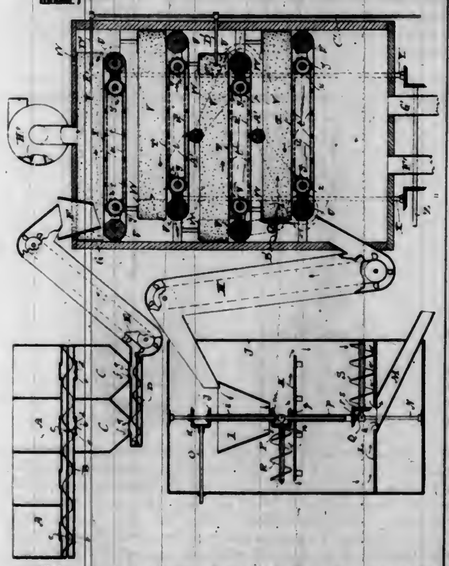
481,956. AUTOMATIC TROLLEY-DISCONNECTOR. GEORGE A. KIMBALL, Seattle, Wash. Filed Nov. 21, 1891. Serial No. 412,673. (No model.)

Claim.—1. In an automatic trolley-disconnector, the combination of the trolley-pole, a cord, a pivoted trigger actuated by the cord, and a weight normally hung within a slot formed in the short arm of the trigger, substantially as described.

2. In an automatic trolley-disconnector, the combination of a trolley-pole, a cord attached thereto, and a pivoted trigger adapted to trip a weight which is normally hung within a slot formed in the short arm of the trigger, as and for the purpose set forth.

3. In an automatic trolley-disconnector, the combination of an open-bottom box secured to the car, a trigger pivoted in the box and having its long arm projecting outside thereof, a downwardly-extending slot formed in the trigger, a weight normally hung within said slot, and a cord connected to the weight, trolley, and trigger, substantially as described.

481,957. DEVICE FOR HOLDING OPEN GRAIN AND OTHER SACKS FOR FILLING SAME. ALBERT L. KLANK, Champaign, Ill. Filed Feb. 17, 1892. Serial No. 421,861. (No model.)



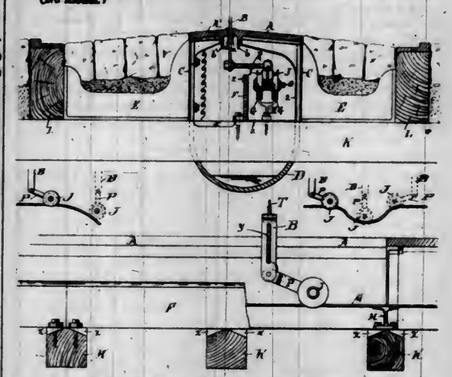
Claim.—1. A wire bag-holder consisting of a continuous wire *a b b a*, having spring-arms, and the wire *c*, having catches *e e*, as and for the purpose specified.

2. A wire bag-holder consisting of a continuous wire *a b b a*, having spring-arms provided with catches *a a* at their extremities, coiled portions *b b*, and a suspending-loop *d*, and a connecting-wire *c*, having catches *e e* adjacent to said coiled portions *b b*, substantially as and for the purpose specified.

3. A bag-holder having springs *b b*, arms extended in opposite directions from said springs and having catches *a a* at their extremities, a connecting-piece *c* to maintain the springs in proper position, and catches *e e*, substantially as and for the purpose specified.

481,958. MALTING APPARATUS. GUSTAVE A. KRAUSE, Milwaukee, Wis., assignor of one-fourth to George C. H. Guettler and George Krausnick, same place. Filed Sept. 7, 1891. Serial No. 404,968. (No model.)

Claim.—1. A germinating-chamber provided with a series of endless screen-floors the alternate members of which are made to travel in opposite directions, a support for each screen-floor, consisting of a pair of endless chains driven by sprocket-wheels and connected at intervals by transverse braces that impinge against said screen-floor, suitable means for conveying steeped grain to the germinating-chamber, and other suitable means for conveying the germinated material to a drying-kiln, substantially as set forth.



2. A germinating-chamber provided with a series of endless screen-floors the alternate members of which are made to travel in opposite directions, endless traveling supports for the screen-floors, endless traveling guards for said floors, suitable means for conveying steeped grain to the germinating-chamber, and other suitable means for conveying the germinated material to a drying-kiln, substantially as set forth.

3. A germinating-chamber provided with a series of endless screen-floors the alternate members of which are made to travel in opposite directions, tracks arranged in the germinating-chamber, a support for each screen-floor, consisting of a pair of endless chains driven by sprocket-wheels and connected at intervals by transverse braces that impinge against said screen-floor, antifriction-rollers carried with the support to run on said tracks, suitable means for conveying the steeped grain to the germinating-chamber, and other suitable means for conveying the germinated material to a drying-kiln, substantially as set forth.

4. A series of steeping-vats, combined with a germinating-chamber connected thereto by a conveyer mechanism, a series of traveling screen-floors within the germinating-chamber, a kiln having upper and lower floors of different diameters, the lower one being the one of the greater diameter and provided with a discharge-opening, a delivery spout in register with the discharge-opening, a screw-stirrer arranged above each kiln-floor, suitable means for imparting a planetary movement to each of the stirrers, and a conveyer mechanism connecting said germinating-chamber and kiln, substantially as set forth.

5. A malting apparatus comprising a series of steeping-tanks, a germinating-chamber, a conveyer mechanism connecting the tanks and chamber, a series of endless screen-floors the alternate members of which are made to travel in opposite directions, a support for each screen-floor, consisting of a pair of endless chains driven by sprocket-wheels and connected by transverse braces that impinge against said screen-floor, a drying-kiln, and a conveyer mechanism connecting said chamber and kiln, substantially as set forth.

481,959. CONDUIT SYSTEM FOR ELECTRIC RAILWAYS. REUBEN LAWRENCE, St. Joseph, Mo. Filed Jan. 27, 1890. Serial No. 338,204. (No model.)

Claim.—1. In an electric-railway conduit, the combination of removable cover-plates A A', having a slot-opening between them, side plates C C, brackets E E, and drain D, substantially as set forth.

2. In an electric-railway conduit, the combination of the removable cover-plates having a slot-opening between them, side plates C C, brackets fixed upon the ties of the railway, supporting and forming the framework of the said conduit, and the longitudinal rail-carrying sills also supported by said brackets, substantially as set forth.

3. In an electric-railway conduit, the combination of the removable cover-plates having a slot-opening between them, side plates C C, brackets fixed upon the ties of the railway, supporting and forming the framework of the said conduit, the longitudinal rail-carrying sills also supported by said brackets, and the drain D, substantially as set forth.

4. In an electric-railway conduit, the side plates C C, the brackets E E, fixed upon the ties of the railway, supporting and forming the frame of said conduit and sustaining the rails of the road, substantially as set forth.

5. In an electric-railway conduit, the combination of dripping-points *a a'* with the strengthening-flanges *b b'* of the plates A A', substantially as set forth.

6. In an electric-railway conduit, the combination of the dripping-points *a a'*, flanges *b b'*, and the splash-guard partition F, substantially as set forth.

7. In a conduit, cover-plates having dripping-points on each side of the slot-opening, and a partition within the conduit to one side of the slot-opening, conducting-wires located therein, substantially as described.

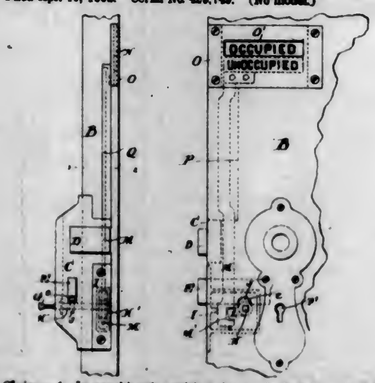
8. In an electric-railway conduit, the combination of removable cover-plates A A', having a slot-opening between them, side plates C C, brackets E E, drain D, a double electric conductor composed of round wire, and elevated supports therefor, substantially as set forth.

9. In an electric-railway conduit, the combination of removable

cover-plates A A', having a slot-opening between them, side plates C C, brackets E E, a double electric conductor composed of round wire, elevated supports therefor, a trolley having two sheave-formed brushes making contact upon the upper sides of said conductors, and a pendulous support for carrying said brushes, substantially as set forth.

10. In combination with a hanger B, an extension R, secured thereto, a trolley J, a swinging arm P, carrying the trolley and supported from the extension R, and an electrical connection between the hanger B and the arm P, substantially as described.

11. In a conduit, the contact-wires located therein, a break in said wires, a bridging-wire 16 between the ends of said wires, a supporting-plate 12 for the trolley, pivoted at one end, a centrally-arranged supporting-bracket, and a spring secured to said bracket and bearing against the pivoted plate 12, substantially as described.



12. In combination with a standard, as V', a hanger B, a trolley supported therefrom, a detachable connection between the standard and hanger, and flexible connecting means, as W, between the said standard and hanger, substantially as described.

13. In an electric-railway conduit, the combination of removable cover-plates having a slot-opening between them and a space partitioned off and to one side of the slot, a double electric conductor, elevated supports therefor, and a trolley supported by a ball-and-socket connection, having contact upon the top of said conductors and having free movement in any direction, substantially as set forth.

14. In an electric-railway conduit, the combination of removable cover-plates having a slot-opening between them, dripping-points on opposite sides of said slot, and a space partitioned off and to one side of the slot, a double electric conductor, elevated supports therefor, and a trolley supported by a ball-and-socket connection, having contact upon the top of said conductors and having free movement in any direction, substantially as set forth.

15. In an electric-railway conduit, the combination of removable cover-plates having a slot-opening between them, a space partitioned off and to one side of said slot, a double electric conductor therein, a trolley having contact upon the top of said conductor, and an automatically resilient support for the trolley, substantially as set forth.

481,960. INDICATOR-LOCK. CHARLES LINDSTROM, Altoona, Pa. Filed Apr. 19, 1892. Serial No. 429,749. (No model.)

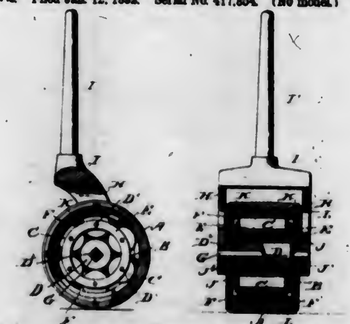
Claim.—1. In combination with a door, a lock-bolt, a shaft H, arranged to turn as bolt moves out and in, a rod M, having a sign N at its top, a plate O, arranged to inclose the sign and having a slot O' for its display, and a lever L, secured to shaft H and engaged with rod M, as described, so as to move the rod and sign when the bolt is moved.

2. In combination with a door, a lock-bolt, a shaft H, arranged to turn as the bolt moves in or out, said shaft extending in through the door beyond the lock, a rod M, inserted in the door, a lever L, secured to shaft H and engaged with rod M, a sign at the head of rod M, and an opening O' in the side of the door for the display of said sign.

481,961. THILL-COUPLING. JOHN E. MILLER, Allegany, N. Y. Filed Apr. 12, 1892. Serial No. 428,818. (No model.)

Claim.—1. The combination of supporting-arms provided with open bearings and with recesses in their sides surrounding the said bearings, the thill-iron, coupling-pin inserted through the thill-iron and resting in said bearings, washers mounted on the coupling-pin and adapted to engage said recesses, and securing-nuts mounted on the pin and bearing against said washers.

2. The combination of the supporting-arms provided with open bearings and with recesses in their sides around the said bearings, the coupling-pin resting in the said bearings, securing-nuts mounted on the coupling-pin, and washers engaging the recesses in the supporting-arms and provided with lips engaging the sides of the nuts.

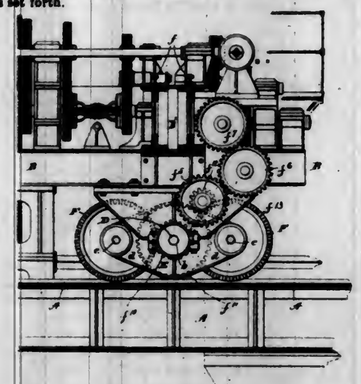


481,962. METHOD OF MANUFACTURING HORSESHOE-NAILS. WILLIAM W. MINER, New Haven, Conn. Filed Apr. 15, 1891. Serial No. 389,006. (No model.)

Claim.—1. The method of making horseshoe-nails, substantially as set forth, which consists in upsetting a rounded head on one end of a blank, reducing the body or shank of the blank to a tapering form circular in cross-section and then flattening the head and shank of the blank, and thereby producing a nail having flattened sides and rounded edges throughout its length.

2. The method of making horseshoe-nails, substantially as set forth, consisting in upsetting on the end of a blank a head circular in cross-section and flattened at its upper end, reducing the body or shank of the blank to a tapered form circular in cross-section throughout its length, and then flattening the shank and head and thereby producing a nail having flattened sides, rounded side edges, and a flattened driving-surface on top of its head.

481,963. FURNITURE-CASTER. ALFRED A. MINOR, Egg Harbor, Wis. Filed Jan. 12, 1892. Serial No. 417,854. (No model.)



Claim.—As an improved article of manufacture, the herein-described furniture-caster, the same comprising, in combination, the roller A and its casting, the shaft G, the roller D, carried thereby, the rollers C, arranged in a series within the roller A and around the roller D, the rings E, carrying stub-shafts on which the rollers C are journaled, the packing-rings F within the roller A at the ends of the rollers C, and the plates H, all arranged and operating substantially as and for the purpose specified.

481,964. OVERHEAD TRAVELING CRANE. JOHN R. MORGAN, Alliance, Ohio, assignor of three-fourths to Thomas R. Morgan, Sr., Thomas R. Morgan, Jr., and William H. Morgan, same place. Filed Aug. 4, 1891. Serial No. 401,662. (No model.)

Claim.—1. In a traveling crane, the combination, with a bridge, of a series of trucks supporting each end of the bridge, each truck being connected to the bridge by a centrally-located horizontal pivot, a pinion concentric with the horizontal pivot of one truck, and a pinion carried by or rigid with a track-wheel of said truck and meshing with the pinion concentric with the horizontal pivot, substantially as set forth.

2. In a traveling crane, the combination, with a bridge, of a series of trucks supporting each end thereof, each truck being mounted on a centrally-located horizontal pivot, one truck at each end of said bridge being provided with a driving-pinion concentric with the horizontal pivot connecting the bridge and truck and with a second pinion fast to one of the track-wheels and meshing with the driving-pinion, substantially as set forth.

3. In a traveling crane, the combination, with a bridge provided at its opposite ends with series of depending brackets arranged in pairs, of a truck pivotally mounted in each pair of brackets, a driving-pinion concentric with the axis of one of said trucks, and gearing connecting said driving-pinion with a track-wheel of said truck, substantially as set forth.

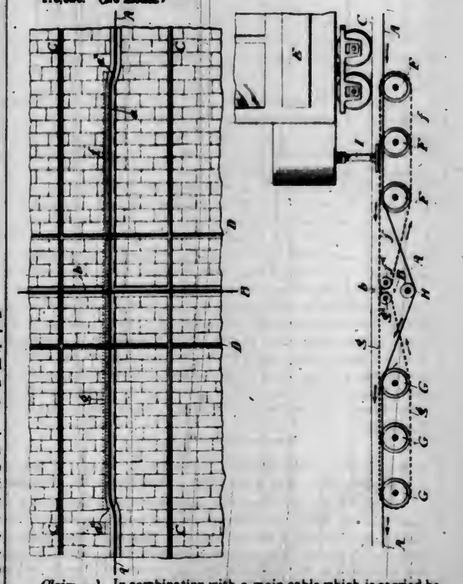
4. The combination, with a frame and series of trucks supporting same, each truck being connected to the frame by a centrally-located horizontal pivot, of a driving gear-wheel concentric with the axis of one of said trucks, and gearing connecting said driving gear-wheel with one or more of the track-wheels, substantially as set forth.

481,965. COIN-CONTROLLED SPIROMETER. ORLAND D. ORVIS, Chicago, Ill. Filed Feb. 10, 1891. Renewed Jan. 30, 1892. Serial No. 419,747. (No model.)

Claim.—1. In a coin-controlled spirometer, the combination, with a liquid-reservoir and an indicator connected therewith, a piston-chamber and a piston working therein for controlling the admission of air to the reservoir, of a stop device for preventing the operation of said piston and a trip carrying said stop device and operated by the coin for removing the same so as to permit the operation of the piston, substantially as described.

2. In a coin-controlled spirometer, the combination, with a liquid-reservoir and an indicator connected therewith, a piston-chamber and a piston working therein for controlling the admission of air to the reservoir, of a stop device for normally preventing the operation of the piston and a trip carrying said stop and alternately operated by the coin and the piston, substantially as described.

3. In a coin-controlled spirometer, the combination, with a liquid-reservoir and an indicator therefor, of the air-inlet passage, a valve-chamber located in said passage provided with outlet-ports, a valve working in said chamber, normally closing said ports and provided with an air-passage of less diameter than the passage connecting said chamber with the reservoir, whereby when air is blown into the reservoir the valve will be forced onto its seat so as to close the outlet-ports, but when the blowing ceases the back-pressure of the compressed air in the reservoir will lift the valve from its seat and open the outlet-ports, so as to permit the escape of the compressed air therethrough, substantially as described.



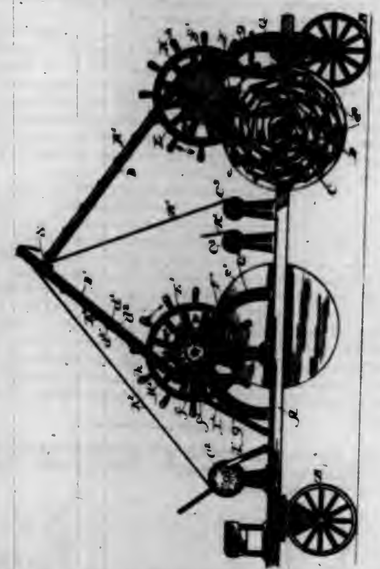
4. In a coin-controlled spirometer, the combination, with a liquid-reservoir and an indicating-vessel connected at the lower end thereof with said reservoir, of a piston-chamber connected with the upper end of said vessel and a spring-seated piston in said chamber opposing the passage of air from said vessel into the chamber, substantially as described.

5. In a coin-controlled spirometer, the combination, with a liquid-reservoir, an air-inlet passage, a valve-chamber located in said passage provided with outlet-ports, and a valve working in said chamber, normally closing said ports and provided with an air-passage of less diameter than the passage connecting said chamber with the reservoir, of an indicating-vessel connected at its lower end with said reservoir and at its upper end with a piston-chamber, and a spring-seated piston working in said chamber, opposing the passage of the air from said vessel into the chamber, substantially as described.

6. In a coin-controlled spirometer, the combination, with a liquid-reservoir, a piston-chamber, a piston working therein for controlling the admission of air to the reservoir, a stop device for normally preventing the operation of the piston, and a trip carrying said stop and alternately operated by the coin and the piston, of an indicating-vessel connected at its lower end with said reservoir and at its upper end with another piston-chamber, and a spring-seated piston working in said chamber, opposing the passage of the air from said vessel into the chamber, substantially as described.

7. In a coin-controlled spirometer, the combination, with a liquid-reservoir, a piston-chamber, a piston working therein for controlling the admission of air to the reservoir, a stop device for normally preventing the operation of the piston, a trip carrying said stop and alternately operated by the coin and the piston, an air-inlet passage connecting said piston-chamber and reservoir, a valve-chamber located in said passage, provided with outlet-ports, and a valve working in said chamber, normally closing said ports and provided with an air-passage of less diameter than the passage connecting said chamber with the reservoir, of an indicating-vessel connected at its lower end with said reservoir and at its upper end with a second piston-chamber and a spring-seated piston working in said chamber opposing the passage of the air from said vessel into the chamber, substantially as described.

481,966. CROSSING FOR UNDERGROUND CABLE RAILWAYS. WILLIAM H. PAGE, Philadelphia, Pa. Filed Jan. 14, 1892. Serial No. 418,086. (No model.)



Claim.—1. In combination with a main cable which is carried beneath a crossing cable, a crossing cable, conduits for said cables, slots in said conduits, a main track, a crossing track, a car upon the main

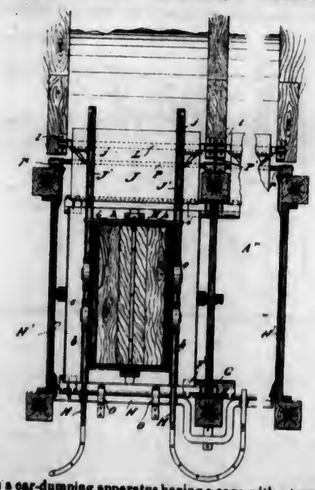
track provided with a cable-grip and with a supplemental toothed motor-chain grip, two endless supplemental motor-chains applied within the main conduit one at each side of the crossing cable and both carried into such proximity to said crossing cable as to leave merely a grip space or way between them, and combined pulleys and sprocket-wheels adapted to respectively support the main cable and the supplemental motor-chains, to be driven by said main cable and to drive said supplemental motor-chains, substantially as set forth.

2. In a cable-crossing device, in combination with supporting and driving sprocket-wheels in the main conduit and with a supplemental toothed motor-grip upon the car, an endless motor-chain composed of links formed with apertured lugs, sprocket-teeth, and grip-teeth, substantially as and for the purpose set forth.

481,967. FIRE-ESCAPE LADDER AND MEANS FOR RAISING THE SAME. PHILIP A. PALMER, Chicago, Ill. Filed Sept. 24, 1891. Serial No. 406,720. (No model.)

Claim.—1. The combination, with a sectional ladder, of swinging supports F, formed with arms *f*, a reel E, mounted between said supports and having fingers *e*, a roller *f'*, mounted between the ends of the arms *f* and separated from the reel by a space sufficient for the passage of the ladder, a windlass C^3, guy-ropes R R^3, coiled on the windlass and fastened to the topmost section of the ladder, and means for rotating the reel and windlass, substantially as shown and described.

2. The combination, with the folding ladder, of swinging supports F, segments G, the reel E, mounted in said supports, means for rotating the reel, and means for fastening the swinging supports at any desired angle upon the segments, substantially as shown and described.



3. The combination, with a wagon-bed, of two drums mounted thereon, sectional ladders constructed substantially as described and wound upon said drums, lifting-reels placed in proper relation to said drums and provided with fingers adapted to engage the successive rounds of said ladders, means for connecting the upper end of one of said ladders with the other ladder at any desired point, guy-ropes for bracing one or both of said ladders, and means for rotating the lifting-reels whereby said ladders may be raised, substantially as shown and described.

481,968. CAR-DUMPING APPARATUS. THOMAS J. PHILLIPS, Ottumwa, Iowa. Filed June 30, 1891. Serial No. 398,092. (No model.)

Claim.—1. In a car-dumping apparatus, a track-rail having beneath it at one end an attached lug adapted to engage with an interposed stop or bar to tip the rail and also adapted to drop below the surface of the track when not in use to afford an unobstructed track, thus enabling the car to run off the cage in an additional direction, substantially as described and shown.

2. In a car-dumping apparatus having a cage with a track thereon made adjustable to enable it to be tilted to place the car on an inclined plane, the rails *b b*, provided with lugs F to prevent the endwise shifting of the rails, substantially as described and shown.

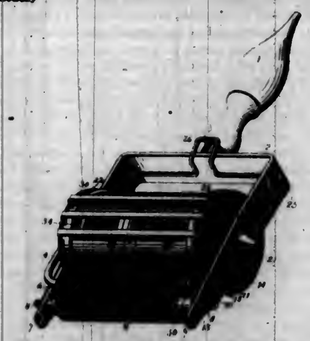
3. In a car-dumping apparatus having a cage with a track thereon made adjustable to enable it to be tilted to place the car on an inclined plane, the rails *b b*, provided with lugs E E to give the ends of the rails *b b* an additional landing-base, substantially as described and shown.

4. In a car-dumping apparatus having a cage with a track thereon made adjustable to enable it to be tilted to place the car on an inclined plane, the rails *b b*, provided with lugs E E to give the ends of the rails *b b* an additional landing-base, and with lugs F to prevent the endwise shifting of the rails, substantially as described and shown.

5. In a car-dumping apparatus carrying a car on an adjustable track, said track adapted to be tipped to place the car on an inclined plane, a slidable bar N, provided with short track-rails M M, so adjusted as to form a continuation of the untipped track, and also adapted to be readily interposed beneath the rails of the adjustable track to tip the same, substantially as described and shown.

6. The combination, in a car-dumping apparatus, of the slidable bar N, connected with the rock-shaft P and lever P' of the rods N' N', and short rods *p p*, located on opposite sides of the twin shafts, substantially as described and shown, and for the purpose specified.

7. In a car-dumping apparatus, the combination of a cage having an adjustable track, with track-rails M M, adapted to form a continuation of the adjustable track, and means whereby the track-rails may be moved beneath the adjustable track to tilt the same, all substantially as described.



8. In a car-dumping apparatus, the combination of a cage having an adjustable track, with a lug or lugs F, attached to the adjustable track to prevent the endwise shifting of the track, all substantially as described.

9. In a car-dumping apparatus, the combination of a cage having an adjustable track, track-rails M M, adapted to form a continuation of the adjustable track, and means whereby the track-rails M M may be moved beneath the adjustable track to tilt the same, a tipple adapted to connect with the adjustable track, having an automatic unlatching device and having tipple-rails inclining downward toward the cage to secure the return of the empty car upon the cage, substantially as described.

10. In a car-dumping apparatus, the combination of the cage adapted to be landed near the surface, an adjustable track on the cage, an elliptic spring adapted to fix the car on the cage and hold it while in vertical transit, a slidable bar adapted to tip the track upon the cage to place the car on an inclined plane, a tipple adapted to connect with the track upon the cage, an automatic unlatching device, and a tipple-track inclining downward toward the cage and located between the tipple and the cage to secure the return of the empty car, all substantially as described and shown.

11. In a car-dumping apparatus, the combination of the cage adapted to be landed near the surface, an adjustable track on the cage, having lugs F and E, an elliptic spring adapted to fix the car on the cage and hold it while in vertical transit, a slidable bar adapted to tip the track upon the cage to place the car on an inclined plane, a tipple adapted to connect with the track upon the cage, an automatic unlatching device, and a tipple-track inclining downward toward the cage and located between the tipple and the cage to secure the return of the empty car, all substantially as described and shown.

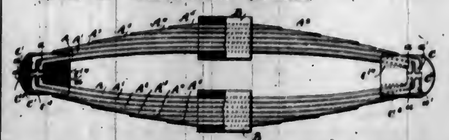
481,969. ROTARY HAND-STAMP. GEORGE A. PIKEP and WILLIAM J. TOWRY, Shelbyville, Tenn. Filed Oct. 6, 1891. Serial No. 407,914. (No model.)

Claim.—1. In a rotary stamp, the combination, with a frame, the main handle, a printing-cylinder journaled therein, and a stud on the end of the cylinder and projecting outwardly therefrom, of an inking-roller bearing against the cylinder, a spring-wire stop extending across said frame in rear of said cylinder and having an end portion projecting through the frame in the path of and normally engaging said stud, and a thumb-piece on said stop opposite the main handle in rear of said cylinder, as and for the purpose set forth.

2. In a rotary stamp, the combination, with a printing-cylinder having the ends of its face raised and grooves in its ends and a notch communicating with one of the grooves, of type having flanges at top and bottom and resting on the face of the cylinder between said raised ends and clamping-bars engaging said flanges, having their ends turned down and having their extremities turned in so as to engage said grooves and cut away at one edge to form engaging and adjusting tongues, as and for the purpose set forth.

3. In a rotary stamp, the combination, with a printing-cylinder having the ends of its face raised and grooves in its ends and a notch communicating with one of the grooves, of type having flanges at top and bottom and resting on the face of the cylinder between said raised ends and clamping-bars engaging said flanges, having their ends turned down and having their extremities turned in so as to engage said grooves, as and for the purpose set forth.

4. In a rotary stamp, the combination, with a printing-cylinder, type having flanges at top and bottom, and clamping-bars for locking said type to the cylinder, of a strip set in the face of the cylinder and provided with holes, a plate having a turned-up edge and a slot through its body, and a screw passing through said slot and engaging one of the holes, as and for the purpose hereinbefore set forth.



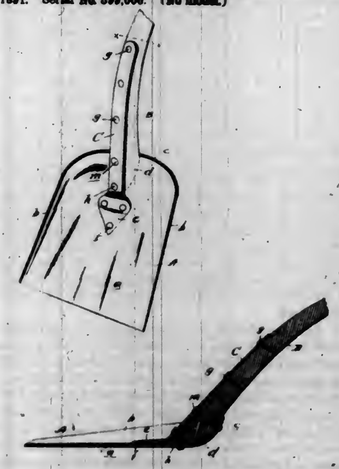
481,970. STAPLE-DRIVING IMPLEMENT. ERNEST A. PORTER, Florence, Mass. Filed May 16, 1891. Serial No. 393,059. (No model.)

Claim.—1. In a hand tacking-machine, the combination of a casing, a vertical guide-rod secured adjacent to the casing to form a feed-way between the casing and the inner edge of the guide-rod, a reciprocative plunger fitted in the casing and provided with a lengthwise slot, a foot-piece secured in the lower end of the casing, a feed-lever fulcrumed in the foot-piece with its free end arranged to sweep the lower end of the guide-rod and feedway, a spring to move the feed-lever inward, and a latch-rod having its upper end engaging in the slot of the plunger and its lower end secured to the feed-lever, substantially as and for the purpose specified.

2. In a hand tacking-machine, the combination of an outer casing having teeth on its base, a guide-rod secured to the casing to form a feedway between the casing and the inner edge of the guide-rod, a reciprocative plunger formed with a slot *j*, arranged in the case, a foot *c*, mounted in the base of the casing and provided with a handle *g*, a feed-lever fulcrumed in the foot to sweep with its free end the lower end of the guide-rod and feedway, a spring to throw the feed-lever inward, and a latch-rod *i*, engaging in the slot of the plunger and the toe of the feed-lever, substantially as and for the purpose specified.

481,971. SPRING. GEORGE L. POTTER, Fort Wayne, Ind. Filed Apr. 29, 1892. Serial No. 431,190. (No model.)

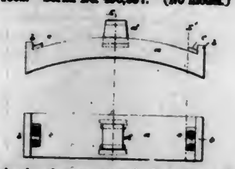
Claim.—1. The spring-support C, having a back C', a supporting-bar C^4, secured to the back by webs, as C^5, and a recess C^6, formed between the back C' and the bar C^4, to receive the bent ends or gibs of the spring.



2. The spring-support C, having a back C', an outwardly-tapered supporting-bar C^4, secured to the back by webs, as C^5, and a recess C^6, formed between the back C' and the bar C^4, to receive the bent ends or gibs of the spring.

3. The spring-support C, having a back C', a supporting-bar C^4, secured to the back by end webs, as C^5, and a partition web or webs, as C^5, and a recess C^6, formed between the back C' and bar C^4, to receive the bent ends or gibs of two or more parallel springs.

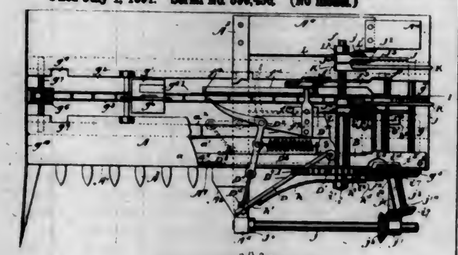
4. The combination of a leaf-spring A^3, having its two longest leaves formed with gib ends *a a'*, lying close together, with spring-supports C, having backs C', and spring-supporting bars C^4, united by webs, as C^5, and a recess C^6, formed between the back and support, to receive the gib ends *a a'*.



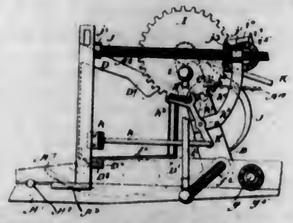
5. The combination of two or more sets of parallel leaf-springs, each set being held together by a separate and independent clamp, as B, with supports C, having backs C', and supporting-bars C^4, united by end and partition webs, as C^5 C^5 C^5, and having recesses C^6 formed between said back and bar to receive gib ends of the spring.

481,972. SHOVEL. PETER POULSON, Somers, Wis. Filed July 14, 1891. Serial No. 399,666. (No model.)

Claim.—The improved shovel herein described, consisting, essentially, of the blade A, having the flat bottom *a*, the outwardly-flaring curved side walls *b*, narrow in width at the forward edge of the blade and increasing in width or height toward the rear end thereof, and the outwardly and upwardly curved rear wall *c*, into which the side walls merge, as shown, the handle B, of oval form in cross-section, having its lower end formed with an enlarged portion *d*, curved upon its rear side to conform to the inside curvature of the rear wall *c* of the blade, the strap C, having at its lower end the flat portion *e* placed upon the flat part of the blade and secured thereto by bolts *f* and having its upper portion shaped to the handle and secured to the face thereof by bolts *g*, the connecting-bolt *m*, taking through the upper portion of the strap C, the handle, and the rear wall *c* of the blade, and the connecting-bolt *h*, taking through the strap C, the handle, and the bottom *a* of the blade, substantially as and for the purpose set forth.



481,978. BRAKE-SHOE. CHARLES T. SCHOEN, Allegheny, Pa. Filed Apr. 27, 1892. Serial No. 430,837. (No model.)



Claim.—1. A brake-shoe composed of a body *a* of wrought metal forged with the lips *b* and lugs *c* to hold the shoe in the shoe-head against lateral displacement and having the clip *d* embedded in the body, substantially as described.

2. A brake-shoe of the master-car-builders' standard, having the wrought-metal body *a* of a single piece and the clip *d* embedded in said body transversely thereof, substantially as described.

481,974. GRAIN-BINDER. GEORGE SCHUBERT, Walnut, Tex. Filed July 1, 1891. Serial No. 398,436. (No model.)

Claim.—1. In a grain-binder, the combination of a butt-board and mechanism for moving the same, with a rod A, hinged to near the free end of the butt-board and with its other end pivoted to the lower end of the lever A^7, and the lever A^7, pivoted to the binder-frame and having its upper end bifurcated, as shown, and the arm A^8, bent grainward and provided with a spring A^9 to engage with a pin i^3, secured to the gear-wheel I, having a depression i^2, a guide i^3, and a shaft mounted in a pivoted bearing-block, as shown, and for the purpose described.

2. In a grain-binder, the combination of a butt-board with a rod A, hinged to near the free end of the butt-board and with its other end pivoted to the lower end of the lever A^7, and the lever A^7, pivoted to the binder-frame and having its upper end bifurcated, as shown, and the arm A^8, bent grainward and provided with a spring A^9 to engage with a pin i^3, secured to the gear wheel I, having a depression i^2, a guide i^3, a shaft mounted in a pivoted bearing-block, a bell-crank D^3, pivoted in the platform, extending with its free end in the path of the conveyer and connected with its other arm to the butt-board by a connecting-rod D^4, as shown, and a conveyer operated in the platform, as and for the purpose described.

3. In a grain-binder, the combination of a butt-board with a rod A, hinged to near the free end of the butt-board and with its other end pivoted to the lower end of the lever A^7, and the lever A^7, pivoted to the binder-frame and having its upper end bifurcated, as shown, and the arm A^8, bent grainward and provided with a spring A^9 to engage with a pin i^3, secured to the gear-wheel I, having a depression i^2, a guide i^3, a shaft mounted in a pivoted bearing-block, a conveyer operated in the platform, a bell-crank D^3, pivoted in the platform, extending with its free end in the passage-way of the conveyer and connected with its other arm to the butt-board by a connecting-rod D^4 in position, as shown, and a spring D^5, secured with one end to a bracket and with its other end to the bell-crank D^3, for the purpose described.

4. In a grain-binder, the combination, with a gear-wheel I, provided with a depression i^2, formed in its toothed periphery, a guide i^3, and a pin i^3, as shown, of a shaft i^{10}, provided with a pinion i^7 and a bevel-pinion i^3, said shaft i^{10} carried by a pivoted bearing j^3, a lever A^7, pivoted to the binder-frame and having its upper end bifurcated, the arm A^8, provided with a spring A^9 to engage with the pin i^3, a rod A, connecting the lever A^7 to a butt-board, and a conveyer to operate the butt-board, as shown, and for the purpose described.

5. In a grain-binder, the combination, with a gear-wheel I, provided with a pin i^3 and a depression i^2, formed in its periphery, and a guide i^3 to correspond with the depression i^2 and secured to the gear-wheel I, as shown, of a shaft i^{10}, having its rear end i^2 projecting and provided with a pinion i^7 and a bevel-pinion i^3, said shaft i^{10} being carried by a pivoted bearing j^3, a lever A^7, pivoted to the binder-frame and having its upper end bifurcated, and the arm A^8, provided with a spring A^9 to engage with a pin i^3, a rod A, connecting the lower end of the lever A^7 to a butt-board, and a bell-crank pivoted in the platform and connected to the butt-board by a rod D^4, as shown, and for the purpose described.

6. In a grain-binder, the combination, with a bracket j, secured to the frame of the machine and provided with an arm j^5, provided with a flange or projection j^7 and a slide j^3, of a bearing j^3, pivoted to the projection j^7 and with its free end resting on the slide j^3 and provided with a shaft i^{10}, provided with the projection i^2 and a pinion i^7 and a bevel-pinion i^3, and a gear-wheel I, provided with a depression i^2 and a guide i^3, as shown, and for the purpose described.

7. In a grain-binder, the combination, with a needle formed of sections, the section f^3, rigidly secured to a rock-shaft f', and the section f^4, pivoted to the free end of the section f^3, of a spring-pressed stud f^6, projecting through a perforation f^5 and secured to the section f^3, a slot f^{11}, formed in the heel of the section f^4, and a bar f^9, located in the platform and projecting with its free end rearward, with its free end adjacent the section f^3 in position to engage in the slot f^{11}, for the purpose described.

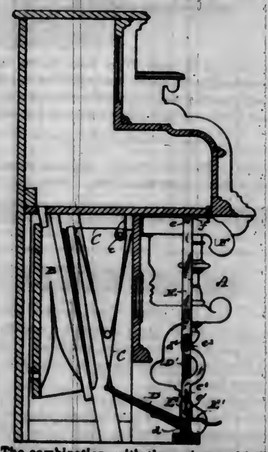
8. In a grain-binder, the combination, with a needle formed of sections, the section f^3, rigidly secured to the rock-shaft f', and the section f^4, pivoted to the free end of the section f^3, of a perforation f^5 in the section f^3, located slightly in rear of the pivot f^{12}, a spring-pin projecting through the perforation f^5, with its projecting end beveled from the lower side, a bar f^9, secured in the platform, projecting toward the rear, with its free end adjacent the section f^3 and located on line with the movement of the stud f^6 and having its end beveled from its upper side, and a slot f^{11} in the heel of the section f^4, as shown, and for the purpose described.

9. In a grain-binder, the combination, with a compressor J, formed as shown and pivoted on a shaft f and provided with a coiled spring J', rigidly secured with its stubble end to the compressor and projecting grainward, with its free and projecting end curved outwardly and bent to form a hook J^4 to engage with the slot J^5 of the breast-plate, of a discharger-arm secured on the shaft f, and a bell-crank lever, as shown, and for the purpose described.

10. In a grain-binder, the combination, with a compressor J, constructed as shown and loosely hinged on the shaft f and provided with a coiled spring J', rigidly secured with its stubble end to the compressor and projecting grainward, with its free and projecting end curved outwardly and bent to form a hook J^4 to engage with the slot J^5 of the vertical flange L of the breast-plate, of a bell-crank pivoted on the outwardly-curved end of the spring J' adjacent the hook J^4, with the arm J^5 extending down adjacent the vertical flange L, with the other arm J^7 projecting in the path of the discharging-arm K, and a discharging-arm rigidly secured on the shaft f adjacent the compressor, as and for the purpose described.

11. In a grain-binder, the combination, with a compressor constructed as shown and loosely hinged on the shaft f and provided with a coiled spring J', rigidly secured at its stubble end to the compressor and projecting grainward, with its free and projecting end curved outwardly and bent to form a hook J^4 to engage with the slot J^5 of the vertical flange L of the breast-plate, of a bell-crank pivoted on the outwardly-curved end of the spring J' adjacent the hook J^4, with the arm J^5 extending down adjacent the vertical flange L, with the other arm

J^7 projecting in the path of the discharging-arm, a discharging-arm K, rigidly secured to the shaft f adjacent the compressor J, and a depression L' in the vertical flange L of the breast-plate, as and for the purpose described.

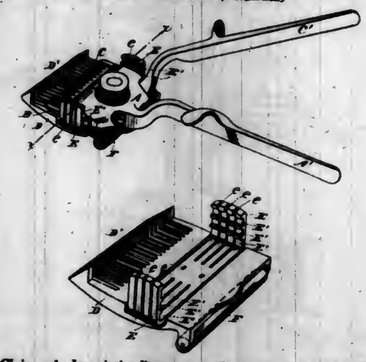


481,975. METER FOR ALTERNATING ELECTRIC CURRENTS. OLIVER B. SHALLENBERGER, Rochester, assignor, by mesne assignments, to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Original application filed Oct. 31, 1888, Serial No. 289,626. Divided and this application filed Sept. 27, 1889. Serial No. 325,201. (No model.)

Claim.—1. In an alternate-current electric motor, a coil or closed secondary conductor consisting of continuous rings or circuits of conducting material connected together in parallel circuit, substantially as described.

2. In an electric motor, a closed secondary circuit composed of circuits of conducting material and metallic connections between the successive circuits.

481,976. SWINGING TREADLE FOR ORGANS. WILLIAM H. SLEMMER, Milwaukee, Wis., assignor to the United States Swing Treadle Company, same place. Filed Jan. 19, 1892. Serial No. 418,563. (No model.)



Claim.—1. The combination, with the casing and bellows of an organ, of suitable levers pivotally connected with the lower part of the casing and operatively connected with the bellows, swinging hanger-arms pivotally connected with the casing at their upper ends and provided at their lower ends with suitable foot-pieces, and operative connections between said levers and said swinging hanger-arms, substantially as and for the purposes described.

2. The combination, with the casing and bellows of an organ, of suitable bell-crank levers pivotally engaged with the lower part of the casing and operatively connected with the bellows, swinging hanger-arms pivotally connected with the casing at their upper ends and provided at their lower ends with suitable foot-pieces, and movable connections between said hanger-arms and said bell-crank levers, substantially as and for the purposes described.

3. The combination, with the casing and bellows of an organ, of independent bell-crank levers, each pivotally engaged with the lower part of the casing and having one of its arms operatively connected with the bellows, independent swinging hanger-arms pivotally connected at their upper ends with the casing and provided at their lower ends with suitable foot-pieces, lateral pins or projections upon said bell-cranks, and slots in said hanger-arms operatively engaged with said pins or projections, substantially as described.

4. The combination, with the casing and bellows of an organ, of suitable levers pivotally connected with the lower part of the casing and operatively connected with the bellows, swinging hanger-arms pivotally connected at their upper ends with the casing and operatively engaged with said levers, and suitable foot-pieces adjustably engaged with the lower ends of said hanger-arms, substantially as described.

481,977. HAIR-CLIPPER. JOHN W. SMITH, Boston, Mass. Filed Nov. 25, 1891. Serial No. 413,077. (No model.)

Claim.—1. In a hair-clipper, a stationary and movable clipper-plate and a detachable comb-plate having spring-clips provided with a series of grooves for the purpose of securing the said comb-plate in different positions relative to the clipper-plates, substantially as specified.

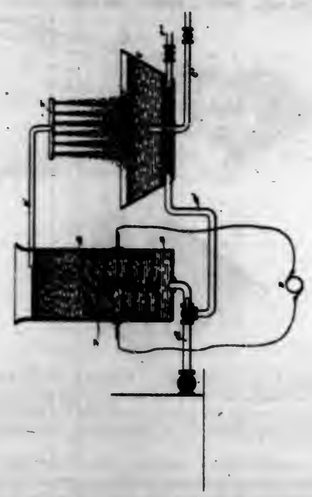
2. In a hair-clipper, a stationary and movable clipper-plate and a detachable comb-plate having laterally-grooved and longitudinally-slitted spring-clips for securing said comb-plate to the clipper, substantially as and for the purpose set forth.

481,978. CURTAIN-FIXTURE. SAMUEL H. SHAVELY, Washington, D. C., assignor of one-fourth to Frederic W. Ritter, Jr., same place. Filed Jan. 27, 1892. Serial No. 419,447. (No model.)

Claim.—1. In a curtain-bracket, the combination of two lapping longitudinally-adjustable arm-sections having adjacent corrugated interlocking surfaces which permit said arm-sections to be adjusted longitudinally in a right line and also at an angle to each other and a clamp for securing the parts when adjusted in either position, substantially as and for the purposes specified.

2. The combination, in a curtain-bracket, of two bracket-sections adjustable one on the other, one of said sections provided with longitudinal grooves and one with points or projections adjacent to one end thereof, whereby said sections may be adjusted in a right line or at an angle to each other, substantially as and for the purposes specified.

3. The combination, in a curtain bracket, of two adjustable sections, each provided on its inner or contacting face with grooves and points, whereby said sections may be adjusted to a right line or at an angle to each other, substantially as and for the purposes specified.



4. In a curtain-bracket, the combination of two longitudinally-slotted extensible arm-sections having adjacent corrugated interlocking surfaces and means for pivotally and adjustably connecting and clamping said arm sections, substantially as and for the purposes specified.

481,979. APPARATUS FOR ELECTRICALLY PURIFYING WATER. LOUIS T. STANLEY, Brooklyn, N. Y., assignor, by mesne assignments, to the Cutter Electrical and Manufacturing Company, Philadelphia, Pa. Filed Feb 11, 1890. Serial No. 340,262. (No model.)

Claim.—1. In an apparatus for purifying water, the combination, with a series of electrodes between which the water passes, of a settling-chamber into which the water is delivered and means, substan-

tially as described, for dividing up or spraying the water in its passage from the electrodes to the settling-chamber, as set forth.

2. The combination, with an electrolyzing-chamber and a series of electrodes alternately opposite and forming a zigzag course of vertical passage between them for water, of a settling-chamber into which the water is delivered and means for dividing up or spraying the water in its passage from the electrolyzing to the settling chamber, as set forth.

3. The combination, with an electrolyzing-chamber, electrodes contained therein, and a water-supply connected with said chamber, of an outlet-pipe in position to take off the water after its passage between the electrodes and provided with a rose or perforated nozzle and a settling-chamber into which the water is delivered in jets or spray, as set forth.

4. The combination, with one or more electrolyzing chambers or compartments and a series of iron and carbon electrodes contained in each, of means for delivering water to the chamber or chambers in jets or spray, a settling-chamber, and means for dividing up or spraying the water in its passage from the electrolyzing-chamber to the same, as set forth.

5. The combination, with the electrolyzing chamber or chambers and an outlet provided with a rose or spraying-pipe, of a settling-chamber composed of one or more connected compartments with sloping or tapered bottoms and partitions or aprons extending from the top nearly to the bottom of each compartment, as set forth.

481,980. FENCE. EDWARD G. STORM and SAMUEL M. STORM, Lebanon, Ind. Filed Feb. 19, 1892. Serial No. 422,165. (No model.)

Claim.—1. In a fence-post, the combination, with a base and upright articulated together, of arms projecting laterally from the sides of the said upright and guys passing over the said arms and secured to the lower end of the said base and the upper end of the said upright, substantially as described.

2. In a fence-post, the combination, with a base formed of a half-circle having lateral and longitudinal wings arising therefrom, the wings having their upper ends connected together, of a ball rigidly secured to the upper ends of the said wings, an upright having in its lower end one-half of a spherical bearing corresponding to the said ball, a block secured to the said bearing and having the opposite half of the said bearing therein, a piece 15, mounted on the said post and having an eye 15^2 on each side thereof, arms projecting laterally from the lower end of the said upright, and guy-wires passing over the said arms and having their lower ends secured to the said half-circle and their upper ends to the said eyes, substantially as described.

3. In a fence, the combination, with a base, of an upright articulated thereon, arms projecting laterally from the side of the said upright, a piece 15, mounted on the said post and having eyes on each side thereof, and guy-wires secured to the said base and to the said eyes and passing over the said arms, substantially as described.

4. In a fence-post, the combination, with a base and of an upright articulated thereto, of a piece 15, having a projection 15′ thereon and having an eye 15^2 surrounding the said upright and an eye 15^2 on each side of the said post, lateral arms projecting from the base of the said upright, guy-wires passing over the said arms and connected to the

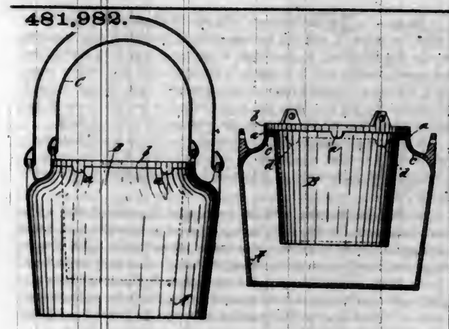
481,980.

said base and to the said eyes 15^2, a brace having its upper end engaged by the projection 15′ and its lower end bearing upon the ground, and twisted wires having their opposite ends secured to the base of the said brace and of the upright, substantially as described.

481,981. DRAINER-PLATE. HERMAN STRATER, Boston, Mass. Filed Apr. 6, 1892. Serial No. 427,854. (No model.)

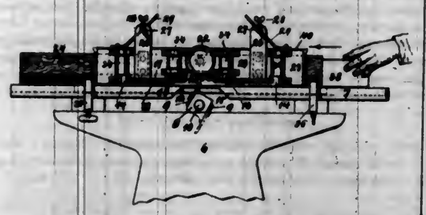
Claim.—1. As a new article of manufacture, a drainer-plate having a corrugated or fluted upper side and a smooth under side and composed of sheet metal corrugated, combined with a metallic substance which enters the depressions on the under side, substantially as and for purposes explained.

2. A drainer-plate composed of a series of corrugated sheets having their ends turned at right angles to form transverse lips, combined with a metallic substance, as solder, which unites said contiguous lips to form a butt-jointed continuous integral sheet, the corrugations being in alignment in the several sheets and the latter located in one and the same plane, substantially as stated and set forth.



3. In combination with a drainer-box and its non-contiguous slats, a drainer composed of a series of corrugated plates, as an integral sheet, and a series of transverse pendent fastening-strips adapted to pass between the slats and be bent thereagainst, substantially as described.

4. A drainer-plate composed of a series of corrugated sheets with downwardly-turned ends, said ends being integrally united to form stiffening-ribs on the under side, combined with the slats of a drainer-box, said ends being adapted to be bent against or fastened to the slats to hold the plate in position, substantially as described.



481,982. STEAMING-KETTLE. JAMES F. TAYLOR, Brooklyn, N. Y. Filed Oct. 16, 1891. Serial No. 408,980. (No model.)

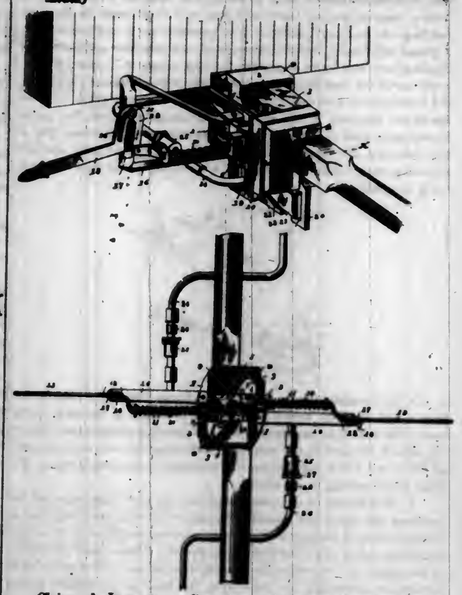
Claim.—In a device of the character herein set forth, the outer vessel for containing water and the inner vessel arranged to close the mouth of the outer one and to contain the material to be heated, said vessels being provided with lugs *a a* and corresponding notches *d d*, the parts being combined and arranged, as set forth, to provide for escape of steam without withdrawing the inner vessel from the water, for the objects explained.

481,982.

481,988. WORK-HOLDER AND SAFETY-GUARD FOR UNIVERSAL WOODWORKERS. JOHN G. TROM, Cincinnati, Ohio. Filed Feb. 12, 1892. Serial No. 421,305. (No model.)

Claim.—1. In a work-holder and safety-guard for universal woodworkers, the combination, with the table of the latter, of pressure-foot 40, arms 29, of elastic material, to which it is secured, arms 27, to which arms 29 are adjustably secured, and standards 26, to which arms 27 are secured in a manner to make them capable of a lateral as well as a rotary adjustment, the latter adjustment being for the purpose of raising or lowering the pressure-foot, all substantially as shown and described.

2. In a work-holder and safety-guard for universal woodworkers, the combination, with fence 25, of a pressure-bar 23 to hold the work against the fence, hinges to which this bar is secured, means to support the hinges, springs interposed between the hinges and their supports, a slide to which said supports are secured, and means to adjust the slide on the table of the machine, all substantially as shown and described.



3. In a work-holder and safety-guard for universal woodworkers, the combination, with fence 25 and the machine-table, of pressure-bar 23 and pressure-foot 40 for holding the work against the two former, a slide to which pressure-bar 23 and pressure-foot 40 are adjustably secured, and means to adjust the slide on the machine-table, all substantially as shown and described.

4. In a work-holder and safety-guard for universal woodworkers, the combination, with fence 25 and the machine-table, of pressure-bar 23, hinges to which it is secured, supports on which the hinges rest, springs between said supports and the hinges, a pressure-foot 40, arms 29 and 27, which hold this pressure-foot adjustable, a slide on which all the parts are supported, and means to adjust this slide on the machine-table, all substantially as shown and described.

5. In a work-holder and safety-guard for universal woodworkers, the combination, with fence 25 and the machine-table, of a slide adjustably secured to this table, means to accomplish such adjustment, standards secured to the slide, pins extending out from the standards, hinges supported on these pins, springs between the standards and hinges, a pressure-bar secured to these hinges, arms 27, supported on the standards mentioned before, elastic arms 29, secured to arms 27, and a pressure-foot 40, secured to these latter arms, all substantially as shown and described.

6. In a work-holder and safety-guard for universal woodworkers, the combination, with fence 25, of a pressure-bar 23 to hold the work against the fence, hinges to which this bar is secured, means to support the hinges, springs interposed between the hinges and their supports, a slide to which said supports are secured, stops to prevent the hinges from becoming disengaged from the slide, and means to adjust the slide on the machine-table, all substantially as shown and described.

481,984. COMBINED CAR AND AIR-BRAKE COUPLING. JAMES R. THOMAS, Sulphur Springs, Tex., assignor to the Thomas Car Coupling Company, same place. Filed Apr. 11, 1892. Serial No. 428,700. (No model.)

Claim.—1. In a car-coupling, the combination of the draw-head having an offset with a chamber therein to receive an opposite portion of the coupling, a sliding key or dog mounted in said draw-head and operating transversely therethrough, and means for releasing said key or dog, substantially as described.

2. In a car-coupling, the combination of a draw-head having an offset with a chamber therein to receive an opposite portion of the coupling, a key or dog movably mounted therein and extending transversely therethrough and provided with an inner beveled end, a rod connected to said key or dog and having a coiled spring thereon bearing against the key or dog to normally impel the same inward, and a lever connected to said rod for uncoupling the said key or dog, substantially as described.

3. In a car-coupling, the combination of a draw-head having an offset with a chamber therein to receive an opposite portion of the coupling, a key or dog transversely mounted therein, a rod having the slotted end thereof connected with said key or dog, whereby the latter may move thereover, a spring surrounding said rod, and a lever connected to the outer end of said rod for the purpose of uncoupling the said key or dog, substantially as described.

4. In a car-coupling, the combination of the draw-head having an offset with a chamber therein to receive an opposite portion of the coupling, a key or dog movable transversely therethrough, a rod connected to said key or dog, and a lever having a U-shaped end attached to said rod, substantially as described.

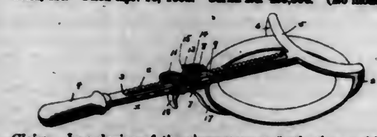
5. The combination, with a car-coupling, of a loosely-mounted gasket-head of the form set forth, having a clamping-spring in connection with the rear thereof, and an air-brake pipe connected with said gasket-head, substantially as described.

6. The combination, with a car-coupling, of a gasket-head loosely supported in connection therewith, a bracket with a slot therein, a clamping-spring attached to the rear portion of said gasket-head, and an air-brake pipe connected to said gasket-head and loosely passed through said slotted bracket and entering the same upon the side, substantially as described.

481,985. CALF-WEANER. WILLIAM H. TYLER, Davis City, Nebr. Filed Jan. 28, 1891. Serial No. 379,444. (No model.)

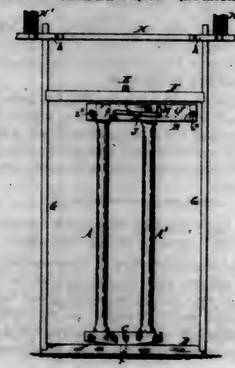
Claim.—1. The muzzle consisting of a nose-embracing frame having opposite front and rear pairs of eyes, opposite side bars terminating in front and rear eyes, the former engaging the rear eyes of the nose-frame, an arched piece 9, engaging the rear eyes of the nose-frame, in combination with a bar loosely mounted in the front pair of eyes, an apron loosely supported by the bar, a chin-strap connecting

the eyes of the nose-frame, and a strap connecting the rear eyes of the cheek-bars, substantially as specified.



2. The herein-described calf-weaner, consisting of a piece of wire bent to form the central kink 1, diverged at opposite sides thereof to form a nose embracing frame and bent at a right angle to form depending side portions 2, coiled to form opposite eyes 3, and rearwardly-disposed side bars 4, coiled at the ends of said side bars and forwardly disposed and bent upon themselves to form supports 7, upwardly disposed under the nose-frame and terminating beyond the same in guards, the arch-piece 9, and the connecting-bar 12, in combination with the apron-bar mounted in the eyes 3, terminating in points, the apron loosely supported thereby, the chin-strap connecting the rear eyes of the side bars, the opposite cheek-bars connecting said eyes, and the adjusting-strap connecting the rear ends of the cheek-bars, substantially as specified.

3. In a muzzle, the nose-embracing frame having the kink 1, the eyes 3, and the side bars 4, the apron 17, hinged in the eyes 3, the lower side bars 6, terminating in apron-supporting projections 7 below the eyes 3, the arch 9, the strap 22, connecting the rear or inner ends of the bars 4 and 6, and means for connecting the muzzle upon the head of the animal, as set forth.



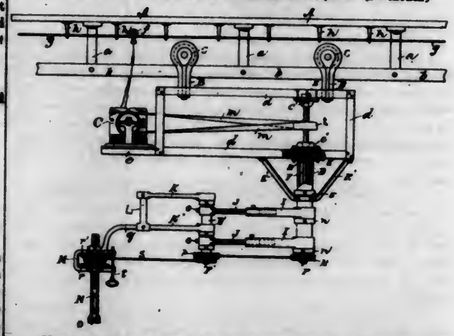
4. In a muzzle of the class described, the wire frame adapted to embrace the mouth and nostrils of a calf or colt and provided with a hinged apron 17, having its lower edge bent outwardly, as at 18, stops extending below and from the frame, and the frame below the pivot of the apron for preventing the rearward movement of the apron, and devices for connecting the muzzle to the head of an animal, as set forth.

481,986. PLATE OR PAN LIFTER. CHARLES I. WALDRON, Round Pond, Me. Filed Apr. 16, 1892. Serial No. 429,302. (No model.)

Claim.—In a device of the character set forth, the combination of a bar or rod having centrally-located ratchet-teeth thereon, with horizontal shoulders on opposite sides thereof, and a front yoked end with downward-extending curved arms, a sliding block mounted on said bar or rod having a lower curved arm and a finger-piece and an upper slotted head, a pawl or dog mounted in said slotted head and having a nose at the front and rear portions thereof, and a spring bearing on the top of said pawl or dog to normally hold the front nose thereof in engagement with ratchet-teeth, substantially as described.

481,987. CATTLE-STANCHION. JEREMIAH WARSON, Friendship, N. Y. Filed Mar. 9, 1887. Serial No. 230,201. (No model.)

Claim.—1. The combination, with the fixed stanchion-bar A, the slotted top piece B, and the bottom piece C, provided with a socket *m*, of a stanchion-bar A', provided at its lower end with a shoulder and seated loosely and removably in the socket of the bottom cross-piece, whereby the stanchion-bar is prevented from falling through the socket by the shoulder and is permitted to be lifted out of the socket when released at its upper end, substantially as set forth.



2. The combination, with the pivoted cross-piece B and stanchion-bars A A', of a catch *o*, pivoted to the cross-piece B, and a beam F, provided with a recess *p*, in which said catch engages, substantially as set forth.

3. The combination, with the cross-piece B, provided with a pivoted catch *o*, and a beam F, having a recess *p*, in which said catch engages, of the movable stanchion-bar A', whereby the catch is withdrawn from said recess upon closing the bar, substantially as set forth.

4. The combination, with the cross-piece B, provided with a pivoted catch *o* and a pivoted locking-latch, of a movable stanchion-bar A', which is locked in a vertical position between the catch *o* and latch, substantially as set forth.

5. The combination of a supporting-frame and a stanchion pivotally connected thereto and consisting of a bottom piece and a head-piece, with the fixed stanchion-upright A and the movable stanchion-upright A', the said head-piece having a longitudinal slot and the upright slots *h h* in its opposite walls, and the latch consisting of a longitudinal middle portion *f*³ and right-angularly extended end portions, one portion *f'* of which constitutes the latch-pivot and the other *f* constituting the latch-engaging member, the said latch being interchangeable, whereby its pivot and supporting member and the engaging portion may be inserted to the hole and slot, respectively, therefor from either side of the stanchion head-piece, substantially as described.

481,988. POWER-TRANSMITTING DEVICE. ELBERT D. WEYBURN, Chicago, Ill., assignor to the Weyburn Special Machine Company, same place. Filed Apr. 16, 1891. Serial No. 389,211. (No model.)

Claim.—1. An apparatus for the purpose described, comprising a suspended traveling carriage, a power-transmitting device, a hollow shaft or tube depending from said carriage, a driving-shaft passing through said tube, arms pivoted to swing horizontally loosely attached at one end to said shaft or tube, a second hollow shaft or tube to which the other ends of said arms are rigidly attached, a second driving-shaft passing therethrough and additional arms loosely attached at one end to said second hollow shaft and carrying the cutting-tool, and connections between the power-transmitting device and first driving-shaft, the latter and second driving-shaft, and between the second driving-shaft and the cutting-tool, substantially as described.

2. An apparatus for the purpose described, comprising a suspended traveling carriage, a power-transmitting device, a hollow shaft or tube depending from said carriage, arms I I, having sockets in one end, loosely embracing said shaft or tube, arms J J, fitting within said sockets, a second hollow shaft or tube to which said arms J J are rigidly attached, arms K K', loosely journaled on said second shaft, a cutting-tool carried by said arms K K', and suitable driving connections between the power-transmitting device and the cutting-tool, substantially as described.

3. In an apparatus for the transmission of power, a suspended traveling carriage, an electric motor carried thereby, a hollow shaft or tube depending therefrom, arms I I, loosely journaled at one end on said shaft or tube, arms J J, adjustably secured at one end to the arms I I, a second hollow shaft or tube D', to which the opposite ends of said arms J J are rigidly attached, and arms K K', loosely journaled on said shaft D', the arm K' having a downwardly-curved extension upon which the cutting-tool is supported, substantially as described.

4. In an apparatus for the transmission of power, a suspended traveling carriage, an electric motor carried thereby, a hollow shaft or tube D, depending therefrom, a second hollow shaft or tube D', arms I I J J, adjustably connected together, the former being loosely journaled on the shaft D and the latter rigidly attached to said shaft D', arms K K', loosely journaled on said shaft D', the arms K' having a downwardly-curved extension, a bracket upon the lower end of said extension, and an adjustable shaft for operating the cutting-tool, journaled in said bracket, substantially as described.

5. In an apparatus for the transmission of power, a suspended traveling carriage, an electric motor carried thereby, a hollow shaft or tube D, screw-threaded upon its internal upper surface, a collar upon the upper portion of said shaft, secured to the under side of the traveling carriage, a nut having a screw-threaded extension adapted to pass down through the bottom of the traveling carriage and take into the threads in the shaft or tube D, and a series of horizontally-swinging arms supporting at the other end of the series the cutting-tool, and means for driving said tool, substantially as described.

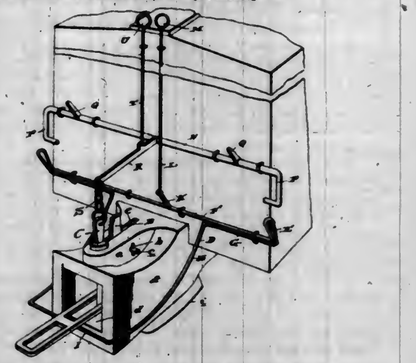
6. In an apparatus for the purpose described, in combination with the traveling carriage and electric motor mounted therein, the hollow shaft D, secured to the under side of the traveling carriage, a driving-shaft passing upward therethrough, a collar upon the upper part of said shaft, having a tapering lower side, a hollow nut having an upwardly-extending screw-threaded part secured to the upper part of the carriage and having a cup-shaped socket for the reception of the tapering lower part of the collar, and connections between the motor and the driving-shaft and the latter and the cutting-tool, substantially as described.

7. In the described apparatus, in combination with the traveling carriage and an electric motor mounted thereon, a hollow shaft or tube D, screw-threaded internally at its upper end, a collar attached thereto and secured to the under side of the traveling carriage, a hollow nut having a downwardly-extending screw-threaded portion passing through the under part of the carriage and taking into the threads in the shaft or tube B, a driving-shaft F, passing through said shaft D, a collar upon the upper end thereof, having a tapering under side, a hollow nut secured to the upper part of the traveling carriage and having a cup-shaped socket in which the tapering collar rests, a second cup-shaped bearing formed upon the interior of the shaft D near its lower portion, and a second tapering collar secured to the shaft F and resting therein, a second shaft or tube D', a driving-shaft F', having bearings similar to those above described, arms pivoted to said hollow shafts to swing horizontally and supporting the cutting-tool, a driving connection between the motor and the shaft F, and driving connections between the shafts F and F' and between the shaft F' and the cutting-tool, substantially as described.

481,989. ELECTRIC FIRE AND BURGLAR ALARM CONNECTION. HOMER T. WILSON, Louisville, Ky. Filed June 9, 1892. Serial No. 436,169. (No model.)

Claim.—1. The combination, with the blade C, of the blade B, bent to form a loop *b'*, which is provided with a melting composition E, as and for the purpose set forth.

2. The spring-blade B, having loop *b'* filled with a melting composition E and having the offset *c'*, in combination with the spring-blade C, having beveled face *c²*, as and for the purpose set forth.

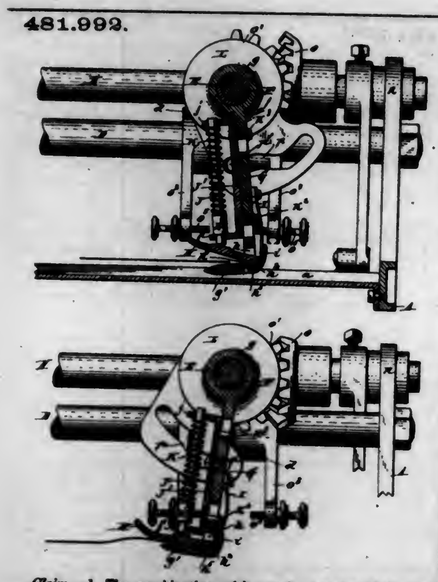


481,990. POUND-NET. GEORGE WILLIAMS and ALBERT A. CLEVELAND, Astoria, Oreg. Filed Nov. 5, 1891. Serial No. 411,011. (No model.)

Claim.—The improved net, substantially as herein described, comprising the pot or pound, the lead extended therefrom and provided at its outer end with a hook *a*, and the series of guard-sections arranged alongside the lead and having their adjacent ends slightly separated and lapped past each other and provided at their ends farthest from the pot or pound with hooks projected toward the lead, the latter hooks and the hook *a* of the lead being arranged to open toward the pot or pound, all substantially as and for the purposes set forth.

481,990.

481,991. CAR-COUPLING. JOSEPH J. WIEDA, Defiance, Ohio. Filed Mar. 19, 1892. Serial No. 425,627. (No model.)



Claim.—1. The combination, with a draw-head, of the link-manipulating device formed from a single piece of material and having the straight portion adapted to be journaled on a car and having the loops at opposite ends of said straight portion forming handles and also having the forwardly and downwardly curved branches on opposite sides of the draw-head, and the transverse connecting portion adapted to assume a position in front of the draw-head and below the the flaring mouth thereof, substantially as specified.

2. The combination, with a draw-head, of the link-manipulating device constructed as described and journaled in the front wall of the car, the vertical rod connected with said device for manipulating the same from the top of a car, the shaft journaled in the front of the car and having the arms P and the stops Q and also having the arm R, the vertical rod leading from said arm, and the coupling-pin connected with the outer end of said arm, substantially as specified.

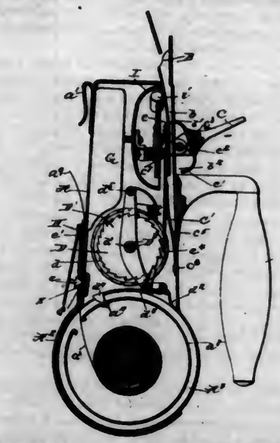
481,992. PAPER-FEEDING MACHINE. WILLIAM WOOLSLEY, Poughkeepsie, assignor to D. H. Burrell & Co., Little Falls, N. Y. Filed Aug. 20, 1891. Serial No. 403,174. (No model.)

481,992.

Claim.—1. The combination, with a rock-arm provided with a lower fixed jaw, of an upper movable jaw hinged to the rock-arm, an oscillating cam, a spring-rod and support movably mounted on the rock-arm and actuated by the cam to close the movable jaw, and means whereby the movable jaw is opened, substantially as set forth.

2. The combination, with a rock-arm provided with a fixed jaw and a movable jaw hinged to the rock-arm, of a spring attached to the rock-arm and holding the movable jaw open, an oscillating cam, and intermediate mechanism whereby the movable jaw is closed by the cam, substantially as set forth.

3. The combination, with the movable gripper-arm and the fixed jaw secured to the lower end of said arm, of a movable jaw pivoted to the gripper-arm and having a movement toward and from the fixed jaw, a nose formed on the movable jaw, a spring secured to the gripper-arm and bearing against the nose of the movable jaw, whereby the latter is yieldingly held in an open position, an oscillating cam, and intermediate mechanism whereby the movable jaw is closed by the cam, substantially as set forth.

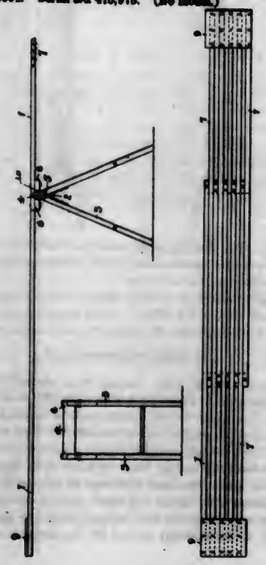


4. The combination, with the movable gripper-arm and the fixed jaw secured to the lower end of said arm, of a movable jaw pivoted to the gripper-arm, a spring whereby said movable jaw is opened, a presser rod bearing loosely upon said movable jaw, a plate movably arranged upon said gripper-arm, and a spring whereby a yielding connection is formed between the presser-rod and the supporting-plate, substantially as set forth.

5. The combination, with the movable gripper arm provided at its lower end with a fixed jaw, of a movable jaw pivoted to said arm and provided with a nose on its upper side, a spring secured to the gripper-arm and bearing against said nose, an upright rod resting loosely upon said movable jaw and provided with a collar, a movable plate arranged upon the gripper-arm and provided with an ear supporting said rod, a spring surrounding said rod and bearing with its ends against said collar and ear, and a cam whereby the movable plate is actuated, substantially as set forth.

481,998. DEVICE FOR COLLECTING, REGISTERING, AND RECORDING FARES. WILLIAM T. WOOD, Nashville, Tenn., assignor of one-half to S. G. MERRILL and JAMES T. DICKS, same place. Filed June 22, 1891. Serial No. 397,091. (No model.)

Claim.—1. A fare receptacle and register comprising a receptacle for the fares, provided with a removable portion, and a movable register arranged adjacent to the receptacle, the register being provided with printing-faces, a surface upon which the printing is to be done, and a connection between the removable portion of the receptacle and the register, whereby when the removable portion is displaced the printing-faces of the register are brought against the surface designed to receive an impression, substantially as described.

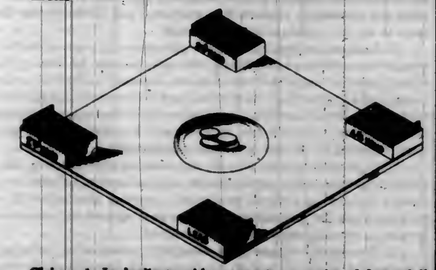


2. A combined fare receptacle and register comprising a fare-receptacle having a removable portion permitting displacement to allow of the removal of the fares, a way or passage leading to the receptacle, a lever provided with a projection or projections extending into the way or passage and serving to regulate the introduction of fares, a register connected with the lever in such manner as to be operated by the lever, the register being movable, and a connection between the removable portion of the receptacle and the register, substantially as described.

3. A combined fare receptacle and register comprising a fare-receptacle provided with a removable portion permitting the removal of the fares, a register placed adjacent to the receptacle, a connection between the removable portion and the register, a printing-surface consisting of a strip of paper or the like, and a locking device for the removable portion, between the parts of which the strip of paper is introduced, the parts being so arranged that the strip of paper or the like is injured in the act of releasing the locking device, substantially as described.

4. A combined fare receptacle and register comprising a fare-receptacle having a removable portion permitting displacement to allow of the removal of the fares, a way or passage leading to the receptacle, a lever provided with a projection or projections extending into the way or passage and serving to regulate the introduction of fares, a bell, and a projection from the lever engaging the hammer of the bell, and a register connected with the lever, substantially as described.

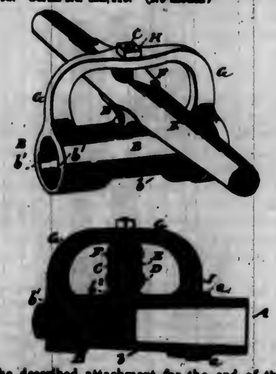
481,994. SEESAW. CRATTON A. WOODBURY, Rutland, Vt. Filed Dec. 23, 1891. Serial No. 415,973. (No model.)



Claim.—1. The seesaw-board consisting of two members, longitudinally movable with respect to each other, composed of interlapping strips provided at each end with a transverse bar secured to the strips, said bars being on opposite sides of the same, and each of the under bars extending laterally beyond its series of strips on one side thereof to afford a support for the exterior strip of the other member, substantially as set forth.

2. The seesaw-board consisting of two members, longitudinally movable with respect to each other, composed of interlapping strips provided at each end with a transverse bar, the bars of the adjacent inner overlapped ends being on their under side and adapted to be arranged close to a fulcrum on each side thereof, in combination with a suitable support constituting such fulcrum, substantially as set forth.

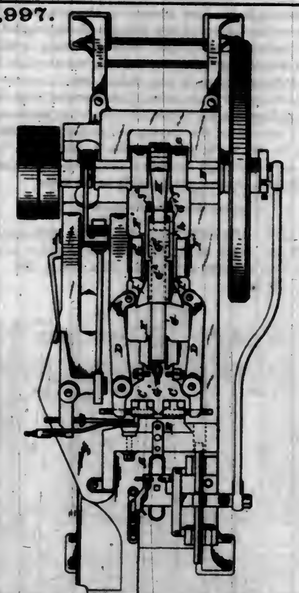
3. In combination, a seesaw-board and a horse, the latter composed of two frames hinged together and having their side bars extended above or beyond the hinge and provided with notches to receive cross-bars to act as a fulcrum when the legs of the horse are spread and said cross-bars notched to retain the board laterally, substantially as set forth.



481,995. APPARATUS FOR DUPLICATE WHIST. MILTON U. WOOD, Philadelphia, Pa. Filed May 31, 1892. Serial No. 435,043. (No model.)

Claim.—1. In duplicate-whist apparatus, a series of four subdivided compartments, each subdivision of each of the four compartments similarly marked to designate the respective hands played and each compartment marked to respectively designate it, substantially as described.

2. In duplicate-whist apparatus, a series of four subdivided compartments, each compartment marked, respectively, to designate the lead-hand, second hand, third hand, and fourth hand and each subdivision marked to designate the order in which the respective hands to be contained therein were played, substantially as described.



481,996. NECK-YOKE. JACOB ESSELEN, Arlington, Nebr. Filed Feb. 29, 1892. Serial No. 422,416. (No model.)

Claim.—The described attachment for the end of the pole or tongue of a vehicle, consisting of the tip B, having the excision *b*, front flange *b'*, hole *b²*, and keeper G, the washers D F, neck-yoke E, and the bolt C, the latter passing through all the other parts and provided with an end nut, substantially as shown and described.

481,997. NAIL-MACHINE. JOHN M. H. BAACKES and CHARLES ESSLER, Cleveland, Ohio. Filed Oct. 13, 1891. Serial No. 408,560. (No model.)

481,997.

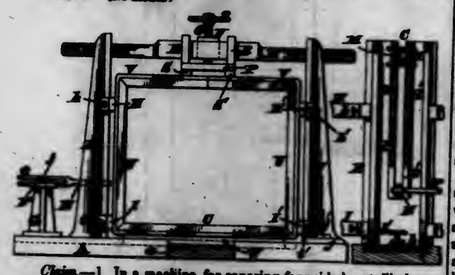
Claim.—1. In a nail-machine, the combination, with a hammer-stock formed with longitudinal grooves in its sides, of cutter-operating cams removably secured with their feet in said grooves, substantially as set forth.

2. In a nail-machine, the combination of a hammer-stock formed in its sides with longitudinal grooves open at one end, cutter-operating cams formed with feet fitting into said grooves and sliding into the same at their open ends, and means for removably closing the open ends of the grooves and locking the cams in place, substantially as set forth.

3. In a nail-machine, the combination of a hammer-stock formed in its sides with longitudinal dovetailed grooves open at one end, cutter-operating cams formed with dovetailed feet fitting into said grooves and sliding into the same at their open ends, and means for removably closing the open ends of the grooves and locking the cams in place, substantially as set forth.

4. In a nail-machine, the combination of a hammer-socket formed with longitudinal dovetailed grooves in its sides, cutter-operating cams formed with dovetailed feet fitting in said grooves, and cheek-pieces upon the sides of the hammer-stock head and having their edges bearing against and locking said cams, substantially as set forth.

5. In a nail-machine, the combination of a hammer-stock formed with longitudinal dovetailed grooves in its sides terminating in wider straight-sided grooves in the hammer-stock head, cutter-operating cams formed with dovetailed feet adapted to enter said wide grooves and to fit and slide in said dovetailed grooves, and cheek-pieces secured upon the sides of the hammer-stock head and having their forward edges bearing against said cams and covering said wide grooves, substantially as set forth.



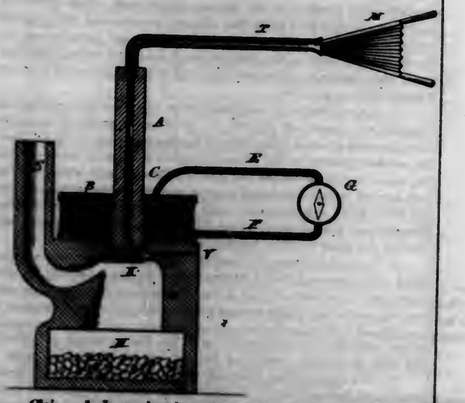
6. In a nail-machine, the combination of a hammer-stock having longitudinal dovetailed grooves in its sides terminating in wider straight-sided grooves in the sides of the hammer-stock head and having vertical grooves at the forward edges of said head, cutter-operating cams having dovetailed feet inserted through said wider grooves and secured in said dovetailed grooves, and cheek-pieces secured upon the sides of the hammer-stock head and having inwardly projecting flanges upon their forward edges fitting in the vertical grooves and locking the cams in place, substantially as set forth.

7. In a nail-machine, the combination of a pitman having a cross-head at its forward end, a hammer-stock having a bearing for said cross-head in its rear end and a rearwardly-flaring mouth from said bearing, and cheek-pieces secured upon the sides of said hammer-stock and formed with holes for the ends of the cross-head and with enlargements upon their inner faces fitting in the flaring mouth and closing the open sides of the cross-head bearing, substantially as set forth.

8. In a nail-machine, the combination of a pitman having a cross-head at its forward end, a hammer-stock having longitudinal dovetailed grooves terminating in wider straight-sided grooves and vertical grooves at the meeting ends of said grooves and formed with a

transverse bearing in its head opening at the rear end in a flaring mouth, cams having dovetailed feet fitting in the dovetailed grooves, a segmental bushing for the pitman cross-head fitting in the bearing and having a slot corresponding to the flaring mouth of the hammer-stock head, bushing-sections in the ends of the slot in the bushing, cheek-pieces secured upon the sides of the hammer-stock head and having vertical flanges in the vertical grooves of the latter and formed with holes for the ends of the bushing and sections and with enlargements fitting in the flaring mouth of the hammer-stock head, and screw-bolts inserted through the ends of the cheek-pieces and bearing against the bushing-sections, substantially as set forth.

481,998. MACHINE FOR SQUARING METALLIC BOXES, FRAMES, &c. JAMES BARR, Cincinnati, Ohio, assignor to the Victor Safe and Lock Company, same place. Filed June 4, 1892. Serial No. 435,557. (No model.)



Claim.—1. In a machine for squaring four-sided metallic boxes, frames, &c., the combination of a horizontal base, a perpendicular standard secured thereto, another perpendicular standard capable of being shifted on said base, a vertically-adjustable bar carried by said standards, and a pressing attachment applied to said bar and adapted to be forced toward said base, substantially as described.

2. In a machine for squaring four-sided metallic boxes, frames, &c., the combination of a horizontal base, a perpendicular standard secured thereto, another perpendicular standard capable of being shifted on said base, a vertically-adjustable bar secured in longitudinal slots of said standards, and a pressing attachment applied to said bar and adapted to be forced toward said base, substantially as described.

3. In a machine for squaring four-sided metallic boxes, frames, &c., the combination of the grooved base A *a*, the shiftable standard B, having a vertical slot C, perforated ribs D *d* D' *d'*, and bearers H I, the fixed standard J, having a vertical slot K, perforated ribs L *l* L' *l'*, and bearers H' I', and the vertically-adjustable bar M, secured within said slots C K and provided with a nut N, screw O, plate P, and a pair of bars S S', for the purpose described.

481,999. ELECTRIC FURNACE GENERATOR. ELIHU THOMSON, Washington, D. C. Original application filed Aug. 31, 1887, Serial No. 248,397. Divided and this application filed May 18, 1891. Serial No. 393,171. (No model.)

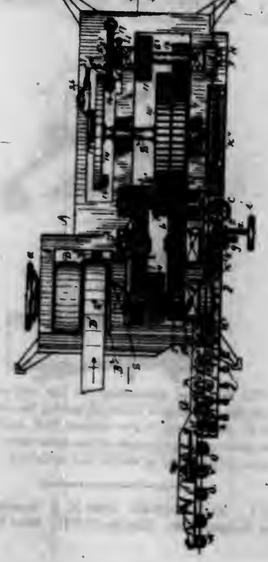
Claim.—1. In an electric generator, the combination of an electro-magnet having an axial bore and an armature in front of the same with a heater acting upon the armature and a cooling apparatus for intermittently passing a cooling fluid through the bore of the magnet against the armature, substantially as described.

2. In an electric generator, the combination of an electro-magnet and an armature supported by non-magnetic material with a heater for heating the armature and a cooler for intermittently cooling the same, substantially as described.

3. In an electric generator, the combination of an electro-magnet having an axial bore and an armature facing the same with a heater acting upon one side of the armature, a source of cooling fluid discharging intermittently through the bore of the magnet against the other side of the armature, and a vent opening or openings for the escape of the cooling fluid, substantially as described.

4. In an electric generator, the combination of a series of electro-magnets and a common extended armature for the same with a heater acting upon one side of the armature and a cooling agent acting intermittently and in rotation upon the individual portions of the armature which are opposed to the individual magnets, substantially as described.

5. In an electric generator, the combination of a series of electro-magnets and a common extended armature facing the same with a heater acting upon the whole surface of one side of the armature, a cooling apparatus acting intermittently and in rotation upon the individual sections on the other side of the armature which are exposed to the individual magnets, and a commutator and collector for straightening the alternating currents thus generated and for conveying the same to the line, substantially as described.



6. In an electric generator, the combination of a series of electro-magnets and a common armature for the same, a heater for heating the whole surface of one side of the armature, a reaction-wheel driven by a cooling fluid, projecting intermittently and in rotation jets of the fluid against the individual sections on the other side of the armature which are exposed to the individual magnets, and a commutator and collector actuated by the reaction-wheel, substantially as described.

7. In an electric generator, the combination of a series of individual magnetic systems exposed to the action of heat and electric conductors included in a circuit or circuits traversing the fields with a reaction-wheel for projecting a cooling agent against the magnetic systems in rotation, substantially as described.

8. The method of generating electricity in a conductor traversing a magnetic field, which consists in subjecting the elements of the field to the continuous action of heat and to the intermittent action of a cooling agent, substantially as described.

9. The method of generating electricity in a conductor traversing a magnetic field, which consists in subjecting the elements of the field to the continuous action of heat and at the same time intermittently cooling the same, substantially as described.

482,000. WIRE STRAIGHTENING AND CUTTING MACHINE. CURTIS B. BRAINARD, Joliet, Ill. Filed May 23, 1892. Serial No. 433,940. (No model.)

Claim.—1. In a machine for cutting off wire in lengths, the combination of drive shaft S^2, having gear-wheels 1, 5, and S^{10}, fast pulley P^2, loose pulley B, and feed-roll F' mounted thereon, shaft S, having gear-wheel 4 and feed-roll F mounted thereon, straightening-rolls n O V W, guide-box K^3 for guiding the wire to the feed-rolls, an adjustable guide K^3 at the opposite side of said rolls, guide-box K^4 for conducting the wire to the wire-cutters, shaft S', having gear-wheels 3 7 8 mounted thereon, shaft S^2, having gear-wheel 10, wiper-wheel 14, and idle-gear 9 mounted thereon, shaft S^3, having gear-wheel 11 and disk H mounted thereon, hollow shaft S^5, having gear-wheels 12 and 23 and disk H' mounted thereon, lathe-point shaft S^4, arranged in said hollow shaft and having the flanges S^7, lever 17, having pin S^8 for engaging said flanges, wire-cutter J, fixed in disk H, and reciprocating wire-cutter J', having the pin J^3 and spring W' arranged in disk H', all arranged to operate substantially as and for the purpose set forth.

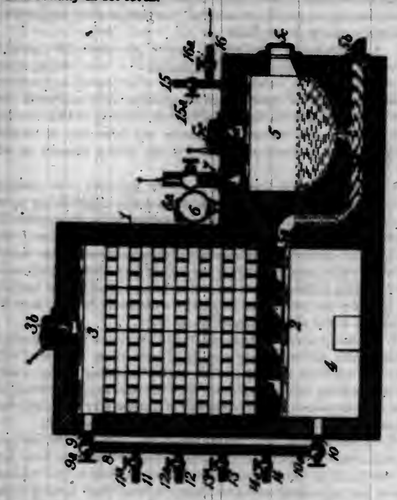
2. In a machine for cutting off wire in lengths, the combination, with the draft-shaft S^2, bearing gear-wheel 1, idle-gear 2, shaft S', bearing gears 3 and 7, shaft S^3, bearing gear 10, and wiper-wheel 14, having cam 15, lever 17, having pin S^8, spring S^{10}, lathe-center shaft S^4, having flanges S^7, hollow shaft S^5, having gears 12 and 23 mounted thereon, and disk H', reciprocating wire-cutter J', having the pin J^3 and spring W', shaft S^3, having gear 11 and disk H mounted thereon, wire-cutter J, fixed in said disk and arranged to register with cutter J', the means for driving shafts S^2 S^3 and said disks and cutters, and the means for feeding the wire into the machine, substantially as and for the purpose set forth.

3. In a machine for cutting off wire in lengths, the combination of the feed-rolls and means for straightening and conducting the wire into and through the machine and a pair of wire-cutters arranged in revolving disk holders in such manner that their cutting-edges may register as they revolve in the direction the wire travels between them, one of said cutters being fixed in its holder and the other adapted to be advanced or reciprocated forward to register with the fixed cutter and cut off the wire between them and then recede to be out of the way of the next feed of wire forward, substantially as and for the purpose set forth.

4. In a machine for cutting off wire in lengths, the combination, with wiper-wheel 14 and the means for driving the same, of the tally or registering mechanism comprising the standard 30, the notched wheels 32 and 34, having, respectively, the pins 31 and 40, the bell 36 and its knocker 27, adapted to be engaged by pin 31, lever 37, pawl 39, springs 33 and 35, and pitman 18, all arranged to operate substantially as and for the purpose set forth.

5. In a machine for cutting off wire in lengths, the combination of bed L', arm L, pivoted thereto and having the guide-box K^2 on its outer end at the rear of the feed-rolls, hand-wheel C, and its screw-shaft having the collar s^2 for vertically adjusting the said guide-box, substantially as and for the purpose set forth.

6. In a machine for cutting off wire in lengths, the combination of bed L', guide-box K^4, screw-shaft *s*, having hand-wheel *i* and flange *i'*, and die *g*, having a notch for receiving said flange and for reciprocating said die, substantially as and for the purpose set forth.

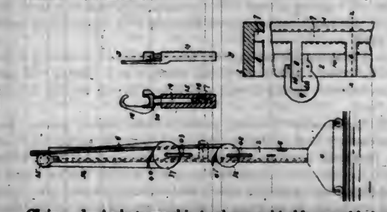


7. In a machine for cutting off wire in lengths, the combination of bed L', screw-shaft *s*, having hand-wheel *i* and flange *i'*, and die *g*, having a notch for receiving said flange and for reciprocating said die, substantially as and for the purpose set forth.

482,001. PROCESS OF AND APPARATUS FOR PURIFYING, REFINING, AND CARBURETING METALS. BENJAMIN BRAGSLAY, St. Louis, Mo. Filed Mar. 31, 1890. Serial No. 346,294. (No model.)

Claim.—1. The improvement in the method of purifying and refining metals, which consists in introducing molten metal into an inclosed chamber, highly heating a mass of refractory material in a separate chamber, passing an air-blast first through the hot refractory material and thereafter through the molten metal, and shutting off the air-blast and forcing a blast of hydrogen first through the hot refractory material and thereafter through the molten metal, substantially as set forth.

2. The improvement in the method of purifying and refining metals, which consists in introducing molten metal into an inclosed chamber, highly heating a mass of refractory material in a separate chamber, passing an air-blast first through the hot refractory material and thereafter through the molten metal, shutting off the air-blast and forcing a blast of hydrogen first through the hot refractory material and thereafter through the molten metal, and shutting off the hydrogen-blast and forcing a blast of nitrogen gas and a hydrocarbon first through the hot refractory material and thereafter through the molten metal, substantially as set forth.



3. The improvement in the method of purifying and refining metals, which consists in introducing molten metal into an inclosed chamber, highly heating a mass of refractory material in a separate chamber, passing an oxidizing-blast—such as steam or carbonic acid, or both—first through the hot refractory material and thereafter through the molten metal, shutting off the oxidizing-blast and forcing a non-oxidizing blast—such as hydrogen or hydrocarbon gas—first through the hot refractory material and thereafter through the molten metal, and shutting off the non-oxidizing blast and forcing a solid material—such as charcoal, coke, spiegel, manganese, aluminium, &c.—into the body of molten metal by means of a blast of nitrogen gas previously heated by passing it through the hot refractory material, substantially as set forth.

4. In an apparatus for purifying and refining metals, the combination, substantially as set forth, of a combustion-chamber, a valve controlling an outlet therefrom, a regenerator-chamber communicating therewith and containing a body of loose refractory material, a metal-chamber communicating by a passage with the combustion-chamber and having a charging-opening and a lower tapping-gate, air and gas and hydrocarbon pipes leading into the upper portion of the metal-chamber, air, gas, and steam, and oil pipes controlled by valves and leading into a connecting-pipe which communicates at its ends with the regenerator-chamber and the combustion-chamber, respectively, and valves controlling communication between said connecting-pipe and said chambers.

5. In an apparatus for purifying and refining metals, the combination, substantially as set forth, of a combustion-chamber, a valve controlling an outlet therefrom, a regenerator-chamber communicating therewith and containing a body of loose refractory material, a metal-chamber communicating by a passage with the combustion-chamber, a charging-hopper for solid material, a valve-controlled pipe leading therefrom to the passage leading to the metal-chamber, an upper charging-opening and a lower tapping-gate on the metal-chamber, air and gas and hydrocarbon pipes leading into the upper portion of the metal-chamber, air, gas, and steam and oil pipes controlled by valves and leading into a connecting-pipe which communicates at its ends with the regenerator-chamber and the combustion-chamber, respectively, and valves controlling communication between said pipe and said chambers.

482,002. PHOTOGRAPHIC-BACKGROUND HOLDER. ALVIN C. CASWELL, Fitchburg, Mass., assignor to the Nashua Iron and Brass Foundry Company, Nashua, N. H. Filed Nov. 14, 1890. Serial No. 371,395. (No model.)

Claim.—1. A photographic-background holder provided with upright standards, a roller bearing or support sliding on each of them, a series of rollers or drums supported at intervals on said standards, and connections between the stationary roller-supports and the sliding sup-

ports, whereby any roller of the series may be readily transferred from its stationary supports to the sliding supports, as set forth.

2. A photographic-background holder provided with upright standards, a block or bearing for the journal of a roller sliding upon each of said standards, one of which blocks is provided with means for locking the roller against turning while supported in it, a series of rollers or drums supported at intervals on said standards, and connections between the stationary and sliding roller-supports, whereby any roller of the series may be readily transferred from its stationary supports to the sliding supports as set forth.

3. A photographic-background holder provided with upright standards, a block or bearing for the journal of a roller, sliding upon each of said standards, a series of stationary roller-journal supports on said standards, those of one standard being constructed to prevent the rollers from turning while supported therein, hoisting devices for the sliding supports, and connections whereby any roller may be readily transferred from its stationary supports to the sliding supports, as set forth.

4. A photographic-background holder provided with upright standards, a block or bearing for the journals of a roller, sliding upon each of said standards, the block of one standard being constructed to prevent the roller from turning while supported therein, a series of stationary roller-journal supports on said standards, those of one standard being constructed to prevent the rollers from turning while supported therein, hoisting devices for the sliding supports, and connections whereby any roller may be readily transferred from its stationary support to the sliding support, as set forth.

5. A photographic-background holder having a pair of upright standards with vertical grooves on their inner faces, a series of roll-supporting brackets secured to said standards, sliding hooks in said vertical standards, and cross-grooves from the roll-supporting brackets to the vertical groove, whereby any roll of a series may be transferred from its supporting-brackets to the sliding hooks, as set forth.

6. In combination, the upright standards provided with vertical grooves, a series of stationary brackets on the standards for receiving and holding a roll from turning, and sliding supports in the vertical grooves for supporting and preventing the roll from turning while being elevated or lowered, one of the standards having a cross-groove leading from each bracket to the vertical groove, whereby any roll of the series may be transferred from its bracket to the sliding supports, as set forth.

7. In combination, a frame having two upright standards, stationary roller-supporting brackets secured to said standards, journal-supports sliding vertically on said standards, connections between the brackets and the sliding supports, and a stub-shaft mounted at the top of the standards to receive and hold a roller when elevated, as set forth.

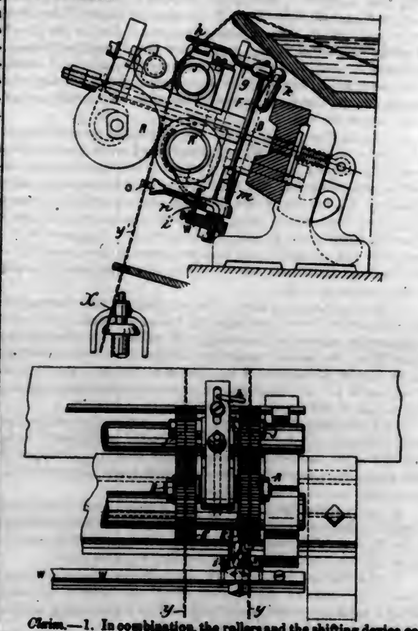
8. In combination, the standard 1, having a vertical groove and a series of brackets 12, the standard 2, having vertical and cross-grooves and a series of brackets 9, the sliding blocks 15, having hooks 16, the cords 27 and 28, attached to said hooks and passing over suitable pulleys, and the winding-drum to receive said cords, as set forth.

9. In combination, the standards having vertical grooves, and a roller having a round journal at one end and a journal with round and square portions at the other end, the journal-supporting blocks 15, having hooks to receive the round journals and a spring-pressed fork to embrace the square journal, as and for the purpose set forth.

10. In combination, the standards having vertical grooves, a roller having a round journal at one end and a journal with round and square portions at the other end, and stationary brackets on the standards, one of which has an angular groove to receive and hold the square journal, the journal-supporting blocks 15, having hooks to receive the round journals and a spring-pressed fork to embrace the square journal, as and for the purpose set forth.

11. In combination, the standards having vertical grooves, a roller having a round journal at one end and a journal with round and square portions at the other end, stationary brackets on the standards, one of which has an angular groove to receive and hold the square journal, the journal-supporting blocks 15, having hooks to receive the round journals and a spring-pressed fork to embrace the square journal, and a stop to release the square journal from the fork when it is elevated, as set forth.

12. The sliding journal support herein described, consisting of the block 15, formed with C-hook 16 and central bore 17, spring 18 in said bore, and bar 19, resting on said spring and having angular fork 20, as set forth.



13. The standard 2, having partially-closed vertical groove 7 and cross-grooves 8, in combination with the brackets 9, having open slots whose horizontal portions 10 register with cross-grooves 8 and whose vertical portions are angular in shape, and a roller having a square journal fitting and adapted to slide in said slots and grooves, as set forth.

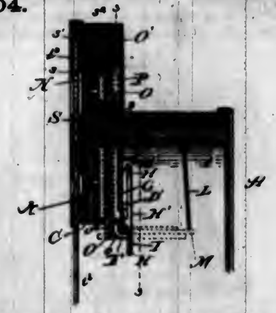
14. In combination, the standards with vertical grooves, the rollers supported therein, the cords for elevating them, the pulley 29 on standard 1, the pulleys 30 and 31 on standard 2, arranged at an inclination to each other, and the winding-drum 32, as set forth.

15. In combination, the standard 2, having vertical slot 7, the casting 33 at the upper end of the standard, having a slot 30* registering with slot 7 in the standard, and the stub shaft 34, journaled in said casting and having notch 30, which may be caused when desired to register with slots 7 and 30*, as and for the purpose set forth.

482,008. SPINNING-MACHINE. LOUIS D. CROM, EDOUARD ROBERMAIN-MERRAERE, and JEAN LAPIN, Roulers, Belgium. Filed May 31, 1892. Serial No. 435,111. (No model.) Patented in Belgium Mar. 11, 1891, No. 94,103; in France May 14, 1891, No. 213,480, and in Russia May 26, 1891, No. 6,760.

Brief.—A vertical rock-shaft, placed under tension so as to rotate in one direction, has two arms, one below the drawing-rolls which is in contact with the thread, and the other above the rollers and removed from the thread. When the thread breaks, the rock-shaft, being no longer restrained by the lower arm contacting with the thread, rotates, whereupon the upper arm carries the thread out of the bit of the rollers.

Claim.—1. In combination, the rollers and the shifting device consisting of the upper part, to engage the thread, the lower part, the positive connection between the same, joined at its ends to both said parts, being under tension, and the lower one arranged to engage the thread and hold the shifter against the said tension until the thread breaks, substantially as described.



2. In combination, the rollers, the upper and lower arms, the rock-spindle extending between and connecting the said arms, and the means for placing the arms under tension, the said lower arm being arranged to engage the thread and hold the parts under restraint until the thread breaks, whereupon the rock-shaft will turn under the tension and cause the upper arm to withdraw the thread from the rollers, substantially as described.

3. In combination, the rollers, the upper and lower arms, and the positive connections between them joined to both, said arms being pivotally supported and extending in different radial directions, whereby when the lower arm is engaging the thread to hold the parts against movement the upper arm will be to one side of the said thread, substantially as described.

482,004. REGISTERING MONEY-BOX. JOSEPH C. F. DEE, Chicago, Ill. Filed June 27, 1891. Serial No. 397,704. (No model.)

Claim.—1. In a self-registering money-box, an inclined horizontal coinway, stops at intervals above and varying in their distance from the coinway, and a registering device and an actuator therefor at each stop, comprising two parts respectively on opposite lateral sides of the way, connected by an introduced coin, to operate substantially as described.

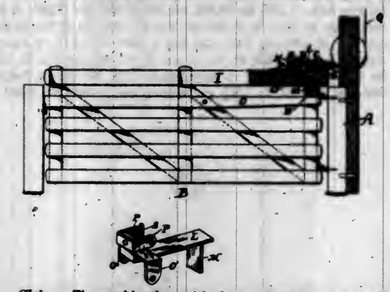
482,004.

2. In a self-registering money-box, an approximately-horizontal coinway, a stop for the coin in its movement on the coinway, a spring-sustained shelf on one side and a pivoted finger on the other side of the coinway, a handle for turning the finger on its pivot, and a register-operating device in the line of movement of the shelf, said shelf and finger being adapted normally to pass each other in the movement and connected to move together by an introduced coin, substantially as described.

3. In a self-registering money-box, a coinway arranged at the upper part of the box, a tilting shelf on one side of the coinway and a tilting finger on the other side of the coinway and adapted to pass the shelf without engaging the same and to engage the same on the introduction of a coin, and a tripping device supported in the box and arranged to engage the coin carried by the tilting shelf and cause the coin to fall into the receptacle below, substantially as described.

4. In a self-registering money-box, in combination, an inclined coinway, stops for the introduced coin arranged above and at varying distances from the coinway, a rod at one side of the coinway, spring-controlled fingers supported on said rod, spring-controlled slotted shelves on the other side of the coinway opposite to the fingers, a registering device for each stop having its operating mechanism in the line of movement of the shelf, a trip located in the box and adapted to engage the coin and cause it to fall from the shelf when the latter returns after it is tilted, and a handle to turn the rod carrying the fingers, substantially as described.

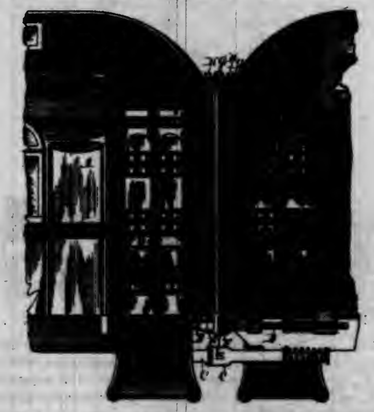
5. A self-registering money-box having dials in its face, pointers on said dials, mechanism to revolve said pointers a definite space at each motion, a coinway in the rear of the registering mechanism, fingers at one side of the coinway and shelves on the other side, both made pivotal and adapted to operate together on the introduction of a coin, an extension of the shelves to engage the register-operating mechanism, a coin-receptacle below, and a trip arranged to engage the coin and cause it to be removed from the shelf as the shelf returns, substantially as described.



6. In a self-registering money-box, in combination, an inclined coinway, a coin-receptacle below the same, stops above the coinway and arranged at varying distances therefrom, a rod below the coinway extending out through the wall of the box and provided with a handle, fingers secured to the rod, and a spring upon the rod normally retaining the same in position to cause the fingers to point upward, a shelf pivoted on the shaft at each finger and having a tail piece or extension, the finger and shelf being on opposite sides of the coinway, a slot in the shelf to permit the finger to pass through the same, and a registering device engaged to be operated by the tail-piece of the shelf in the movement, substantially as described.

7. In a self-registering money-box, in combination, an inclined coinway, stops above the coinway, arranged at varying distances therefrom, a spring-retained upsetting shelf having an extension and arranged on one side of the coinway and a spring-retained finger on the opposite side of the coinway, slots in the coinway and the shelves to permit the passage of the finger, a trip device supported in a box to extend downward to a point adjacent to the end of the shelf when upset, a registering mechanism, and a connection between the registering mechanism and the shelf, operative when the latter is upset, substantially as described.

8. In a self-registering money-box, in combination, a coinway D', rod F, fingers G, pivotally supported on the spring retaining-rod F normally in a vertical position, shelves H, extensions I on the shelves, register-dials, serrated disks, and spring-controlled rods carrying pawls to engage the serrations, said rods being arranged to be engaged and elevated by the extensions I when the shelves are down, substantially as described.



9. In a self-registering money-box, the combination of the following elements: register dials and fingers s, radially-serrated disks N, carrying the fingers, rods O, with their surrounding retaining-springs P and having a vertical movement against the resistance of the springs, pawls R, secured to the rods and engaging the serrations of the disks N, a slotted coinway, stops arranged at intervals above the coinway at varying distances therefrom, rod F, arranged below and parallel with the coinway, a handle for turning said shaft against the resistance of the spring thereon, fingers and slotted shelves mounted upon the shaft at opposite sides of the coinway, said shelves having an independent movement controlled by the springs, a trip L, spring-controlled to extend normally adjacent to the outer end of the shelf when down, and a coin-receptacle below, the parts being arranged to operate substantially as described.

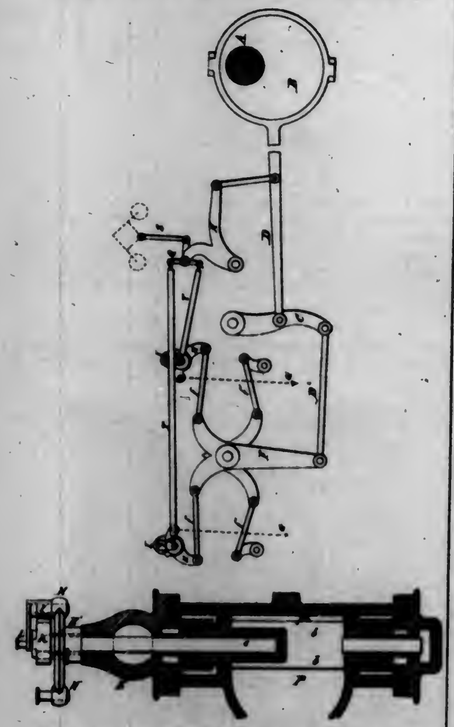
482,005. GATE. UDO DREESMAN, Pekin, and JOSEPH WAGNER, Tremont, Ill. Filed Jan. 20, 1892. Serial No. 419,069. (No model.)

Claim.—The combination, with the standard A, of a beam D, pivoted in a recess near its upper end, pulleys C C, secured in pulley-blocks upon opposite faces of the standard A, the gate B, hinged to the standard A and provided with a recess K in its upper rail, a lever L, located in said recess, provided with the clip O', the pin S, an elbow M, passed through the rail I and bearing against the latch O, and with the perforated arms P and the connecting-cords Q Q, substantially as specified.

482,006. CAR-VESTIBULE. ARTHUR FORDHAM, Chicago, assignor of one-half to Robert H. Wiles, Prospect, and Harry Bitner, Chicago, Ill. Filed Dec. 21, 1891. Serial No. 415,606. (No model.)

Claim.—1. The combination, with a car-platform and a spring-actuated buffer-plate at the end thereof, of a vestibule-frame hinged to the buffer-plate and a spring transmitting its force in one direction to the car-platform and in the opposite direction to the vestibule-frame and tending to throw the upper end of the frame outward or away from the platform, substantially as shown and described.

2. The combination, with a car-platform and a spring-actuated buffer-plate at the end thereof, of a vestibule-frame connected with the buffer-plate by a spring-hinge tending to throw the upper end of the frame outward from the car, substantially as shown and described.



3. The combination, with a car-platform and a spring-actuated buffer-plate at the end thereof, of a frame G, hinged to the buffer-plate, and springs S S, encircling the hinge-pintles and pressing the upper end of the frame outward, substantially as shown and described.

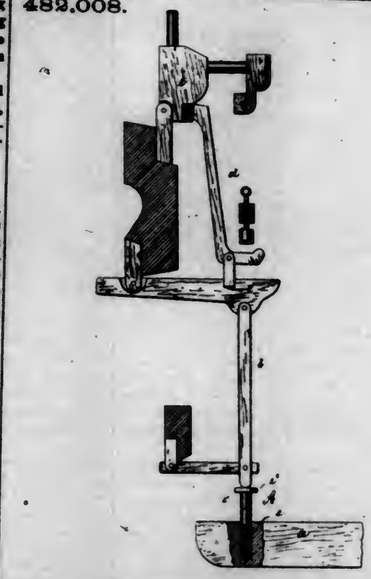
4. The combination, with a car-platform and a buffer-plate at the

end thereof, of a vestibule-frame hinged to the buffer-plate, a spring interposed between the platform and the vestibule-frame and tending to throw the upper end of the frame outward, and a stop limiting the outward movement of the upper end of the frame, substantially as shown and described.

5. The combination, with the car platform, the buffer-plate, and the vestibule-frame connected with the buffer-plate by spring-hinges, of chains *g*, connecting the upper end of the frame with the superstructure of the car and limiting the outward movement of the upper end of the frame, substantially as shown and described.

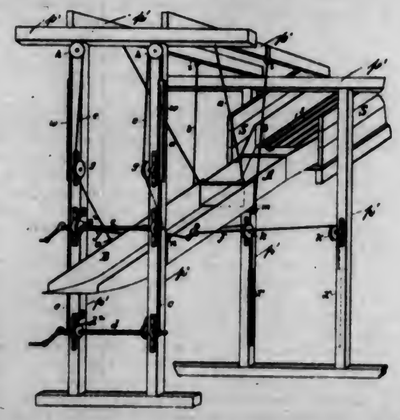
482,007. VALVE-GEAR. JOHANN B. PREHARY, Munich, Germany. Filed Mar. 3, 1891. Serial No. 383,668. (No model.) Patented in France July 20, 1883, No. 156,067, and July 20, 1887, No. 184,908; in Belgium Sept. 17, 1884, No. 66,393, and Nov. 3, 1887, No. 79,386; in Germany Sept. 20, 1884, No. 31,542, and May 16, 1888, No. 47,261; in England Apr. 27, 1887, No. 6,151, and May 3, 1888, No. 7,277; in Austria-Hungary Aug. 22, 1887, No. 13,114 and No. 35,302, and Feb. 28, 1888, No. 36,622 and No. 3,861; in Italy Aug. 20, 1888, No. 449; in Switzerland Sept. 20, 1889, No. 1,606, and in Spain Aug. 7, 1890, No. 10,901.

Claim.—1. The combination of disk F and rods *f* with lever H, connected thereto, a lever L, pivoted to lever H and having catch I, a crank K, keyed to the valve-spindle and adapted to be engaged by catch I, rod T, connected to lever L, and a governor-controlling rod T, substantially as specified.



2. The combination of lever N with lever Q, operated by the governor, rods T T, levers L L, and with the lever H, catch I, and crank K, substantially as specified.

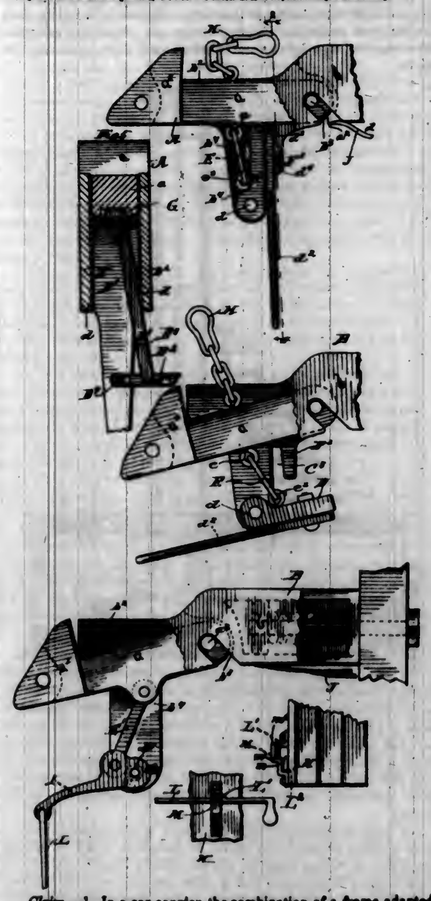
482,008. PILOT FOR PIANO-ACTIONS. JOSEPH HERRBURGER, Paris, France. Filed June 30, 1892. Serial No. 438,296. (No model.)



Claim.—1. A pilot for piano-actions, consisting of a shank having a threaded lower section, a squared upper section, a contracted neck, and an annular head that receives such neck, substantially as specified.

2. The combination of a key and abstract in a piano-action with an interposed pilot consisting of a shank having a threaded lower section, a squared upper section, a contracted neck, and an annular head that receives such neck, substantially as specified.

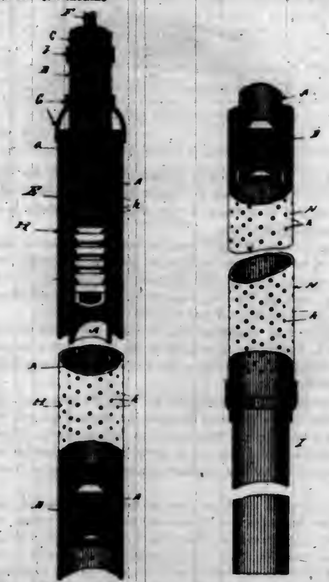
482,008.



482,009. COAL-CHUTE. RAPHAEL M. ROSSA, Denver, Colo. Filed Dec. 4, 1890. Serial No. 373,610. (No model.)

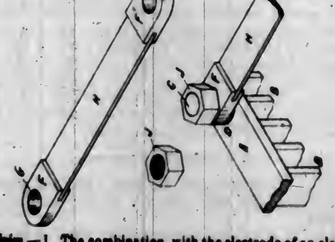
Claim.—1. In a coal-tipple, the combination of the following elements, namely: a fixed inclined receiving-chute or guideway, a movable extension or delivery-chute adjustable longitudinally in constant telescopic relations therewith, a windlass and connection for suspending the forward or delivery end of said movable chute at any desired height, while permitting its longitudinal movement, and a second windlass and counterweighted connections for drawing said delivery-chute forward to loading position and withdrawing the same when released to receded position, substantially as and for the purpose specified.

2. In a coal-tipple, in combination with a fixed inclined receiving-screen or guideway having an extension, a delivery-chute movable in longitudinal telescopic relations with said extension, rods pivotally suspending said chute at the rear, cords suspending said chute at its forward portion, a windlass upon which said cords are wound, a second windlass placed upon the tipple framing forward of the chute, cords extending thence rearwardly to and connected with the chute and cords extending rearwardly of said connection over idler-pulleys upon the tipple-framing, and overbalancing counter-weights hung upon the free ends of said last-named cords, substantially as set forth.



482,010. CAR-COUPLING. ROBERT S. KIRKPATRICK, Des Moines, Iowa, assignor of two-thirds to A. P. Chamberlin and R. Chaverness, same place. Filed Sept. 24, 1891. Serial No. 406,695. (No model.)

Claim.—1. In a car-coupler, the combination of a frame adapted to be secured in a car, a hook pivoted by the stem thereof in the frame, so that the hook extends beyond the edge of the frame on the hook side thereof and can be moved laterally therein and thereby retracted from such extension, a lever pivoted in the frame to one side of and between the pivotal point of such hook-stem and the hook end thereof, and a link connecting the stem of the hook with the lever, whereby when the hook is in position in the frame to automatically couple with a suitable coupler on an adjacent car it is locked in such position by the lever and when the lever is turned so that the hook is unlocked such hook is moved laterally to one side and into a position not adapted to engage with the coupler on an adjacent car, substantially as described.



2. In a car-coupler, the combination of a frame adapted to be secured in a car, a spring abutting against the car and against the frame, a hook pivoted by the stem thereof in the edge of the frame on the hook side thereof, so that the hook extends beyond the frame and can be moved laterally therein and thereby retracted from such extension, a lever pivoted in the frame to one side of and between the pivotal point of such hook stem and the hook end thereof and a link connecting the stem of the hook with the lever, and an arm movably secured on the lever, adapted to lock such lever in a determined position, whereby when the hook is in position in the frame to automatically couple with a suitable coupler on an adjacent car it is locked in such position and the lever so locking it in position can be locked in a determined position by the movable arm thereon and when the lever is turned so that the hook is unlocked such hook is moved laterally one side and into a position not adapted to engage with the coupler on an adjacent car, substantially as described.

482,011. OIL-WELL PUMPING MECHANISM. OLIVER A. KING, Bradford, Pa. Filed May 31, 1891. Renewed Aug. 2, 1892. Serial No. 441,970. (No model.)

Claim.—The combination, in an oil-well pumping mechanism, of a working barrel A and tube-sections B C, secured thereto and extending upward out of the well, with a perforated tube H, surrounding the working barrel A, and a collar G on the upper end of the perforated pipe H, surrounding the tube-section between thimbles or collars *a* and *b* thereon, substantially as and for the purpose set forth.

482,012. BATTERY-CONNECTOR. EDWARD R. KNOWLES, Brooklyn, N. Y. Filed Oct. 15, 1891. Serial No. 408,691. (No model.)

Claim.—1. The combination, with the electrode of an electric battery, of a screw-threaded projection C, provided with a shoulder D, and a conical-shaped projection E, substantially as described.

2. The combination, with the electrode of an electric battery, of a screw-threaded projection C, provided with a shoulder D, and conical-shaped projection E, all composed of a hard non-oxidizable metal or alloy, substantially as described.

3. A connecting-piece for electric batteries, consisting of a strip or bar composed of a soft non-oxidizable metal, provided at each end with a head or lug composed of a hard non-oxidizable metal or alloy, substantially as described.

4. A connector for electric batteries consisting of a screw-threaded projection C, provided with a shoulder D, in combination with a connecting-piece H, provided with lugs F and cut J, substantially as described.

5. A connector for electric batteries, consisting of a screw-threaded projection C, provided with a shoulder D, composed of a hard elastic non-oxidizable metal or alloy, in combination with a connecting-piece H, composed of a soft flexible non-oxidizable metal or alloy, said strip being provided with lugs F, composed of a hard elastic non-oxidizable metal or alloy, substantially as described.

482,018. VENTILATED VAULT-COVER. WILSON LAIN, Chartiers Heights, Md. Filed Nov. 6, 1891. Serial No. 411,074. (No model.)

Claim.—1. The covered ventilated trap or basin for streets or other exposed points, having the upper edge of the lower wall of its chamber adapted to discharge at the surface, substantially as and for the purpose set forth.

2. The covered ventilated trap or basin for streets or other exposed points, having within its chamber the manhole proper, with the upper or top edge thereof standing above the upper edge of the basin or trap and removed from the imperforate portion of the cover, substantially as and for the purpose set forth.

3. The covered ventilated trap or basin for streets or other exposed points, having the upper edge of the lower wall of its chamber provided with overflow-outlets at the surface, substantially as and for the purpose specified.

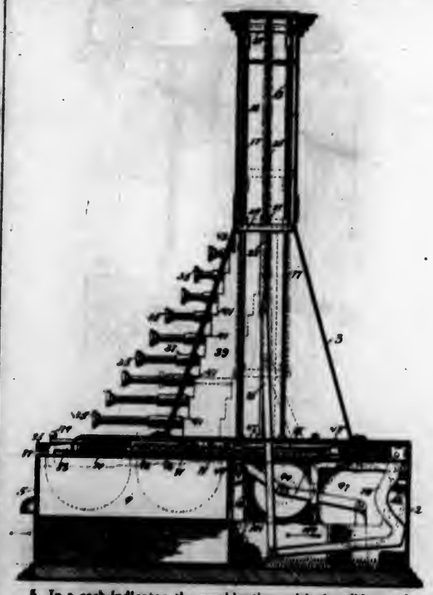
4. The covered ventilated trap or basin for streets or other exposed points, having within its chamber the manhole proper, with the upper or top edge thereof standing above the upper edge of the basin or trap, and the upper edge of the lower wall of its chamber adapted to discharge at its surface, substantially as and for the purpose specified.

5. The covered ventilated trap or basin for streets or other exposed points, having within its chamber the manhole proper, with the upper or tip edge thereof standing above the higher edge of the basin or trap and removed from the imperforate portion of the cover, the upper edge of the lower wall of said chamber having discharge-outlets at the surface, substantially as set forth.

6. The covered ventilated trap or basin for streets or other exposed points, having the top or upper edge of the walls of its chamber higher at one side than at the other to adapt said edge to the general inclination of the surrounding surface and having within its chamber the manhole proper, with the top edge thereof standing above the upper edge of the higher wall of said chamber and removed from the imperforate portion of the cover, substantially as set forth.

7. The combination, with the trap or basin, having its top surface in the same general inclination as the surrounding surface, of the ventilated cover having in its under side channels adapted to register with cavities in the upper edge of the lower side of said trap or basin, substantially as specified.

8. The covered ventilated trap or basin for streets or other exposed points, having the top or upper edge of the walls of its chamber higher at one side than at the other and having within its said chamber the manhole proper, with the top edge thereof standing above the upper or top edge of the higher wall of said chamber, the cover of said basin or trap having in its under side channels adapted to register with cavities in the top or upper edge of the lower wall of said chamber, substantially as and for the purpose specified.



482,014. CASH INDICATOR, REGISTER, AND RECORDER. PETER J. LARSEN, Minneapolis, Minn. Filed Sept. 19, 1890. Serial No. 365,552. (No model.)

Claim.—1. In an indicator, the combination, with a series of slides or drops provided with numbers or characters, of a series of keys for each of said slides, means for supporting said slides in any position in which they may be, and means for moving said support and thereby permitting said slides to drop a sufficient distance only to expose the number or character corresponding to the key that is operated, and means for locking each of said keys in the position to which it has been moved.

2. In an indicator, the combination, with a series of slides or drops, of a series of keys for each of said slides and a series of sliding plates upon which said slides are adapted to be supported and arranged to be controlled by said keys, whereby upon the operation of any key in a series the sliding plate will be moved a sufficient distance to permit the corresponding slide to drop and expose the number or character corresponding to that of the key that is operated.

3. In a cash-indicator, the combination, with a series of slides, each provided with numbers or figures, of a series of sliding plates having inclined or step edges and upon which said slides are adapted to be supported, and a series of keys for each of said sliding plates, adapted to move said plates different distances, whereby upon the operation of any one of said keys the corresponding sliding plate will be moved and the corresponding slide will be permitted to drop and rest upon said plate and expose the number or figure corresponding to the key that is operated.

4. In a cash-indicator, the combination, with a movable drop or slide provided with a series of numbers or figures, of a sliding plate provided with an inclined or stepped edge and supporting said slide and a series of keys by any one of which said sliding plate may be moved.

5. In a cash-indicator, the combination, with the slides or drops 13, each provided with a series of figures, of means for simultaneously raising said slides, means for holding them in their raised position, a series of keys for each slide, and means arranged to be moved by said keys and controlling said slides and adapted to permit said slides to move either simultaneously or one at a time, and means for arresting each slide when it has moved a sufficient distance to expose the character represented by the key that is operated, substantially as described.

6. In a cash-indicator, the combination, with a suitable case, of a series of slides provided with figures or characters, means for setting said slides, the sliding plates 39, and the series of keys for each of said slides adapted to move said sliding plates and thereby to permit said slides to move a sufficient distance to expose a character or figure corresponding to that of the key that is operated.

7. In a cash-indicator, the combination, with a suitable case and a money-drawer, of a series of drops or slides, each provided with a series of figures or numbers, means operated by said money-drawer for setting said slides at zero, a series of keys for each slide, and means controlled by said keys whereby upon the operation of any key the corresponding slide will be moved a sufficient distance to expose the number or character represented by the key that is operated.

8. In a cash-register, the combination, with a series of registering-wheels, of a series of movable bars for operating said wheels, means for moving said bars in any order in the direction in which they do not operate the wheels, and means for causing said bars to be operated successively in the direction in which they operate the registering-wheels.

9. In a cash-register, the combination of the registering mechanism, a series of operating-keys, a series of drops or slides arranged to be operated by said keys, a series of movable bars also operated by said keys, and means for causing the wheels of said registering mechanism to be operated by said movable bars in succession when said slides or drops are reset at zero.

10. In a cash-register, the combination, with a series of registering ratchet-wheels, of a series of movable ratchet-bars, each provided with a series of teeth and adapted to pass said ratchet-wheels without turning them when moving in one direction and to turn said wheels when moving in the opposite direction, the number of teeth on said bars corresponding to the number of teeth on said wheels, a series of keys for moving each bar in the direction in which it does not move said wheels, said keys being arranged to move said bars different distances, the distance that each bar is moved by any key corresponding to the number of the key, and means for reversing the movement of said bars after they have been moved by said keys and thereby turning said wheels to correspond to the movement of said bars.

11. In a cash-register, the combination, with the cash-drawer, of the registering-wheels 49, the movable bars 71, adapted to operate said wheels, the series of keys for each bar, and means for locking said bars in the positions into which they are moved.

12. In a cash-register, the combination, with the cash drawer, of the registering-wheels 49, the movable bars 71, adapted to operate said wheels, keys for moving said bars, and a locking device for holding said bars in the position into which they are moved by said keys and releasing them in succession upon the opening of the cash-drawer.

13. In a cash-indicator, the combination, with the registering mechanism, of the cash-drawer provided with the stepped surfaces 89 and 93 and the pivoted frame having bearings upon said surfaces and arranged to engage the bars that operate the registering mechanism when the drawer is closed and to release them in succession when the drawer is opened.

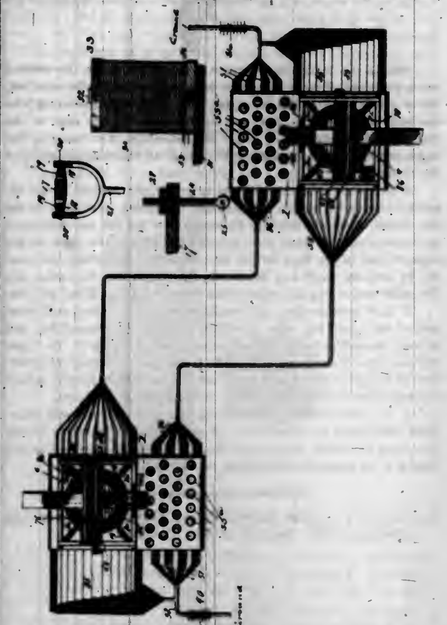
14. In a cash-register, the combination, with the registering-wheels, of the sliding bars 71, the sliding bars 47, connected therewith and provided with the projections 96, the series of keys for each wheel, the pivoted frame engaging the projections on the bars 47, and the sliding drawer provided with the stepped surfaces 89 and 93 and controlling said frame.

15. In a cash-register, the combination, with the sliding bars, of the series of wheels 49, provided with the ratchet-teeth 61, the spring-dogs 57, the shaft 51, the disk 63, secured to said shaft and arranged between said wheels and adapted to hold said dogs 57 out of engagement with the ratchet 61 except at one point in the movement of the wheel, and means for successively operating said sliding bars.

16. In a cash indicator and register, the combination of a cash-drawer, a registering mechanism, a series of drops or slides, each provided with a series of numbers or characters, a series of numbered keys for each slide, and mechanism connecting said devices whereby upon the opening of the cash-drawer the slides are set at zero and the preceding sale or transaction is registered and upon operating the keys in any order the slides are moved to show the number represented by the keys that are operated and the registering mechanism is set to register these numbers at the next opening of the cash-drawer.

17. In a cash indicator, register, and recorder, the combination of a cash-drawer, a recording mechanism, a registering mechanism, a series of drops or slides, each provided with a series of numbers, a series of numbered keys for each slide, and mechanism connecting said devices whereby upon the opening of the cash-drawer the preceding transaction is recorded and registered and the indicating-slides are set at zero and upon the operating of said keys simultaneously or in any order the slides are moved to show the numbers represented by the keys that are operated and the registering and recording mechanisms are set to register and record these amounts at the next opening of the cash drawer.

18. In a cash-register, the combination of a cash-drawer, a registering mechanism provided with a series of wheels, a series of numbered keys for each wheel, and mechanism connecting said devices whereby upon the opening of the cash-drawer the preceding transaction is registered and upon operating said keys simultaneously or in any order the registering mechanism is set to register upon the next opening of the cash-drawer the amount represented by the numbers of the keys that are operated.



482,015. PRINTING OR RECORDING TELEGRAPH. ZACHARY T. LILLARD and URBINUS RENARD, Kansas City, Mo. Filed Jan. 23, 1892. Serial No. 419,081. (No model.)

Claim.—1. A printing or recording telegraph apparatus comprising a receiver consisting of a number of pivotal type-carrying bars, a number of electro-magnets, each having its armature mechanically connected to one of the type-carrying bars, an impression-cylinder journaled above the type-carrying bars, a presser-roll geared to the impression-cylinder, a drum carried by the impression-cylinder, a band wound upon the drum and carrying a gravity-weight, a sprocket-wheel carried by the presser-roll, a pair of ribbon-feeding spools journaled at opposite points relative to the impression-cylinder, a sprocket-wheel carried by one of the spools, and a sprocket-chain running over the sprocket-wheels of said spool and roll, substantially as set forth.

2. A printing or recording telegraph apparatus comprising a receiver consisting of a number of pivotal type-carrying bars, a number of electro-magnets, each having its armature mechanically connected to one of the type-carrying bars, an impression-cylinder journaled above the type-carrying bars, a lower presser-roll geared to the impression-cylinder and an upper presser-roll geared to the lower presser-roll, a drum carried by the impression-cylinder, a band connected to the drum, and a gravity-weight connected to the band, substantially as set forth.

3. A printing or recording telegraph apparatus comprising a receiver consisting of a number of pivotal type-carrying bars, a number of electro-magnets, each having its armature mechanically connected to one of said type-carrying bars, an impression-cylinder journaled above the type-carrying bars, a presser-roll geared to the impression-cylinder, a drum, a band wound upon said drum and carrying a gravity-weight, a sprocket-wheel carried by the presser-roll, a pair of ribbon-feeding spools journaled at opposite points relative to the impression-cylinder, a sprocket-wheel carried by one of the spools, a sprocket-chain running over said sprocket-wheel and over the sprocket-wheel of the presser-roll, a number of teeth or serrations carried by the opposite spool, and a spring-detent engaging said teeth or serrations, substantially as set forth.

4. A printing or recording telegraph apparatus comprising a receiver consisting of a number of pivotal type-carrying bars, a number of electro-magnets, each having its armature mechanically connected

to one of said bars, an impression-cylinder journaled above the type-carrying bars and carrying a drum, a band wound upon said drum, a gravity-weight carried by said band, a guide-plate mounted vertically upon the machine frame and having the band passing longitudinally of it, and a clamping-plate and clamping-screw carried by the guide-plate, the clamping-plate being arranged to engage and clamp the band, substantially as set forth.

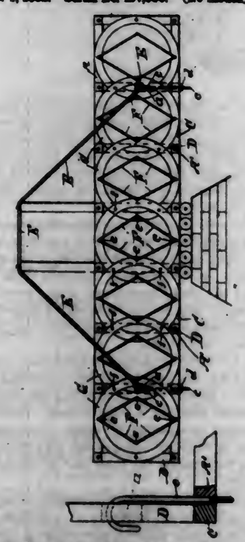
5. A printing or recording telegraph apparatus comprising an impression-cylinder journaled upon the frame of a receiver, a guide-plate mounted vertically upon said frame and carrying at one end a friction-roll, a clamping-screw working through the guide-plate, a clamping-plate swiveled upon the clamping-screw, a drum carried by the impression-cylinder, and a weighted band connected to the drum and extending past the guide-plate and also engaged at times by the clamping-plate, substantially as set forth.

6. A printing or recording apparatus comprising a transmitting-instrument having a key the stem of which is provided with an enlargement or collar, a tubular post surrounding the stem of the key and having an internal partition, a contact-block located within the post, a conducting-shell surrounding the collar or enlargement of the key and also placed in frictional engagement with the enlargement, and a lifting-spring surrounding the inner part of the key-stem, substantially as set forth.

7. A printing or recording telegraph apparatus comprising a combined transmitter and receiver, consisting of a suitable supporting-framework, a nest or circular series of type-carrying levers mounted above the base of the framework, a circular series of electro-magnets mounted also upon the base of the framework and immediately below the nest of type-levers and each having an armature-lever mechanically connected to one of the type-levers, a series of keys mounted upon the base of the framework and each surrounded by a tubular stem having an internal shoulder, a conducting-plug inserted into the lower end of each post and connected electrically to the line, and a conducting-

shell located in the upper part of each post and connected electrically also to the line and in electrical contact with the stem of the key, each magnet being separately connected to the key of a similar instrument in the circuit, and each key being also separately connected to a magnet of each similar instrument, substantially as set forth.

482,016. METHOD OF LASTING. HUGH E. V. LELLEY, Milford, Mass., assignor of one-half to THOMAS LELLEY, same place. Filed Aug. 28, 1891. Serial No. 403,999. (No specimens.)



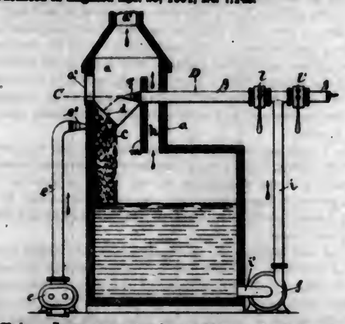
Claim.—1. In the manufacture of boots and shoes, the method herein described of securing uppers to channeled inner soles on a last, which consists in drawing the upper over the last and securing it to the inner sole by tacks, then temporarily securing the edge of the upper to the channel-flap by staple-like fastenings, then removing the tacks, and thereafter connecting the upper to the channel-flap by a line of stitches.

2. In the manufacture of boots and shoes, the method herein described of securing uppers to channeled and slitted inner soles on the last, which consists in drawing the upper over the last and securing it to the inner sole by tacks, then securing the edge of the upper to the edges of both of the flaps formed by channeling and slitting the inner sole by suitable staple-like fastenings, then removing the tacks, and thereafter connecting the upper to the channel-flap by a line of stitches.

3. In a boot or shoe, the combination, with a channeled inner sole, of an upper the edge of which overlies the channel-flap and pointed staple-like fastenings which embrace the edge of the upper and the edge of the channel-flap, the points of said fastenings entering the opposite ends of said upper and channel-flap to thereby secure the said upper to said channel-flap, substantially as described.

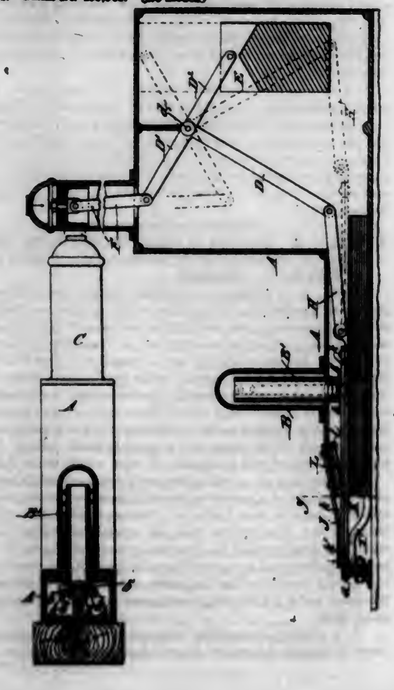
4. In a boot or shoe, the combination, with an inner sole channeled and slitted to form flaps a' a^3, the former of which is turned over upon the latter, of an upper the edge of which is secured to said flaps a' a^3 by staple-like fastenings, substantially as described.

482,017. IRON BRIDGE. HIRAM A. LEGATE, Springfield, Ark. Filed Apr. 1, 1892. Serial No. 427,264. (No model.)



Claim.—1. The combination, with a bridge and the beams A', of the uprights having a slot and the bolt *c*, its straight end passed through one of the said beams and secured there and its hook end passed through the said slot, substantially as and for the purpose set forth.

2. The combination, with a bridge, of the uprights provided with slots, the hook-bolt adapted to engage the slots, and the cables engaging the said hook-bolt, substantially as and for the purpose set forth.



3. The combination of the slotted uprights, the hook-bolts extending through the slots, and the cables engaging the said hook-bolts with the rings G and rods F, connected together, to the rings, and to the said uprights, substantially as and for the purpose set forth.

482,018. APPARATUS FOR PURIFYING AND REFINING ALCOHOLIC LIQUORS AND OTHER LIQUIDS. SAMUEL MASON, Jr., Manchester, England. Filed Sept. 15, 1891. Serial No. 406,007. (No model.) Patented in England Apr. 30, 1891, No. 7,140.

Claim.—In an apparatus for purifying and refining alcoholic liquors and other fluids, a treating-vessel *a*, open at its upper end *a'* and having internally above the fluid level a vertical passage *h* and inclined positioned perforated plates *c* and *d*, onto which latter are respectively projected in film form air and the fluid to be treated from flat-mouthed pipes d' d^3 and g g', positioned, respectively, above the plates *c* and *d*, the pipe d' leading to an air-pump *e* and the pipe *g* by means of branch pipe *i* to a fluid-circulating pump *f*, in communication with the treating-vessel *a*, the plates *c* and *d* being adapted to thoroughly break up and mix the fluid to be treated with the air and the passage *m* and open end a' to permit the foul gases or other foreign matter released to escape from the purified fluid, substantially as set forth.

482,019. TORPEDO-SIGNAL. WILLIAM H. MILLNER, Chicago, Ill., assignor of one-half to J. Chester Lyman, same place. Filed Sept. 12, 1891. Serial No. 405,903. (No model.)

Claim.—1. In a torpedo-signal, the combination of the torpedo-carrier, a magazine for the torpedoes, a device for individually removing the torpedoes therefrom and placing them upon the carrier, an anvil adjacent to the track on which the outer end of the carrier is adapted to rest, an air-piston having a suitable connection with a pneumatic power-supply, and a leverage connection between said piston and torpedo-carrier, substantially as described.

2. In a torpedo-signal, the combination, with the torpedo carrier consisting of a horizontal plate and a pair of longitudinal spring-arms thereon and means for actuating said carrier, of a torpedo-magazine, spring devices thereon having oppositely-projecting points and operating to remove the torpedoes individually therefrom and place them upon the aforesaid carrier, an anvil adjacent to the track, and a projecting cover above it, between which and the anvil the torpedo-carrying end of the carrier is adapted to rest in operative position.

3. In a torpedo-signal, the combination of a main casing, a carrier consisting of a horizontal plate and a pair of longitudinal spring-arms thereon, a vertical torpedo-magazine above the carrier, a spring device or devices for automatically placing the torpedoes individually upon the carrier, and suitable leverage connections for actuating the carrier, substantially as described.

4. The herein-described combined torpedo-signal and semaphore-signal, consisting, essentially, in the combination, with a pneumatic supply of a semaphore, of an air-piston and a torpedo-carrier operated by said piston so that when the semaphore-arm indicates "danger" the torpedo may simultaneously be placed in exploding position adjacent to the track.

5. In a torpedo-signal, the combination of the carrier consisting of a longitudinal plate and two parallel longitudinal spring-arms thereon, an air-piston within an air-cylinder, and leverage connections between said piston and torpedo carrier, substantially as described.

6. In a torpedo-signal, a carrier consisting of longitudinal plate K and crescent-ended parallel spring-arms *k k*, an anvil I adjacent to the track, a cover J above said anvil, a torpedo-magazine located vertically above the carrier, and suitable devices for operating the carrier, substantially as described.

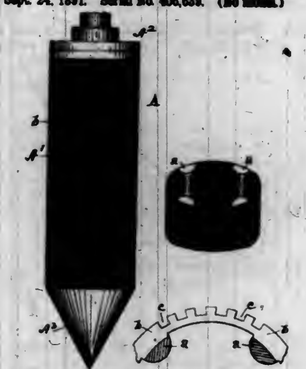
7. In a torpedo-signal, the combination of a horizontally-reciprocating carrier consisting of a longitudinal plate K and spring-arms *k k* thereon, the anvil I adjacent to the track, the cover J above said anvil, the cylindrical torpedo-magazine B', located vertically above the carrier, and the devices for reciprocating the carriage, substantially as described.

8. In a torpedo-signal, the combination of a torpedo-carrier consisting, essentially, of a longitudinal plate K and parallel longitudinal spring-arms *k k*, secured thereon and having the forward crescent ends *k'*, the anvil I near the back, cover J above said anvil, cylindrical torpedo-magazine B', located above the carrier, and the springs *b*, secured to the sides of said magazine and provided with oppositely-projecting points *b'*, that engage the torpedo-column, substantially as described.

9. In a torpedo-signal, the combination of the carrier provided with the parallel crescent-ended spring-arms, the cylindrical torpedo-magazine arranged vertically above the carrier, provided with engaging-springs which automatically permit the torpedoes to be deposited singly at the proper time upon the carrier, and a scraper-pawl pivoted above the carrier and having its end adapted to drop between the carrier-arms and sweep the surface of the carrier, all substantially as described.

10. The combination of the main casing A, an air-cylinder thereon containing an air-piston, a horizontally-reciprocating torpedo-carrier operating within the lower portion of the casing and having its forward end adapted to move contiguous to the face of the track, a torpedo-magazine above said carrier, and a T-shaped lever pivoted within the casing, said lever being provided with a weight and being connected with the aforesaid piston and also with the carrier, substantially as described.

11. In a torpedo-signal, the combination of the air-cylinder to which the air-pipe of the semaphore is connected, said cylinder containing a piston, a horizontally-reciprocating torpedo-carrier consisting of a longitudinal plate provided with parallel spring-arms *k*, having enlarged ends *k'*, the anvil I, cover J thereabove, torpedo-magazine B', having cover B and provided with the springs *b*, and the leverage mechanism between the air-piston and the torpedo-carrier, consisting, essentially, of the T-shaped weight-provided lever and the links F and H, substantially as described.

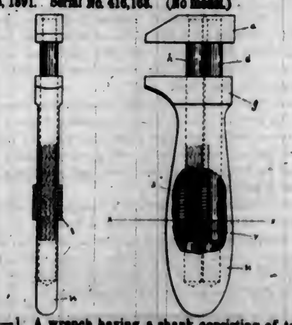


12. In a torpedo-signal, the combination of the torpedo-carrier consisting of a horizontal longitudinal plate K and the parallel spring-arms *k k*, secured thereon and having crescent-shaped forward ends *k'*, the anvil I adjacent to the track, cover J above it, the cylindrical torpedo-magazine B', containing the vertical column of torpedoes and provided with the springs *b b*, having oppositely-projecting points *b'*, that engage the lower end of the torpedo column, and the pivoted pawl or latch L, adapted to drop at certain times between the spring-arms *k k* and sweep the surface of the plate K, substantially as described.

13. In a torpedo-signal, the combination, with the torpedo-carrier consisting of a plate provided with a pair of longitudinal spring-arms, of a depending pawl supported above the carrier and adapted to clear the upper surface thereof of the fragments of an exploded torpedo.

14. In a torpedo-signal, the combination of a torpedo-carrier, a magazine for torpedoes, a horizontally-reciprocating torpedo-carrier consisting of a plate and a pair of longitudinal spring-arms thereon, an anvil adjacent to the track, and a protecting-cover above the anvil, said cover being for the purpose of protecting and covering the torpedo which may be below it and preventing any interference therewith, substantially as described.

15. In a torpedo-signal, the combination of the main casing to inclose the mechanical parts, a reciprocating torpedo-carrier consisting of a horizontal plate provided with longitudinal spring-arms, a torpedo-magazine above the carrier, which deposits its torpedoes individually thereon, a pivoted depending pawl, the end of which is in contact with the upper face of the carrier for the purpose of clearing it of the fragments of an exploded torpedo, an anvil located adjacent to the track, and a protecting-cover above the same for protecting the torpedoes which may be located beneath it, and thus prevent interference therewith, substantially as described.



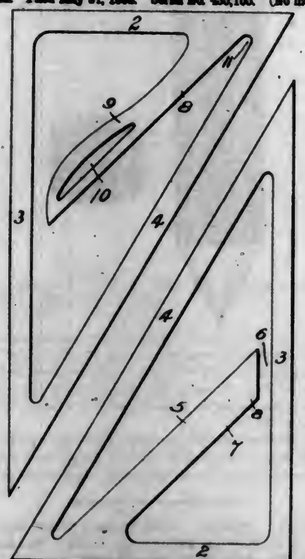
482,020. SAND-SCREEN. CLEOPHAS MORLEAU, Middletown, Ohio. Filed Sept. 24, 1891. Serial No. 406,639. (No model.)

Claim.—1. A sand-screen consisting of a continuous cylindrical tube or shell of metal formed with a series of longitudinal ribs upon its inner periphery integral with the cylindrical shell and provided with circumferential screening-slits extending entirely around and through the shell, leaving the supporting-ribs substantially intact, substantially as set forth.

2. In a sand-screen of the general type embodying a tubular shell cut through by screening-slits, a series of cross-grooves cut partially through the shell across the screening-slits, substantially as set forth.

482,021. WRENCH. FRANK MOSBERG, Attleborough, Mass., assignor to the Mosberg Manufacturing Company, same place. Filed Dec. 26, 1891. Serial No. 416,168. (No model.)

Claim.—1. A wrench having a shank consisting of two parallel bars, in combination with an adjusting-nut having an internal screw-thread fitting into a screw-thread on one of said bars and a screw-thread on its outside fitting into a section of screw-thread made on the concave milled side of the other of said bars, substantially as specified.



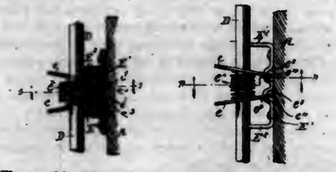
2. In a wrench, the combination of the following elements, viz: an outer jaw, to which are secured two parallel bars which extend into the inner jaw and handle, with means for holding and adjusting them lengthwise in said handle, substantially as herein specified.

482,022. WEATHER-STRIP. WILLIAM H. NIXON, Plymouth, Ind. Filed Jan. 26, 1892. Serial No. 419,530. (No model.)

Claim.—The combination, with the door and the molding-strip having a groove upon its under face and a vertical groove upon its inner face, of the hinged strip, the inner edge of which is designed to be held between the foot and the groove of the under face of the molding-strip, and the vertically-adjustable foot on the door beneath the molding-strip, with the vertical portion in the groove of the inner face of the molding-strip, substantially as and for the purpose specified.

482,023. COMPOUND TRIANGLE. ARTHUR T. PAGE, Minneapolis, Minn. Filed May 31, 1892. Serial No. 435,105. (No model.)

Claim.—1. As a new article of manufacture, a compound triangle composed of the three main side pieces or bars 2, 3, and 4, respectively, forming within themselves a triangular space, and a projection extending from the inner side of one of said bars into said triangular space, substantially as described.

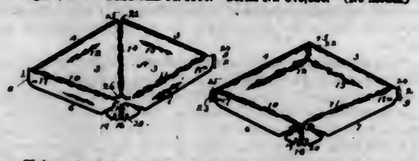


2. As a new article of manufacture, a compound triangle composed of the side pieces or bars 2, 3, and 4, forming within themselves a triangular space, and a projection extending from the base of the triangle into said space, said projection being provided with a straight upper edge and an irregularly-curved lower edge, substantially as and for the purpose specified.

3. As a new article of manufacture, a compound drafting-instrument composed of the three bars 2, 3, and 4, forming a triangular space within themselves, and a bar 5, projecting from the base-bar 2 into the triangular space, and a protractor 12, arranged within said space and provided with perforations having irregularly-curved edges, substantially as described, and for the purpose specified.

482,024. TRANSOM-LIFTER. EDWARD PATTEN, Chicago, Ill. Filed Oct. 12, 1889. Serial No. 326,930. (No model.)

Claim.—1. The combination, with the operating-rod of a transom-lifter, of a clutch or holding device comprising a base-plate adapted for attachment to the door-casing and two apertured clutch-plates engaging said rod, said clutch-plates having at their inner ends lugs or pivot-pins, and the base-plate being made flat on its inner face for contact with the door-casing and provided in such flat inner face with notches or recesses having flat walls or surfaces parallel with the inner face of the base-plate for engagement with the lugs or pivot-pins upon the clutch-plates, substantially as described.



2. The combination, with a transom-lifter bracket and connecting-rod, of a connecting piece or head having a permanent swiveled connection with both the bracket and the connecting rod, substantially as described.

3. The combination, with a transom-lifter bracket provided with an annular groove near its end, of a connecting-rod provided with a similar groove near its end and a connecting piece or head provided with sockets to receive the ends of the bracket and connecting-rod and with projecting parts entering said grooves to retain the said bracket and connecting-rod in engagement with the said connecting piece or head, substantially as described.

4. The combination, with a transom-lifter bracket provided with an annular groove near its end, of a connecting-rod provided with a similar groove near its end, a connecting piece or head provided with sockets to receive the ends of the bracket and connecting-rod, an integral projection on the head engaging the groove on the connecting-rod to hold the same in the socket, and a rivet inserted through the head and engaging the groove in the bracket, substantially as described.

482,025. METALLIC ROOFING-TILE. BERRAIN B. REPP, Washington, D. C. Filed Jan. 31, 1891. Serial No. 379,890. (No model.)

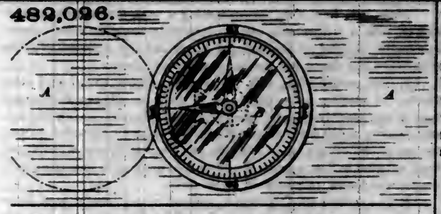
Claim.—1. A roofing-tile having upward-turned flanges on its upper sides, as 4 and 5, and extending along the cut-away portions 8 and 9, as and for the purposes set forth.

2. A roofing-tile having cut-away portions 8 and 9 at each side, each having an upward flange, one of said flanges forming a rib, and a nail-hole in the apex of said rib, as and for the purposes set forth.

3. A roofing-tile having a notch in its upper end and a rib at one side with a nail-hole in its apex, whereby when the tiles are secured in position the nail passing through the rib of one tile will pass through the notch of the tile immediately below it, substantially as described.

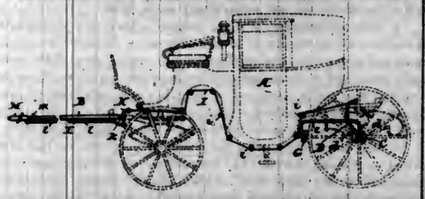
4. An approximately rectangular roofing-tile having cut-away sides 1 and 2 and provided with a rib 9 at one side 2 and an upward-projecting flange 8 at its side 1, as and for the purposes set forth.

5. A roofing-tile having holes 17 and 18 at the lower ends of the cut-away sides 1 and 2 and provided with points 19 and 20 at its central lower end, as and for the purposes set forth.



6. A roofing-tile having a nail-hole 24 at the apex of a rib running along one side of the tile and a raised portion 26 to accommodate the head of a nail passed through a similarly-situated nail-hole of an under tile, as and for the purposes set forth.

7. A roofing-tile having ribs 10 and 11 and flanges on the upper sides 4 and 5, said ribs and flanges meeting each other at their outer extremities, as set forth.



482,026. PLUMB-LEVEL. JOHN T. RIDER, South Oil City, Pa., assignor of one-fourth to Harvey Fritz, same place. Filed Apr. 6, 1891. Serial No. 387,826. (No model.)

Claim.—The herein-described plumb-level, consisting of the stock A, in which is adjusted the axis D, having bearings in the adjustable step E, screwed into the bottom of the recess *a* and in the graduated dial-plate B, covering the top of said recess and having rigidly secured thereto a pointer F, adapted to traverse the aforesaid dial-plate, and a ring G, supporting a closed vessel H, containing mercury, adapted to bring the aforesaid pointer speedily to a perpendicular.

482,026.

482,027. VEHICLE-BRAKE. ELI SWARTZ and DANIEL S. REESER, Scranton, Pa. Filed Jan. 30, 1892. Serial No. 419,697. (No model.)

Claim.—1. The combination, with the axle, of the brackets fixed to the axle, the brake-shaft supported in the brackets above and in front of the axle, the brake-carrying arms upon the ends of the brake-shaft, and the lever extending upward from the shaft and connected to the brake-operating devices, substantially as described.

2. The combination, with the axle, of the brackets D, extending upward and forward, the brake-shaft E, mounted on the brackets and having arms *c* carrying the brakes, and a lever H for operating the shaft, substantially as described.

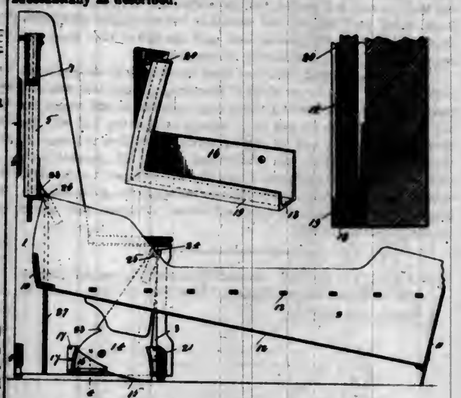
3. The combination of the axle, the brackets attached to the axle, the brake-shaft having arms *c* and lever H attached thereto, the brakes at the outer ends of the arms *c*, the arm *k'* upon the brake-shaft, and the spring *k*, connecting the arm *k'* with the axle, substantially as described.

4. The combination, with a cut-under vehicle, of the brackets connected with the rear axle, the brake-shaft provided with arms carrying the brakes and a lever, a cable extending from the upper end of said lever to a lever pivoted between the hounds, a rod connecting the latter lever with a sleeve upon the tongue of the vehicle, and guides for conducting the cable along the bottom of the vehicle, substantially as described.

5. The combination, with the axle, of the brackets fixed to the axle, the brake-shaft, the lever for operating the shaft, the arms at the outer ends of the shaft, and the two-part brake-heads, each having one part rigidly connected to the brake-shaft and the other part movable and provided with a shoe, substantially as described.

6. The combination, with the brake-shaft, of the two-part brake-head, the lower part of the brake-head being connected rigidly to the shaft and provided with an upwardly-extending slotted tongue and the upper part having a recess to receive said tongue, and a screw or pin arranged to pass through the slot in the tongue, whereby the two parts are movably held together, substantially as described.

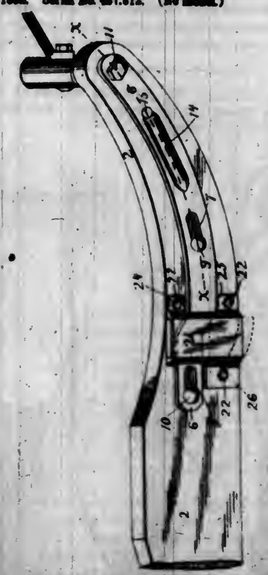
7. The herein-described two-part brake-head, the lower part having an upwardly-extending slotted tongue and the upper part having a portion overlapping the lower part, the said overlapping portion being provided with a recess to receive the tongue, and a pin or bolt for retaining the tongue within the recess, substantially as described.



8. The combination, with the shaft E, having the arms *c f*, of the two-part brake-head, the lower part *g* being rigidly connected to the arms *f* and provided with the slotted tongue *g'* and the upper part *g''* overlapping the lower part and provided with a recess to receive the tongue, a pin or bolt *g''* to retain the tongue within the recess, and a shoe *m*, attached to the back of said upper portion, substantially as described.

482,028. WARDROBE-BED. CHARLES TEMPEL, Chicago, Ill. Filed Aug. 31, 1891. Serial No. 403,863. (No model.)

Claim.—1. In a folding bed, the combination, with a stationary frame, of rocking supports carried by the stationary frame and bearing directly against the floor when rocked toward the front of the frame and a folding-bed portion pivoted to the upper ends of the rocking supports, substantially as described.



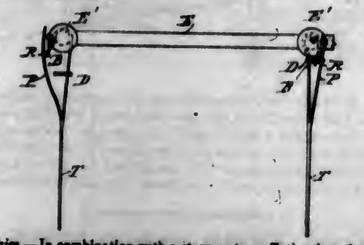
2. In a folding bed, the combination, with a stationary frame, of segmental rocking supports carried by the stationary frame and bearing directly against the floor when rocked toward the front of the frame and a folding-bed portion pivoted to the upper ends of the segmental rocking supports, substantially as described.

3. In a folding bed, the combination, with a stationary frame having rear brackets 16, of segmental rocking supports 14, resting on the brackets when rocked toward the rear of the frame and having downwardly-extended portions 15, which bear directly against the floor when the supports are rocked toward the front of the frame, and a folding-bed portion pivoted to the upper ends of the rocking supports, substantially as described.

4. In a folding bed, the combination, with a stationary frame having the front stops 21 and the rear brackets 16, provided with upwardly-extending stop portions 20, of the segmental rocking supports 14, having front and rear notches 22 and 23 and downwardly-extending portions 15, which bear directly against the floor when the supports are rocked toward the front of the frame, substantially as described.

482,029. SLED-BRAKE. JOHN WESTBERG, Fertile, Minn. Filed Apr. 5, 1892. Serial No. 427,813. (No model.)

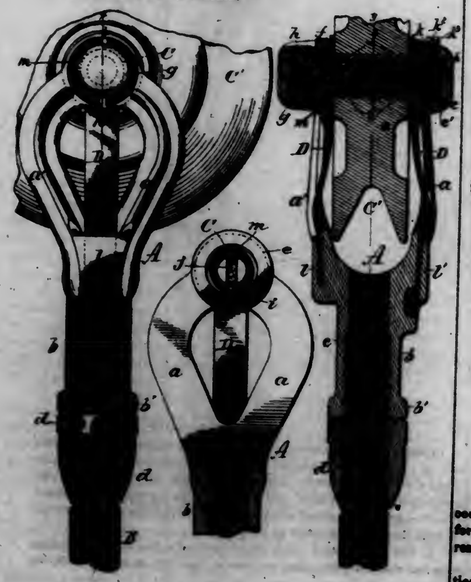
Claim.—1. The combination, with the sled-runner having a slotted end, of a sliding bar arranged upon the side thereof and having inclined shoulders, guides for the rear end of the bar, a spring to normally hold the bar forward, and a brake-block having inclined shoulders to engage the inclined portions of said bar, guides being provided for said block, substantially as described.



2. The combination, with the runner, of a bar slidably secured upon the side thereof, guides for the bar, said bar connected with the

cross-rod of the sled and having an inclined shoulder, a brake-block having an inclined shoulder to be engaged thereby, and a guide-plate for said block, secured upon the side of the runner and fastening the block in place, substantially as described.

3. The combination, with the sled-runner, of the cross-rod 3 thereof, said runner having a slotted end, the bar arranged upon the side of the runner and having the slots 7 and 8, bolts 9 and 10, extending through the same, the forward end of said bar engaging said cross-rod and the rear end having the upwardly-inclined shoulder 16, the brake-block provided with the beak-like lower end and with shoulders 17, and the guide-plate secured upon the side of the runner and engaging said block, substantially as described.



4. The combination, with the runner provided with the slot 4 and with the plate 5, of the cross-rod 3, extending through said slot, said runner having the recess 13, the spring contained in said recess, the bar 6, provided with the lug 15 to engage said spring and with the slots 7 and 8, bolts 9 and 10, passing through said slots and securing the bar upon the runner, the brake-block having the recessed inner side and the inclined shoulders 17 and shoulders 19, said bar provided with the inclined edges 16 to engage the same, and the guide-plate 21, provided with lugs fastened upon said runner, all substantially as and for the purpose specified.

482,080. BUCKLE. GEORGE WILLIAMSON, Luton, and CONSTANTINE DE NEUVE, London, England. Filed Feb. 12, 1892. Serial No. 421,381. (No model.)

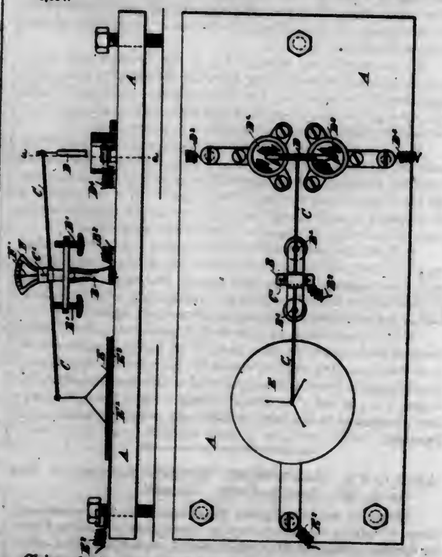
Claim.—In combination with a strap or trace T, the slotted piece B on the free end of the same, the D-piece D, loosely arranged on the trace to slide thereon toward and from the said free end, and the tongue P for holding the parts together, substantially as described.

482,031. TROLLEY FOR ELECTRIC RAILWAYS. CLARENCE A. ADAMS and THOMAS J. TREBY, Lincoln, Nebr. Filed Mar. 25, 1892. Serial No. 426,365. (No model.)

Claim.—1. In a harp for supporting a trolley-wheel, the combination, with a trolley-pole and an internally-screw-threaded sleeve screwed to the end of said pole, of a lock-nut also screwed onto the pole below the sleeve and bearing against said sleeve.

2. The combination, with the arms of a harp, one of said arms having an opening in its upper end, of an internally-screw-threaded boss at the upper end of the other arm and a journal passing through said opening in one arm and screwing into the screw-threaded boss at the upper end of the other arm, the said journal having an enlarged head adapted to bear against the outer face of the arm through which the journal passes, substantially as set forth.

3. The combination, with the arms of a harp, one of said arms having an opening in its upper end, of a hollow journal passing through said opening and provided with a head, the latter adapted to bear against the outer face of said arm, an internally-screw-threaded boss at the upper end of the other arm adapted to receive the screw-threaded end of the hollow journal, substantially as set forth.



4. The combination, with the arms of a harp, one of said arms having an opening therein, of an internally-screw-threaded boss at the upper end of the other arm, a hollow journal passing through the opening in one of said arms and adapted to screw into the internally screw-threaded boss at the upper end of the other arm, said boss and journal having aligned screw-threaded perforations, and a screw passing through said screw-threaded perforations, substantially as set forth.

5. The combination, with the arms of a harp, one of said arms having an opening therein, of an internally-screw-threaded boss at the upper end of the other arm, a hollow journal passing through the opening in one of said arms and adapted to screw into the screw-threaded boss at the upper end of the other arm, said boss and journal having aligned screw-threaded perforations, and a screw passing through said screw-threaded perforations, said screw having a vertical groove therein, substantially as set forth.

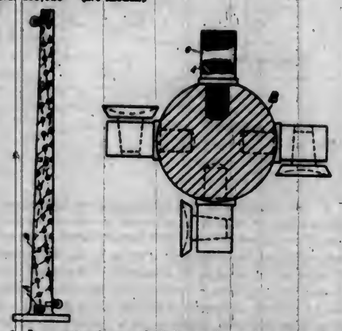
6. The combination, with a harp adapted to support a journal for a trolley-roller, of pockets cast on said harp and springs inserted in said pockets and adapted to bear on said trolley-wheel, substantially as set forth.

7. The combination, with a harp and a journal carried thereby, of pockets cast on said harp and contact-springs inserted in said pockets and provided at their upper ends with openings to encircle said journal, substantially as set forth.

482,032. ELECTROSTATIC SWITCH AND PHASE-INDICATOR. ALFRED U. ALSEN, Melbourne, Victoria. Filed May 26, 1891. Serial No. 394,106. (No model.) Patented in Victoria Apr. 15, 1891, No. 5,057.

Claim.—1. A system of electrical distribution consisting of the combination of electric alternators, circuit-closers therefor, and means for operating said circuit-closers, consisting of relatively-movable plates respectively charged by different alternators.

2. A system of electrical distribution consisting of the combination of two electric alternators, a main line in circuit with one of said alternators, circuit-closers in circuit with the other alternator, and means controlling said circuit-closers, consisting of relatively-movable plates of an electric condenser, which plates are respectively connected to the two alternators.

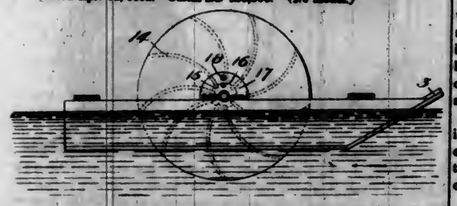


3. An electrostatic switch and phase-indicator constructed of the beam C, suitably supported and carrying at its one end the disk E and at its other end the link D, in combination with the disk E and mercury-wells D' and D², all arranged and connected substantially as described and illustrated.

4. A system of electrical distribution consisting of the combination of a circuit-closer, alternators in circuit therewith, and means controlling the circuit-closer, consisting of electrically-charged bodies within inductive distance to one another.

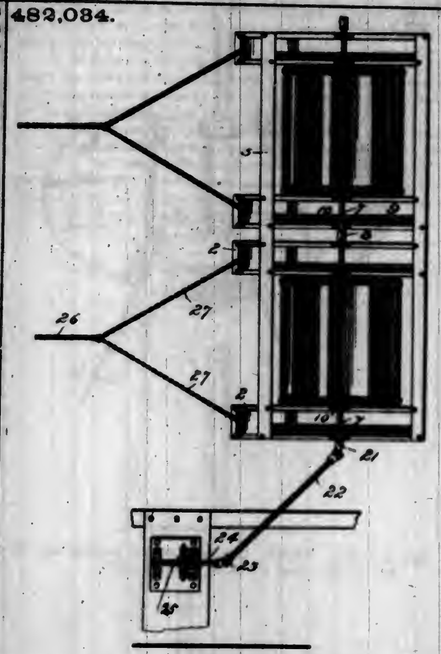
5. An electrostatic switch consisting of the combination of a circuit-closer, relatively-movable plates of a condenser controlling said circuit-closer, and an indicating device controlled by said plates or plate.

6. The combination, in an electrical system of distribution, of main-line conductors, alternators in parallel circuit therewith, circuit-closers in circuit between the main-line conductors and the alternators, and relatively-movable plates charged by said alternators and engaged to said circuit-closers.



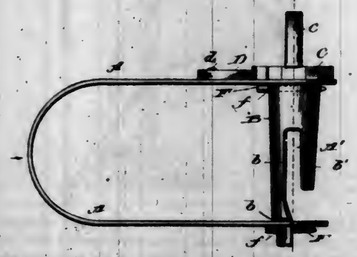
482,033. CUTTER OR DRILL FOR COAL. CLAUDE W. ATKINSON and LLEWELYN B. ATKINSON, London, England. Filed Aug. 18, 1891. Serial No. 403,026. (No model.)

Claim.—1. In a cutter bar or drill for coal or other minerals, the combination, with a cylindrical bar, of a series of tool-holders arranged at and fitted into holes in the intersections of right and left handed spirals of different pitch, one with pitch the length of the bar and the other intersecting spiral with a pitch of about one-tenth the length of the bar, substantially as set forth.



2. In a cutter bar or drill for coal or other mineral, a diamond-shaped cutting-tool with a taper shank detachably attached to a holder A, in combination with a revolving bar supporting the said holders, the cutter being so disposed in the holder and to the bar that the front and back corners of the cutting-edge rotate in different planes of revolution, substantially as and for the purpose specified.

482,034. CURRENT WATER-WHEEL AND MEANS FOR TRANSMITTING POWER THEREFROM. ISAAC R. BURNY, Minneapolis, Minn. Filed Apr. 11, 1892. Serial No. 428,503. (No model.)

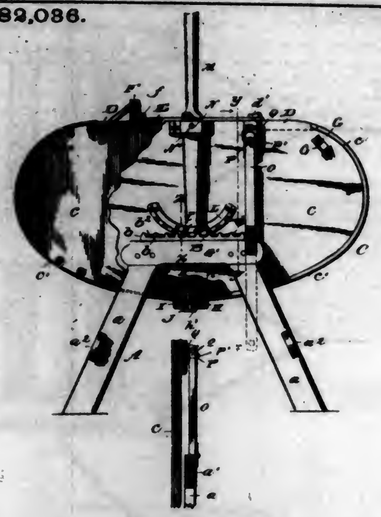


Claim.—The combination of the boats 2 and the beams 5 and 6, extending between the same and rigidly connecting them with the transverse shaft 7, extending between said boats, the water-wheel arranged upon said shaft, said water-wheel being made up of the parts 11, 12, and 13 and the curved blades 14, the plates 17, arranged upon said ends and having hubs secured upon said shaft, the universal joints 21 and 23, the rod 22, extending between the same, and the power-shaft arranged upon the shore in connection with the joint 23, substantially as described.

482,034.

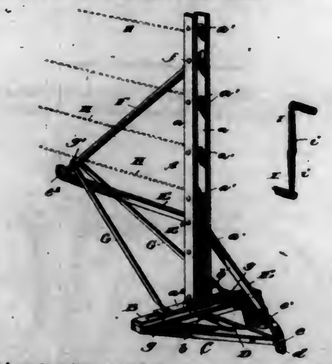
482,035. WIRE-TIGHTENER. JOHN I. BUCKINGHAM, Harmon, S. D. Filed Jan. 14, 1892. Serial No. 418,069. (No model.)

Claim.—1. The combination, with a U-shaped frame, of a winding-shaft having a longitudinal slot disposed at one end diametrically and passing entirely through one side of the shaft at a point between the arms of the frame, substantially as specified.



2. The combination of the U-shaped frame having at its bend a wire-receiving slot and guiding-eye with a winding-shaft rotatably mounted in the frame and provided with a longitudinal slot terminating in a curved portion which passes through one side of the shaft and having at one end a ratchet and means for turning the shaft and at the other end means for preventing the spreading of the arms of the frame, substantially as specified.

3. The combination, with a U-shaped frame, of a shaft terminating at one end in bifurcations and an adjacent ratchet and at the other end in a shoulder and a semi-cylindrical bearing and having between the arms of the frame a slot with one end extending through the side of the shaft, substantially as specified.

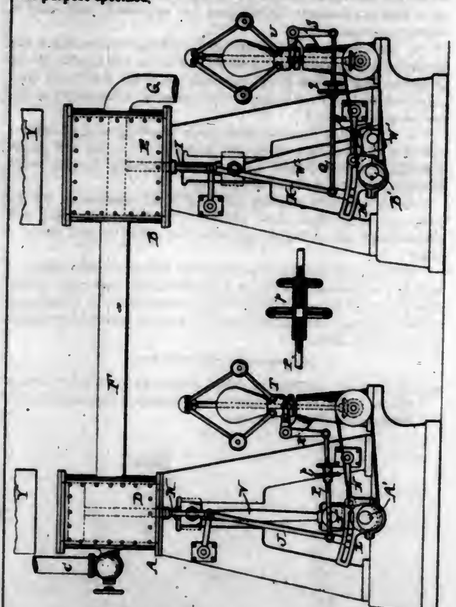


482,036. WASHING-MACHINE. FRED L. BUCKLEY, Assin Creek, Pa. Filed Mar. 11, 1892. Serial No. 424,867. (No model.)

Claim.—The combination, with the support and the oscillating tub, of a bar hinged to the tub and having a hole at its upper end, a pin on the tub to engage said hole, the outer end of the pin being provided with a transverse groove, and a gravity-loop hinged to the tub and adapted to embrace the upper end of said bar and enter said groove, as and for the purpose specified.

482,086.

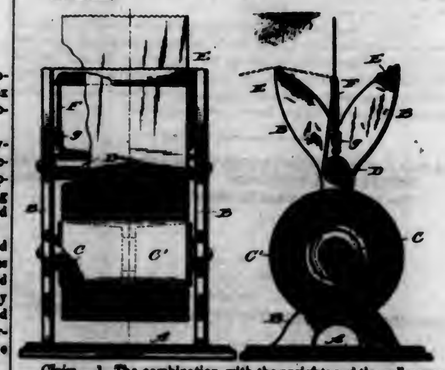
482,037. FENCE. RICHARD H. FENTON, Sheridan, Ind. Filed Mar. 16, 1892. Serial No. 425,131. (No model.)



Claim.—1. A base for a fence-post, comprising a triangular support, a cross-bar secured thereto, and a rod extending from the apex of the triangle to the base and hooked over the said cross-bar, substantially as specified.

2. The combination, with a post and its triangular base, of a stay-bar connected at one end to the base, extended in an inclined direction and thence substantially horizontally, an inclined brace-bar supported on the horizontal portion of the stay-bar, the rod extending from the apex of the base and engaging one end of the stay-bar, and a bar connecting the brace-bar and base, as set forth.

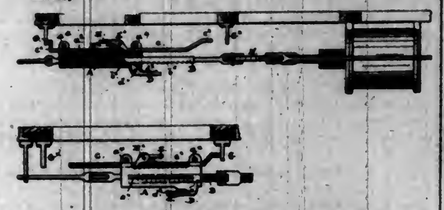
3. The combination, with the base having notched cross-bar and the metal cross-bar on the same, of the rod extending at right angles to the cross-bar and seated in the notch of the base, with a hooked end engaging the metal cross-bar and its other end hooked, the stay having one end engaged with the said hook and the other end extended horizontally, the inclined brace-bar supported on the horizontal portion of the stay, and the oppositely-inclined brace-bar secured to the base and embracing the inclined bar, as set forth.



482,088. STEAM-ENGINE. WILLIAM R. GOOD, Philadelphia, Pa., assignor to the Southwark Foundry and Machine Company, same place. Filed Mar. 26, 1892. Serial No. 426,694. (No model.)

Claim.—1. In combination with high and low pressure cylinders connected by a conduit or receiver, a governor regulating the admission of steam to the high-pressure cylinder, said governor being arranged to lengthen the admission as the work on said cylinder increases, and a governor regulating the admission of steam to the low-pressure cylinder, said governor being arranged to shorten the admission as the work on that cylinder increases, substantially as and for the purpose specified.

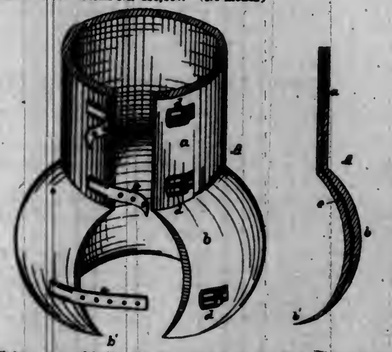
2. The combination of two steam-engines disconnected as to their reciprocating or rotative movements, a receiver connecting the exhaust of one engine-cylinder with the admission of the second, a governor regulating the admission of steam to the high-pressure cylinder and arranged to increase the admission as the work on said cylinder increases, and a governor regulating the admission of steam to the low-pressure cylinder, arranged to shorten the admission as the work on said cylinder increases, substantially as and for the purpose specified.



482,089. ROLL-PAPER HOLDER AND CUTTER. EDWARD B. CRAPSER, Richford, N. Y. Filed May 31, 1892. Serial No. 435,099. (No model.)

Claim.—1. The combination, with the uprights and the roll-paper holder, of a bar above the roll-paper support and a spring tension device secured to said bar and standing vertically, as and for the purpose specified.

2. The paper-holder and cutter consisting of the uprights, the roll-paper support held between the same, the bar held between the uprights above the roll-paper support, the serrated cutting-plates, one upon each side of the vertical center of the device upon the uprights, and a central vertical spring tension device provided with parallel bars, between which the paper is designed to be passed and yieldingly held, as set forth.



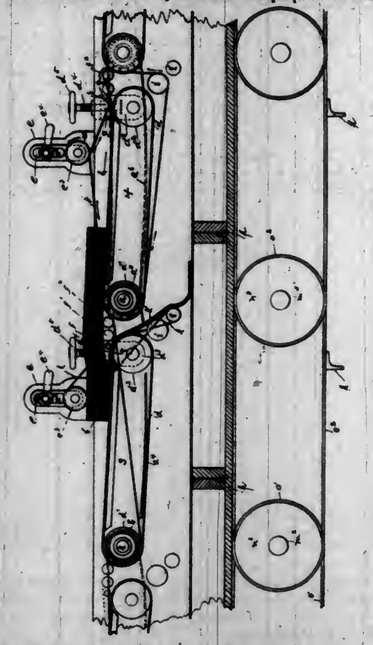
482,040. SLACK-TAKE-UP FOR AIR-BRAKES. LEONIDAS GUILLERET, San Francisco, Cal. Filed Dec. 9, 1891. Serial No. 414,462. (No model.)

Claim.—1. The herein-described slack-take-up for air-brakes, consisting of the two-part bar or part A B, the ratchet-teeth and pawl as a means of connecting the said parts to permit longitudinal movement of one part on the other in one direction, but to lock them together against movement in the opposite direction, the slide bar C, of greater length than the two-part bar, and means by which the same is locked to the two-part bar in one direction and is allowed to slide in it in the opposite direction to shift it longitudinally thereon, and stops or abutments setting in the path of said slide-bar to engage the ends thereof and limit its movement, constructed and combined for operation substantially as described.

2. In a slack-take-up for air-brakes, the combination, with the lever of the brake-piston and the lever, rod, or other part to be operated thereby, of the two-part rod or bar A B, one part or section connected to the brake-lever and the other part to the rod, lever, or part to be moved, the two parts sliding in opposite directions one on the other, ratchet-teeth on one part and a spring-pawl on the other part as a means of connecting said parts together to allow longitudinal movement of the parts on each other in one direction, but to lock them in the opposite direction, and the slide *c* and means for locking it to the said parts to afford longitudinal movement in one direction and to lock it on said part in the opposite direction, and stops or abutments arranged for operation in the path of said slide to limit the movement thereof, substantially as described.

482,041. HORSE-BOOT. HUTSON R. HUBB, Cleveland, Ohio. Filed Oct. 29, 1891. Serial No. 410,167. (No model.)

Claim.—An ankle-boot for horses, composed of an integral piece of rubber having a layer of fibrous stiffening material embedded therein and having an upper tubular portion to fit upon the leg and a lower globose portion to inclose the joint, said globose portion thickened at its middle part and having a thin flexible free edge, and means for securing the boot upon the leg, substantially as described.



482,042. APPARATUS FOR CUTTING AND SPREADING GLUE. CHARLES KELLER, Springdale, Pa. Filed May 23, 1891. Serial No. 393,733. (No model.)

Claim.—1. In an apparatus for cutting glue, the combination of a traveling carrier, a wire in such position as to cut a sheet from the top of the glue block and bring it to the desired thickness, and a cutting-wire back of said cutting-wire and close to a traveling carrier supporting the block to cut a sheet from the lower end of the glue block, substantially as and for the purposes set forth.

2. In apparatus for cutting glue, the combination of a traveling carrier, and a cutting-wire close to the same to cut a sheet from the lower face of the glue block, and a depressing-roller rotating in the opposite direction to the movement of said glue block to force such sheet down from the glue block as it is fed forward, substantially as and for the purposes set forth.

3. In apparatus for cutting glue, the combination of two or more traveling carriers having cutting-wires close to the same and feeding-rollers between said carriers to carry the glue block from one carrier to the next, substantially as and for the purposes set forth.

4. In apparatus for cutting glue, the combination of two or more traveling carriers having cutting-wires close to the upper surfaces thereof, a depressing-roller traveling in an opposite direction to the course of the glue, and one or more feeding-rollers traveling in the same direction as the glue block and adapted to feed it from one carrier to the next, substantially as and for the purposes set forth.

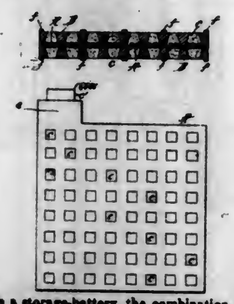
5. In apparatus for cutting glue, the combination of a series of traveling aprons or pulleys mounted on suitable sheaves, each of said aprons being driven from the forward sheave, a cutting-wire extending across above the apron, and adjusting-bearings for the rear roller of each apron to adjust the same, according to the thickness of the glue sheet to be cut, substantially as and for the purposes set forth.

6. In apparatus for cutting glue, the combination of a traveling apron to carry the glue block, a stationary wire extending across above said apron, and a power-driven roller above the wire, traveling in the direction of the glue block to assist in feeding the same, said power-driven roller being mounted on sliding bearings providing for the adjustment of the same with relation to the cutting-wire, substantially as and for the purposes set forth.

7. In apparatus for cutting glue, the combination of a traveling apron and a cutting-wire extending across and above the same, a depressing-roller traveling in the opposite direction to the course of the glue sheet, and a net under the apron, traveling at the same speed as the apron, to receive the glue sheet therefrom, substantially as and for the purposes set forth.

8. In apparatus for cutting glue, the combination of an endless traveling apron, a cutting-wire extending across and above the same, a depressing-roller extending across and above the sheet to the under surface of the block, guiding-rollers under and back of the endless apron, and a net under the apron, traveling at the same speed as the apron, to receive the glue sheet, substantially as and for the purposes set forth.

9. In apparatus for cutting glue, the combination of two or more traveling carriers having cutting-wires close to the same to cut a sheet from the lower surface of the glue block, and a series of drying-nets corresponding to the traveling carriers and extending under the same and adapted to receive the glue sheets therefrom, and pushing mechanism to feed forward the series of drying-nets, substantially as and for the purposes set forth.



10. In apparatus for cutting glue, the combination of a series of drying-nets, a pushing apparatus to feed the same forward, and a transverse pushing apparatus to feed the same crosswise to bring other surfaces of the nets into position to receive the glue sheets, substantially as and for the purposes set forth.

11. In apparatus for cutting glue, the combination, with a series of drying-nets arranged in a step-by-step position, of mechanism for feeding said drying-nets forward and a reciprocating transverse pusher having a series of steps to engage with the several nets.

12. In apparatus for cutting glue, the combination, with a series of drying-nets arranged in a step-by-step position, of mechanism for feeding said drying-nets forward, a reciprocating transverse pusher having a series of steps adapted to engage with said nets, and mechanism for normally holding said pusher away from said nets, substantially as and for the purposes set forth.

13. In apparatus for cutting glue, the combination, with the frame, of the pusher *q*, the rack *u*, the toothed segment *u'*, engaging said rack, the spring *w*, and the arm *z*, having the toothed segment *z'*, adapted upon the revolution of the shaft *y'* to engage the toothed segment *u'* to operate the pusher, substantially as and for the purposes set forth.

482,043. STORAGE-BATTERY. PATRICK KENNEDY and CHARLES J. DIM, Brooklyn, N. Y., assignors to the Acme Storage Battery Company, of West Virginia. Filed Sept. 25, 1891. Serial No. 406,802. (No model.)

Claim.—1. In a storage-battery, the combination, with non-conducting structures for holding the active material, of an electrical conductor placed between them and a joint integrally connecting the said structures, substantially as herein set forth.

2. In a storage-battery, the combination of non-conducting structures provided with ribs *d* and constructed to hold the active material with a slotted electrical conductor placed between said structures, substantially as herein set forth.

3. In a storage-battery, a conductor constructed and arranged for connection with electric wires and having openings therethrough, active material arranged at opposite surfaces of said conductor, and non-conducting structures for containing the active material and for holding the same against the opposite sides of said conductor and constructed to meet at intervals through the openings therein, all substantially as and for the purpose herein set forth.

4. In a storage battery, a conductor constructed and arranged for connection with electric wires and having openings therethrough, active material arranged at opposite sides thereof, and non-conducting structures composed of material which becomes adhesive when warmed and joined through the openings in the conductor by adhesion, substantially as and for the purpose herein set forth.

5. The combination, with the active material of a storage-battery, of a conductor A, composed of multiple flat strips or plates *b*, connected together with slots *a* between them and constructed and arranged for connection with suitable electric wires, and non-conducting structures which hold the active material in contact with the strips or plates *b* and which meet through the slots *a*, all substantially as and for the purpose herein set forth.

6. The combination, with the active material of a storage-battery, of a conductor A, composed of multiple flat strips or plates *b*, connected together with slots *a* between them and constructed and arranged for connection with suitable electric wires, and non-conducting structures which hold the active material in contact with the strips *b* and are united through the slots *a* by adhesion along their length, substantially as and for the purpose herein set forth.

7. In a storage-battery, the combination of non-conducting structures having a series or system of cavities with an interposed conductor constructed for connection with suitable electric wires and having a series or system of openings coincident with the spaces between the cavities of each of the said structures, whereby provision is made for bringing the conductor in contact with the contents of the cavities and for connecting the structures by their contact through the said openings, substantially as and for the purpose herein set forth.

8. In a storage-battery, the combination of non-conducting structures having cavities which are larger at their inner than at their outer ends with a slotted conductor A, the bars *b* of which lie across the said inner ends of said cavities, while the structures meet and are connected through the slots *a* of said conductor, substantially as and for the purpose herein set forth.

9. In a storage-battery, the combination of an electrical conductor having a shank or connecting device *c* with a non-conducting structure for holding the active material and a sleeve extended from said structure to protect said shank or device, substantially as herein set forth.

10. In a storage-battery, a conductor A, composed of connected flat strips or plates *b*, having slots *a* between them and provided with means for connection with suitable electric wires, in combination with a non-conducting structure having rows of cavities larger at their inner than at their outer ends and arranged coincident with and opposite to the strips or plates *b*, and a non-conducting backing or support at the back of said conductor, all substantially as and for the purpose herein set forth.

482,044. STORAGE-BATTERY. PATRICK KENNEDY and CHARLES J. DIM, Brooklyn, N. Y., assignors to the Acme Storage Battery Company, of West Virginia. Filed Sept. 25, 1891. Serial No. 406,803. (No model.)

Claim.—1. A structure for holding the active material of a storage-battery, composed of a cohesive bitumen, resin, gum, or gum-resin and a mineral non-conductor of electricity, substantially as herein set forth.

2. A structure for holding the active material of a storage-battery, composed of a cohesive bitumen, resin, gum, or gum-resin and a mineral non-conductor of electricity, in substantially the proportions herein set forth.

3. A structure for holding the active material of a storage-battery, composed of a cohesive bitumen, resin, gum, or gum-resin and a finely-pulverized mineral non-conductor of electricity, substantially as herein set forth.

4. A structure for holding the active material of a storage-battery, composed of shellac and a mineral non-conductor of electricity, substantially as herein set forth.

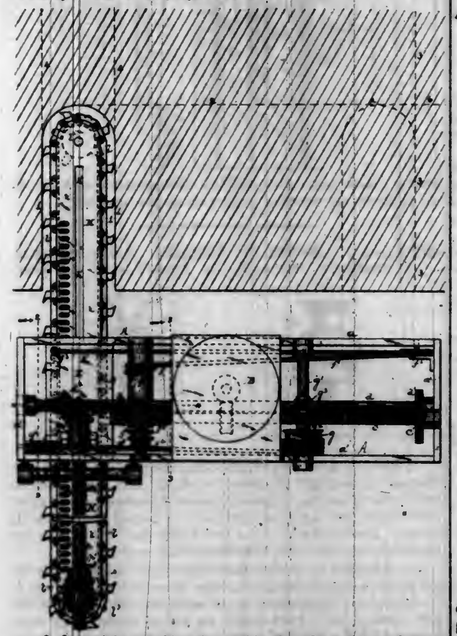
5. A structure for holding the active material of a storage-battery, composed of shellac and a finely-pulverized mineral non-conductor of electricity, substantially as herein set forth.

6. A structure for holding the active material of a storage-battery, composed of shellac and a finely-pulverized mineral non-conductor of electricity, in substantially the proportions herein set forth.

7. A structure for holding the active material of a storage-battery, composed of shellac and finely-pulverized glass, substantially as herein set forth.

8. A structure for holding the active material of a storage-battery, composed of shellac and finely pulverized glass, in substantially the proportions herein set forth.

9. A structure for holding the active material of a storage-battery, composed of a cohesive bitumen, resin, gum, or gum-resin and a floured mineral non-conductor of electricity, substantially as herein set forth.



10. A structure for holding the active material of a storage-battery, composed of a cohesive bitumen, resin, gum, or gum-resin and floured glass, substantially as herein set forth.

11. A structure for holding the active material of a storage-battery, composed of shellac and floured glass, substantially as herein set forth.

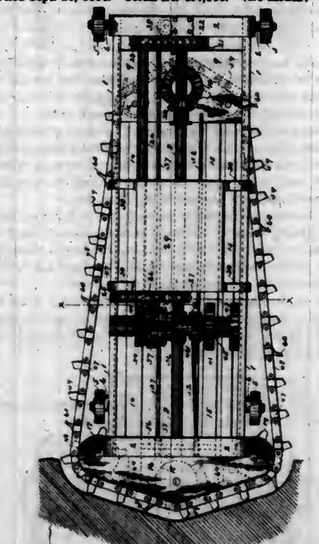
482,045. MINING-MACHINE. BENJAMIN A. LIGE, Allegheny, Pa. Filed Apr. 30, 1891. Serial No. 391,096. (No model.)

Claim.—1. In a mining-machine, the combination of a stationary frame, a carriage sliding therein, a cutter-frame pivoted to and carried by the carriage, a motor secured to the stationary frame and driving a grooved shaft extending longitudinally of said frame, beveled gearing driven by said grooved shaft, a grooved shaft extending longitudinally of the cutter-frame, and beveled gearing driven thereby to drive a cutter-chain on said frame, substantially as and for the purposes set forth.

2. In a mining-machine, the combination of a stationary frame having a motor mounted thereon and driving a grooved shaft extending longitudinally thereof, a carriage sliding in said frame, a cutter-frame having a sliding connection with said carriage, beveled gearing driven by said grooved shaft to drive a grooved shaft extending longitudinally of the cutter-frame, and beveled gearing driven by the latter grooved shaft to drive the cutting mechanism of the frame, substantially as and for the purposes set forth.

3. In a mining-machine, the combination of a stationary frame, a carriage sliding in said stationary frame, a cutter-frame having a sliding connection with such carriage, gearing driven from said carriage to drive a grooved shaft extending longitudinally of the cutter-frame, and beveled gearing driven by the latter grooved shaft to drive the cutting mechanism of the cutter-frame, said grooved shaft being formed in two sections, so that the outer or free end thereof may be removed, substantially as and for the purposes set forth.

4. In a mining-machine, the combination of a stationary frame having a motor secured thereto and having a carriage sliding therein, and a cutter-frame pivoted to said carriage and having a sliding movement with relation thereto, a longitudinal shaft mounted on a stationary frame and carrying a worm, drums mounted on said frame and driven by such worm, and gearing and rope connections for such drums to opposite ends, respectively, of the machine and thence to the carriage, substantially as and for the purposes set forth.



5. In a mining-machine, the combination of an electric motor mounted centrally of the stationary frame and having a vertical armature-shaft, a longitudinal shaft mounted in the stationary frame, worm-gearing connections between said armature-shaft and said longitudinal shaft, a grooved shaft extending longitudinally of the machine, gearing between such longitudinal shafts, a carriage sliding in the stationary frame, a cutter-frame pivoted to and carried by the carriage, and gearing connections from said grooved shaft to the cutting mechanism mounted on the cutting-frame, substantially as and for the purposes set forth.

6. In a mining-machine, the combination of a stationary frame, a carriage sliding therein, a cutter-frame pivoted to and having a longitudinal movement with relation to the carriage, a grooved shaft extending longitudinally of the stationary frame and having a pinion sliding thereon, a shaft driving the cutting mechanism and carrying a pinion engaging with said pinion and mounted in a swivel-bearing, and a yoke to hold said second pinion in engagement with said first pinion, substantially as and for the purposes set forth.

7. In a mining-machine, the combination of a stationary frame, a carriage, a cutter-frame pivoted to and swinging with relation to the carriage, the shaft *m*, mounted in the swivel-bearings m^2 m^2, a shaft *d*, carrying the pinion d^2, the pinion *m'* meshing therewith, and a clevis *r*, adapted to fit between the bearing m^2 and a pinion *m'* to hold said pinions in engagement, substantially as and for the purposes set forth.

8. In a mining-machine, the combination of a stationary frame, a carriage sliding therein, a cutter-frame extending under the carriage and having a longitudinal slot *k'* in the top plate thereof, and a king-bolt passing through said slot and forming a pivotal connection between the carriage and the cutter-frame, substantially as and for the purposes set forth.

482,046. MINING-MACHINE. BENJAMIN A. LIGE, Allegheny, Pa. Filed Sept. 29, 1891. Serial No. 407,110. (No model.)

Claim.—1. In a mining-machine, the combination of a winding-drum, a removable sleeve adapted to be secured to said drum for the purpose of varying the feed, devices for driving said drum, a rope wound on said drum and connected with a movable carriage, and said carriage movable on a stationary frame, substantially as set forth.

2. In a mining-machine, a cutter having a V-shaped groove on its cutting-edge, said edge being sloped back from the shank to the end of said cutter in a direction reversely inclined to the movement of the chain, substantially as set forth.

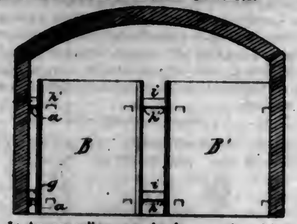
3. In a mining-machine, a cutter having a V-shaped groove on its end and its cutting-edge sloped back from the shank to the end of said cutter in a direction reversely inclined to the movement of the chain, substantially as set forth.

482,047. SHIPPING RECEIPT-BOOK. JOHN D. D. MORTIMER, Stockton, Cal. Filed Feb. 24, 1892. Serial No. 422,678. (No model.)

Claim.—As an improved article of manufacture, the shipping receipt-book herein described, consisting, essentially, of the covers A, suitably connected together, the shipping-order detachably connected to a stub, which in turn is permanently connected to the covers, the detachable shipping-receipt arranged after the shipping-order and next to the same, said shipping-receipt being detachably connected to a stub, which in turn is permanently connected to the covers, and the permanent or stationary shipping-receipt arranged after the detachable shipping-receipt and next to the same, the said permanent shipping-receipt, which is designed to remain in the book and form a permanent record, being permanently connected to the covers, substantially as specified.

482,048. ANNEALING-OVEN. DANIEL W. MURPHY, Marion, Ohio. Filed Apr. 5, 1892. Serial No. 427,998. (No model.)

482,050.



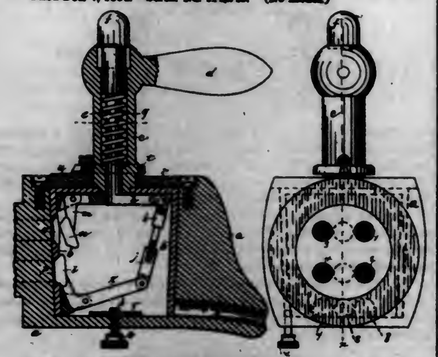
482,052.

Claim.—1. In apparatus for purifying and disposing of sewage, the combination, with a sewer-main and a tank or pit into which such main opens, of a support carrying a series of traveling perforated screening-buckets for receiving the contents from the main, a press for receiving the solid matter from the buckets and provided with a pipe leading back to the pit, a delivery-chute between the buckets and press, a pipe leading to the bottom of the pit and provided with an enlarged lower end, and a pump connected to the upper end of said pipe, substantially as shown, and for the purpose set forth.

2. In apparatus for purifying and disposing of sewage, the combination, with a sewer-main and a tank or pit into which said main opens,

manent record, being permanently connected to the covers, substantially as specified.

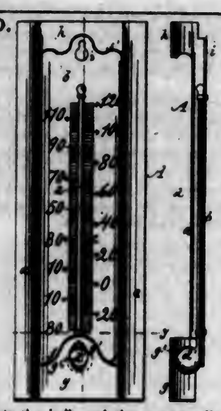
482,048. ANNEALING-OVEN. DANIEL W. MURPHY, Marion, Ohio. Filed Apr. 5, 1892. Serial No. 427,986. (No model.)



Claim.—1. An annealing-oven having a series of inwardly-projecting seats, in combination with annealing-pots, and devices resting on the seats on the oven-walls and bearing against the pots, and devices resting between the pots, substantially as set forth.

2. An annealing-oven having a series of inwardly-projecting seats, in combination with a series of sectional annealing-pots and devices resting on the seats in the oven-walls and bearing against sections of the pots, and removable devices interposed between the pots for supporting the sections thereof, substantially as set forth.

3. The combination, with an annealing-oven having a series of inwardly-projecting seats, of sectional annealing-pots formed of detachable sides and ends, said sides and ends having outwardly-projecting seats, and devices interposed between the pots and walls of the oven and between the pots, substantially as set forth.



4. An oven, in combination with two longitudinal series of sectional annealing-pots, and removable devices interposed between the adjacent ends of the pots of the two series for holding said ends in position, substantially as set forth.

482,049. FAUCET OR VALVE. FRANK POMPEO, Chicopee, Mass. Filed Dec. 7, 1891. Serial No. 414,946. (No model.)

Claim.—In a compound faucet and valve, the combination of a casing provided with a chamber and having four inlet-ports and one outlet-port, a rotatable shell fitted in the chamber and formed with a hollow vertical stem and provided with two inlet ports to register with two inlet ports of the casing and two outlet-ports to register in turn with the outlet-ports of the casing, a vertical movable spring-actuated rod in the hollow stem of the shell having a radially-arranged arm on the lower end within the rotatable shell, valves fulcrumed in the shell to open and close the inlet-ports thereof, and connections between the valves and the arm of the vertically-movable rod, substantially as shown and described.

482,050. THERMOMETER-CASE. JOHN D. WARD, Phelps, N. Y. Filed Jan. 21, 1892. Serial No. 418,769. (No model.)

Claim.—1. A thermometer-case made from a single piece of sheet metal provided with a guard *g*, struck out from the bottom, forming a shield and cover to the bulb, as herein shown and described.

2. A thermometer-case made from a single piece of sheet metal provided with a guard *g*, struck out from the bottom, said guard having an arch *g'*, with an opening *g²* therein which comes opposite the inclosed bulb, as and for the purpose specified.

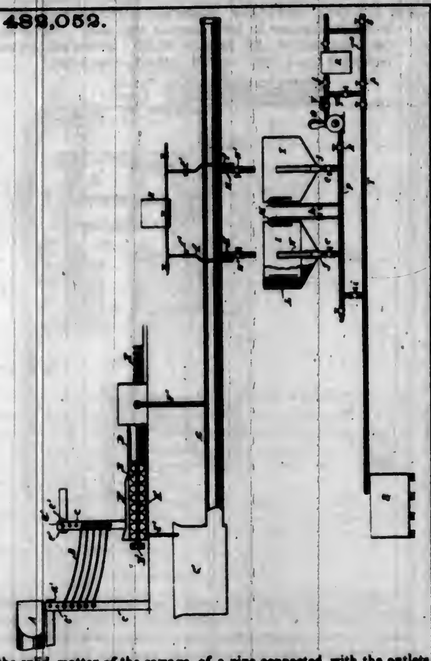
3. A thermometer-case made from a single piece of sheet metal provided with the body *b*, the side ribs *a a*, the guard *g* at the bottom, forming a shield to the bulb, and the corresponding guard *h* at the top, as shown and described, and for the purpose specified.

482,051. STOPPER FOR INKSTANDS. CHARLES L. WEBBER, Jr., Bradford, Pa. Filed Dec. 31, 1891. Serial No. 416,690. (No model.)

Claim.—1. A stopper for inkstands, consisting of a flexible cork adapted to fit ink-wells of different sizes, said cork being provided with a central opening of greater diameter than the dip-cup to admit of the lateral play of said tube and having a dome-shaped top having a central opening therein and a very flexible and yielding apex and comparatively thick lower walls, substantially as set forth.

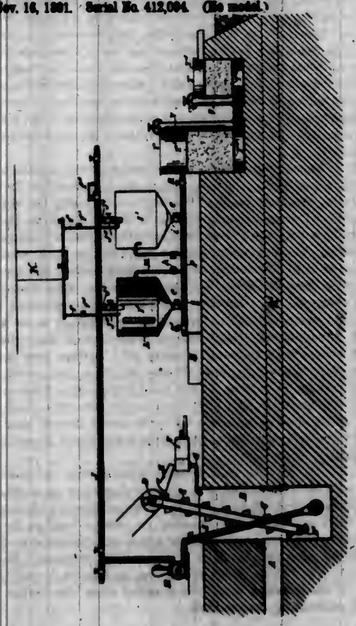
2. A stopper for inkstands, consisting of a flexible cork having thick walls, a central opening of greater diameter than the dip-cup or ink-conveying tube to permit of the lateral play of said tube within said opening, and a dome-shaped top having comparatively thick lower walls and a thin flexible and easily-yielding apex and a central opening to receive the dip-cup or ink-conveying tube, in combination with an ink-conveying tube and dip-cup, substantially as set forth.

3. In a stopper for inkstands, the combination, with a dip-cup and ink-conveying tube, of a cork having a lower portion of a thickness and solidity to adapt it to fill the mouth of the ink-well and having a tapering circumference to adapt it to fit ink-wells of different sizes and a central opening of greater diameter than the diameter of the ink-conveying tube, and a dome-shaped cap having a thin flexible and easily-yielding centrally-bored apex and comparatively thick lower walls, substantially as and for the purpose set forth.



482,052. APPARATUS FOR PURIFYING SEWAGE. JOHN WILSON, New York, N. Y., assignor to Roman Dohm, same place. Filed Nov. 16, 1891. Serial No. 412,093. (No model.)

Claim.—1. A sewage disposal plant comprising, in combination, the following devices: a series of inclined screens for receiving the sewage discharged from a main and upwardly curved at the ends remote from the discharge, a conveyer and press for receiving and compressing the solid matter, a conduit for carrying off the liquid separated and expressed from the solid matter, tanks into which said conduit discharges, outlets for said tanks at different levels therein for drawing off the liquid or the sludge, and a pump connected with the outlets and ducts or pipes therefrom to a discharging-filter and to a receptacle for the sludge, as set forth.

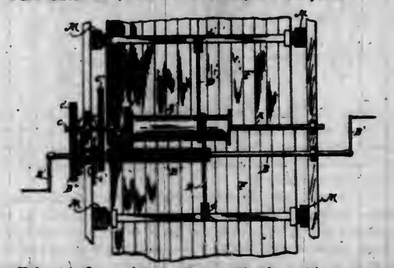


2. The combination, with a main tank or receptacle for containing the liquid separated and expressed from the solid matter of a sewerage system, of a series of tanks under independent discharge-pipes from the main tank, a reservoir for chemicals connected with the said discharge-pipes or the tanks thereunder, a conduit for liquid from each of the series of tanks, a pump and filter therein, and a discharge-pipe at a lower level for the sludge, as set forth.

3. The combination, in a sewage-disposal plant, with a series of settling or storage tanks for the liquid separated and expressed from the solid matter of the sewage, of a pipe connected with the outlets of said tank and a pump connected therein, a pipe or duct from said pump to and through a filter, another around said filter, another pipe T to a tank or receptacle for sludge, and a pipe or duct from the outlet of the tanks to the sludge-tank direct, and cocks or valves for controlling said pipes or ducts, as herein set forth.

482,052.

482,058. APPARATUS FOR PURIFYING SEWAGE. JOHN WILSON, New York, N. Y., assignor to Roman Dohm, same place. Filed Nov. 16, 1891. Serial No. 412,094. (No model.)



Claim.—1. In apparatus for purifying and disposing of sewage, the combination, with a sewer-main and a tank or pit into which such main opens, of a support carrying a series of traveling perforated screening-buckets for receiving the contents from the main, a press for receiving the solid matter from the buckets and provided with a pipe leading back to the pit, a delivery-chute between the buckets and press, a pipe leading to the bottom of the pit and provided with an enlarged lower end, and a pump connected to the upper end of said pipe, substantially as shown, and for the purpose set forth.

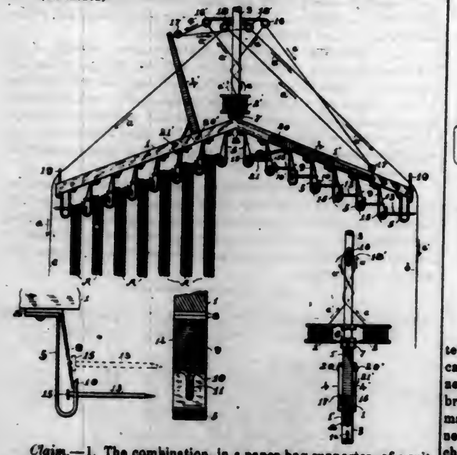
2. In apparatus for purifying and disposing of sewage, the combination, with a sewer-main and a tank or pit into which said main opens, of a support carrying a series of traveling perforated screening-buckets for receiving the contents from the main and elevating such contents to the top of the pit, a delivery-chute, a press receiving the material from said chute, a pipe leading to the bottom of the pit, two or more separate settling-tanks, and pipe connections between said settling-tanks and pumps and provided with suitable cocks and valves, substantially as and for the purpose described.

3. In apparatus for purifying and disposing of sewage of the character described, the combination, with the elevator, press, and pump, of the discharge-pipe leading from said pump, the settling-tanks, and the branch pipes connecting said discharge-pipe with said tanks, the reservoir, and the pipes leading from said reservoir and communicating with the branch pipes, each of the pipes named being provided with suitable cocks or valves, substantially as shown, and for the purpose set forth.

4. In apparatus for purifying and disposing of sewage, the combination, with the settling-tanks, of the pipe or conduit communicating therewith at the bottom and provided with suitable cocks or valves, the sludge-tank S, the siphon-pipes connecting said tanks with the conduit and controlled by cocks, and a suitable filter apparatus, substantially as described.

482,054. HAND-ELEVATOR. HENRY G. ZOECKNICK, Cleveland, Ohio. Filed Feb. 5, 1891. Serial No. 380,870. (No model.)

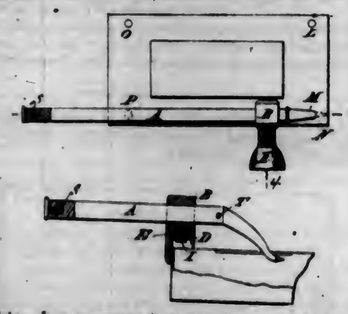
Claim.—1. In an elevator, the combination, with a car or cage and a revolubie drum capable of sliding endwise, of a hoisting-rope passed over the drum and extending in two directions from the latter and adapted to impart endwise motion to the drum in either direction to accommodate the position of the drum to itself, and elongated gear intermeshed with a gear on the drum for the purpose of accommodating the position of the drum, substantially as set forth.



2. In a hand-elevator of the variety indicated, the driving-shaft thereof having ratchet-wheels and engaging pawls arranged in reverse order, cords connected with the respective pawls and operatively connected with a gravity-lever in common, whereby the casting of each lever tilts and holds inoperative the one pawl or the other, according to the direction that the gravity-lever is tilted, substantially as set forth.

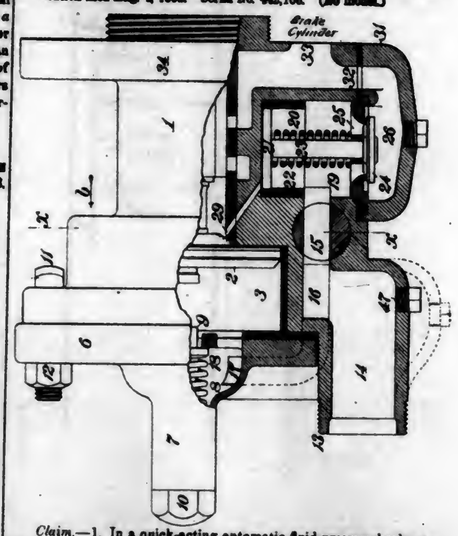
482,055. SEALED CAN. GEORGE W. GARRISON, East Orange, N. J., assignor to Reed & Carnrick, New York, N. Y. Filed Feb. 6, 1890. Serial No. 339,330. (No model.)

Claim.—The can-body having an inwardly-turned annular shoulder *a* and an upwardly-projecting rim *f*, forming an annular recess in its outer surface for receiving the downwardly-turned flanges or lips of the inner and outer covers, in combination with an inner soft-metal head or cover having an upturned flange extending from shoulder *a* and having its edge or lip *d* turned over and soldered to the outer edge of rim *f*, away from the contained food, as described, and an outer slip-cover having its flange in said recess flush with the body of the can, whereby a space or chamber is formed between the covers below the top edge of the can and burning of the food is avoided during the soldering operation, as described.



482,056. PAPER-BAG HOLDER. HENRY F. ELTON and JONATHAN W. CADWELL, New York, N. Y. Filed Oct. 16, 1891. Serial No. 408,872. (No model.)

Claim.—1. The combination, in a paper-bag supporter, of a suitable frame, a holder depending therefrom, a slot therein to receive the bag-supporting wire or nail, and a spring whose free end closes the upper end of said slot to prevent the accidental displacement of the wire or nail, as described.



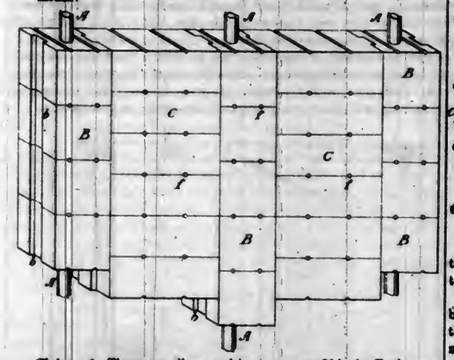
2. In a paper-bag supporter of the character described, the combination, with a suitable supporting-frame, of the holder 5, whose curved end 10 is provided with the slot 11 to admit the body portion of a nail below its head, spring 9 to close the upper open end of said slot so as to retain the nail therein, as shown, and slot 14, formed through both said spring and holder, said latter slot placed above the curved slotted end of said holder and the free end of said retaining-spring, so as to receive the point of a nail whose head portion rests in the holder adjacent thereto, in the manner and for the purpose set forth.

482,057. CAN-OPENER. JOHN H. GOLDEN, Bay Shore, N. Y. Filed May 8, 1891. Renewed Aug. 6, 1892. Serial No. 442,200. (No model.)

Claim.—In a can-opener, the combination, substantially as before set forth, of the self-adjusting block B, the knife D, and the guide E, the lever A, and the handle F, constructed to form a complete device to open all forms of cans.

482,058. AIR-BRAKE. THOMAS J. HOGAN, Pittsburg, Pa., assignor to the Westinghouse Air Brake Company, same place. Original application filed June 20, 1891, Serial No. 396,937. Divided and this application filed Aug. 4, 1892. Serial No. 442,108. (No model.)

Claim.—1. In a quick-acting automatic fluid-pressure brake system, the combination, with the main body or shell of the triple-valve casing, of a nozzle or connection formed integral therewith for connection with the train-pipe, whereby the train-pipe, triple valve, and brake-cylinder or auxiliary reservoir, to whichever the triple valve may be directly connected, may form a permanent rigid structure beneath the car, a separate removable head for the triple-valve piston-chamber, and a separate removable head for the quick-acting devices, whereby the triple valve or the quick-acting devices, or both, may be removed or examined without breaking the continuity between the triple-valve casing and the train-pipe, substantially as set forth.



2. In an automatic fluid-pressure brake system, a quick-acting triple-valve casing consisting of a main body or shell containing the triple valve and its piston, a nozzle or connection formed on the main body or shell for connection with the train-pipe, a passage from this nozzle or connection to the triple-valve piston-chamber, another passage from the nozzle to the quick-acting valve, a separately-removable cover for the triple-valve piston-chamber, and a separately-removable cover for the quick-acting valve devices, whereby the triple valve and quick-acting devices are accessible for examination or repair without disturbing the rigid permanent structure formed by the train-pipe, triple valve, and brake-cylinder or auxiliary reservoir, substantially as set forth.

3. In an automatic fluid-pressure brake system, the combination, with the triple valve, of a train-pipe nozzle or connection formed integral with the main body of the triple-valve casing for permanent connection to the train-pipe, passages in the main body or casing and leading from said nozzle or connection to the triple-valve piston-chamber and to the quick-action valve, a valve in the latter passage for connecting or disconnecting the quick-action devices, and separately-removable heads or covers for the triple-valve piston-chamber and quick-acting devices, whereby these parts may be removed without breaking connection with the train-pipe, substantially as set forth.

4. In an automatic fluid-pressure brake system, the combination, with a quick-acting triple-valve casing, of a passage from the train-pipe to the brake-cylinder controlled by the quick-acting valve, a valve in said passage for cutting out the quick-acting valve from communication with the train pipe, and a separately-removable cover for the quick-acting devices, whereby the quick-acting devices may be examined or repaired without opening the train-pipe to the atmosphere, substantially as set forth.

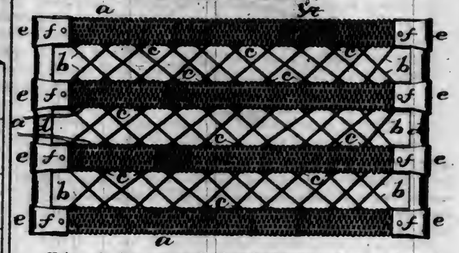
5. In an automatic fluid-pressure brake system, the combination, with a triple-valve casing, of a quick-acting valve controlling communication from the train-pipe to the brake-cylinder, and an automatic drain-valve located in the chamber or passage between the quick-acting valve and the brake-cylinder and so constructed as to close automatically when said chamber is subjected to pressure by the opening of the quick-acting valve and to open automatically and drain the water of condensation from said chamber when the brakes are released, substantially as set forth.

482,059. CONSTRUCTION OF SEA-WALLS. ALSTON C. KINWAY, Tacoma, Wash. Filed June 16, 1891. Serial No. 396,483. (No model.)

Claim.—1. The sea-wall comprising courses of blocks B, the metallic piles A, arranged in said courses, and the courses of blocks C, of different heights from the blocks B, said blocks being all locked together by tongue-and-groove joints, whereby great lateral strength is obtained without the use of mortar and the blocks made to break joints, substantially as specified.

2. A sea-wall comprising metallic piles and concrete blocks locked together by tongue-and-groove joints, said blocks having edge grooves which serve the twofold function of passages for tide-water and receiving a sling in lowering them, substantially as specified.

482,060. TORPEDO-CASE. WILLIAM S. LOWE and GERDON W. VAN KENNELAER, Lima, Ohio. Filed Aug. 27, 1891. Serial No. 403,900. (No model.)



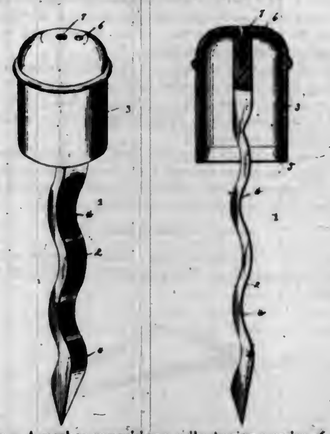
Claim.—1. A torpedo-shell the side walls whereof are composed of flexible material and the ends of rigid material and the connecting devices extending from one end to the other and located within the shell.

2. A torpedo-shell comprising side walls, the bottom located at one end and a perforated cap located at the opposite end, substantially as set forth.

3. In a torpedo-case, the combination, with a cylindrical shell, of a bottom having a conical lower end and a concaved upper end, substantially as set forth.

4. The combination, with a body portion, of a top provided with a conical inner end having perforations therein and a bottom having a conical outer end and a concaved inner end, substantially as set forth.

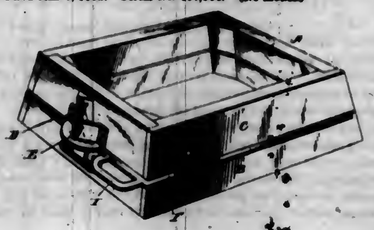
482,061. WIRE MAT. THOMAS MIDGLEY, Beaver Falls, Pa. Filed Mar. 21, 1892. Serial No. 426,234. (No model.)



Claim.—1. A wire mat having flexible bars forming the ends thereof abutting the metallic body and secured thereto by clips extending around the bars.

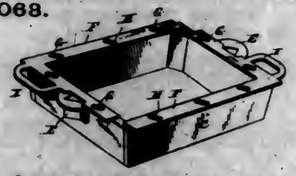
2. A wire mat composed of bars and separating sections, in combination with flexible bars abutting the metallic body and secured thereto by clips extending around the flexible bar and secured to the mat.

3. A wire mat composed of bars of coiled-wire helices and separating sections, in combination with flexible bars abutting the ends of the former bars and secured thereto by metallic clips extending around the flexible bars and surrounding the ends of said wire bars.



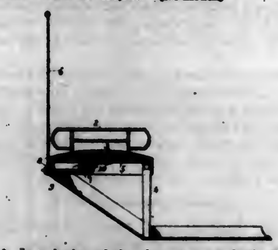
4. A wire mat having flexible bars at the end, in combination with metallic clips provided with lateral extensions to engage a bar of the mat and a tongue to surround the flexible bar.

482,062. LAND-MARKER. HENRY C. MCBROOM, Nashville, Tenn. Filed Sept. 11, 1891. Serial No. 405,413. (No model.)



Claim.—A marker comprising a spike having a series of sinuous bends and provided in its head with a threaded socket, a cylindrical cap fitting over the head of the spike and having a central opening in its top and with a perforation near the opening and having its lower edge sharpened and adapted to be driven into the ground, and a screw passing through the central opening of the cap and engaging the threaded socket of the spike, substantially as described.

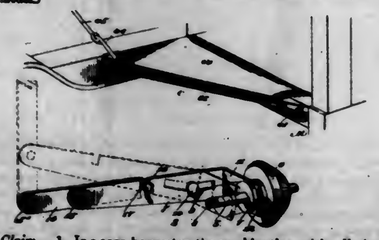
482,063. MOLDING-FLASK. JAMES G. NEWBURY, Gowanda, N. Y. Filed Jan. 7, 1892. Serial No. 417,301. (No model.)



482,068.

Claim.—In a molding-flask, the combination, with the cope, of retaining set-screws secured in the bottom edges of said cope, and opposite right-angled sand-supporting plates provided with diagonal slots working over said set-screws, and with handles to slide said plates toward the center of the cope to form an inner sand ledge or shelf or withdraw the same, substantially as set forth.

482,064. VEHICLE-SEAT. THOMAS B. PADGITT, Dallas, Tex. Filed May 26, 1892. Serial No. 434,356. (No model.)

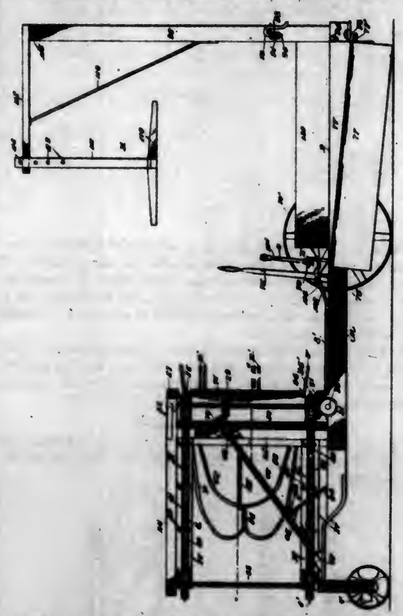


Claim.—1. In a device of the character set forth, the combination of hinged end arms or irons and legs, hooks on the bottom side of the seat, the seat-body, the foot rod or rail, and safety-hooks, all constructed and arranged as set forth.

2. In a device of the character set forth, the combination of the seat-body or stool, hooks connected to the under side of the same, a foot rail or rod, and safety-hooks engaging said foot rail or rod and arranged in such manner as to prevent slipping of the seat or stool body, substantially as described.

3. In a device of the character set forth, the removable seat-body or stool having the hinged end arms 2, the hinged legs 4, and the hooks or bolts 10, arranged on the under side and adapted to hold the seat or stool in position, substantially as described.

482,065. CORN-HARVESTER. HENRY C. PROPLES and ALONZO R. PROPLES, Eskridge, Kans. Filed Aug. 14, 1891. Serial No. 402,634. (No model.)



Claim.—1. In a corn-harvester, the combination, with a discharge-table consisting of a series of slats axially pivoted in a pivoted transverse sill at the forward end of the table and pivoted spring-actuated retaining-arms at the rear end thereof, of means for maintaining the slats in a horizontal position within their supports, substantially as specified.

2. In a corn-harvester, the combination, with the main frame and the cutting apparatus, of a table comprising slats, each pivoted in an oscillating bar extending across the frame, means for rocking said bar, spring-actuated retaining-arms at the delivery-edge of the table, adapted to support it when raised, and means for turning the slats on their pivots to discharge the stalks, all substantially as described.

3. In a corn-harvester, the combination, with the main frame and the cutting apparatus thereon, of a dumping-table comprising a series of axially-pivoted slats mounted at their front ends in a transverse bar journaled in the frame, arms extending from the front corners of the slats, a metal strap pivotally connected to the upper ends of the arms, a latch on said bar for locking the slats in their flat positions, and retaining-arms at the rear end of the table for supporting the slats, substantially as specified.

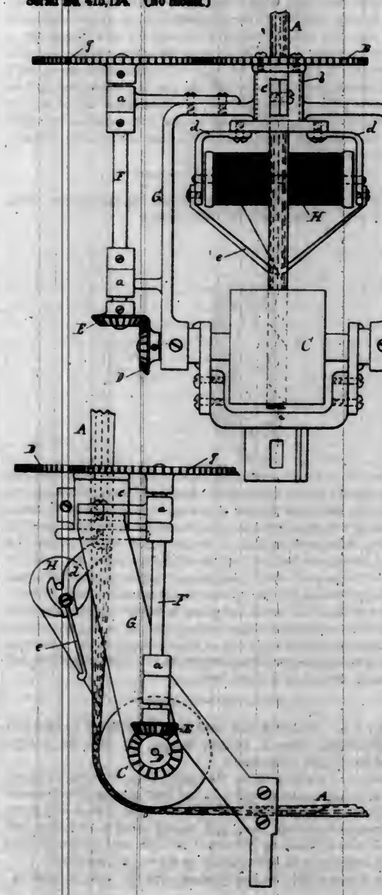
4. In a corn-harvester, the combination, with the main frame, a transverse bar journaled in said frame, a handle rising from said bar, a number of slats, each having one thin edge, and pins projecting from the ends of the slats near their thin edges, those at the front ends being pivoted in said bar, of retaining-arms pivoted to the frame and having lower horizontal members adapted to support the pins at the rear ends of the slats when the arms are swung inwardly and the means for turning said slats on their pivots, substantially as described.

5. In a corn-harvester, the combination, with the frame having a transverse bar, a number of slats, each having one thin edge, pins projecting from the ends of the slats near their thin edges, those at the front being journaled in said bar, and arms adapted to support the rear pins, of straps secured across the slats and each having a forwardly-bent end, two horizontal straps, each pivotally mounted on the forwardly-bent ends at its side of the frame, a toggle-lever connecting the inner ends of said horizontal straps, and a latch for said lever, substantially as described.

6. In a corn-harvester, the combination, with the main frame, two banks of slats therein, each slat being pivotally supported near one edge, a horizontal strap connected to each bank, and a toggle-lever connecting said straps, of a button on the frame adapted to engage the knuckle of said lever, an upright adjacent said knuckle, and a tripping-lever pivoted to said standard and passing beneath the knuckle, as and for the purpose set forth.

7. In a corn-harvester, the combination, with the main frame and a dumping-table therein having pins projecting from its delivery-edge, of uprights on the frame, eyes therein, retaining-arms whose upper ends are pivoted in said eyes and thence extend forwardly and whose bodies are adapted to engage said pins, and springs throwing said arms normally forward, so that their forwardly-bent ends will strike said uprights, as and for the purpose set forth.

8. In a corn-harvester, the combination, with a main frame and a dumping-table therein having pins projecting from its delivery-edge, of uprights on the frame, eyes therein, retaining-arms, each comprising a horizontal lower member pivoted at its outer end to the frame, its inner end extending slightly to the rear, an upwardly-inclined upper member leading therefrom into an inverted U at its upper end and thence forwardly, the lower member being adapted to engage said pins, an eye in the upright in which said U is pivoted, and means for throwing the arm normally forward, as and for the purpose set forth.

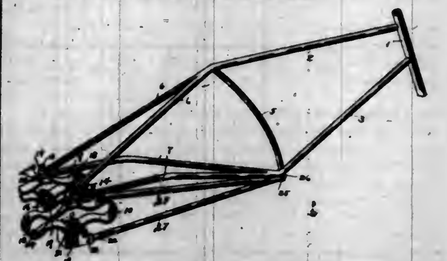


9. In a corn-harvester, the combination, with the framework having a stub-shaft provided with a box and the main wheel mounted on said shaft and having a toothed ring, of a shaft one end of which is journaled in said box and the body of which adjacent this end is squared, a gear having a square hub sliding on said shaft and adapted to engage said ring, a grooved collar connected to said gear, a lever pivoted to said frame and having a finger, and a plate pivoted to the lever, having a slot in its body sliding over a stud on the frame having an outturned end provided with a notch engaging the groove in the collar and having a notch in which said finger is adapted to rest, as and for the purpose set forth.

10. In a corn-harvester, the combination, with the frame, an upright thereon, and the cutting apparatus, of a guiding-finger comprising two stout spring-wires crossed and twisted together at their centers, turned on edge, and bent into U shape in plan, one end of the U being secured in said upright and the other end projecting to the rear above said cutting apparatus substantially as described.

11. In a corn-harvester, the combination, with the frame mounted on wheels and a sill on said frame having a forward extension, of a knife pivoted near one edge of the extension with its other end moving in a slot, an upright shaft driven by connections with one of said wheels, grasping-fingers operated by the rotation of said shaft, an inclined crank-shaft terminating at its upper end in a gear meshing with a gear on the upright shaft, and a pitman-rod connected at one end with the crank and at the other end with the movable end of the knife, as and for the purpose set forth.

12. In a corn-harvester, the combination, with stub-axles having boxes on their front sides, main wheels on said axles, and toothed rings on said wheels, of shafts journaled in said boxes and leading forwardly, the cutting apparatus connected oppositely with and operated by said shafts, gears and collars on the shafts, and shifting mechanism, substantially as described, for moving each gear by its collar into or out of mesh with the toothed ring on the main wheel, as and for the purpose hereinbefore set forth.



482,066. MECHANISM FOR WRAPPING WARP-CHAINS. CHAS. E. SOUTHMAYD and HENRY GILBARD, Lewiston, Me. Filed Dec. 15, 1891. Serial No. 415,134. (No model.)

Claim.—1. A roll arranged to be rotated by the frictional contact of a chain of warping, in combination with a wheel having a tubular hub through which the said chain passes, a spool arranged transversely with relation to the said chain and carried by the said hub in its rotation to wind a thread around the said chain and intermediate gearing, whereby the said roll transmits rotation to the said wheel and spool, whereby the said chain in its forward motion causes the thread to be wound around it, substantially as set forth.

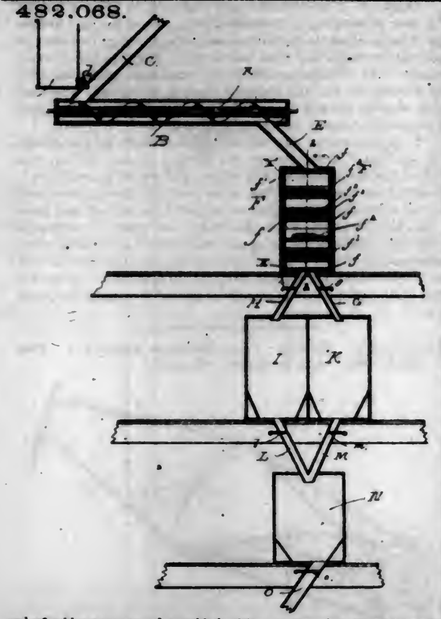
2. In combination with the roll C and its shaft, the gear-wheels D E, the shaft F, driven thereby, the wheel *g*, turning with the said shaft, the wheel B, meshing with wheel *g* and having a tubular hub *b*, the detachable arms *d*, attached to the said hub, the transverse spool H, journaled in the said arms and rotating with the said hub, and frame G, to which all the said parts are attached, the relative arrangement of the hub, spool, and roll being such that a chain of warping which passes straight through the said hub will be in contact with and impart motion to the said roll and be wound by the thread from the said spool as the latter is carried around by the hub *b*, substantially as set forth.

482,067. BICYCLE. FRANK SWEETLAND, Angola, N. Y. Filed Feb. 10, 1892. Serial No. 420,994. (No model.)

Claim.—1. In a machine of the class described, the combination, with the framework bifurcated at its rear end to form a fork, each of the bifurcations terminating in eyes, a pair of blocks having tenons fitting the eyes, and nuts threaded on the tenons, said blocks being provided at their lower ends with base-plates having a depending tenon and pairs of perforations, of a pair of axle-blocks having transverse axle-receiving openings and their upper sides provided with base-plates having upwardly-disposed studs and pairs of perforations, the bowed springs interposed between the upper and lower blocks, U-shaped clips passing at the opposite sides of the springs and through the base-plates, nuts mounted on the clips, and a brace-bar pivotally connected to the lower block and at its front end to the framework, substantially as specified.

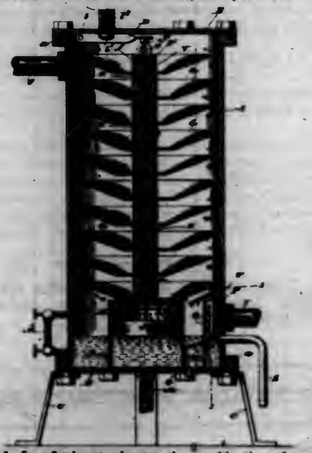
2. In a machine of the class described, the combination, with the rear end of the framework and the axle-supporting blocks, of the intermediate springs 9, having the gradually-curved ends 10 and upper and lower central oppositely-bowed portions 11, substantially as specified.

3. The combination, with the upper and lower reaches 2 and 3, the upper and lower sockets 4, the latter being provided with the pairs of perforated ears 25, the upper and lower converging forks 6 and 7, terminating in eyes, and the blocks 8, secured to the eyes, of the pairs of bow-springs 9, the lower axle-blocks 18, having the ears 22, and the brace-bars 27, pivoted between the ears 22 and 25, substantially as specified.



482,068. PROCESS OF AND APPARATUS FOR TREATING WHEAT. CHARLES O. WEBB, Longmont, Colo. Filed July 30, 1891. Serial No. 401,204. (No model.)

Claim.—1. A process for preparing wheat before grinding, which consists in first dampening the wheat-berry in an aqueous solution of soda, passing the soda-dampened or wet berry tortuously through a steam-heated chamber to subject the same to the action of steam-heat and cause a penetration of the soda into the berry, and finally successively passing it into and allowing it to remain within a series of bins, substantially as set forth.



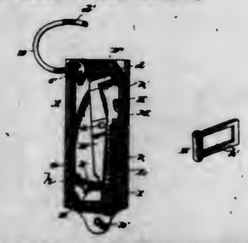
2. In an apparatus for preparing wheat, the combination, with a screw conveyer and a solution-containing tank located at one end thereof, of a steam heater or penetrator connected with the opposite

482,068.

end of said conveyer and provided with a rectangular steam-circulating frame of connected piping, a series of parallel horizontal circulating-pipes communicating with the sides of said rectangular frame of piping, and a series of alternately and diagonally arranged deflecting-plates located over said parallel pipes within the sides of the rectangular pipe-frame, and a series of communicating pins provided with valved openings and connected in series with said heater or penetrator, substantially as set forth.

482,069. FEED-WATER HEATER. JOHN J. WILSON, Wahoo, Nebr. Filed Jan. 21, 1892. Serial No. 418,958. (No model.)

Claim.—1. In a feed-water heater, the combination of a cylinder having a top water-inlet and a lower steam-inlet, a vertical supporting-tube centrally supported within said cylinder, a series of regularly-spaced concaved water-pans having eccentrically-disposed bottom perforations receiving said vertical supporting-tube and alternately disposed with relation to each other, so that the said concaved pans have their edges alternately contacting with the inner sides of the cylinder to form a tortuous steam-passage, a float-actuated valve-stem moving through said supporting-tube, and a valve arranged over the upper end of said stem, substantially as set forth.



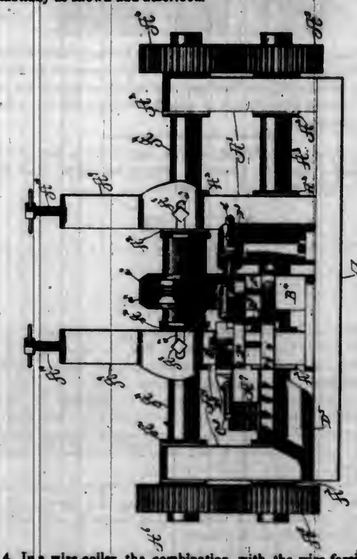
2. In a feed-water heater, the combination of the cylinder having an upper water-supply opening and lower steam-inlet, of a supplemental perforated cylinder resting upon the bottom of said main cylinder, a vertical supporting-tube supported upon said perforated cylinder, a series of spaced water-pans mounted upon said vertical tube and arranged out of line with each other, and a float-actuated valve working over said water-supply opening, substantially as set forth.

3. In a feed-water heater, the combination of a cylinder having an upper water-inlet and a lower steam-inlet, a supplemental perforated cylinder resting upon the bottom of said main cylinder, a vertical supporting-tube extending above said perforated cylinder, a series of spaced water-pans mounted over said supporting-tube, a float inclosed by and working within said perforated cylinder, a float stem connected with said float and working through said tube, and a valve controlled by said float-stem working over the water-inlet, substantially as set forth.

4. In a feed-water heater, the combination of a cylinder having an upper water-inlet and a lower steam-inlet, a supplemental perforated cylinder resting upon the bottom of the main cylinder, a vertical supporting-tube supported upon said perforated cylinder, a series of concaved water-pans mounted over said tube and arranged out of line with each other, intermediate spacing collars or blocks mounted over said tube, a float-controlled stem working through said tube, a valve-lever hinged to the top of the cylinder and carrying a valve working over the water-inlet and controlled by said float-controlled stem, and an oil collecting and discharging chamber located directly opposite said steam-inlet and opening into the cylinder, substantially as set forth.

5. In a feed-water heater, the combination of a cylinder having an upper valve-controlled water-inlet and a steam-inlet in one side near the bottom thereof, an oil-collecting chamber located directly opposite said steam-inlet and extending slightly above the same, said oil-chamber having a series of downwardly-inclined curved deflectors arranged upon one wall thereof directly opposite said steam-inlet, a series of perforations directly below said deflectors and opening into the cylinder for the escape of the water of condensation, an oil-drain below the steam-inlet and above the top line of perforations, and an inclined steam-deflector arranged over the open upper end of said oil-chamber and projecting downwardly beyond the same into the cylinder to direct the steam throughout the bottom of the latter, substantially as set forth.

482,070. PADLOCK. VORIES F. BROWN, San Antonio, Tex. Filed Apr. 5, 1892. Serial No. 427,861. (No model.)



Claim.—In a lock, the casing having an opening in one end thereof, a shackle pivoted at one end to said casing and having a locking-perforation in the other end thereof, a locking-lever pivoted at its center in said casing and provided with a locking-pin at one end, adapted to engage the shackle-perforation, a leaf-spring arranged within the casing and having one end bearing against the pin end of said locking-lever to hold the same within said shackle-perforation, a key-guide plate arranged within the casing over the other end of said locking-lever and provided with a slot extending from end to end of the same and adapted to receive the blade or wing of a key, so that such blade or wing can engage said inner end of the locking-lever to move said lever, and a spring-actuated shackle-ejecting bolt arranged at one side of the casing, substantially as set forth.

482,071. MACHINE FOR MAKING COILED-WIRE FABRIC FOR BED-BOTTOMS. FRED L. BRYANT, Chicago, Ill. Filed Oct. 1, 1891. Serial No. 407,420. (No model.)

Claim.—1. In a wire-coiler, the combination, with the wire-forcing rolls, and shafts bearing said rolls, and bearing-posts receiving said shafts, of studs extending laterally from the upper ends of said posts, arches located above said posts and having notches receiving said studs, and screws extending downward through said arches to bear upon said shafts or rolls, substantially as shown and described.

2. In a wire-coiler, the combination, with the base A, posts A', shaft A^3, bearing a roll a^2, shafts A^4, each bearing a roll a^4, and bearing-blocks A^5, surrounding said shafts and resting in said posts, and gears A^6 and A^7, applied to said shafts, of studs extending laterally from the upper ends of said posts, and arches located above said posts and having notches receiving said studs, and screws extending downward through said arches to bear upon said shafts or rolls, substantially as described.

3. In a wire-coiler, the combination, with wire-forcing rolls and a coiling-spindle, of a guide B^9, extending from said rolls to said spindle and consisting of two superposed plates B^9, having a wire-passage between them and having arranged at the front of them a pair of rolls B^{10}, separately adjustable with reference to the paths of the wires, substantially as shown and described.

4. In a wire-coiler, the combination, with the wire-forcing rolls and the coil-forming spindle, of a post rising between said rolls and said spindle, a guide supported upon said post and consisting of two superposed guide-plates having a wire-passage between them, and two arms B^9, hinged to said guide in planes perpendicular to the plane common to both wires and each supporting a roller B^{10}, adjacent to a similar roller on the other of said arms, and means for forcing either of said rollers into the path of the adjacent wire independently of the other of said rollers, substantially as shown and described.

5. In a wire-coiler, the combination, with wire-forcing roll and a coil-forming spindle, of a channeled guide-support located between said rolls and said spindle, a guide located upon said support in the channel thereof and consisting of two superposed guide-plates having a wire-passage between them, one of said plates being cut away at its sides at the front sufficiently to receive at each side an arm B^9, and an arm B^9, located at each side of the plate and hinged thereto at the rear end, and rollers B^{10}, located between and each independently journaled to the adjacent arm B^9, the rear ends of said arm B^9 extending into and confined by the walls at the side of the channel in said guide-support, substantially as shown and described.

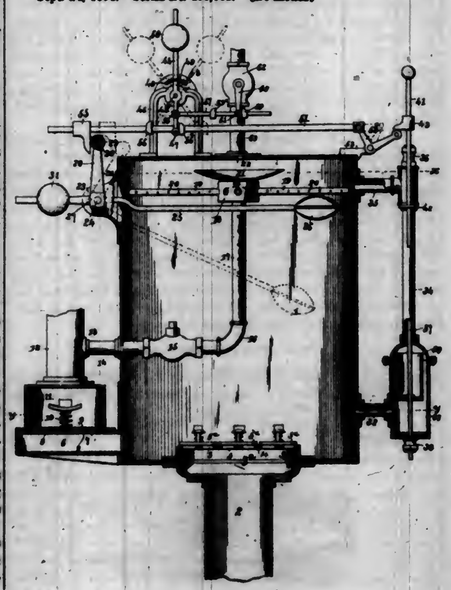
6. In a wire-coiler, the combination, with wire-forcing rolls and a coil-forming spindle, of a channeled guide-support located between said rolls and said spindle, a guide located upon said support in the channel thereof and consisting of two superposed guide-plates having a wire-passage between them, one of said plates being cut away at its sides at the front sufficiently to receive at each side an arm B^9, and an arm B^9, located at each side of said plate and removably hinged thereto by a pin b^9, extending through said arms and said guide-plate, and rollers B^{10}, located between and each independently journaled to the adjacent arm B^9, the rear ends of said arms B^9 extending into and confined by the walls at the side of the channel in said guide-support, substantially as shown and described.

7. In a wire-coiler, the combination, with the wire-forcing rolls and a guide for conducting the wire from said rolls, of a coil-forming spindle secured by an adjustable eccentric mounting, substantially as shown and described.

8. In a wire-coiler, the combination, with the wire-forcing rolls and a guide for conducting the wires from said rolls, of a post D, an adjustable eccentric block D^3, supported by said post D, and a coil-forming spindle located adjacent to said wire-guide and supported by said eccentric block eccentrically to the wrist of said eccentric block, substantially as shown and described.

9. In a wire-coiler, the combination, with wire-forcing rolls and a guide for leading the wire from said rolls, of a spirally-grooved spindle C, a shell C', surrounding said spindle, a prolongation c, a tapering loose shell C^3, surrounding said prolongation, and a guide-spindle C^5, secured endwise to said prolongation c, substantially as shown and described.

10. In a wire-coiler, the combination, with a spiral die, and means for forcing the wire through said spiral die, and a substantially cylindric coil-guide, of a plate D^2, a suitable support for said plate, a finger-block adjustably secured to said plate, and a finger extending from said finger-block into substantial contact with said coil-guide, substantially as shown and described.



11. In a wire-coiler, the combination, with a spiral die, mechanism for forcing the wire through said spiral die, and a substantially cylindric coil-guide leading from said spiral passage, of a block D^2, a suitable support for said block, bolts D^7 and d^7 for adjustably securing said plate to said support, and a coil-engaging device adjustably secured to said plate and extending into the path of the coil, substantially as shown and described.

12. The combination, with a wire-coiler, of an obliquely-curved guide in front of said coiler and against which the wire bears as it leaves the coiler and means for adjusting said guide longitudinally and also in a direction at right angles to the axis of the coiler, substantially as shown and described.

13. In a wire-coiler, the combination, with devices forming a spiral passage and mechanism for forcing wire through said spiral passage, of coil-modifying mechanism embodying an engaging device arranged to extend from the outside of into the cylindric space occupied by the coil and being adjustable in a direction substantially parallel to the coiling-axis and also at right angles to said coiling-axis, whereby said engaging device may force the coil to traverse the path longitudinally out of the normal sufficiently to bend and permanently modify the pitch, substantially as shown and described.

14. In a wire-coiler, the combination, with devices forming a spiral passage, and mechanism for forcing wire through said spiral passage, and a spindle axially in line with said spiral passage and adapted to have the coil travel around it as said coil issues from said spiral passage, of coil-modifying mechanism embodying an engaging device arranged to extend obliquely over and partially embrace said spindle in a direction parallel to the adjacent portions of the coil and being adjustable in a space parallel to the surface of said spindle, substantially as shown and described.

482,072. STEAM VACUUM-PUMP. DAVID P. BURDON, Jacksonville, Fla., assignor of one-half to Paul Battelkan, same place. Filed Sept. 24, 1891. Serial No. 406,663. (No model.)

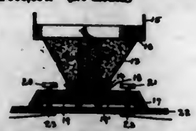
Claim.—1. In a steam vacuum-pump, the combination, with the steam vacuum-cylinder, the valve-controlling devices, and discharge-pipe, of a vertical spray-pipe connected with the discharge-pipe and extending vertically in said cylinder to near the top thereof, said vertical spray-pipe being provided with a series of longitudinally-arranged perforations and terminating at its extreme upper end in an enlarged collecting chamber or reservoir of larger diameter than the same, a series of radially-extending perforated spray-tubes connected to said enlarged chamber or reservoir and projecting near to the sides of the cylinder to thoroughly spread and diffuse the spray below the inlet, and a concaved diffusing-plate supported upon the top of said collecting chamber or reservoir directly beneath the cylinder steam-inlet to diffuse and spread the steam above and over the network of spray-tubes, substantially as set forth.

2. In a steam vacuum-pump, the combination, with a cylinder having a discharge-pipe extending above the top of the same, of a spray-condensing pipe connected to said discharge-pipe and projecting within said cylinder, a shaft journaled in the upper end of said cylinder, floats connected to said shaft, weighted bell-crank levers carried upon the outer ends of said shaft, an opposite reciprocating cup-stem, a horizontal valve-operating lever controlled in both directions alternately by said float-actuated bell-crank levers, and means for connecting said horizontal lever with the steam-valve, substantially as set forth.

3. In a steam vacuum-pump, the combination, with a cylinder having valved receiving and discharge openings and a spray-condensing tube, of a shaft journaled in the upper end of said cylinder, parallel float-carrying arms mounted upon said shaft within the cylinder, double bell-crank levers carried upon the outer ends of said shaft without the cylinder, an opposite reciprocating cup-stem, a horizontal operating lever or rod controlled in both directions alternately by said float-actuated bell-crank levers and said cup-stem, a weighted tilting lever controlled by said horizontal rod, and a valve arm or lever controlled by said tilting lever and connected with the steam-valve, substantially as set forth.

4. In a steam vacuum-pump, the combination, with a cylinder having valved receiving and discharge openings and a spray-condensing tube, of a shaft journaled in the upper end of said cylinder, floats connected to said shaft, weighted bell-crank levers carried by said shaft without the cylinder, a horizontal lever or arm controlled in one direction by said bell-crank levers, a bell-crank lever connected to one end of said horizontal rod, a vertically-reciprocating cup-stem engaging the bell-crank lever connected to said rod and operating the same in an opposite direction, a weighted tilting lever controlled by said horizontal rod, and a valve arm or lever connected with said tilting lever and the steam-valve, substantially as set forth.

5. In a steam vacuum-pump, the combination, with the cylinder, of the float-operated weighted bell-crank levers, a cup-cylinder connected with the main cylinder at its lower end, a tube projecting upwardly from said cup-cylinder and connected with the main cylinder at its upper end, a reciprocating stem mounted in said tube and cylinder and carrying a gravitation or float cup located within the cylinder, depending parallel arms connected to said reciprocating stem and carrying tappets, a horizontal rod or lever having a tappet at one end engaged by said weighted bell-crank levers, a bell-crank lever connected to the other end of said rod and adapted to be engaged by the tappets upon said depending arms, and means for connecting said horizontal lever with the steam-valve, substantially as set forth.



6. In a steam vacuum-pump, the combination, with the cylinder, of the float-operated bell-crank levers, the opposite reciprocating cup-stem carrying tappets, the horizontal lever or rod having a depending tappet engaged by said bell-crank levers and connected at its other end with a bell-crank lever operated by said stem and further provided with the intermediate spaced tappets, a U-shaped casting supported upon said cylinder and provided with a segmental slot, a tilting weighted lever pivoted to said casting and having a contact end engaged by said spaced tappets, and a stud or roller working in said slot, a horizontal valve lever or arm connected to said tilting lever and provided with spaced tappets, and a depending valve-operating lever engaging said tappets, substantially as set forth.

482,078.

Claim.—The herein-described envelope having soluble or fugitive ink applied to its inner surface and adapted to be covered and inclosed by a flap, substantially as described, said soluble or fugitive ink being slightly removed from the line of gum for securing the flap, substantially as described.

482,074. ELECTRICAL HEATER. JOHN V. CAPEN, New York, N. Y., assignor of one-half to Edward H. Johnson, same place. Filed Mar. 5, 1891. Serial No. 383,860. (No model.)

Claim.—1. An electrical heater consisting of an insulated heating-conductor and an inclosing sheet-metal box, the lower edge of the cover being bent under the box, thereby holding it in place and forming a tight joint, substantially as described.

2. An electrical heater consisting of an insulated heating-conductor and an inclosing box or case having a cover, a metal plate on the box-cover, and a screw or similar device passing through the plate, cover, and box and connecting said three parts together, substantially as described.

3. The combination of a heater, a box inclosing the same, a heating-platform for electrical heaters, consisting of a sheet-metal box, cover, and a copper plate in direct contact therewith and connected thereto, substantially as described.

4. The combination, with a heating-conductor and inclosing box, of a cover therefor and a composition containing graphite and a metallic oxide between the conductor and the cover, substantially as described.

5. The combination, in an electrical heater, of a heating-conductor, enlarged terminals therefor, an inclosing case, and conductors, in the form of screws or bolts, extending from the terminals to the outside of the case, substantially as described.

6. The combination, in an electrical heater, of a heating-conductor in the form of a volute coil, with a space at the center, and enlarged terminals therefor in said space, substantially as described.

7. The combination, in an electrical heater, of a heating-conductor in the form of a volute insulated ribbon, terminal plates or blocks having a thickness substantially equal to the width of the heating-conductor, and means for connecting the conductor thereto, substantially as described.

8. The combination, in an electrical heater, of an insulated heating-conductor in the form of an insulated ribbon, layers of asbestus treated with sulphate of alumina, below and above said heating-conductor, and an inclosing case, substantially as described.

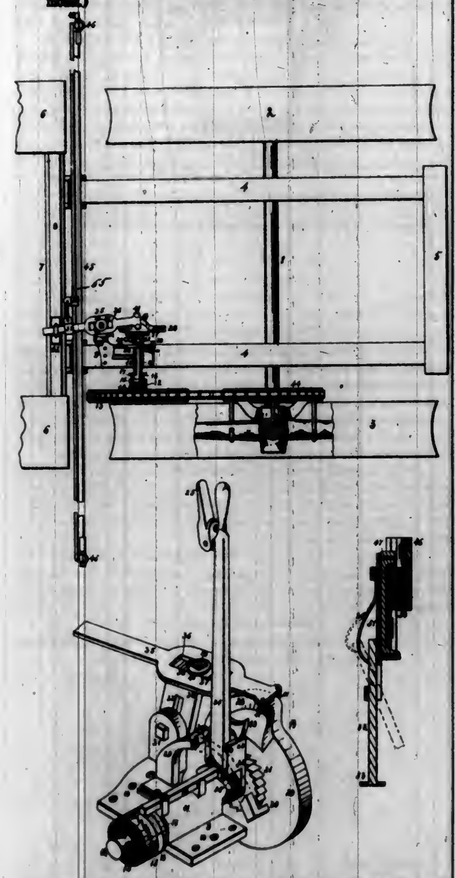
9. The combination, in an electrical heater, of the base, the shell supported thereon, the heating-conductor, an inclosing box therefor supported by the shell, and the screw or rod connecting said parts together, substantially as described.

10. The combination, in an electrical heater, of the base, the metal terminals supported on said base, the shell also supported on the base, the heater supported on the shell, and the screws or conductors extending from the heating-conductor to said terminals, substantially as described.

11. The combination, in an electrical heater, of the base, the metal terminals supported on said base, the shell also supported on the base, the heater supported on the shell, and the screws or conductors extending from the heating-conductor to said terminals, and means for connecting the terminals to the supply-circuit, substantially as described.

12. The combination, with an electrical heater, of screws or similar devices passing through the base thereof and in electrical contact with the terminals of the heater and sockets in a table or similar support connected to the supply-circuit, whereby by inserting the screws

482,078. MEANS FOR DETECTING THE OPENING OF SEALED ENVELOPES. LESSEE P. CALLENDER, Madison, N. J. Filed July 28, 1891. Serial No. 400,711. (No model.)

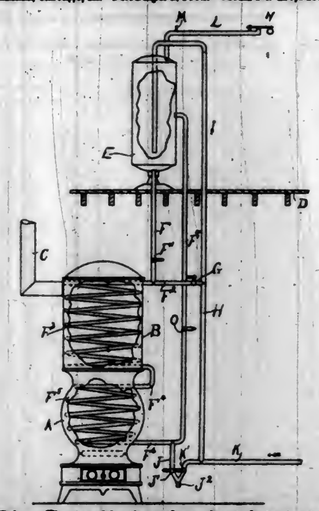


the circuit may be closed through the heater and at the same time the heater be held in place, substantially as described.

13. The combination of a shell or body forming a stand, a heater comprising a heating-conductor inclosed in a metal case supported thereon, and a mass of asbestus or similar material in the space within the shell below the heater, substantially as described.

14. The combination, in an electrical heater, of a heating-plate having depressions and a heater mounted on the under side of the plate below each depression, each of said heaters being complete in itself and adapted to concentrate heat at the point of the plate where it is secured, substantially as described.

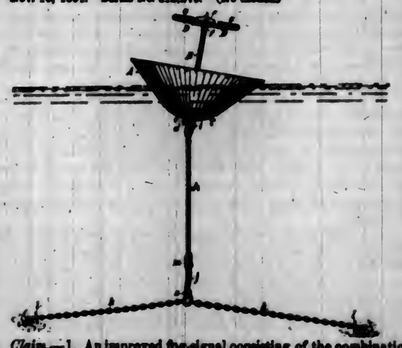
482,075. MARKING ATTACHMENT FOR PLANTERS. CHARLES W. CRAPUE, Marengo, Ill. Filed Mar. 12, 1892. Serial No. 424,732. (No model.)



Claim.—1. A corn-planter having a main frame, supporting-wheels therefor, a sprocket-wheel affixed to one of the supporting-wheels, a shaft on the frame, a cam-wheel and a sprocket-wheel secured to the shaft, a marker rod and a seed-slide, a pivoted lever engaging the rod and the slide and having, also, an engagement with the cam, and an oscillatory marker-arm having a pivoted connection with the marker-rod, said marker moving transverse to the line of advance of the planter.

2. A corn-planter having a main frame, supporting-wheels therefor, a sprocket-wheel secured to one of the supporting-wheels, a shaft journaled in the frame, a sprocket-wheel and a cam-wheel on the shaft, a belt connection between the sprocket-wheels, a clutch for connecting the driven wheel and its shaft, a lever for operating the clutch, a seed-slide and a marker-rod, a lever having an enlargement with the slide and the rod and with the cam-wheel, and a movable joint for said lever.

3. A corn-planter having a main frame, supporting-wheels therefor, a seed-slide and a marker-bar, a marker-arm having a pivotal connection with the marker-bar, said arm having an upward yielding movement and a backward yielding movement for its lower end.

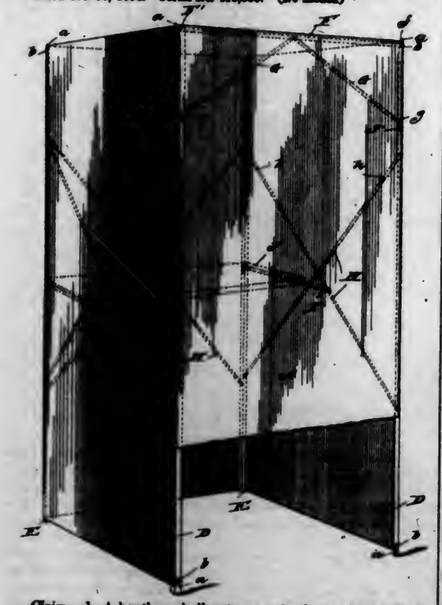


4. A corn-planter having a main frame, supporting-wheels therefor, a seed-slide and a marker-bar, a marker-arm having a pivotal connection with the marker-bar, said arm sliding in vertical ways and having an upward yielding movement therein, the lower portion of the arm having a pivotal connection with the upper portion, and a spring for holding the two parts in a vertical line.

482,076. APPARATUS FOR HEATING WATER. HENRY B. CLARKE, Chicago, Ill. Filed Apr. 1, 1892. Serial No. 427,248. (No model.)

Claim.—The combination of an elevated storage-tank, a lower heating apparatus containing a coil, a pipe F, leading from the top of the coil to the bottom of the tank, a pipe F^3, leading from the tank to the bottom of the coil, a supply-pipe K H, leading to the tank and discharging at the bottom thereof, a cross-pipe F^2, extending from the supply-pipe to the pipe which leads from the top of the coil to the bottom of the tank, and pipes communicating with the lower end of the pipe which leads from the tank to the bottom of the coil and with the feed-pipe, respectively, and terminating in an outlet-tube J^3, the said pipes being provided with suitable valves, whereby the circulation through the coil may be stopped or controlled.

482,077. FOG-SIGNAL. WALTER R. CLOSE, Bangor, Me. Filed Nov. 18, 1891. Serial No. 412,570. (No model.)



Claim.—1. An improved fog-signal consisting of the combination of a float, a vertical mast extending above said float, a gong attached to the upper end of said mast, radial arms projecting beneath said gong and beyond the same, tubes with one end closed attached to said radial arms in proximity to said gong, and rolling balls located within said tubes and adapted to roll and strike against said gong in the manner described, with an anchoring attachment consisting of a balance-rod secured to the bottom of said float and connected thereto

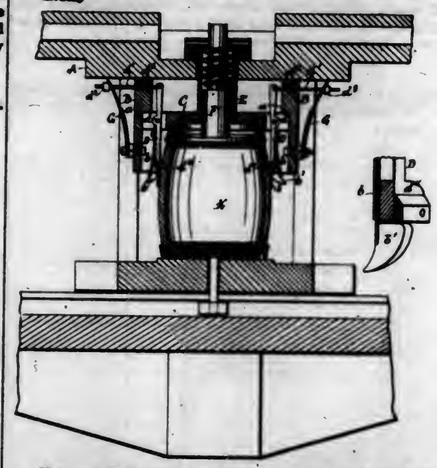
by a link, a cable fastened to the lower end of said rod, and tender-chains departing from said cable, their opposite ends attached to anchors, all substantially in the manner shown, and for the purpose set forth and described.

2. In a fog-signal, the combination, with a float having converging sides, of a heavy bottom secured thereto, the bottom surface of which is convex and provided with two depending lugs, a mast secured to the bottom and projecting above the top of the float, a gong secured to the top of the mast, tubes secured to the mast and projecting outward beyond the outer edge of the gong, balls within the tubes, a pin through the lugs on the bottom of the float, a link secured thereto, and anchoring mechanism secured to the link, substantially as set forth.

482,078. COLLAPSIBLE BOOTH. HENRY C. COOK, Oak Park, Ill. Filed Oct. 30, 1891. Serial No. 410,855. (No model.)

Claim.—1. A booth or similar structure having upright walls, the frame whereof is composed of vertical corner-posts connected by diagonal braces hinged at their ends to the posts and having joints between said ends, whereby the members of the braces may be folded and the frame may be collapsed, substantially as described.

2. A booth or similar structure the frame whereof is composed of vertical posts consisting of angle-bars, and diagonal braces hinged at their ends, respectively, to the said posts, said braces crossing each other on the same side and provided between their ends with joints to adapt them to be folded into the angles of the corner-posts, whereby the frame may be collapsed, substantially as described.



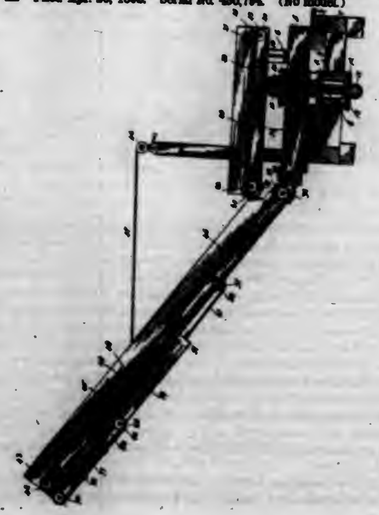
3. A booth the frame whereof is composed of metal corner-posts connected by hinged braces provided with joints between their ends, said corner-posts having hooks or lugs at their respective ends, and walls composed of canvas or other flexible material adapted to be engaged by said hooks or lugs whereby to secure the canvas or covering to the frame, the entire structure being thus adapted to collapse for storage or shipment without separation of its parts, substantially as described.

4. A booth the frame whereof is composed of vertical corner-posts connected by hinged braces provided with joints between their ends, and a bar having one end thereof hinged to the top of one of the corner-posts and the other end socketed into the other of said corner-posts, and diagonal braces hinged to said horizontal brace and having their ends adapted to engage the front corner-posts, substantially as described.

5. A booth the frame whereof comprises, in combination, vertical corner-posts connected by hinged braces and short bars or arms hinged to said braces and adapted to engage the rear corner-posts to support a table or shelf, substantially as described.

6. A booth the frame whereof comprises, in combination, vertical corner-posts connected by hinged braces and short arms or bars hinged at one end to one part of the frame and their free ends adapted to engage another part of the frame whereby to support a shelf, said shelf having grooves in its lower surface adapted to engage said arms or bars whereby to brace the structure, substantially as described.

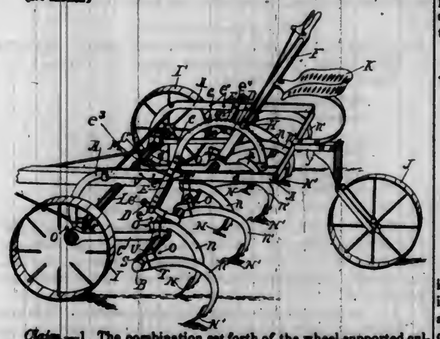
482,079. MACHINE FOR HOOPING AND HEADING KEGS. THEODORE A. COOK, Callicoon Depot, assignor to James Mathison and Walter Mathison, Brooklyn, N. Y. Filed Nov. 3, 1891. Serial No. 410,730. (No model.)



Claim.—1. The ring or casing B, formed with apertures d^3, the inclosed header-plate C, the hoop-drivers pivoted in the header-plate and projecting above the same, and the rods d', attached to the upper ends of the hoop-drivers and projecting through the apertures d^3 and provided with adjusting-nuts at the outer ends, in combination with the plate-springs G, bolted to the outside of the casing and engaging the said rods d', substantially as and for the purposes described.

2. The hoop-driver pivoted in the header-plate and having a spring *b* bolted to the outer surface thereof and projecting below the lower end of the driver, said spring being provided at its lower end with a cam *b'*, held by the spring at a point below the driver, substantially as and for the purposes set forth.

3. A hoop-driver provided with a spring and cam held by the spring at the lower end of the driver, in combination with another stronger spring attached to the upper end of the driver, substantially as described.



482,080. STRAW-STACKER. JAMES R. COOPER, Sugar Grove, Ill. Filed Apr. 26, 1892. Serial No. 430,794. (No model.)

Claim.—1. In a straw-stacker, the combination, with the frame 1, of a circular track carried thereby, the frame 5, having depending rollers engaging said circular track, the standards 3 and 6 in said frames 1 and 5, respectively, the circular top 4, resting on the top of the standards 3 and provided with a sleeve extending upwardly and downwardly therefrom through the standards 6 and 3, a shaft extending through said sleeve, carrying gear-wheels 12 and 14, uprights extending from the frame 5, side pieces supported by said standards, a conveyer traveling between said side pieces, a shaft supported by the frame 5, an elevator mounted to swing on said shaft, a longitudinally-sliding frame carried by said elevator, means for sliding said frame, a rope connected with said elevator and with a windlass carried by one set of the upright standards, pulleys in said elevator and in said longitudinally-sliding frame, conveyers traveling on said pulleys, gear mechanism intermediate said pulleys and the gear-wheel 14, and means connected with the gear-wheel 12 for driving the conveyer-belts, substantially as described.

2. In a stacker, the combination, with a frame 1, adapted to be secured to a separator, a standard 3, rigidly fixed in said frame 1 and having a smooth circular top 4 and provided with a vertical sleeve 8, extending upward from said standard 3, of a frame 5, a standard 6, rigidly fixed thereto and having a smooth circular bottom 7, adapted to rest upon said circular top 4 and to turn thereon, said standard 6 having a circular opening at the center to permit the passage through it of the sleeve 8, side pieces 22, supported above said frame 5 by suitable standards, a table 28, carried by side pieces 22, a bevel gear-wheel 11, mechanism for driving the same, a vertical shaft 13, passing upward through said sleeve 8, a bevel gear-wheel 12, mounted upon the lower end of said shaft 13 and adapted to mesh with said gear-wheel 11, a bevel gear-wheel 14, mounted upon the upper end of said shaft 13, a horizontal shaft 16, a bevel gear-wheel 15, mounted upon the inner end of said shaft 16 and adapted to mesh with said gear-wheel 14, a sprocket-wheel 30, mounted upon the outer end of the shaft 16, a horizontal shaft 26, journaled in said side pieces 22, a sprocket-wheel 27, mounted upon one end of said shaft 26, bearings 32, secured to said frame 5, a horizontal shaft 31, journaled in said bearings 32, a sprocket-wheel 33, mounted upon one end of said shaft 31, a sprocket-chain 34, passing around said sprocket-wheels 27, 30, and 33, pulleys 24, mounted upon said shaft 26, a horizontal shaft 25, journaled in said side pieces 22, pulleys 23, mounted upon said shaft 25, conveyer-belts 28, carried by said pulleys 23 and 24, an elevator 39, hinged to said frame 5, so as to permit of adjustment vertically at its upper end, devices for lowering and raising said elevator 39, a sliding frame 74, carried by said elevator 39 and adapted to be moved longitudinally of said elevator, devices for moving said sliding frame 74, conveyer-belts carried by said elevator 39 and said sliding frame 74, and mechanism for driving said conveyer-belts so as to carry the straw up said elevator 39 and sliding frame 74, substantially as described.

482,081. ORCHARD-CULTIVATOR. JOHN E. DALY, Glendora, and ALBERT A. NEIL, Covina, Cal. Filed Apr. 12, 1892. Serial No. 428,775. (No model.)

Claim.—1. The combination set forth of the wheel-supported cultivator-frame, the beam provided with shovels arranged in front and rear series, draft-bars arranged to pivotally connect the beam with the frame, the tilting arm fixed to the beam, the link pivotally connecting such arm with the frame, and means for rotating the beam and retaining it in position.

2. The combination set forth of the wheel-supported cultivator-frame, the axle journaled thereto, the beam provided with shovels arranged in front and rear series, the draft-bars arranged to pivotally connect the beam with the frame, the link pivoted to the frame above the beam, the tilting arm fixed to the beam and arranged to extend forward in an upward oblique direction and pivoted to the link, so that the pivotal joint uniting the two is practically between the axle of the cultivator and the beam, the operating-lever fixed to the beam, a rack fixed to one of the draft-bars, and a pawl mounted on the lever and arranged to engage the rack.

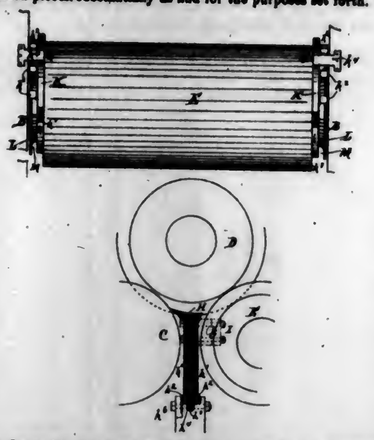
3. In a cultivator, the combination set forth of parts to be clamped, the clip-bracket provided with a socket arranged to receive the part to be clamped and also provided with a recess at one side of such socket to receive the clamp member 8, such clamp member provided with a socket arranged to receive the part to be clamped, the end of the clamped member being arranged to extend along the stem of the bracket, the clip-link arranged to embrace the stems of the bracket and of the clamp member, and a suitable key inserted within the link to press the stems toward each other.

482,082. PAINT-POT. WILLIAM B. DENISE and HENRY C. FULLER, Bentonville, Ark. Filed May 19, 1892. Serial No. 433,577. (No model.)

Claim.—1. The combination of a paint-pot provided at its ends with openings, the tapering paint-brush-receiving pockets arranged on the outside of the pot on the ends thereof and communicating with the interior of the pot by means of said openings, a transverse partition dividing the pot in two compartments, and the inclined flanges arranged at the top of the partition and on both sides of the same and extending from one side of the pot to the other to form shields to prevent the paint of one compartment splashing into the other, substantially as described.

2. The combination of a paint-pot provided at its ends with openings, the tapering paint-brush receiving pockets arranged at the ends of the pot and communicating with the interior of the pot by means of said opening, a transverse partition dividing the pot into two compartments and extending above the upper edges thereof, the curved flanges secured to the partition and extending therefrom over the compartments and forming shields, and a wire hook having divergent shanks secured to the partition at opposite sides of the pot, substantially as described.

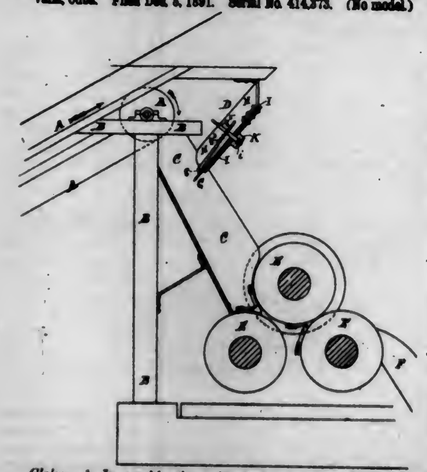
482,083. COMBINED INHALER AND MEDICAMENT-HOLDER. THOMAS M. DUNHAM, Ocean Grove, N. J. Filed June 11, 1892. Serial No. 436,394. (No model.)



Claim.—1. A metallic holder for medicaments, comprising a casing divided into two communicating compartments, a diaphragm having a perforation therein and separating said compartments, and an adjustable screw fitting in and governing the admission of fluid from one compartment to the other, substantially as specified.

2. In a portable metallic holder for medicaments, the combination, with the exterior casing of the receptacle provided with a filling port or duct, of a diaphragm interiorly placed within said casing and provided with an orifice and an adjustable screw seated in the filling-port and terminating in a valve-point fitting the orifice of the said diaphragm, substantially as specified.

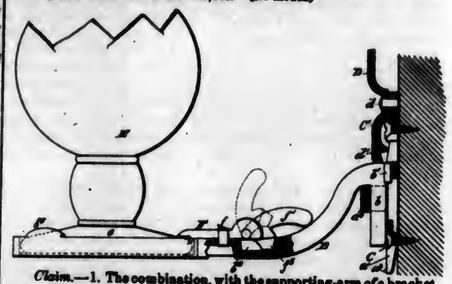
482,084. CANE-MILL. JOHN FISHER, Havana, Cuba. Filed Dec. 8, 1891. Serial No. 414,372. (No model.)



Claim.—1. In combination with the turn-plate or knife of a cane-

mill, a supporting cross-beam extending between the two cheek-pieces, composed of a pair of vertical side plates grooved at their upper edges into said turn-plate or knife and at their lower edges into a bottom strip extending the whole length of the vertical plates, a series of bolts screwing into the bottom of said turn-plate or knife and passing through the said bottom plate, a series of nuts or equivalent devices operating to hold the said bottom plate, the vertical side plates, and the turn-plate securely together, a pair of swing boxes or bearings attached to the upper end portions of said supporting cross-beam, a pair of bearing pins or projections securely attached to each of the cheek-pieces, and a pair of bottom bearing lugs or projections attached to each of the cheek-pieces, substantially as and for the purposes set forth.

2. In combination with the rolls of a cane-mill, a pair of segmental stop-pieces K, adapted to wear against the necked ends of said rolls, and side and radial pressure-brackets K^2 and K^4, as and for the purposes set forth.



482,085. FEED-CHUTE FOR SUGAR-MILLS. JOHN FISHER, Havana, Cuba. Filed Dec. 8, 1891. Serial No. 414,373. (No model.)

Claim.—1. In combination with the main chute for supplying material to the rolls of a sugar mill, a counter-chute provided with an extension-blade for controlling the size and shape of the opening or space between the two chutes, and means for moving said extension-blade or a portion thereof in and out to project more or less from the counter-chute, substantially as and for the purposes set forth.

2. In combination with the main chute for supplying materials to the rolls of a sugar-mill, a counter-chute provided with an extension-blade for controlling the size and shape of the opening or space between the two chutes, a pair of swivel connections attached to the ends of the extension-blades, a pair of swinging levers connected by a shaft extending the width of the chute, and a pair of connecting-pitmen, either one of which is provided with a series of gabs or hook-slots, whereby the said pitman is lengthened or shortened, substantially as and for the purposes set forth.

482,086. BRACKET. WILBUR D. GRIDLEY, Brooklyn, N. Y. Filed Apr. 20, 1892. Serial No. 430,061. (No model.)

Claim.—1. The combination, with the supporting-arm of a bracket, of a latch for locking the article to be held in its seat and a catch pivoted to and carried by the latch for holding the latch in locked adjustment, substantially as set forth.

2. The combination, with the supporting-arm of a bracket, of a latch for locking the article to be held in its seat, and a catch pivoted to and having a swinging movement transverse to the movement of the latch, the catch and the supporting-arm being provided the one with a recess and the other with a projection adapted to engage the recess and thereby hold the latch in locked adjustment, substantially as set forth.

3. The combination, with a supporting-arm section and the wall-section, the one provided with a pintle and the other with a socket, the wall-section being further provided with an opening therethrough at a point above the pintle and socket for the adjustment of the wall-section on and its removal from a fixed fastening device at pleasure, of a latch pivoted to the wall-section and adapted to swing into position over said opening through the wall-section to lock the pintle in the socket, substantially as set forth.

4. The combination, with the wall-section provided with an opening having a contracted neck to receive a fastening device, of a swinging latch pivotally secured to the said wall-section and provided with a lip adapted to overlap the head of the fastening device and prevent the accidental displacement of the wall-section, substantially as set forth.

5. The combination, with the wall-section provided with an opening having a contracted neck to receive a fastening device and with a socket, of a supporting-arm having a pintle adapted to enter the said socket and a latch provided with a lip and adapted to swing into position to simultaneously lock the pintle in its socket and wall section to its fastening device, substantially as set forth.

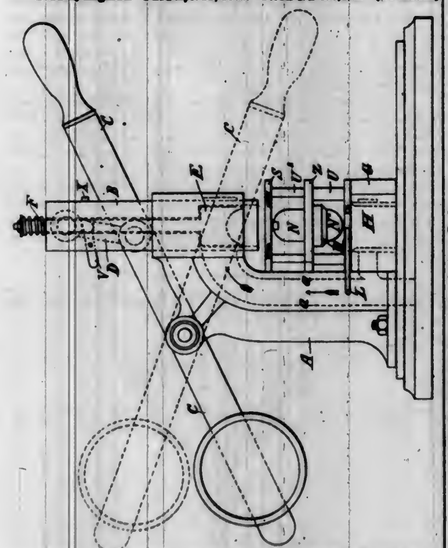
482,087. BAR AND FASTENING FOR SASHES AND LIKE STRUCTURES. WILLIAM HENDERSON, Chicago, Ill. Filed Mar. 2, 1891. Serial No. 383,473. (No model.)

Claim.—1. A bar and fastenings consisting of the marginal doubled caps or fastenings C and D, without seams on their outer surfaces, and the rib B, connecting them, said caps or fastenings being separate and distinct pieces from the rib, substantially as and for the purpose set forth.

2. A bar and fastenings consisting of the marginal doubled caps or fastenings C and D, without seams on their outer surfaces, and the rib B, connecting them and forming the bar A, having the notches *d*, said caps or fastenings being separate and distinct pieces from the rib, substantially as and for the purpose set forth.

3. A bar and fastenings consisting of the marginal doubled caps or fastenings C and D, without seams on their outer surfaces, and the rib B, connecting them, and the ledges or shoulders *a* and *b* on each side of the rib and substantially at right angles therewith, said caps or fastenings being separate and distinct pieces from the rib, substantially as and for the purpose set forth.

4. A bar and fastenings consisting of the marginal doubled caps or fastenings C and D, without seams on their outer surfaces, and the rib B, connecting them and forming the bar A, having the notches *d*, and the ledges or shoulders *a* and *b* on each side of the rib and substantially at right angles therewith, said caps or fastenings being separate and distinct pieces from the rib, substantially as and for the purpose set forth.



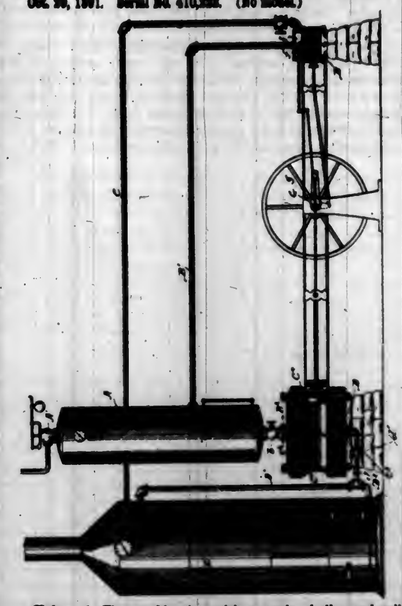
5. A bar and fastenings consisting of the hollow marginal doubled caps or fastenings C and D, without seams on their outer surfaces, and the rib B, connecting them, and the ledges *a* and *b* on each side of the rib and substantially at right angles therewith, said heads being separate and distinct pieces from the rib, substantially as and for the purpose set forth.

6. A bar and fastenings composed of three pieces, consisting of the hollow marginal doubled caps or fastenings C and D, without seams on their outer surfaces, and the ribs B, connecting them, said caps or fastenings being separate and distinct pieces from the rib, substantially as and for the purpose set forth.

7. A bar and fastenings composed of three pieces, consisting of the doubled marginal caps or fastenings C and D, without seams on their outer surfaces, and the rib B, connecting them and forming the bar A, having the notches *d*, and the ledges or shoulders *a* and *b* on each side of the rib and substantially at right angles therewith, substantially as and for the purpose set forth.

8. A bar and fastenings composed of three curved pieces, consisting of the hollow marginal doubled caps or fastenings C and D, without seams on their outer surfaces, and the rib B, connecting them, and the ledges and shoulders *a* and *b* on each side of the rib and substantially at right angles therewith.

482,088. PROCESS OF AND APPARATUS FOR THE MANUFACTURE OF HOLLOW CAOUTCHOUC BALLS. GUSTAV L. HILLE, London, England. Filed Apr. 28, 1892. Serial No. 430,172. (No model.)



Claim.—1. The process of making hollow rubber balls with overlapping seam, consisting in first forming two rubber disks into hollow hemispheres, of which one has a projecting beveled edge, next placing the said hemispheres together, with the said projecting edge of the one overlapping the edge of the other, and finally contracting and compressing the said projecting and overlapping edge around the other hemisphere to produce the autogenous union of the two halves, substantially as and for the purpose set forth.

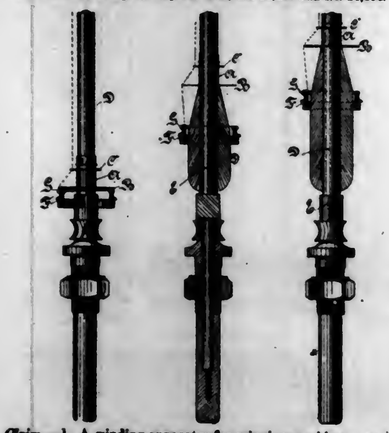
2. The combination, with a stationary outer die, an outer die movable toward and from said stationary outer die, a support for said stationary die, a standard containing a guide for said movable die, and means of heating said support and standard, of an inner former comprising two hemispherical form-pieces, a carrier for said inner former movable laterally toward and from a position between said stationary and movable outer dies, and a clamping device interposed between said stationary and movable outer dies, substantially as herein set forth.

3. The combination, with the bed G, the stationary die H, the standard A, and the piston B and ejector E, constituting a movable die, of the laterally-movable carrier T, the cross-head Z, with its attached form-pieces N N', and sockets U, fitted to guides in said carrier, the disk supporting cross-head S and its guide-rods U^3, fitted to said sockets U, and the springs U^4 and U^5, applied, respectively, to said cross-head Z and rods U^3, all substantially as and for the purpose herein set forth.

482,089. STEAM-ENGINE. JAMES D. JACKSON, Chicago, Ill. Filed Oct. 20, 1891. Serial No. 410,222. (No model.)

Claim.—1. The combination, with an engine, boiler, and cylinder, of a tank connected directly with the cylinder-exhaust by an unobstructed pipe, said tank being provided with an escape-valve, a pump actuated by the engine and connected directly with the tank by a valved pipe, and a pipe connecting the discharge end of the pump with the boiler, said pipe being provided with a check-valve and with a regulator-valve adapted to close communication between the pump and boiler, substantially as described.

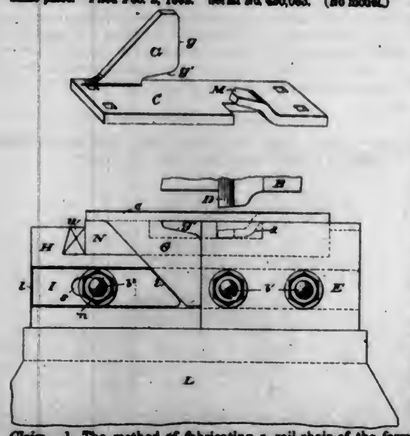
2. The combination, with an engine, boiler, and cylinder, of a tank connected directly with the cylinder-exhaust by an unobstructed pipe, said tank being provided with an escape-valve, a pump connected directly with the tank by a valved pipe, a pipe leading from the discharge end of the pump, and branch pipes leading from the discharge-pipes to both the steam and water spaces of the boiler, said discharge-pipe being fitted with a check-valve, and a regulator-valve adapted to close communication between the pump and boiler, substantially as described.



482,090. FORK FOR VELOCIPEDES. CYRUS KERR, Lakeside, Ill. Filed Jan. 11, 1892. Serial No. 417,749. (No model.)

Claim.—1. In a velocipede-fork, the combination of a crown A, which is concave beneath and has faces A^2 and lateral down-directed edges A^4, and an arch composed of the tubular legs B', having at their upper ends faces B^2, meeting and brazed to the faces A^2, and a reinforcing member B^3, integral with said legs and concave, with upward-directed edges B^4, meeting and brazed to the edges A^4, substantially as shown and described.

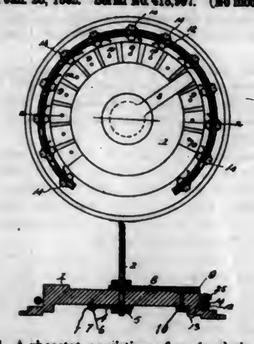
2. In a velocipede-fork, the combination of the crown A, concave beneath and having the lateral downward-directed edges A^4, faces A^5, and reinforcing-tongues C, and tubular legs B', having faces B^3 meeting and brazed to the faces A^5, and said tongues entering and being brazed to the outer walls of said legs, and a connecting member integral with said legs and concave above and having upward-directed edges B^2 meeting and brazed to the edges A^4 of the crown A, substantially as shown and described.



482,091. SPINDLE FOR SPINNING MACHINERY. ERNST F. KRAFFT, St. Blasien, Germany. Filed Apr. 2, 1891. Serial No. 387,372. (No model.) Patented in Switzerland Feb. 28, 1891, No. 3,285; in Luxemburg Feb. 28, 1891, No. 1,415; in Belgium Feb. 28, 1891, No. 93,965; in England Feb. 28, 1891, No. 3,674; in France Feb. 28, 1891, No. 211,779; in Italy Feb. 28, 1891, No. 29,180; in Spain Feb. 28, 1891, No. 11,843, and in Austria-Hungary July 25, 1891, No. 11,127 and No. 26,896.

Claim.—1. A winding apparatus for spinning machinery, consisting of a short tube A, that is provided with a disk B and arranged to fit upon a spindle and to turn therewith and slide thereon, and an eyeleted ring arranged upon the tube, substantially as described.

2. A winding attachment for spinning machinery, consisting of a short tube A, arranged to fit upon a spindle, a disk carried by the tube, and an eyeleted ring mounted on the tube and arranged to slide and turn thereon.



482,092. METHOD OF AND DIE FOR MAKING RAIL-CHAIRS. PATRICK J. LAVELLE, Johnstown, Pa., assignor to the Johnson Company, same place. Filed Feb. 2, 1892. Serial No. 420,063. (No model.)

Claim.—1. The method of fabricating a rail-chair of the form substantially as hereinbefore described, which consists in first cutting out a side lug or brace from a piece of angle-iron to form a blank for the chair and then truing up said lug and stamping up a clip in dies to complete the chair.

2. A pair of dies for forming rail-chairs, consisting of a die provided with a punch, as D, and a mating die provided with a depression suited to the shape of said punch in performing its office and with a guide for truing up a side lug or brace on the chair.

482,098. RHEOSTAT. HARRY W. LAWRENCE, Denver, Colo., assignor of one-half to Henry H. Metcalf, same place. Filed Apr. 25, 1891. Renewed Jan. 23, 1892. Serial No. 418,997. (No model.)

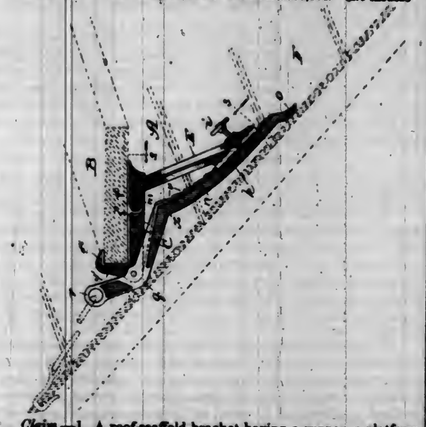
Claim.—1. A rheostat consisting of an insulating-block 1, provided with a series of plates 9, insulated from each other, metal screws 10, passing up through the block into said plates, a carbon resistance supported upon block 1 and provided with clamps 14, surrounding the carbon, and secured by adjusting-screws 25, a wire connecting each screw 10 with screw 25, a rotating metal stem 2, secured to plate 1 and provided with a metal arm adapted to engage plates 9, and a circuit the wires of which are electrically connected, respectively, with stem 2 and the plate 9 at one extremity of the series of plates, substantially as and for the purpose set forth.

2. A rheostat consisting of an insulating-block 1, provided with a series of metal plates 9, insulated from one another, metal screws 10, passing up through block 1 into said plates, a carbon resistance provided with adjustable clamps, wires connecting said clamps with screws 10, a rotating metal stem 2, passing through block 1 and provided with a metal arm adapted to engage plates 9, a circuit the wires of which are electrically connected, respectively, with stem 2 and the plate 9 at one extremity of the series, and a casing inclosing the mechanism and provided with foraminated sides, substantially as and for the purpose set forth.

482,094. GAS-STOVE. JAMES B. MICHENER, Kokomo, Ind. Filed Feb. 13, 1892. Serial No. 421,367. (No model.)

Claim.—1. In a stove, the combination of the hollow tapering bowl having its lower and smaller end closed, the open gas-chamber of larger diameter than the smaller end of the bowl and forming therewith an annular gas-jet surrounding the exterior of the bowl, the hood arranged to cover the open upper end of the bowl and to conduct the products of combustion to the interior thereof, said hood being provided with an opening for the escape of the products of combustion, and a gas-supply pipe connected to said gas-chamber and arranged to form a support therefor, all substantially as set forth.

2. In a stove, the combination of the hollow tapering bowl having its lower and smaller end closed, the open gas-chamber of larger diameter than the smaller end of the bowl and forming therewith an annular gas-jet surrounding the exterior of the bowl, the hood arranged to cover the open upper end of the bowl and to conduct the products of combustion to the interior thereof, said hood being provided with an opening for the escape of the products of combustion, the pipe secured to said hood beneath said opening and forming an extension thereof downwardly into the interior of the bowl, and a gas-supply pipe connected to said gas-chamber, all arranged to co-operate, substantially as set forth, whereby the bowl is heated exteriorly by an open flame and interiorly by the escaping products of combustion.



3. As a new article of manufacture, a gas-stove consisting of a tapering bowl-shaped body surrounded at its smaller end by an annular gas-jet and provided at its upper open end with a hood arranged to gather the products of combustion and to conduct them to the interior of the bowl, and a discharge-pipe connected with the interior of the bowl, whereby the exterior of the bowl may be surrounded by an open flame and be heated interiorly by the products of combustion, substantially as set forth.

482,095. STOCKING. HENRY C. MCCLURE, Davenport, Iowa. Filed June 10, 1892. Serial No. 436,262. (No model.)

Claim.—As a new article of manufacture, a stocking having a great-toe pocket and an opening extending from the base of said pocket to the outer edge of the stocking at the base of the little toe and a flap or an extension of the sole of the stocking adapted to be turned back over said opening and conform to the shape of the toes of the wearer, substantially as and for the purpose set forth.

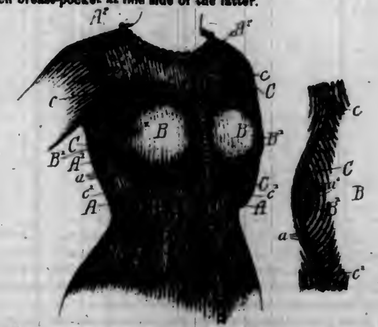
482,096. ROOF-SCAFFOLD BRACKET. HERBERT MCCORMACK, McLuney, Ill. Filed July 13, 1891. Serial No. 399,301. (No model.)

Claim.—1. A roof-scaffold bracket having a runner, a platform-support hinged to the runner, and a brace extending between the free end of the platform-support and the runner and movable at both ends to different points along the said support and runner to adjust the angle of the support with relation to the pitch of a roof, substantially as described.

2. A roof-scaffold bracket having a runner concave on its upper side toward its rear end, a platform-support hinged to the runner, and a brace extending between the free end of the platform-support and the said concave portion of the runner and movable at both ends to different points along the said support and runner to adjust the angle of the support with relation to the pitch of a roof, substantially as described.

3. A roof-scaffold bracket having a runner concave on its upper side toward its rear end, a platform-support pivoted to the runner, and a brace having a socket at one end confined upon the concave portion of the runner and loosely engaging at its opposite end the platform-support toward its free end, substantially as and for the purpose set forth.

4. A roof-scaffold bracket having a runner, a bell-crank-shaped platform-support pivoted at its angle to the runner and provided with a clip on its upper arm to overlap the platform, and a brace extending between the free end of the platform-support and the runner and movable to adjust the angle of the said support with relation to the pitch of a roof, substantially as described.

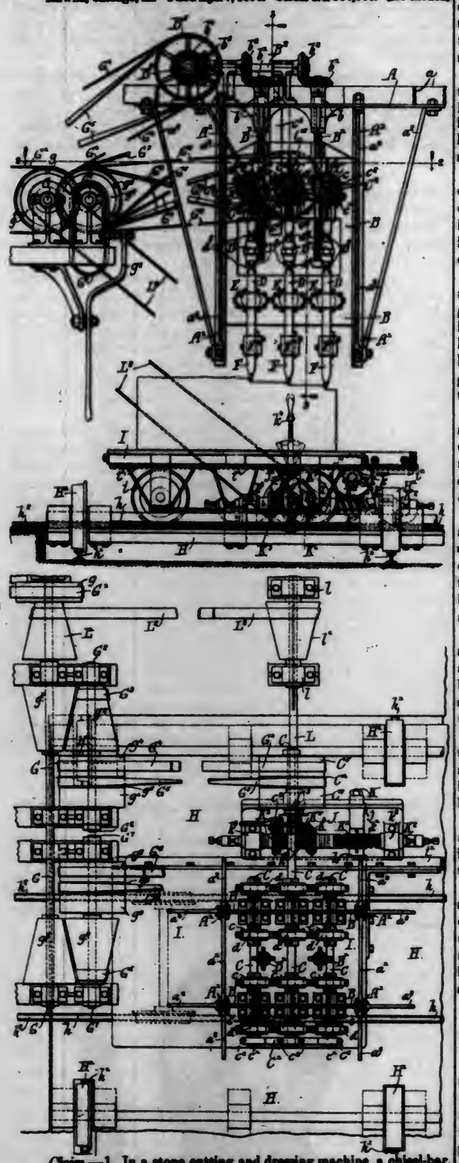


5. A roof-scaffold bracket having a runner formed with a convex bearing *q* near its forward end, a convex bearing *o* near its rear end and a straight seat *p* on its upper side, a platform-support pivoted to the runner near the bearing *q* to extend lengthwise of and coincide with the seat *p*, and a brace extending between and engaging at opposite ends the free end of the platform-support and the runner and movable simultaneously at both ends to different points along the said support and runner to adjust the angle of the said support with relation to the pitch of a roof, substantially as described.

6. A roof-scaffold bracket having a runner formed with a convex bearing *q* near its forward end, a convex bearing *o* near its rear end, a straight longitudinally-recessed seat *p* on its upper side and lateral flanges *s* extending between the said seat and bearing *o*, a platform-support pivoted to the runner near the bearing *q* to extend lengthwise of and coincide with the seat *p*, and a brace loosely engaging at one end the platform-support near its free end and provided at its opposite end with a socket embracing the said flanged portion of the runner, substantially as and for the purpose set forth.

7. A roof-scaffold bracket A, comprising, in combination, the runner C, formed with the convex bearings *q* and *o* and seat *p* and concave on its upper side and flanged laterally lengthwise between the seat *p* and bearing *o*, a platform-support D, pivoted to the runner near the bearing *o* to extend lengthwise of and coincide with the seat *p*, a brace E, bifurcated at one end and embracing and having limited movement at that end upon the free end of the platform-support and provided at its opposite end with a socket *k*, embracing the said concave portion of the runner, and a set-screw *i* on the socket for securing the brace in its adjusted position on the runner, the whole being constructed and arranged to operate substantially as described.

482,097. KNIT UNDERGARMENT. JOSEPH H. PIER, Jacksonville, Ill. Filed May 31, 1892. Serial No. 433,817. (No model.)



Brief.—The breast-pocket is formed by leaving a vertical slit at the time of knitting the garment, and widening the part of the garment at one side of such slit so as to form a flap having a corner edge, which is afterward joined to the opposite or straight side of the slit, so that a single curved seam exists extending from top to bottom of each breast-pocket at one side of the latter.

Claim.—A garment of elastic or ribbed knit goods, containing a breast-pocket formed by means of ribs or rows of stitches *a' a'*, added to the fabric at one side of a vertical seam O therein and forming a

lateral extension or flap B', the margin of which is secured to the adjacent part of the garment by said seam, the fabric forming the garment being continuous above and below said seam, substantially as described.

482,098. STONE CUTTING AND DRESSING MACHINE. JOHN RAWLS, Chicago, Ill. Filed Apr. 7, 1891. Serial No. 387,962. (No model.)

Claim.—1. In a stone cutting and dressing machine, a chisel-bar, in combination with an eccentric or its equivalent for actuating said chisel-bar, a stationary bearing engaging said chisel-bar, and driving-gear for the eccentric, embracing means for reversing the direction of motion of the same, substantially as described.

2. In a stone cutting and dressing machine, a chisel-bar, in combination with an eccentric or its equivalent for actuating the same, a stationary bearing engaging said chisel-bar between the actuating-eccentric and the cutting end of the bar, said bearing being adjustable toward and from the actuating-eccentric to vary the oscillation of the chisel-bar, and driving-gear for the eccentric, embracing means for reversing the direction of motion of the same, substantially as described.

3. In a stone cutting and dressing machine, the combination, with a plurality of chisel-bars of different lengths arranged in a straight row, one behind the other, and an eccentric or its equivalent for imparting to said chisels a combined reciprocatory and oscillatory motion, of stationary bearings engaging said bars between the eccentrics and the ends thereof, and driving-gear for the eccentric, embracing means for reversing the direction of motion of the same, substantially as described.

4. In a stone cutting and dressing machine, the combination, with the main chisel-actuating shaft C, having a fast pulley C^4 and loose pulleys C^5, of the straight and cross belts G^4 G^5, the counter-shaft G^2, having pulleys g^4 and g^5 and cone-pulley g^6, the shaft G, having cone-pulley g^7, and the adjustable belt G^3, gripped between said cone-pulleys, substantially as described.

5. In a stone cutting and dressing machine, the combination, with chisels and actuating mechanism therefor, of a frame wherein said chisels are mounted, and power-actuated feeding mechanism for moving said frame toward and from the stone, comprising means for varying the speed of said feeding mechanism to advance the frame more or less rapidly, as desired, substantially as described.

6. In a stone cutting and dressing machine, the combination, with a chisel-carrying frame and feed-screws therefor provided with bevel-gears, of a shaft provided with bevel-gears to mesh therewith and having a bevel-gear b^3, a shaft B^3, having a bevel-gear b^4 and fast and loose pulleys B^4 B^5, straight and cross belts G^6 G^7, a counter-shaft G^1, having pulleys g^8 g^9 and cone-pulley g^{10}, a shaft G, having cone-pulley g^{11}, and an adjustable belt G^8, gripped between said pulleys, substantially as described.

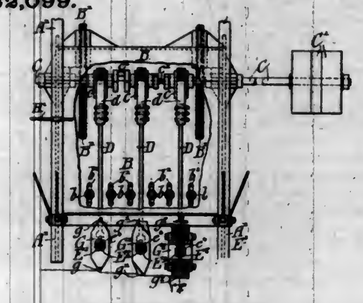
7. In a stone cutting and dressing machine, the combination, with a frame, of a plurality of shafts mounted therein and provided with eccentrics to actuate the chisels, pins on the outer eccentrics, a connecting-rod having bearings for said pins, and actuating mechanism connected with one of said shafts to rotate the same, substantially as described.

8. In a stone cutting and dressing machine, the combination, with a chisel-bar and an eccentric or its equivalent for actuating the same, of an oscillating bearing, through which the chisel-bar passes and reciprocates, said bearing being located between the said eccentric and the working end of the bar, and driving-gear for the eccentric, embracing means for reversing the direction of motion of the same, substantially as described.

9. In a stone cutting and dressing machine, the combination, with a chisel-bar and its actuating mechanism, of a bearing-box E, having a recess *e*, bearing-blocks E^3, having surfaces adapted to fit the chisel-bars and having their outer faces curved, and gibs E^2, having correspondingly-curved faces to bear against the bearing-blocks, substantially as described.

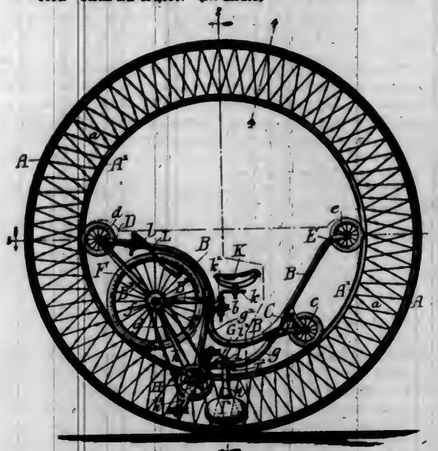
10. In a stone cutting and dressing machine, the combination, with the chisel bar and its actuating mechanism, of a bearing-box E, having a recess *e*, bearing-blocks E^3, having curved outer surfaces, gibs E^2, having correspondingly curved abutting-surfaces, and adjusting-screws e^3, bearing on said gibs, substantially as described.

11. In a stone cutting and dressing machine, the combination, with a chisel-bar having a serrated rabbet *d*, of a chisel having a corresponding rabbet *f*, a collar F', wedge F^2, and set-screws f^2 and f^3, substantially as described.



12. In a stone cutting and dressing machine, the combination, with a chisel-bar and an eccentric or its equivalent for actuating said bar, of a stationary bearing engaging the bar between the eccentric and its end, a driving-gear for actuating the eccentric, comprising means for reversing the direction of motion of the same, a carriage, and reversible feed mechanism for moving said carriage in either direction, substantially as described.

482,099. STONE CUTTING AND DRESSING MACHINE. JOHN RAWLS, Chicago, Ill. Filed July 31, 1891. Serial No. 400,838. (No model.)



Claim.—1. In a stone cutting and dressing machine, the combination, with a supporting-frame and a revoluble shaft mounted therein and provided with an eccentric and eccentric-rod, of a tool-carrying bar provided with an elastic or spring portion pivotally connected with the supporting-frame, said bar having connected with it by a pivotal joint the end of the eccentric-rod, whereby the said bar is supported and its motions are controlled by said rod, substantially as described.

2. In a stone cutting and dressing machine, the combination, with a supporting-frame and a revoluble shaft mounted therein and provided with an eccentric and eccentric-rod, of a tool-carrying bar provided at one end with a tool intermediately pivoted to the eccentric-rod and connected at its other end with the frame, the connection at this latter point being an adjustable one to vary the tilt of the tool, substantially as described.

482,099.

482,100. UNICYCLE. JOHN RAWLS, Chicago, Ill. Filed Aug. 30, 1891. Serial No. 404,233. (No model.)

Claim.—1. The combination, with inner and outer connected rims, of a frame supported within the inner rim and provided with a driving-wheel, separate crank-shafts mounted on the frame at points exterior to the inner rim and provided with cranks, and driving mechanism connecting the crank-shafts with the driving-wheel, embracing a driving-chain and sprockets for each crank-shaft, substantially as described.

2. The combination, with inner and outer connected rims, of a frame supported within the inner rim and provided with a driving-wheel and with a forked bracket extending beyond the inner rim, stub-shafts journaled to the lower ends of the fork and each carrying a sprocket-wheel and crank, sprockets on each end of the hub of the drive-wheel, and chains extending around said sprocket-wheels, substantially as described.

3. The combination, with the inner and outer connected rims, of a frame supported within the inner rim and provided with driving and guide wheels running on said inner rim, driving mechanism connected with the driving-wheel, and weights secured to the lower part of the frame and extending below the inner rim, substantially as described.

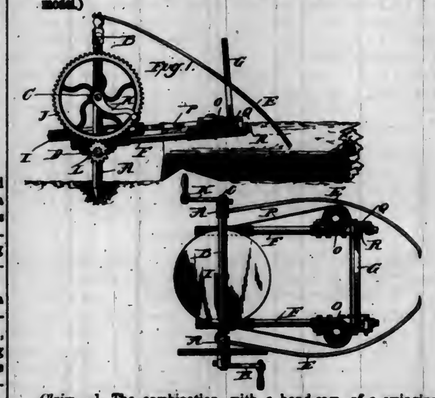
4. The combination, with the inner and outer connected rims, of a frame provided with driving and guide wheels running upon the inner rim, driving mechanism connected with the driving-wheel, and weights adjustably secured to the lower part of the frame and extending below the inner rim, substantially as described.

5. The combination, with the outer and inner connected rims, of a frame provided with driving and guide wheels running upon the inner rim, a sleeve or yoke attached to the frame and longitudinally adjustable thereon, and weights attached to said sleeve or yoke and located below and outside of the inner rim, substantially as described.

6. The combination, with the outer and inner connected rims, of a frame having driving and guide wheels running upon the inner rim, driving mechanism carried by the frame and connected with the driving-wheel, and a tire or tires, of rubber or other yielding substance, interposed between the said inner rim and the said driving and guide wheels, substantially as described.

7. The combination, with the outer and inner connected rims, said inner rim having a groove in its inner face, of a frame having grooved driving and guide wheels, driving mechanism carried by the frame and connected with the driving-wheel, and a cylindric tire or tires, of rubber or other yielding substance, interposed between the said inner rim and the said driving and guide wheels, substantially as described.

8. The combination, with an outer rim, of an inner rim suspended concentrically therein by two sets of spokes extending from rim to rim and inclined relatively to the radii of the wheel, the spokes of one set being arranged alternately with and at opposite angles to the spokes of the other set, whereby the rims may be maintained in the same plane, substantially as described.



482,101. PROCESS OF MAKING DISINFECTANTS. BRUNO R. SCHMIDT, Radebeul, Germany, assignor to Dr. F. von Heyden Nachfolger, same place. Filed July 5, 1890. Serial No. 357,961. (No specimens.)

Claim.—The process herein described for converting phenols which are difficultly soluble in water into disinfecting mixtures which are easily soluble in water, said process consisting in taking difficultly-soluble phenols, such as the so-called "crude carbolic acid" of a higher boiling-point than pure carbolic acid, and consisting mainly of cresols, and mixing them with water and with a metallic salt of an aromatic compound of the classes of aromatic acids and phenols, substantially as herein set forth.

482,102. DISINFECTANT. BRUNO R. SCHMIDT, Radebeul, Germany, assignor to Dr. F. von Heyden Nachfolger, same place. Original application filed July 5, 1890, Serial No. 357,961. Divided and this application filed July 16, 1892. Serial No. 440,273. (No specimens.)

Claim.—The disinfecting compound herein described, consisting of a mixture of cresol or matter containing cresol, such as crude carbolic acid and a metallic salt of an aromatic compound of the classes of aromatic acids and phenols in the proportions herein set forth, and water.

482,103. PORTABLE BAND SAWING-MACHINE. ABRAM C. STERR, Woodville, Oreg. Filed Sept. 25, 1891. Serial No. 406,817. (No model.)

Claim.—1. The combination, with a band-saw, of a swinging frame having an arched outer end, a carrier-pulley near each foot of the arch, a driving-pulley at the pivoted end of the frame, having its plane parallel with the pivotal axis of said frame, and a shaft and gearing concentric with said pivotal axis and connected to gearing on said driver-pulley, substantially as described.

2. The combination of a fixed frame, a driver-shaft journaled therein, a swinging frame pivoted concentrically with said driver-shaft, a driver-pulley parallel to said shaft, and carrier-pulleys at the outer ends of the side pieces of said swinging frame, the saw passing over said pulleys and having its cutting portion lying between said carrier-pulleys, substantially as described.

3. The combination, in a band sawing-machine, of supporting devices consisting of a frame adapted to be fixed in relation to the piece operated upon, a swinging frame pivoted to said fixed portion, the outer end of said swinging portion being spanned by a laterally-projecting arch, pulleys carried by said swinging frame and having their planes of rotation parallel to the pivotal axis of said swinging frame, and a band-saw extending across the open space at the outer end of said swinging frame, substantially as described.

4. The combination, in a portable band sawing-machine, of a frame having pointed side bars adapted to be driven in the ground, braces

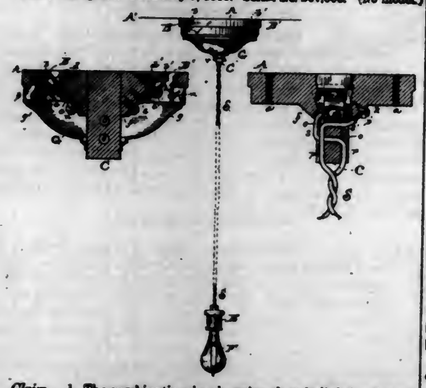
pivoted to its upper portion and adapted to be secured to the piece operated on, a swinging frame pivoted to the first-named frame, the outer end of said swinging frame being spanned by a laterally-projecting arch, pulleys carried by said swinging frame and having their planes of rotation parallel to the pivotal axis of said swinging frame, and a band-saw extending across the open space at the outer end of said swinging frame, substantially as described.

482,104. CEILING-BLOCK FOR INCANDESCENT LAMPS. [illegible]

Claim.—1. In a car-coupler, the combination, with the head and the swinging section carrying a locking-bolt, of the rock-shaft having a lug to engage the locking-bolt and an arm on the outer end of said shaft, substantially as specified.

2. The combination of the coupler-head, the swinging section, the locking mechanism, means comprising a rock-shaft for operating the locking mechanism, and an arm or arms on the outer end of said shaft of malleable iron, substantially as specified.

3. In a car-coupler, the combination, with the head and the

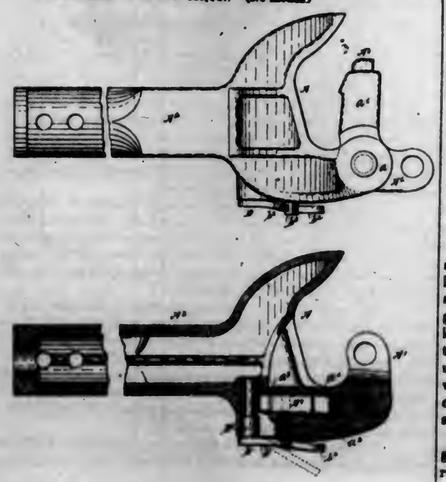


said rule-holder and its respective graduations brought to register with the lower end of the rule-holder, whereby its lower outwardly-projecting end is always identical with or the same in length as that of the vacant part or space above the gage at the upper end of the rule-holder and each rule readily and accurately set in position for mitering or other dressing, substantially as herein set forth.

3. In a miter-tool, the combination, with a grooved or slotted rule-holder, of a longitudinally-adjustable gage and a lug or projection constructed on its inner upper end and engaging the slot in said holder,

482,110.

pivoted to its upper portion and adapted to be secured to the piece operated on, a swinging frame pivoted to the first-named frame, the outer end of said swinging frame being spanned by a laterally-projecting arch, pulleys carried by said swinging frame and having their planes of rotation parallel to the pivotal axis of said swinging frame, and a band-saw extending across the open space at the outer end of said swinging frame, substantially as described.



482,104. CEILING-BLOCK FOR INCANDESCENT LAMPS. LOUIS STERNBERGER, New York, N. Y., assignor to himself and William J. Jenks, same place. Filed July 3, 1886. Serial No. 207,063. (No model.)

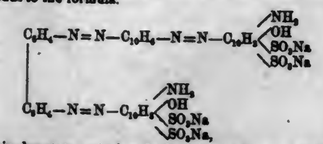
Claim.—1. The combination, in a hanging electric-lighting fixture, of an insulating-block adapted for mechanical attachment to a ceiling or like support, connecting devices on said block for making electrical connection with main or supplying conductors, connecting devices on said block in electrical connection with the connecting devices for the main conductors for making electrical connection with suspended conductors, flexible electrical conductors depending from the said last-named connecting devices, a socket or holder for an incandescent electric lamp supported by and having its terminals electrically connected with the said flexible conductors, and an additional mechanical connection of said flexible conductors with said block for removing the weight from the electrical connections, substantially as set forth.

2. The combination, with the ceiling-block having the perforated projecting pin, of the flexible lamp-conductors depending therefrom and electrically connected with contact devices on the block, said wires being threaded through holes in said pin to remove the weight from the electrical connections, substantially as set forth.

482,105. CAR-COUPLING. CLINTON A. TOWER, Cleveland, Ohio, assignor to the Empire Car Coupler Company, Weehawken, N. J. Filed Jan. 30, 1892. Serial No. 419,647. (No model.)

Claim.—1. In a car-coupler, the combination, with the head and the swinging section carrying a locking-bolt, of the rock-shaft having a lug to engage the locking-bolt and an arm on the outer end of said shaft, substantially as specified.

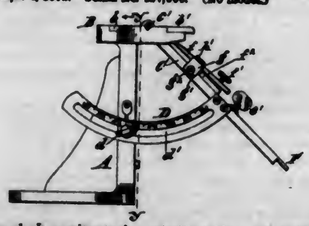
2. The combination of the coupler-head, the swinging section, the locking mechanism, means comprising a rock-shaft for operating the locking mechanism, and an arm or arms on the outer end of said shaft of malleable iron, substantially as specified.



3. In a car-coupler, the combination, with the head and the swinging section carrying a locking-bolt, of a rock-shaft having a lug to engage the locking-bolt, an arm on the outer end of said shaft, and a connection between said arm and a fixed portion of a car, whereby the unlocking device will be operated should the coupler be detached in the rear thereof, substantially as specified.

4. The combination of the coupler-head having the recess and an outward opening, the rock-shaft having the lug, the arms b' b^3, and the stop b^3 on the head, substantially as specified.

482,106. AZO COLORING-MATTER. MORITZ ULRICH and JOHANNES BARNHAMS, Elberfeld, Germany, assignors to the Farbenfabriken, vormals Fr. Bayer & Co., same place. Filed Feb. 1, 1892. Serial No. 419,947. (Specimens.) Patented in England Aug. 26, 1890, No. 13,443; in France Dec. 6, 1890, No. 210,053, and in Italy Apr. 27, 1891, XXV, 29,631.



Claim.—1. The process for producing a blue direct-dyeing coloring-matter by combining one molecular proportion of tetrazo-dipheuyl chloride with one molecular proportion of alpha-naphthylamine, by further diazotizing the thus-formed intermediate product, and by subsequently combining the obtained hexazo compound with two molecular proportions of the sodium salt of the 1.8 amido-naphthol beta-disulpho-acid, hereinbefore described.

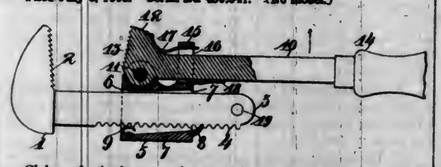
2. As a new product, the dye-stuff hereinbefore described, which corresponds to the formula:

which is in dry state and when finely pulverized a grayish-black powder easily soluble in hot water, with dark-blue color, on the addition of acids a dark-blue precipitate separates, in solutions of sodium carbonate and in ammonia liquid it is soluble with dark-blue color, and in soda-lye with reddish-blue color, in concentrated sulphuric acid it is soluble with greenish-blue color, and on addition of water a flaky-blue precipitate is separated, it dyes unmordanted cotton in alkaline soap-baths a pure greenish-blue, and the said dyed cotton if passed through a watery solution of sodium nitrite and diluted mineral acid, washed and placed in an alkaline solution of beta-naphthol, changes this greenish-blue shade to black.

482,107. MITER-TOOL. ANDREW VAN BERGER, Cincinnati, Ohio. Filed Apr. 4, 1892. Serial No. 427,680. (No model.)

Claim.—1. In a miter-tool, a suitable table, a rule-holder having a recessed base or stock and pivotally connected with said table, a longitudinally-adjustable bar or gage in said rule-holder, and a suitable clamp for holding the work to place, said gage having a series of graduations or lines on its face which are respectively brought to register with any desired mark or index on said holder-stock, whereby the space for the rule at the upper end of the holder, lying beyond the upper end of said gage, is readily determined and made to correspond with the length of the rule to be dressed, and said rule readily and accurately set in place for mitering or dressing, substantially as herein set forth.

2. In a miter-tool, the combination, with a rule-holder, of a longitudinally-adjustable and scaled or graduated gage and a suitable rule-holding clamp, the said gage being of the same length as the said rule-holder and its respective graduations brought to register with the lower end of the rule-holder, whereby its lower outwardly-projecting end is always identical with or the same in length as that of the vacant part or space above the gage at the upper end of the rule-holder and each rule readily and accurately set in position for mitering or other dressing, substantially as herein set forth.



3. In a miter-tool, the combination, with a grooved or slotted rule-holder, of a longitudinally-adjustable gage and a lug or projection constructed on its inner upper end and engaging the slot in said holder, whereby a guard is provided and the sharply-mitered edges of the respective rules are positively prevented from entering or being forced under said upper end of the gage, substantially as herein set forth.

4. In a miter-tool, the combination, with a grooved or slotted rule-holder, of a gage having its face scaled or graduated and at its upper end a lug or stop projecting inwardly from its bottom or inner face, substantially as and for the purpose specified.

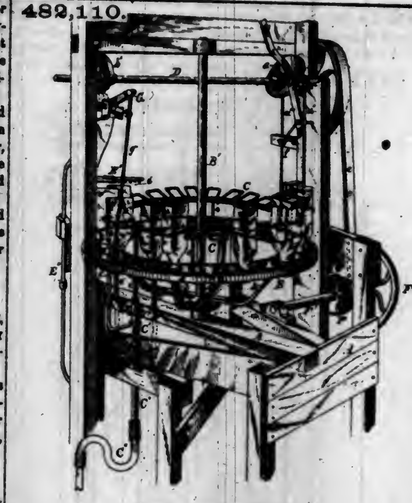
482,108. PROCESS OF MAKING PIPERAZIN. PAUL VOLKMANN, Elberfeld, Germany, assignor to the Farbenfabriken, vormals Fr. Bayer & Co., same place. Filed June 11, 1892. Serial No. 436,393. (Specimens.)

Claim.—The new process of producing piperazin, which consists in treating the dinitroso compounds of diphenylpiperazin, ditolylpiperazin, dixylylpiperazin, dinaphthylpiperazin, or the sulpho-acids or other substitution products thereof with sulpharous acid, sulphur dioxide, or alkaline bisulphites.

482,109. PIPE-WRENCH. WILLIAM J. WALKER, St. Louis, Mo. Filed July 8, 1892. Serial No. 439,341. (No model.)

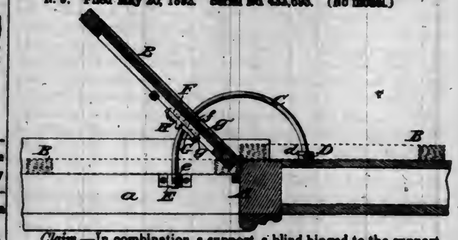
Claim.—1. A pipe-wrench comprising a stationary jaw, an extension formed on the same, teeth formed on said extension, a movable member adapted to slide on said extension, a tooth formed rigidly with said member for engagement with said teeth, and a lever movably attached to said member, one end of which forms the movable jaw, substantially as described.

2. A pipe-wrench comprising a stationary jaw, an extension 3, formed on the same, teeth formed on the said extension, a movable member 5, having a space through which the said extension passes, inclined upper and lower surfaces 7, forming a part of said space, a tooth 8, formed on the said member and adapted to engage with said teeth, a lever 10, movably attached to said member, one end of which forms the movable jaw, and a spring 9 for holding the said tooth 8 in engagement with the teeth 4, formed on the extension 3, substantially as described.



3. A pipe-wrench consisting of a stationary jaw 1, a horizontal extension 3, forming a part of the same, teeth 4, formed on the lower surface of said extension, movable member 5, having a space 6, through which the said extension passes, a tooth 8, formed with the said member and adapted to engage with the said teeth 4, a spring 9, located within the said passage 6 and interposed between the lower wall of the same and the lower surface of said extension, and a handle or lever 10, movably attached to said member 5, one end of which forms the movable jaw, substantially as described.

4. A pipe-wrench consisting of a stationary jaw 1, having a horizontal extension 3, teeth formed on the lower surface of the same, a movable member 5, having a passage 6, through which the said extension passes, inclined upper and lower surfaces 7, forming a part of said passage, a tooth 8, formed with the said member 5 and adapted to engage with the said teeth 4, a spring 9, interposed between the extension 3 and the lower wall of the passage 6, an extension 15, formed with the member 5 and provided with an opening 16, and a lever 10, movably attached to the said member, one end of which forms the movable jaw, substantially as described.



482,110. APPARATUS OR MACHINE FOR CLEANING BOTTLES. GEORGE R. WALLACE, Belfast, Me. Filed Apr. 11, 1892. Serial No. 428,645. (No model.)

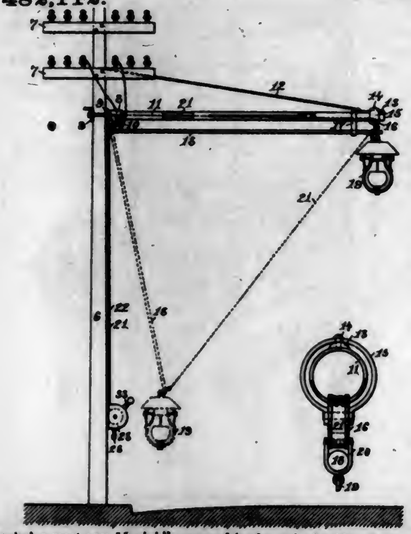
Claim.—The combination of the supporting-wheel B and shaft B', the shaft D, having on it the two cams a and b', the band-wheel E, band c, pulley-wheel F, and driving crank-wheel F'', the pawl-lever d', check-rod f, lever G, connecting-rod g, and water-pipe C, and branch jets d.

482,110. [illegible]

482,111. SHUTTER-FASTENER. CHARLES L. WALKER, Seabright, N. J. Filed May 20, 1892. Serial No. 433,698. (No model.)

Claim.—In combination, a support, a blind hinged to the support, a plate upon the blind, said blind and plate having an elongated slot therein, a curved bar passing through said slot and adjustably secured at both sides of the hinged connection between the blind and the support, and means for securing the blind to the bar at different angles, substantially as set forth.

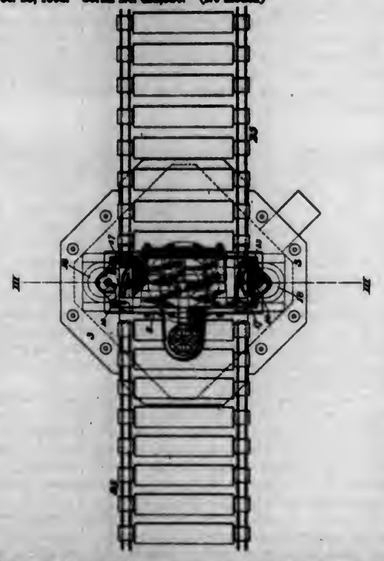
482,112. SUPPORT FOR ELECTRIC LAMPS. AUGUSTUS WRIGHT, Providence, R. I., assignor to the Hope Electric Appliance Company, same place. Filed Mar. 23, 1892. Serial No. 426,061. (No model.)



Claim.—1. In an electric-lamp support, the combination, with a mast-arm suitably supported, a pivoted drop-arm, a lamp secured to the end thereof, and a metallic band by which the lamp is sustained, of a rocking bearing over which the band is passed, carried by the outer end of the mast-arm, as described.

2. In a support for electric lamps, the combination, with a mast-arm suitably supported and a bearing-block 13, secured thereto, of the pulley-frame 15, bearing on said block and secured by the screw 14, a pulley 16, journaled between the ends of said frame, a metallic band 21, bearing on said pulley, and a lamp secured to the end of said band, as described.

3. In a support for electric lamps, the combination, with a mast and an arm extending therefrom, of a capstan-case 23, a drum 24, carried by the shaft 25, having the pin 26 journaled therein and having a groove to receive the band 21, a brake-band 27, extending around said drum and operated by the lever 28, extending through and pivoted to the bottom of the case, a ratchet-wheel 29, also secured to said shaft, a pawl 30, having the depending arm 31, pivoted to the back of the case and engaging said ratchet, a crank-shaft 32, having the tapering enlargement 35, an axial recess formed in said shaft and a transverse slot cut through the end portion thereof and adapted to engage the transverse pin 36, a groove 37, formed around said crank-shaft, and a counterweighted pivoted plate 38, adapted to engage in said slot and to be operated by the arm 41, as described.



4. The combination, with the pole 6 and a capstan secured thereto, the hollow casting 8, secured to the upper portion thereof by the yokes 9 9 and suitable bolts, a pulley 10, journaled within said casting,

482,112.

a tubular mast-arm 11, rigidly secured to the end of said casting and having the depending flagers 17 and the upper stay 12, secured to the outer end of said arm by an elongated strap forming a bearing-block 13, having a rounded upper surface, a pulley-frame 15, supported by said block and secured in place by the screw 14, and a pulley 16, journaled between the ends of said frame, of the tubular rigid stay 18, pivoted to the mast 6, and a metallic band 21, secured to the outer end of said stay, passing over said pulleys 10 and 16, and secured at the other end to the capstan-drum contained within said case 23, as and for the purpose described.

482,113. METAL-SHEARS. HENRY AIKEN, Pittsburg, Pa. Filed Feb. 23, 1892. Serial No. 422,886. (No model.)

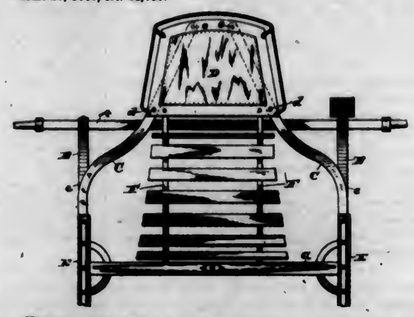
Claim.—1. In metal-shears, the combination of knife-heads and an actuating-motor, a machine-frame movable to separate the knife-heads, and a motor for so moving the frame, substantially as and for the purpose described.

2. The combination of a stationary head, a machine-frame, an actuating-cylinder, a moving head actuated by the cylinder, and mechanism which acts on the machine-frame and is adapted to move the same, with the stationary head, to vary the gap between the heads, substantially as and for the purposes described.

3. The combination of a stationary head, an upright machine-frame fixed thereto, a moving head held by the frame and movable independently thereof, an actuating-cylinder carried by the frame and adapted to actuate the moving head, and lifting mechanism acting on the frame and adapted to lift the same to vary the distance between the heads, substantially as and for the purposes described.

4. The combination of a stationary head, an upright machine-frame fixed thereto, a moving head held by the frame and movable independently thereof, an actuating-cylinder carried by the frame and adapted to actuate the moving head, a support independent of the machine-frame, which supports the moving head when in its bottom position, and lifting mechanism acting on the frame and adapted to lift the same to vary the distance between the heads, substantially as and for the purposes described.

5. In metal-shears, the combination of the moving knife-head and actuating-motor, a stationary knife-head, and a lifting-cylinder adapted to lift the stationary head to vary the width of the gap between the knives, substantially as and for the purposes described.



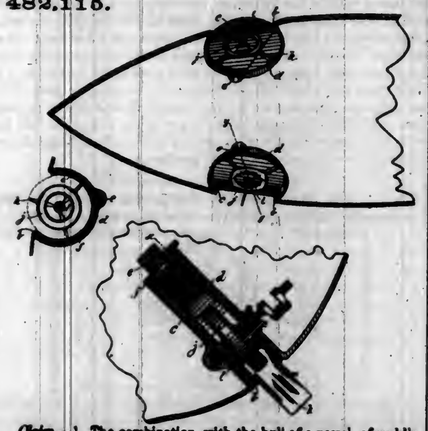
6. The combination of a machine-frame composed of upright bars, a head carried thereby, a moving head movable within the frame, motors comprising cylinders and plungers set in series in the frame, with their stationary parts supported thereby, and lifting mechanism by which the frame can be moved vertically, substantially as and for the purposes described.

7. The combination of a stationary head, an upright machine-frame fixed thereto, a moving head held by the frame and movable independently thereof, an actuating-cylinder carried by the frame and adapted to actuate the moving head, lifting mechanism acting on the frame and adapted to lift the same to vary the distance between the heads, and a counterbalancing-cylinder fixed to the frame and bearing downwardly on the moving head, substantially as and for the purposes described.

8. The combination of a machine-frame, knife-heads, one of which is fixed to the frame, motors comprising cylinders and plungers set in series in the frame, and a frame-lifting motor, substantially as and for the purposes described.

9. The combination of a machine-frame composed of upright bars, a head carried thereby, a moving head movable within the frame, an actuating-cylinder carried by the frame, guides for supporting the frame, and a lifting-cylinder connected with the frame and adapted to lift the same, substantially as and for the purposes described.

482,114. SULKY. JOHN B. ARMSTRONG, Guelph, Canada. Filed Apr. 7, 1890. Serial No. 346,907. (No model.) Patented in Canada Mar. 27, 1886, No. 28,709.



Claim.—1. In a sulky, the combination, with the axle and shafts, of curved single-plate steel springs which connect the shafts and axle and are rigidly connected thereto, and upwardly-curved single-plate springs or seat-supports rigidly connected with the shafts in line with the first-mentioned springs, substantially as and for the purposes specified.

2. In a sulky, the combination, with the axle, shafts, and seat, of two sets of reversely-curved single-plate tempered-steel springs, which springs taper in thickness, one set of said springs rigidly connected to the axle and the other set connected with the seat, and both sets rigidly connected with the shafts at adjacent points and in line with each other, substantially as and for the purposes specified.

482,115. PADDLE-WHEEL BOAT. JACOB S. BAKER, New York, N. Y. Filed Oct. 26, 1889. Renewed Feb. 4, 1892. Serial No. 420,932. (No model.)

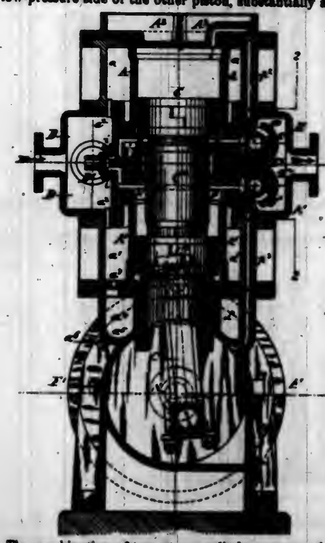
482,115.

Claim.—1. The combination, with the hull of a vessel, of paddle-wheels located in and projecting laterally from recesses in the sides of the hull forward of the middle thereof, said wheels having their plane of rotation inclined from the front downward lengthwise of the hull.

2. The combination, with the hull of a vessel, of paddle-wheels located in and projecting laterally from recesses in the side of the hull, said wheels having their plane of rotation inclined downwardly outward transversely, and being wholly below the water-line.

3. The combination, with the hull of a vessel, of paddle-wheels located in and projecting laterally from recesses in the sides of the hull forward of the middle thereof, said wheels having their plane of rotation inclined from the front downward lengthwise of the hull and also downwardly outward transversely and being wholly below the water-line.

4. The combination, with the hull of the vessel, having the wheel-recesses in the sides below the water-line and adapted for horizontal paddle-wheels, of such wheels located in said recesses and consisting of paddles attached at the inner ends to a ring of equal width on the face as the width of the paddles and equal, or thereabout, to the vertical width of the recesses and attached to arms of the wheel-hub, the radius of said ring being equal to the distance of the wheel-shaft from the mouth of the recess, substantially as described.



5. The combination, with the hull of the vessel, having the wheel-recesses in the sides below the water-line and adapted for horizontal paddle-wheels, of such wheels located in said recesses and consisting of three paddles attached at the inner end to a ring of equal width on the face as the width of the paddles and equal, or thereabout, to the vertical width of the recesses and attached to arms of the wheel-hub, the radius of said ring being equal to the distance of the wheel-shaft from the mouth of the recess, and the opening of the recess being one-third of the circumference of the wheel, substantially as described.

6. The combination, with the hull of the vessel, having the wheel-recesses in the sides below the water-line and adapted for horizontal wheels, of such wheels located in said recesses and each consisting of three paddles attached at the inner end to a ring or hub secured to the shaft and being of equal radius, or thereabout, as the distance of the wheel-shaft from the mouth of the recess and the opening of the recess being one-third of the circumference of the wheel, substantially as described.

482,116. COMPOUND STEAM-ENGINE. RUDOLF BEHR, New York, N. Y. Filed Mar. 17, 1892. Serial No. 425,202. (No model.)

Claim.—1. The combination of two cylinders arranged axially in line with each other, an intermediate separating portion or web between said cylinders, two pistons, one in each cylinder, connected by an intermediate portion or shank guided in the separating-web of the cylinders, a steam-supply valve communicating with ports at the lower ends of the cylinders, and exhaust-valves also communicating by ports with the inner ends of the cylinders and provided with cavities communicating alternately with channels leading to the outer ends of the cylinders and with the exhaust-pipe, substantially as set forth.

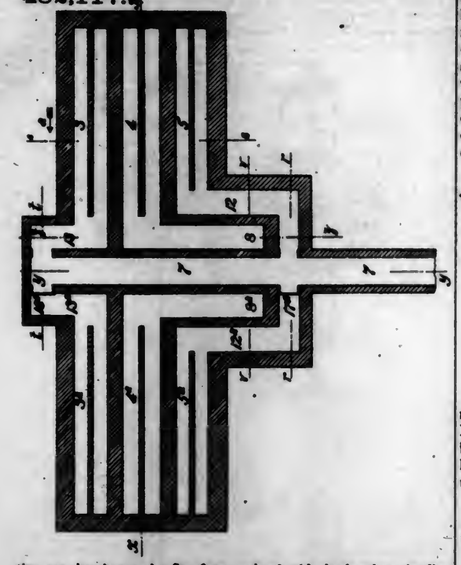
2. The combination of two cylinders arranged in line with each other, an intermediate separating portion or web between said cylinders, two pistons, one in each cylinder and connected by an intermediate portion or shank that is guided in the separating portion, a steam-supply valve, two exhaust-valves having longitudinal cavities communicating with the high and low pressure sides of the cylinders, steam-ports connecting the high-pressure spaces of the cylinders with the supply and exhaust valves, and channels connecting the low-pressure ends of the cylinders with the exhaust-valves, whereby the high-pressure steam is conducted from the high-pressure side of one piston to the low-pressure side of the other piston, substantially as set forth.

3. The combination of two steam-cylinders arranged axially in line with each other, an intermediate separating portion or web between said cylinders, two pistons, one in each cylinder, an intermediate portion or shank connecting said pistons, said shank being guided in the separating portion of the cylinders, a supply-valve for the live steam, two exhaust-valves provided with central cavities, radial slits, and recesses at each side of said slits, a bent tube connecting the ends of the exhaust-valves, ports for connecting the steam-supply valve with the high-pressure sides of the cylinders and with the exhaust-valves, and channels by which the exhaust-valves are connected with the low-pressure sides of the cylinders, substantially as set forth.

4. The combination of two cylinders arranged in line with each other, an intermediate separating portion between said cylinders, a steam-piston for each cylinder, a connecting portion or shank for said pistons guided in the intermediate separating portion, a steam-supply valve, and steam-exhaust valves which are coupled together and strapped to an eccentric on the driving-shaft, substantially as set forth.

5. The combination of two cylinders arranged vertically in line with each other and provided with steam-jackets, a steam-chest, a steam-supply valve in said steam-chest, channels connecting the steam-chest with the steam-jackets, a reservoir for the water of condensation, located below the lower cylinder, and a channel connecting the steam-jacket of the lower cylinder with the reservoir, said reservoir being provided with a plugged discharge-opening for the water of condensation, substantially as set forth.

482,117. REGENERATIVE GAS-FURNACE. FRIEDRICH DANNER, Tarentum, assignor of one-half to the Pittsburgh Plate Glass Company, Creighton, Pa. Filed Feb. 27, 1892. Serial No. 423,096. (No model.)

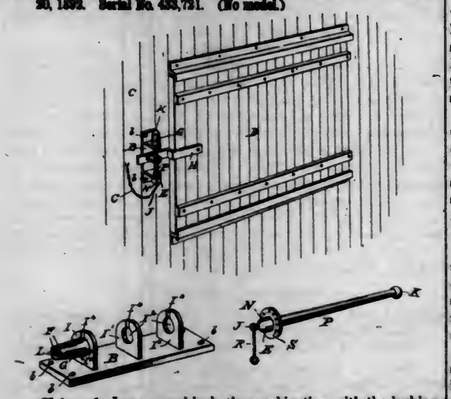


Claim.—1. The improvement in the method of controlling the distribution of heat to a furnace, which consists in varying the supply of air to opposite sides of a jet of gas, and thereby causing the greater supply of air to deflect the flame toward the opposite side of the furnace, substantially as set forth.

2. The combination, in a gas-furnace, of a gas-port opening therein, air-ports opening in rear of and at opposite sides of the gas-port, and valve mechanism for controlling the supply of air to each air-port, so as to cause the deflection of the hot gases toward either side of the furnace, substantially as set forth.

3. The combination, in a gas-furnace, of a gas-port opening therein, two air-ports in rear of the opposite sides of the gas-port, and valve mechanism for increasing or decreasing the supply of air to either or both air-ports, whereby the hot gases may be deflected toward the side of the furnace away from the port through which the greater supply of air enters, substantially as set forth.

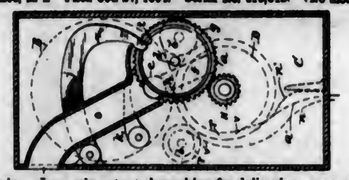
4. The combination, in a regenerative gas-furnace, of a central regenerative gas-chamber, a flue leading therefrom to the furnace, two regenerative air-chambers, one located on each side of the regenera-



482,117.

tive gas-chamber, and a flue from each of said air-chambers, leading to a port-opening in rear of each side of the gas-flue, substantially as set forth.

5. A regenerative gas-furnace having two sets of regenerative chambers, one set at each end, consisting of a central gas-chamber and two air-chambers, one on each side of the gas-chamber, with flues opening into opposite ends of the furnace, substantially as set forth.



482,118. SEAL-LOCK. JOHN DOWLING, Altoona, Pa. Filed May 20, 1892. Serial No. 433,731. (No model.)

Claim.—1. In a car seal-lock, the combination, with the locking-plate having the series of outwardly-projecting lugs provided with holes, and with slots extending from their outer edges to the holes, said slots and holes being in alignment, spring-tongues surrounding the upper hole of the series and converging, and a cylindrical guard having a slot mounted on the upper lug and encircling the tongues, of a hasp for engaging the intermediate lug, a locking bolt or pin having upper and lower heads of a diameter less than the holes of the lug, the lower head exceeding in size the upper head, the seal adapted to pass over the upper head and of a lesser diameter than the lower head, and the chain connected to the bolt or pin and adapted at its opposite end to be connected to a car, substantially as specified.

2. The combination, with the lock-plate having the outwardly-projecting lugs provided with holes and inwardly-extending slots, the holes and slots registering, the cylindrical guard surrounding the hole of the upper lug, slotted to agree with the same, and provided at the inner corners of its slot with parallel flanges, and the L-shaped spring-tongues riveted to the upper lug, extending up into the guard, and having their upper ends converged, of the hasp for engaging the intermediate lug, the bolt or pin having the upper and lower heads of less diameter than the holes of the lugs, the lower head exceeding in diameter the upper head and provided with a notch and depending eye, the circular seal adapted to be introduced over the upper head of the pin and rest against the lower head thereof, the rod having opposite eyes, one of which engages with the eye of the bolt or pin, and the chain loosely connected to the lower end of the rod and adapted to be connected to a car, substantially as specified.

482,119. COIN-ACTUATED MECHANISM. JOHN EVANS, Providence, R. I. Filed Oct. 27, 1891. Serial No. 410,012. (No model.)

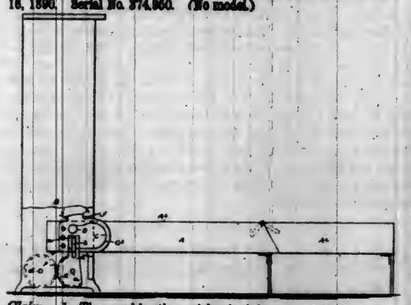
Claim.—In a coin-actuated machine for delivering paper, using a roll of paper, the combination of the main delivery-roll D, paper-roll B, supported by said roll D, roll *b'*, arranged to carry the paper once in each or opposite directions between said rolls D and B, the two layers of paper being in contact with each other while between said rolls, substantially as set forth.

482,120. AMMUNITION-MEASURE. HORACE O. FRENCH, Washington, D. C. Filed May 24, 1892. Serial No. 434,134. (No model.)

Claim.—1. In a tool of the class described, the combination of two sliding shells telescopically connected, the inner shell being provided upon its exterior with a scale and the outer shell having its lower edge notched to form a sight-opening and at one side of the same provided with an indicating-finger for moving over the scale, a loop rising from the end of the inner section, a stud passing through the loop and projecting from the outer section, and a clamping-nut on said stud and designed to bear upon the loop, substantially as specified.

2. In a tool of the class described, the combination of two sliding shells telescopically connected, the inner shell being provided upon its exterior with a scale and the outer shell having its lower edge notched to form sight-openings, provided with a scale and at one side of the sight openings provided with an indicating-finger for moving over the scale, a loop carrying a finger rising from the base of the inner shell, a stud threaded and extending through the loop, and a nut located upon the stud and bearing on the loop, substantially as specified.

3. In a tool of the class described, the combination, with the two telescopically-connected shells, of a threaded stud extending from the outer shell, a slotted loop or plate extending upwardly from the inner shell through recesses formed in the base of the stud, and a clamping-nut threaded on the stud and impinging upon the loop or plate, substantially as specified.



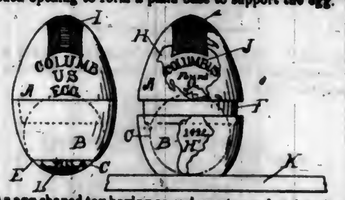
4. In a tool of the class described, the combination, with the telescopically-connected shells, the inner one of which is provided upon its exterior with a series of scales and the outer one of which is provided at its lower edge opposite the scales with recesses having at one side indicating-fingers for moving over the scales, of a threaded stud extending from the outer shell and provided at its base with an opening, a loop extending upwardly from the lower shell through the opening and lying upon the external shell, and a handle terminating at its inner end in a threaded ferrule engaging the nut and at its inner end impinging upon the loop, substantially as specified.

482,121. CAR-COUPLING. WILLIAM R. GALLAHER, Orugers, N. Y. Filed Mar. 20, 1892. Serial No. 426,076. (No model.)

Claim.—1. The combination, in a car-coupler, of the draw-head *a*, provided with a pawl having a square spindle-support and a perforation through it for a coupling-pin to align with the holes in the draw-head only when raised by the introduction of a link, the pawl to be manipulated by means of a crank *j*, a rod connecting with the crank and extending to the top of the car and having connection with the lever *l*, by which the rod and pawl may be operated, and a link provided with enlarged ends *k k* and a central lug *g*, substantially as shown and described.

2. In a car-coupling, a draw-head provided with a pawl *d*, suspended on a square spindle having bearings in the sides of the draw-head, the spindle having a crank on one end to be manipulated by a connecting-rod *b* and a lever *l*, the pawl and draw-head being perforated to receive an ordinary coupling-pin, a coupling-pin *p*, and a link *c*, provided with enlarged ends and with a lug *g* at its center, substantially as shown and described.

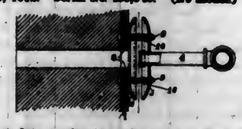
482,122. WARDROBE-BEDSTEAD. MARTHA C. GELDOWSKY, executrix of Ferdinand Geldowsky, deceased, Cambridge, Mass. Filed Dec. 16, 1890. Serial No. 374,960. (No model.)



Claim.—1. The combination, with a bed-frame and the base therefor, of a camway which is held on the side rail of said bed-frame and has straight and rounded concave opposite end portions C^3 C^3, a straight portion C^4 along one of its sides and joining said ends C^3 C^3, rounded concave portions C^5 C^7 and a rounded convex portion C^6 between said concave portions and severally along the other of its sides and joining each other and said end portions C^3 C^3, and a stud D, held on said base and having said camway bearing thereon, as described, for the purposes specified.

2. The combination, with a bed-frame and the base therefor, of a camway which is held on the side rail of said bed-frame and has straight and rounded concave opposite end portions C^3 C^3, a straight portion C^4 along one of its sides and joining said ends C^3 C^3, rounded concave portions C^5 C^7 and a rounded convex portion C^6 between said concave portions and severally along the other of its sides and joining each other and said end portions C^3 C^3, a stud D, held on said base and having said camway bearing thereon, weighted gears F and gear E, both hung on said base and meshing each other, and the gear E having a slotted arm or extension E^3, and a stud *m* on side rail of bed-frame and engaging said slotted arm, as described, for the purposes specified.

3. The combination, with a bed-frame and the base therefor, of a camway which is held on the side rail of said bed-frame and has straight and rounded concave opposite end portions C^3 C^3, a straight portion C^4 along one of its sides and joining said ends C^3 C^3, rounded concave portions C^5 C^7 and a rounded convex portion C^6 between said concave portions and severally along the other of its sides and joining each other and said end portions C^3 C^3, a stud D, held on said base and having said camway bearing thereon, stops *h j* on the side rail of the bed-frame, and stops *f g* on the base, adapted to act in co-operation, as described, for the purposes specified.

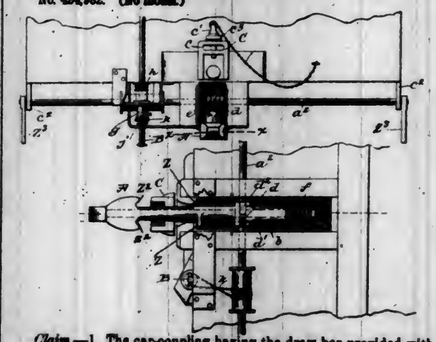


482,123. HISTORICAL TOY NOVELTY. FREDERICK C. J. GERER, Los Angeles, Cal. Filed Aug. 7, 1891. Serial No. 401,964. (No model.)

Claim.—1. An egg-shaped toy comprising the combination of two shell members adapted to fit together and arranged to form an interior chamber, one of said shell members being chambered and provided with an end opening extending through the end of the shell from the chamber, and an interior member arranged within the chamber to protrude through the end opening to complete the symmetry of the egg, all the parts being so constructed and arranged that the interior member may be retracted from the opening to allow the rim of shell around such opening to form a plain base to support the egg.

2. An egg-shaped toy having an end opening and an interior member yieldingly mounted in such opening, all the parts being so constructed and arranged that the interior member may be retracted from the opening to allow the rim around such opening to form a plain base to support the toy.

482,124. SMOKE-CONSUMER. THOMAS GUNNING, Pittsburg, Pa. Filed May 19, 1892. Serial No. 433,540. (No model.)



Claim.—1. A furnace having a hole through its front casing, a perforated dished plate secured to the casing, a second dished plate adjustably held in front thereof, and an injector projecting into the space between the two plates, substantially as and for the purposes described.

2. A furnace having a hole or holes in its front casing, perforated dished plates secured at the front of the holes, dished plates supported upon bolts passing through the first-named plates, and injectors passing through the outer plates into the space between the two, substantially as and for the purposes described.

3. A furnace having a hole or holes in its front casing, perforated dished plates secured at the front of the holes, dished plates supported upon bolts passing through the first-named plates, spiral springs surrounding the bolts, and injectors passing through the outer plates into the space between the two, substantially as and for the purposes described.

482,125. CAR-COUPLING. GEORGE C. HARLIN, Seattle, Wash., assignor of one-tenth to Alexander Densmore. Filed Mar. 15, 1892. Serial No. 424,982. (No model.)

Claim.—1. The car-coupling having the draw-bar provided with a worm-and-gear connection with its actuating-shaft, substantially as set forth.

2. The car-coupling having the draw-bar provided with a segmental gear and the actuating-shaft provided with a worm adapted to mesh with said gear, substantially as specified.

3. The car-coupling having the draw-bar provided with a segmental gear and a cam-stop, the support for said draw-bar having a slot to receive said cam-stop and the actuating-shaft having a worm meshing with said gear, substantially as specified.

4. The car-coupling having its actuating-shaft adapted to be operated by a hand-shaft having a spline connection with the drum or spool, the drum having a chain or cable connection with the first-named shaft, substantially as set forth.

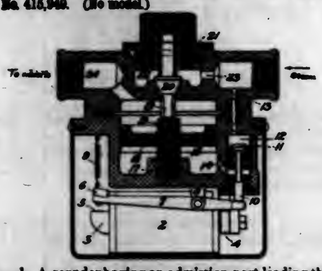
5. In a car-coupling, the ordinary link-receiving draw-head having at one end a socket to receive said link and hung or pivoted near one end upon an apertured bracket and a pin adapted to effect engagement between the draw-head and bracket, substantially as specified.

482,126. TRAIN SIGNALING APPARATUS. JAMES M. HENRY, Wilmerding, and ROBERT B. WILSON, Altoona, Pa. Filed Dec. 23, 1891. Serial No. 415,949. (No model.)

below the surface of the board and working entirely within said curved depression, as and for the purpose set forth.

2. A drawing-board having depressed arcs or recesses in its face near its ends and in each arc a supplemental curve on the arc of a circle and bent inwardly at its center, in combination with an independent T-square, whose head loosely rests against said curve and works within said recesses, as and for the purpose set forth.

3. A drawing-board having depressed arcs or recesses in its face near its ends and wire guides in the bottoms of said arcs, in combination with a supplemental inwardly-bent spring-curve in each recess, having its free working ends resting on said guides, and means, substantially as described, for adjusting the bend of said curve with relation to said depressed arcs, but always keeping it on the arc of a circle,



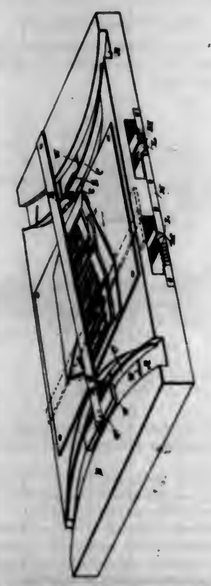
3. The combination of a frame, a vertical sounder-magnet, a horizontal armature-lever arranged below the magnet, the adjustable eccentric forming its lower stop, and the adjustable screw forming its upper stop.

4. The combination of a C-shaped frame A, the pendent sounder-magnet, the iron extension *b* of its core arranged outside of the magnet-coil, the horizontal armature-lever arranged below the magnet, and the horizontal key arranged below the armature-lever.

482,181.

5. In a car-coupling, the ordinary link-receiving draw-head having at one end a socket to receive said link and hung or pivoted near one end upon an apertured bracket and a pin adapted to effect engagement between the draw-head and bracket, substantially as specified.

482,126. TRAIN SIGNALING APPARATUS. JAMES M. HENRY, Wilmerding, and ROBERT B. WILSON, Altoona, Pa. Filed Dec. 23, 1891. Serial No. 415,949. (No model.)



Claim.—1. A sounder having an admission-port leading thereto, a main valve controlling said port, a piston bearing against the main-valve stem, a branch passage leading to said piston, a valve controlling said passage, and an electrically-operated lever bearing upon the valve in the branch passage, substantially as and for the purposes described.

2. A sounder having an admission-port leading thereto, a main valve controlling said port, a piston working loosely in a cylinder and bearing against the main-valve stem, a branch port leading to one side of the piston, a secondary valve controlling the branch passage, a lever bearing upon the secondary valve, an electro-magnet, and an armature carried upon the lever, substantially as and for the purposes described.

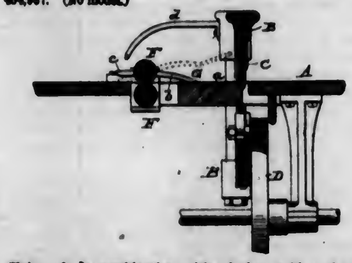
3. An electric coupling comprising two similar halves having interlocking lugs, each half having two contact-buttons to which the wires of the circuit lead, a hollow bushing with which one of the wires contacts, a movable button within the bushing, and a ring to which a branch wire from the other wire leads and arranged to contact with the movable button, substantially as and for the purposes described.

482,127. DRAWING APPARATUS. ALBERT H. JOHNSON, Tampa, Fla. Filed Sept. 14, 1891. Renewed July 23, 1892. Serial No. 440,994. (No model.)

Claim.—1. A drawing-board having near one edge the curved depression or recess on the arc of a circle, in combination with a T-square whose blade passes over the curve and the ends of whose head loosely rest against the outer face of said curve, said head projecting below the surface of the board and working entirely within said curved depression, as and for the purpose set forth.

2. A drawing-board having depressed arcs or recesses in its face near its ends and in each arc a supplemental curve on the arc of a circle and bent inwardly at its center, in combination with an independent T-square, whose head loosely rests against said curve and works within said recesses, as and for the purpose set forth.

3. A drawing-board having depressed arcs or recesses in its face near its ends and wire guides in the bottoms of said arcs, in combination with a supplemental inwardly-bent spring-curve in each recess, having its free working ends resting on said guides, and means, substantially as described, for adjusting the bend of said curve with relation to said depressed arcs, but always keeping it on the arc of a circle, as and for the purpose set forth.



4. The combination, with a drawing-board and near one edge thereof an inwardly-bent curve, of means, substantially as described, for adjusting the bend of said curve, but always keeping it on the arc of a circle, as and for the purpose set forth.

5. The combination, with a drawing-board having a depressed arc in its face and a supplemental spring-curve within said arc and having its free working ends resting against the inner wall thereof, of a rod connected directly to the center of said curve and moving longitudinally in the body of the board, and means, substantially as described, for adjusting the position of said rod from the front edge of the board, as and for the purpose set forth.

6. The combination, with a drawing-board having a depressed arc in its face and a spring-curve within said arc, its ends resting against the inner wall thereof, of a rod connected to the center of said curve and moving in the body of the board, a lever pivoted near one end to said rod and centrally to the board, and a notched plate over which the other end of the lever moves, as and for the purpose set forth.

7. The combination, with a drawing-board having a depressed arc in its face and a spring curve within said arc, its ends resting against the inner wall thereof, of a rod connected to the center of said curve and moving in the body of the board, a guide having eyes through which said rod is guided, and a pivoted lever connected to the rod and projecting beyond the edge of the board, as and for the purpose hereinbefore set forth.

482,128. TAKE-UP DEVICE FOR CLOTH-CUTTING MACHINES. WILLIAM H. KERR, Rochester, Md. Filed May 31, 1892. Serial No. 434,967. (No model.)

Claim.—1. In combination with a bed or table and a feed-roll adapted to advance a sheet or web of material over the same, a cutter and a take-up device located between the cutter and the feed-roll and serving by its movement to take up the slack of material accumulating between the feed-roll and the cutter during the cutting operation.

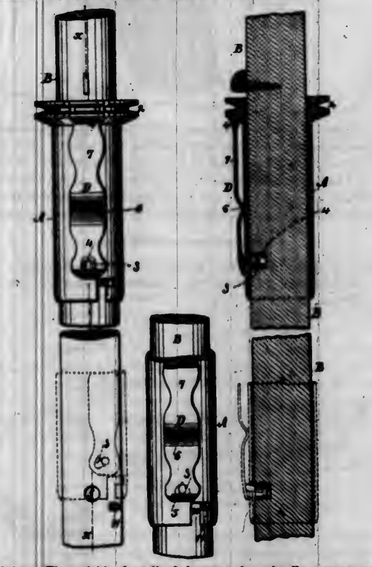
2. In combination with a bed or table A, reciprocating cutter C, and feed-roll F, an intermittent take-up G, substantially as and for the purpose set forth.

3. In combination with bed or table A and feed-roll F, cutter-frame B, provided with cutter C and arm *d*, and a take-up G, consisting of arms *b*, plate or bar *a*, and tail *c*, the arms being pivotally supported and the tail *c* being located in path of the arm *d*, substantially as set forth.

482,129. COMBINED TELEGRAPH KEY AND SOUNDER. DAN J. LOUWIE, New York, N. Y. Filed May 2, 1892. Serial No. 431,532. (No model.)

Claim.—1. The combination of a frame, the sounder-magnet depending from its upper end, the armature-lever arranged below the magnet, and the key arranged below the armature-lever, all the parts being in the same plane, or substantially so.

2. The combination of a bifurcated frame, the key and armature-lever pivoted and playing between the sides or bifurcations of the frame, and the sounder-magnet supported above the armature-lever.

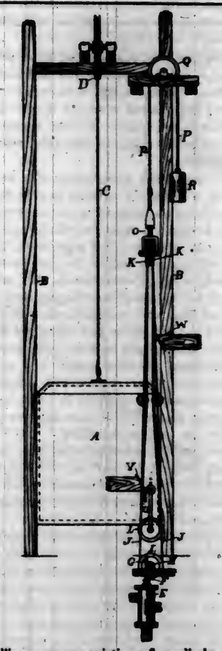


3. The combination of a frame, a vertical sounder-magnet, a horizontal armature-lever arranged below the magnet, the adjustable eccentric forming its lower stop, and the adjustable screw forming its upper stop.

4. The combination of a C-shaped frame A, the pendent sounder-magnet, the iron extension *b* of its core arranged outside of the magnet-coil, the horizontal armature-lever arranged below the magnet, and the horizontal key arranged below the armature-lever.

5. The combination of a C-shaped frame the lower side or end of which is bifurcated and formed with lateral feet or extensions for attachment to the base-board, the downwardly-projecting sounder-magnet supported by the upper end of the frame, the horizontal armature-lever pivoted and playing between the bifurcations or sides of the frame and its adjusting-stops, and the horizontal key-lever also pivoted and playing between the sides of the frame, arranged below the armature-lever.

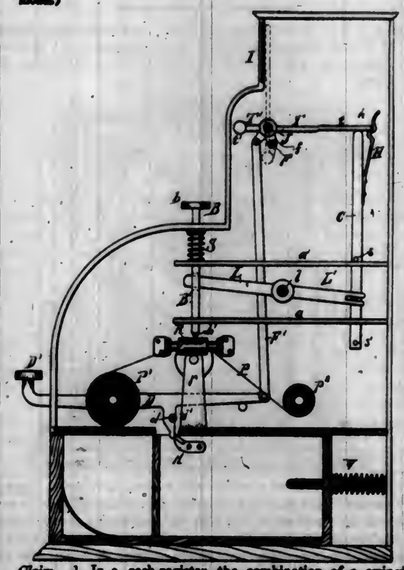
482,180. UMBRELLA-RUNNER. JAMES F. MASON, Brooklyn, N. Y. Filed Nov. 3, 1891. Serial No. 410,712. (No model.)



Claim.—The within-described improved umbrella-runner, comprising the tubular runner A and spring D, the latter constructed at its lower free end with a downwardly-inclined and inwardly-projecting pin provided with the point or spur 8, the opposite end thereof being rigidly secured to the upper portion of said runner, the spring having the bend 6 about the center thereof, forming a fulcrum, whereby when the portion 7 of the spring is depressed it causes the free end thereof to disengage with the holes 4 and 5 in the staff B, all as shown and described.

482,181. ELEVATOR-CONTROLLING MECHANISM. ALEXANDER J. MCADAM, San Francisco, Cal. Filed Apr. 21, 1892. Serial No. 430,082. (No model.)

Claim.—1. In elevator-controlling gearing, the combination of the cage A, the water-controlling means consisting of a cylinder, piston, rack and pinion, and pulley I, up-and-down-traveling pulleys K K, pulley L, attached to the cage, ropes J J, passed partially and oppositely around and fastened to the pulleys I and L, hand-lever T, attached to the axle of the pulley L, rope P, suspended shackle-pulley Q, and movable weight R, substantially as described.



2. In elevator-controlling gearing, the combination of the cage A,

482,181.

the water-controlling means consisting of a cylinder, piston, rack and pinion, and pulley I, up-and-down-traveling pulleys K K, pulley L, attached to the cage, ropes J J, passed partially and oppositely around and fastened to the pulleys I and L, hand-lever T, attached to the axle of the pulley L, rope P, suspended shackle-pulley Q, and movable weight R, lever U, and stops V and W, substantially as described.

482,182. CASH INDICATOR AND RECORDER. WILLIAM T. MCGRAW, Detroit, Mich. Filed May 14, 1892. Serial No. 433,002. (No model.)

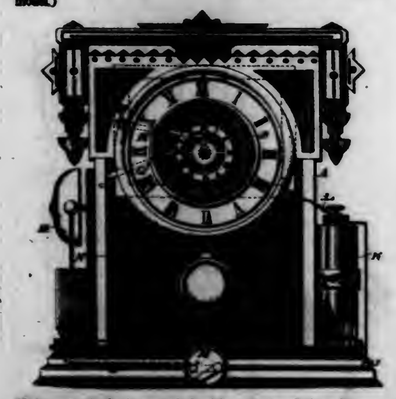
Claim.—1. In a cash-register, the combination of a swinging counterweighted tablet-rod, an actuating-key, and a lever actuated by said key and actuating said tablet-rod and adapted to turn said tablet-

rod from a horizontal to a vertical position, substantially as and for the purpose specified.

2. In a cash-register, the combination of a swinging counter-weighted tablet-rod, a vertically-moving rod, and a spring secured to said vertically-moving rod and adapted to receive the end of said tablet-rod in holding engagement when the tablet-rod is in a vertical position and to release said tablet-rod from engagement with said spring as the last-mentioned rod rises vertically, substantially as and for the purpose described.

3. In a cash-register, the combination of a swinging counter-weighted tablet-rod, a lifting-rod adapted to raise the tablet end of said tablet-rod from a horizontal position, and a spring secured to said lifting-rod adapted to hold the tablet end of said tablet-rod when in a horizontal position and to move out of engagement therewith as said lifting-rod rises, substantially as and for the purpose described.

4. In a cash-register, the combination of a swinging counter-weighted tablet-rod, a readjusting-bar swinging from the journal upon which said tablet-rod turns, and an actuating-key adapted to turn said readjusting-rod, and thereby throw said tablet-rod from a vertical to a horizontal position, substantially as and for the purpose described.



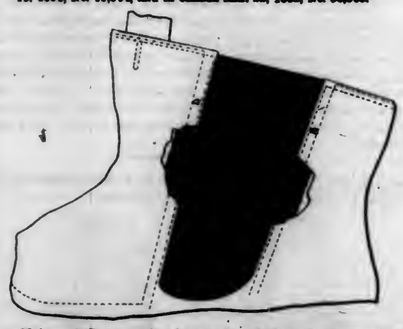
5. In a cash-register, the combination of a swinging counter-weighted tablet-rod, a lifting-bar provided with a holding-spring, a re-adjusting-bar, an actuating-key adapted to operate said lifting-bar, and an actuating-lever adapted to operate said readjusting-bar, substantially as and for the purpose described.

6. In a cash-register, the combination of a swinging counter-weighted tablet-rod, a lifting-bar, and an actuating-key, and an impression-type formed integral with the stem of said key adapted to produce an impression upon a web of paper beneath it, substantially as and for the purpose described.

7. In a cash-register, the combination of an inclosing case, a drawer adapted to move in and out of said case, a swinging counter-weighted tablet-rod, a key, and intermediate mechanism adapted to swing said tablet-rod, a readjusting-lever, also adapted to swing said tablet-rod, a pair of paper-rolls, mechanism connected with said readjusting-lever adapted to move forward the paper from one of said rolls to the other, and a printing-type formed integral with the stem of the tablet-actuating keys and adapted to print characters upon the web of paper, substantially as and for the purpose described.

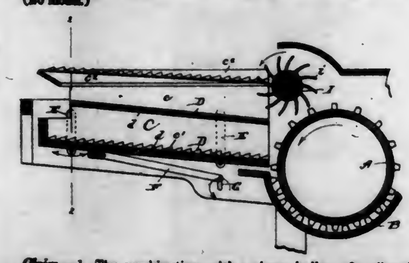
8. In a cash-register, the combination of a swinging counter-weighted tablet-rod, an actuating-key adapted to lift the said counter-weighted tablet-rod to a position of inspection, a readjusting-lever adapted to return said tablet-rod from a position of inspection to a position of concealment, and a locking-bolt actuated by said readjusting-lever and adapted to be lifted out of locking engagement with a catch on the drawer of said cash-register cotemporaneously with its readjusting movement, substantially as and for the purposes described.

482,183. ELECTRIC ALARM-CLOCK. JOHN MCMILLAN and GEORGE H. TAYLOR, Philadelphia, Pa.; said Taylor assignor to said McMillan. Filed Mar. 26, 1891. Renewed Feb. 15, 1892. Serial No. 421,635. (No model.)



Claim.—1. A clock provided with a setting-dial and a recessed disk carried by the same, a gravitating pivoted arm normally in contact with the periphery of said disk, and a stationary finger forming an electric terminal adapted to be contacted by said arm, said arm and finger being in an electric circuit which is closed when said arm and finger contact, substantially as described.

2. An electric alarm attachment to a clock, consisting of a setting-dial with a recessed disk on the hand post or arbor, a gravitating pivoted arm connected with the frame of the works of the clock, a stationary finger forming an electric terminal and supported adjacent to said arm and normally free of contact of said arm, a battery, and a bell, said frame, arm, finger, and bell being in an electric circuit which is closed by contact of said arm with said finger, substantially as described.



3. A clock provided with a setting-dial and a recessed disk carried by and movable with said dial, a gravitating pivoted arm normally in contact with the periphery of said disk, a stationary finger forming an electric terminal adapted to be contacted by said arm, a battery, and a bell, said frame, arm, finger, bell, and battery being in an electric circuit, and a switch for opening and closing said circuit, interposed in said circuit, substantially as described.

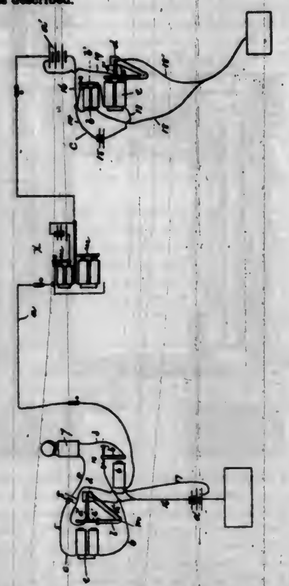
482,184. SHOE. HENRY NEWCOMB, Corinth, Miss. Filed Sept. 26, 1891. Serial No. 406,963. (No model.) Patented in England Nov. 11, 1891, No. 19,564, and in Canada Mar. 22, 1892, No. 38,563.

Claim.—A Congress shoe having the elastic goring secured to the leather portions of the upper and provided with a lining extending beyond the edges of the leather and overlapping the inside of the goring and having fastenings securing the elastic threads or filaments to the web of the goring itself and to the extended lining, said fastenings being removed from and independent of the leather portions of the shoe.

482,185. FEEDING DEVICE FOR CLOVER-HULLERS. CHAUNCEY PITTENGER, Kingsbury, Ind. Filed Dec. 18, 1891. Serial No. 415,471. (No model.)

Claim.—1. The combination, with a clover-huller, of a vibrating feeding-box having inclined side ledges c^3 and vertical wall c, supporting said ledges, both the ledges and walls being armed with rows of teeth D, substantially as specified.

2. In a clover-huller, the combination, with cylinder A and concave B, of a rotary feeding-picker I, located over the front of cylinder A and provided with reversible teeth, substantially as set forth.



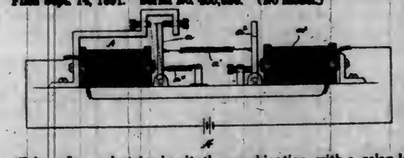
3. The combination, with a clover-huller, of a vibrating feeding-box and a picking-cylinder, said cylinder having reversible curved teeth, substantially as set forth.

482,186. AUTOMATIC BATTERY CUT-OFF. WALTER S. RICHARDS, Natick, assignor of one-half to George B. James, Boston, Mass. Filed Jan. 3, 1891. Serial No. 376,945. (No model.)

Claim.—1. In a telegraph, the combination of a line-circuit, a battery or equivalent generator connected therewith, and two relatively movable terminals or contacts connected with the generator and reacting upon each other, with a magnet in a local circuit controlling one of said contacts directly and the other contact by the reaction of the first, and devices in the main line for controlling the local circuit, whereby upon the opening of the main line the reacting contacts will

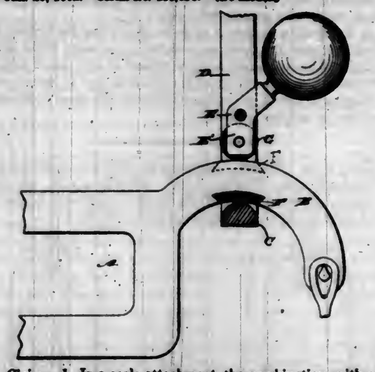
momentarily short-circuit the generator without removing the same from the line, substantially as described.

2. In a telegraph, the combination of a line-circuit, a battery or equivalent generator connected therewith, two relatively movable terminals or contacts connected with the poles of the generator, with a local circuit controlled by the main line and a circuit-controller controlled by the local circuit, actuating to separate the said contacts by the closing of the local circuit and to momentarily close the said contacts and then separate them again when the local circuit is opened, substantially as described.



3. In a telegraph, the combination of a line-circuit, a battery or equivalent generator connected therewith, two relatively movable terminals or contacts and connections between the same and the poles of the generator, whereby the generator is short-circuited when the contacts are brought together, with a local circuit controlled by the main line, an electro-magnet in the local circuit, and mechanical connections between the armature of said magnet and the said contacts, whereby the movement of said armature toward the magnet acts to separate the contacts, while its return movement acts to first bring together and then separate the contacts, substantially as described.

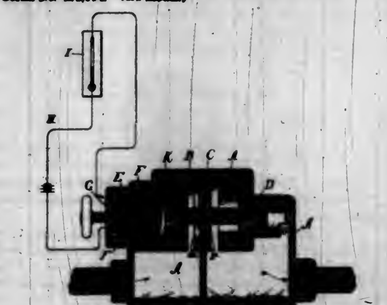
4. The combination of the electro-magnet, its armature, a retracting spring for the latter, a bell-crank lever loosely engaged with said armature and having a contact or terminal and arranged to momentarily engage another contact or terminal secured to the armature, as set forth.



5. The combination of the electro-magnet, its armature, and armature-retracting spring, a bell-crank lever having studs arranged to permit lost motion of the armature between them, a contact d, attached to said lever, and a contact d', attached to the armature, as set forth.

482,187. ELECTRICALLY-ADJUSTING RELAY. WALTER S. RICHARDS, Natick, assignor of one-half to George B. James, Boston, Mass. Filed Sept. 14, 1891. Serial No. 405,898. (No model.)

Claim.—In an electric circuit, the combination, with a relay located in said circuit and its armature, of an electro-magnet included in the same circuit with the relay and provided with an armature pivoted outside of the electro-magnet and located in front of the pole-piece of the said electro-magnet, and a spring connecting said armatures, substantially as described.



482,188. SCALE ATTACHMENT. LOUIS F. ROBARE, An Sable Forks, assignor to himself and Robert J. Clark, Champlain, N. Y. Filed Jan. 20, 1892. Serial No. 418,623. (No model.)

Claim.—1. In a scale attachment, the combination, with a fork, of a scale-beam projecting through the fork and a locking-lever pivoted in the fork and having a roller, of rubber or analogous material, journaled therein, said roller being adapted to engage the top of the beam, substantially as described.

2. In a scale attachment, the combination, with a fork, of a scale-beam projecting through the fork and provided with a contact of soft material on its under side and a locking-lever pivoted in the fork and having a roller, of rubber or analogous material, journaled therein, substantially as herein shown and described.

482,189. ELECTRIC VALVE-CONTROLLER. EDWARD F. ROBERTS, Columbus, Ohio. Filed Aug. 26, 1890. Renewed Feb. 11, 1892. Serial No. 421,094. (No model.)

Claim.—1. In a heating system, the combination of a valve for controlling the heating fluid, provided with pistons upon the opposite sides thereof, one of which is operated by excess of pressure and the other by an electro-magnet included in an electric circuit which also includes a thermostatic circuit-closer, substantially as and for the purpose set forth.

2. In a heating system, the combination of a valve for controlling the heating fluid, provided with differential pistons on the opposite sides thereof, the one open to and adapted to be operated by excess of pressure and the other by an electro-magnet included in an electric circuit which also includes a thermostatic device controlled by a variation of temperature, substantially as and for the purpose set forth.

3. In a heating system, the combination of a valve for controlling the heating fluid, provided at one of its sides with a piston open to and operated by excess of pressure and at its other side with an armature in connection with a magnet for operating the same, and a thermostat in the circuit of the magnet, substantially as and for the purpose set forth.

4. In a heating system, the combination of a valve having differential pistons secured to its opposite sides, the smaller piston open to and operated by excess of back-pressure and the larger having an armature in connection with one or more magnets arranged in the same chamber, and a thermostat arranged in the circuit of the magnets, substantially as and for the purpose set forth.

5. In a heating system, the valve for controlling the heating fluid, provided at one of its sides with a piston open to and operated by ex-

cess of pressure and at its other side with an armature, in combination with an electro-magnet contained with the valve-casing, an electric circuit including such magnet, and a thermostatic circuit-closer, substantially as and for the purpose set forth.

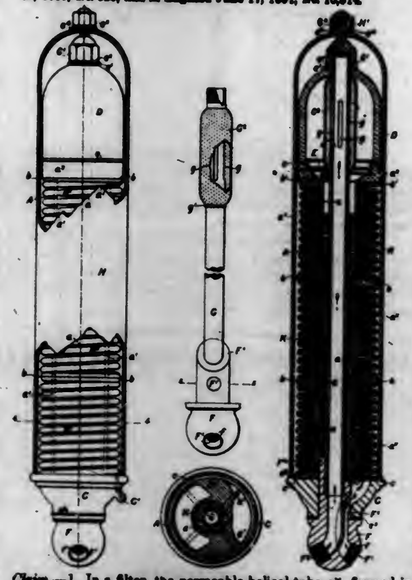
6. In a heating system, a valve for controlling the heating fluid, an electro-magnet for operating said valve, the same being inclosed within the valve-casing and being composed of two sets of coils, and appropriate cores, the one set within the other, and an electric circuit including such magnet, and a thermostatic circuit-closer, substantially as and for the purpose set forth.

---

ting said outlet-pipe and consisting of an annularly-flanged top cap and a series of depending spaced plates provided with an alternate series of lateral perforations, said cap being further provided with a circular series of perforations within the flange thereof and communicating with the spaces inclosed by said plates, a regulator connected to said cover, and water-supply pipes, substantially as set forth.

cap and a series of spaced plates depending therefrom and provided with a series of alternately-arranged perforations in the sides thereof, and guide-rollers secured to the bottom edge of the inner inclosing plate, a regulator connected to said cover, a pan or plate supported within the opposite compartment and provided with a series of slotted openings and depending tubes connected therewith, and an escape-chamber arranged horizontally thereunder and provided with an elongated escape-tube communicating with the space above the water-line inclosed by said pan or plate, substantially as set forth.

7. In a gas purifier and condenser, a condensing-chamber provided with circulating-pipes surrounded by a water-space, a supple-



chute, a circuit-closing device moved by the depression of said lever into position to bear on a coin in said chute, an electro-magnet and electrical connections completing a circuit through said magnet when the said circuit-closing device is in contact with a coin, and an escapement mechanism controlled by said electro-magnet, said mechanism being adapted to co-operate with the teeth or pins of the wheel in permitting a partial rotation of the latter, and including a latch which is thrown by the action of said magnet into position to be actuated by the lever during its return movement, as set forth.

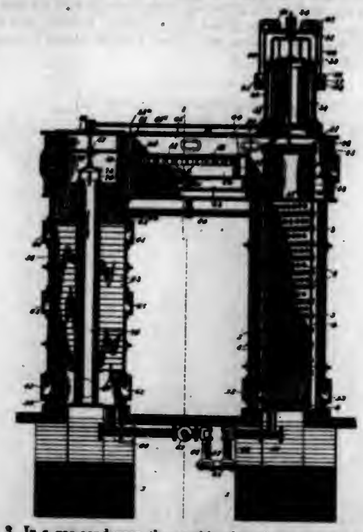
8. In a coin-operated vending-machine, the combination of a rotary wheel having merchandise-holding pockets and a series of teeth

cess of pressure and at its other side with an armature, in combination with an electro-magnet contained with the valve-casing, an electric circuit including such magnet, and a thermostatic circuit-closer, substantially as and for the purpose set forth.

6. In a heating system, a valve for controlling the heating fluid, an electro-magnet for operating said valve, the same being inclosed within the valve-casing and being composed of two sets of coils, and appropriate cores, the one set within the other, and an electric circuit including such magnet, and a thermostatic circuit-closer, substantially as and for the purpose set forth.

482,140. FILTER. DOMINGO M. SARTORIO, Buenos Ayres, Argentine Republic. Filed Nov. 7, 1891. Serial No. 411,187. (No model.) Patented in France Oct. 8, 1890, No. 201,080; in Argentine Republic Nov. 19, 1890, No. 822, and in England June 17, 1891, No. 10,314.

Claim.—1. In a filter, the permeable helical tube a^x, formed integral with the cylinder A, which it surrounds, and adapted to serve as herein set forth.



2. In a filter, the combination, with the upright cylindrical vessel A and the cap D on its upper end, of the base C under that vessel, the support F under and partially within the said base, the central tube G, and the concentric grating G^2, arranged substantially as and for the purposes set forth.

3. In a filter, the combination, with a vessel A, formed with a permeable helical tube a^x, of a sand-reservoir K, a passage for leading sand therefrom into the current entering the helical tube, and an opening for allowing the sand to return to the sand-reservoir for reuse in scouring the filtering-surfaces, substantially as set forth.

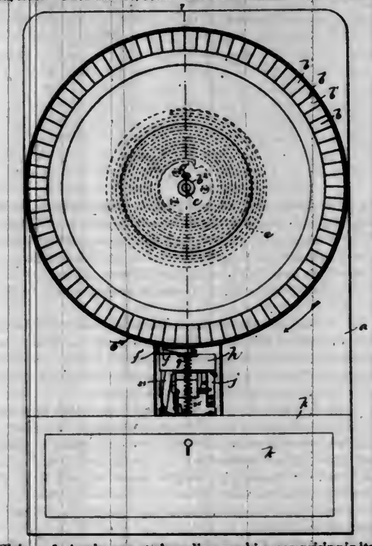
482,141. GAS PURIFIER AND CONDENSER. GOTTLIEB SMARTT, Annapolis, Md. Filed July 13, 1891. Serial No. 399,263. (No model.)

Claim.—1. In a gas-condenser, an outer inclosing cylinder, an inner independent condensing-chamber provided with separate series of circulating-pipes arranged in a horizontal series at right angles one above the other, a supplemental cooling-chamber above said condenser, an outlet-pipe communicating with the interior thereof and said condenser directly over the network of circulating-pipes therein, a cover inclosing said outlet-pipe and provided with a series of lateral perforations, a regulator connected to said cover, drain-pipes connected with said condenser and cooling-chamber, a hydraulic gas closer or cut-off located in the drain-pipe from said condensing-chamber, and water-supply pipes, substantially as set forth.

2. In a gas-condenser, an outer inclosing cylinder, an inner condensing-chamber provided with a series of water-circulating pipes communicating with the inclosed water-space between said condensing-chamber and the outer cylinder, a supplemental cooling-chamber above said cylinder and inclosed condensing-chamber, an outlet-pipe communicating with the interior thereof and said condensing-chamber directly above the network of circulating-pipes therein, a cover inclosing said outlet-pipe and consisting of an annularly-flanged top cap and a series of depending spaced plates provided with an alternate series of lateral perforations, said cap being further provided with a circular series of perforations within the flange thereof and communicating with the spaces inclosed by said plates, a regulator connected to said cover, and water-supply pipes, substantially as set forth.

3. In a gas-condenser, the combination of an outer inclosing cylinder, an inner condensing-chamber provided with a series of water-circulating pipes, a supplemental cooling-chamber above said cylinder and condenser, an outlet-pipe communicating with the interior thereof and said condenser and projecting into said cooling-chamber, a laterally-perforated cover inclosing said upwardly-projecting pipe and provided with a circular series of perforations in the top thereof, a supplemental open water-cylinder located above said cooling-chamber and said cover and provided with an outer wall and a shorter inner wall forming an open water-space between the same, the overflow from said space being over said shorter wall upon said perforated cover in the cooling-chamber, an inverted weight-regulated cylinder working within said water-space and connected with said cover, and water-supply pipes connected with said upper open water-space and said inclosing cylinder, substantially as set forth.

4. In a gas purifier and condenser, the combination of a cooling-chamber having a gas-inlet and an inclosed gas-space above the water-line, a closed escape pipe or duct below and communicating with said gas-space and leading therefrom, a purifying and condensing cylinder provided with a top inclosing jacket surrounding the entire upper end of the same and connected with said escape pipe or duct, a downwardly-extending pipe connecting said jacket with the bottom inlet of the cylinder, a series of independent and removable sectors arranged in a circle one above the other within the cylinder and each provided with diagonally-arranged plates alternately disposed with each succeeding sector, forming a zigzag passage through the cylinder, an automatically-revolving water sprinkler or distributer located above said sectors within the top of said cylinder, an escape-pipe centrally located within said cylinder and passing down between and supporting said sectors and communicating with the bottom outlet, a deflecting-plate supported above the top open end of said escape-pipe and forming a bearing for the lower end of said sprinkler, and an overflow-pipe connecting said cooling-chamber with the upper end of said cylinder, substantially as set forth.



5. In an apparatus of the class described, a purifying-chamber, a pan or plate located within said chamber and provided with a series of perforations, depending sides, and depending tubes inclosed within said sides and communicating with said openings and extending below said pan, and an escape pipe and duct provided with an upwardly-extending elongated escape-tube projecting up between said tubes and communicating with the space above the water-line, inclosed by said pan or plate and water supply and circulating pipes, substantially as set forth.

6. In an apparatus of the class described, a purifying-chamber provided with communicating compartments separated by a short partition-wall, a supply-pipe inwardly extending within one of said compartments, a cover inclosing said pipe, the same consisting of a top cap and a series of spaced plates depending therefrom and provided with a series of alternately-arranged perforations in the sides thereof, and guide-rollers secured to the bottom edge of the inner inclosing plate, a regulator connected to said cover, a pan or plate supported within the opposite compartment and provided with a series of slotted openings and depending tubes connected therewith, and an escape-chamber arranged horizontally thereunder and provided with an elongated escape-tube communicating with the space above the water-line inclosed by said pan or plate, substantially as set forth.

7. In a gas purifier and condenser, a condensing-chamber provided with circulating-pipes surrounded by a water-space, a supplemental chamber arranged thereover and communicating therewith and provided with two compartments, a gas regulator and purifier within one compartment, a tubed plate and an escape chamber and duct located under said plate in the other, a purifying and condensing cylinder provided with a top inclosing jacket communicating with said escape chamber and duct and the bottom inlet to said cylinder, drain-pipes communicating with the several purifiers, a hydraulic gas closer or cut-off located in said drain-pipes, valved supply and outlet pipes communicating with both cylinders and a common supply, and water-circulation pipes communicating with the various chambers, substantially as set forth.

8. In a gas purifier and condenser, the combination, with communicating purifying and condensing chambers and drain-pipes connecting the same with a common-drain center, of a hydraulic gas-closer located in said drain-pipes intermediate of the purifying-chambers, the same consisting of a U-shaped portion depending beneath the horizontal plane of said drain-pipes and designed to be normally filled with the drain-water and condensed products, substantially as set forth.

482,142. COIN-CONTROLLED VENDING-MACHINE. CHARLES A. SEATTON, Malden, assignor of one-half to Harry L. Ayer, West Newton, Mass. Filed Jan. 18, 1892. Serial No. 418,444. (No model.)

Claim.—1. A coin-operated vending-machine comprising in its construction a coin-chute, a lever adapted to be depressed by the operator and provided with means for returning it to its normal position, a wheel having merchandise-holding pockets and a series of teeth or pins, an electric circuit including an electro-magnet and a swinging contact or electrode adapted to be moved by the depression of said lever, the circuit being adapted to be closed by the contact of said electrode with a suitable coin in the chute, and an escapement or let-off mechanism normally in position to engage a tooth of the wheel and adapted to be engaged with said lever by the action of the electro-magnet when the latter is energized, the arrangement being such that a movement of said lever in one direction prepares it for engagement with said escapement mechanism, while a movement of said lever in the opposite direction operates the escapement, as set forth.

2. In a coin-operated vending-machine, the combination of a rotary wheel having merchandise-holding pockets and a series of teeth or pins, a lever adapted to be moved or depressed by the operator and provided with means for returning it to its normal position, a coin-chute, a circuit-closing device moved by the depression of said lever into position to bear on a coin in said chute, an electro-magnet and electrical connections completing a circuit through said magnet when the said circuit-closing device is in contact with a coin, and an escapement mechanism controlled by said electro-magnet, said mechanism being adapted to co-operate with the teeth or pins of the wheel in permitting a partial rotation of the latter, and including a latch which is thrown by the action of said magnet into position to be actuated by the lever during its return movement, as set forth.

3. In a coin-operated vending-machine, the combination of a rotary wheel having merchandise-holding pockets and a series of teeth or pins, a lever adapted to be moved or depressed by the operator and provided with means for returning it to its normal position and provided with two escapement-operating arms 61 62, a coin-chute, a circuit-closing device moved by the depression of said lever into position to bear on a coin in said chute, an electro-magnet and electrical connections completing a circuit through said magnet when the said circuit-closing device is in contact with a coin, and an escapement mechanism comprising two pallets independently movable, a rocking bar, such as 52, connections between said bar and the pallets, through which each movement of the bar moves the pallets simultaneously in opposite directions, a latch connected with one end of said bar and formed to engage the arm 62 when said arm is moved by the return movement of the lever, said latch being controlled by the electro-magnet and engaged with said arm only when the magnet is energized, the latch and bar being moved in one direction by said arm during a part of the return movement of the lever, and a loose connection, such as the link 58, between the opposite end of the bar 52 and the arm 61, through which the bar is moved in the opposite direction during the latter part of the return movement of the lever, as set forth.

4. In a coin-operated vending-machine, the combination of a fixed coin-chute, a coin-arresting gate therein, means for alternately opening and closing said gate, delivery mechanism and electrically-controlled operating devices therefor, including an electric circuit, devices for closing said circuit through a coin or piece of conducting material in the position it assumes by gravitation in the chute when arrested by said gate, said devices including a swinging contact and means for moving it alternately into and out of the chute, a permanent magnet movable crosswise of the chute, and mechanism for reciprocating said magnet, said mechanism being timed to give the magnet a movement in the direction required to displace a fraudulent piece attached thereby before the said swinging contact enters the slot, whereby the said piece is prevented from closing the circuit, as set forth.

5. A coin-operated vending-machine comprising in its construction a coin-chute, a lever adapted to be depressed by the operator and provided with means for returning it to its normal position, a wheel having merchandise-holding pockets and a series of teeth or pins, an electric circuit including an electro-magnet and a swinging contact or electrode adapted to be moved by the depression of said lever, the circuit being adapted to be closed by the contact of said electrode with a suitable coin in the chute, an escapement or let-off mechanism controlled by said electro-magnet and operated by the return movement of said lever, a permanent magnet movable across the coin-chute and adapted to displace a fraudulent piece therein from the path of the swinging electrode, and connections between said permanent magnet and lever, whereby the magnet is reciprocated when the lever is oscillated, as set forth.

6. The combination of the coin-chute, the coin-arresting gate therein, the bell-crank lever affixed to said gate, the locking-lever 23, adapted to engage one arm of said bell-crank lever and arranged to be displaced by a coin inserted in the chute, the hand-lever A, having a swinging arm 18, and a fixed locking device with which said arm 18 is held in engagement by the bell-crank lever when the latter is locked by the lever 23, the displacement of the lever 23 causing the release of the bell-crank lever and of the arm 18, thus permitting the depression of the lever A, as set forth.

7. The combination, with the merchandise-holding wheel having a series of pins, of the escapement and escapement-operating mechanism consisting of the pallets f f', the stud or rock-shaft 53, to which the pallet f' is affixed, the pallet f being adapted to swing loosely on said shaft, the bar 52, affixed to said shaft, the pivoted lever 55, engaged at one end with the bar 52 and at the other with the pallet f', the latch 50, engaged with one end of the bar 52, the link 58, engaged with the other end of said bar, the hand-lever A, having arms 61 and 62, arranged to co-operate with said link and latch, an electro-magnet, an armature for said magnet, a pivoted lever supporting said armature and adapted to throw the latch into engagement with the arm 62 when the magnet is energized, and a coin-completed electric circuit including said magnet and adapted to be closed by a movement of the lever A, as set forth.

482,143. DEVICE FOR PREVENTING RAILWAY COLLISIONS. JOHN SUTHERLIN, Marshfield, Wis. Filed Dec. 15, 1891. Serial No. 415,149. (No model.)

fixed cams acting on the eyelet-pusher, and a lever for closing the mold, which lever is also operated from the above-mentioned rocking shaft, substantially as set forth.

5. In a machine for making buttons from plastic material, the combination, with a slide on the end of which part of the mold is formed, of a lever pivoted in said slide, a rocking shaft operated from said lever, a cam-lever operated from the rocking shaft, and an open section of the mold, which open section is provided with two gripping-jaws for holding an eyelet, said open section of the mold being acted upon by the cam-lever that receives motion from the rocking shaft, substantially as set forth.

pin that can enter a slot in the rear end of the handle-lever, and an eyelet-feeding and mold-closing device operated from the rock-shaft, substantially as set forth.

12. In a machine for making buttons from plastic material, the combination, with a slide on which one section of a mold is formed, of a sliding collar on said mold-section, an eyelet-feeder, an additional mold-section, and a handle-lever pivoted to swing vertically and laterally, which handle-lever operates the sliding collar on the mold-section connected with the slide and also operates the eyelet-feeder and the additional mold-section, substantially as set forth.

an abutment and in which the curved passage G' is formed, and the pipes D and D', the latter extending down through the retort C within the range of the fire and formed with the openings d^3, and the shields d^3, substantially as shown and described, and for the purpose specified.

6. The combination of a partition-wall K, formed with an opening K', and a retort C, formed with the openings C', lugs C^2, and flanges C^3, said partition K closing the space between the retort and the furnace-walls, the fire-pan F, formed with the slotted standards f'', a superheating-chamber G, the under side of which is solid and forms an abutment and in which the curved passage G' is formed, and the pipes D

482,143. DEVICE FOR PREVENTING RAILWAY COLLISIONS.

John Stibbs, Marshfield, Wis. Filed Dec. 15, 1891. Serial No. 415,143. (No model.)

Claim.—1. A device for preventing railway collisions, &c., that consists of an independent frame designed for automatically-detachable connection with a railway-train in advance of the latter and having its sides provided with inclined upper edges, wheels carried on axles that have their bearings loose in guides on the frame, a windlass mechanism that normally supports said frame above the track for said train and wheels, a pivoted striker arranged to extend in advance of the aforesaid frame, and a trip-catch for the windlass mechanism, controlled by the striker, substantially as set forth.

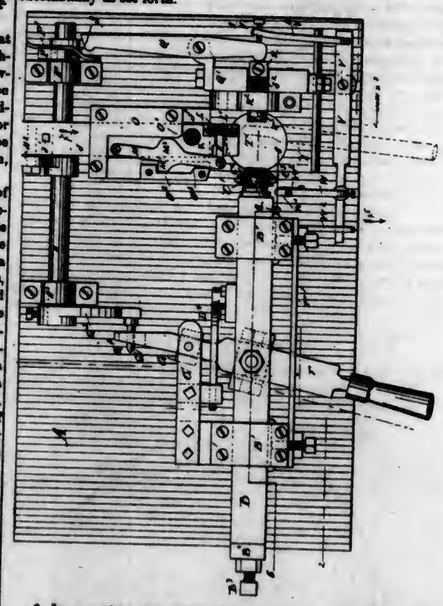
2. A device for preventing railway collisions, &c., that consists of an independent frame designed for automatically-detachable connection with a railway-train in advance of the latter and having its sides provided with inclined upper edges, blocks loose in guides on the frame, wheel-carrying axles having their bearings in the blocks, a shaft arranged intermediate of the axles and provided with drums, antifriction-pulleys on the loose blocks, flexible devices fast at one end to the frame sides, extended over the pulleys, and fastened to the drums to wind thereon in opposite directions, auxiliary antifriction-pulleys arranged over certain of said flexible devices, and an arm extending from said shaft, a trip-catch for engagement with the arm, a pivotal striker arranged to extend in advance of said frame, and a connection between the striker and trip-catch, substantially as set forth.

3. A device for preventing railway collisions, &c., that consists of an independent frame having the sides thereof inclined upon their upper edges, wheels carried on axles loose in guides on the frame, a windlass mechanism that normally supports said frame above the track for said train and wheels, a pivotal coupling-pin controlled by the windlass mechanism and designed for engagement with a locomotive link-bar, a trip-catch for said windlass mechanism, and a pivoted striker that extends in advance of the aforesaid frame and controls said trip mechanism, substantially as set forth.

4. A device for preventing railway collisions, &c., that consists of an independent frame designed for automatically-detachable connection with a railway-locomotive in advance of the latter and having its sides provided with inclined upper edges, wheels carried on axles having their bearings loose in guides on the frame, a windlass mechanism that normally supports said frame above the track for said train and wheels, a pivotal striker arranged to extend in advance of the aforesaid frame, a trip-catch for the windlass mechanism controlled by the striker, and a bar arranged in the path of a brake and throttle-valve controlling lever depending from said locomotive, substantially as set forth.

482,144. MACHINE FOR MAKING BUTTONS FROM PLASTIC MATERIAL.

Max Stern, New York, N. Y., assignor of one-half to Leo Stern, same place. Filed Nov. 6, 1891. Serial No. 411,046. (No model.)



Claim.—1. A machine for making buttons from plastic material, constructed with a slide on the end of which one part of the mold is formed, and a handle-lever for shifting said slide, which lever is pivoted in said slide to swing laterally and is also pivoted in said slide to swing vertically, substantially as set forth.

2. In a machine for making buttons from plastic material, the combination, with a slide on the end of which one part of the mold is formed, of a handle-lever mounted to swing laterally and vertically on said slide, a rocking shaft operated from said handle-lever, an eyelet-feeder operated from said rocking shaft, and a lever for closing the mold, also operated from said rocking shaft, substantially as set forth.

3. In a machine for making buttons from plastic material, the combination, with a mold composed of two sections, of a slide, a handle-lever mounted to swing laterally and vertically on said slide, a rocking shaft operated from said handle-lever, a sliding plate operated from said rocking shaft, an eyelet-holder on said sliding plate, an eyelet-pusher pivoted on said sliding plate, and a lever for closing the mold, which lever is also operated from said rocking shaft, substantially as set forth.

4. In a machine for making buttons from plastic material, the combination, with a mold composed of two sections, of a slide on the end of which one part of the mold is formed, a handle-lever mounted on the slide to swing vertically and laterally, a rocking shaft operated from said handle-lever, a sliding plate connected with the rocking shaft and carrying an eyelet-support, an eyelet-pusher pivoted on said slide, fixed cams acting on the eyelet-pusher, and a lever for closing the mold, which lever is also operated from the above-mentioned rocking shaft, substantially as set forth.

5. In a machine for making buttons from plastic material, the combination, with a slide on the end of which part of the mold is formed, of a lever pivoted in said slide, a rocking shaft operated from said lever, a cam-lever operated from the rocking shaft, and an open section of the mold, which open section is provided with two gripping-jaws for holding an eyelet, said open section of the mold being acted upon by the cam-lever that receives motion from the rocking shaft, substantially as set forth.

6. In a machine for making buttons from plastic material, the combination, with a slide on which one section of a mold is formed, of a sliding clearing-collar on said mold-section, a rocking shaft, a bar connected with said rocking shaft and with the sliding clearing-collar, a hook-arm on said shaft, and a handle-lever pivoted on the slide, which handle-lever is embraced by the hook-arm, substantially as set forth.

7. In a machine for making buttons from plastic material, the combination, with a slide on which one section of a mold is formed, of sliding spring-jaws in the opposite part of the section and a trigger-lever operated from the slide and serving to force outward the spring-jaws in the mold-section, substantially as set forth.

8. In a machine for making buttons from plastic material, the combination, with a slide on which one mold-section is formed, of an opposite mold-section constructed with two spring-jaws, a pivoted lever having an arm adapted to act on the spring-jaws of said mold-section, a projection on the slide, adapted to operate said lever, and an intermediate device interposed between said lever and the spring-jaws, so as to move the spring-jaws forward and permit them to separate, substantially as set forth.

9. In a machine for making buttons from plastic material, the combination, with a slide, of a handle-lever pivoted to said slide to swing laterally and vertically, guide-bars between which the lever can swing laterally, and notches in the edges of said guide-bars to permit the vertical movements of said lever, substantially as set forth.

10. In a machine for making buttons from plastic material, the combination, with a slide, of a handle-lever pivoted in the same to swing laterally and vertically and provided at its rear end with a slot, guide-bars for guiding the handle-lever in its lateral movements, which guide-bars are provided with notches in the edges that permit the vertical movements, a rocking shaft provided with an arm having a pin adapted to enter the slot in the end of the handle-lever, and eyelet-feeding and mold-closing devices operated from the rocking shaft, substantially as set forth.

11. In a machine for making buttons from plastic material, the combination, with a slide, of a handle-lever pivoted in the same to swing laterally and vertically, a slotted pivot through which the handle-lever passes, a rocking shaft provided with an arm having a pin that can enter a slot in the rear end of the handle-lever, and an eyelet-feeding and mold-closing device operated from the rock-shaft, substantially as set forth.

12. In a machine for making buttons from plastic material, the combination, with a slide on which one section of a mold is formed, of a sliding collar on said mold-section, an eyelet-feeder, an additional mold-section, and a handle-lever pivoted to swing vertically and laterally, which handle-lever operates the sliding collar on the mold-section connected with the slide and also operates the eyelet-feeder and the additional mold-section, substantially as set forth.

13. In a machine for making buttons from plastic material, the combination, with a slide, of an eyelet-pusher, a rod having its lower end directly above the pusher, and means for holding said rod, substantially as set forth.

14. In a machine for making buttons from plastic material, the combination, with a mold, of a slide, a rod supported on said slide, an eyelet-pusher on the slide, and an additional rod for holding a series of eyelets and supported from the above-mentioned rod to have its lower end directly above the pusher, substantially as set forth.

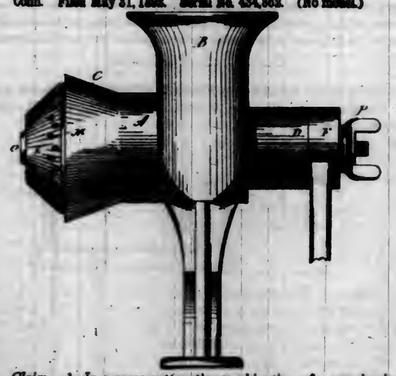
482,145. BURNER.

Edmund T. Wise, London, Canada, assignor of one-fourth to Thomas H. Robinson, same place. Filed Jan. 4, 1892. Serial No. 417,082. (No model.)

Claim.—1. The combination of a partition-wall K, in which the opening K' is formed, and a vaporizing-retort C, in which the centrally-located and inclined or funnel-shaped openings C' are formed, said retort being provided with the flanges C^3, surrounding said openings C', and said partition-wall and retort dividing the chamber into which this apparatus is placed into two apartments, the openings C' through the retort C forming the only communication between the two apartments into which said chamber is divided, with a superheating-chamber G, the under side of which is solid and forms an abutment, and said chamber G being provided with a curved passage G', which communicates with the retort C, and a pipe D', communicating with said passage and extending down through the retort and within the range of the fire, and openings d^3, formed in said pipe D' below said retort, substantially as shown and described, and for the purpose specified.

2. The combination of a partition-wall K, in which an opening K' is formed, and a vaporizing-retort C, in which the centrally-located and inclined or funnel-shaped openings C' are formed, said retort being provided with the flanges C^3, surrounding said openings C', and said partition-wall and retort dividing the chamber into which this apparatus is placed into two apartments, the openings C' through the retort C forming the only communication between the two apartments into which said chamber is divided, a superheating-chamber G, the under side of which is solid and forms an abutment, and said chamber G being provided with a curved passage G', the pipe D, communicating between the retort C and the passage G', and a pipe D', communicating with the passage G and extending down through the retort C and within the range of the fire, and the openings d^3, formed in said pipe D' below said retort, and the shields D^3, surrounding the pipes D and D', substantially as shown and described, and for the purpose specified.

3. The combination of a partition-wall K, formed with the opening K', and the retort C, formed with the openings C' and the flanges C^3, the superheating-chamber G, communicating therewith, and a pipe D', communicating with the said chamber G and extending down through the retort and within the range of the fire and formed with the openings d^3, and said retort formed with the lugs C^3, and a fire-pan F, formed with the slotted standards f^4 and held at the position to which they are or may be adjusted by suitable means whereby the partition-wall, retort, and connections may be raised or lowered to enlarge, reduce, or vary the size of the apartments, substantially as shown and described, and for the purpose specified.



4. The combination of a partition-wall K, formed with an opening K', and a retort C, formed with the openings C' and flanges C^3, said partition K closing the space between the retort and the furnace-walls, a superheating-chamber G, the under side of which is solid and forms an abutment and in which the curved passage G' is formed, and the pipes D and D', the latter extending down through the retort C within the range of the fire and formed with the openings d^3, substantially as shown and described, and for the purpose specified.

5. The combination of a partition-wall K, formed with an opening K', and a retort C, formed with the openings C' and flanges C^3, said partition K closing the space between the retort and the furnace-walls, a superheating-chamber G, the under side of which is solid and forms an abutment and in which the curved passage G' is formed, and the pipes D and D', the latter extending down through the retort C within the range of the fire and formed with the openings d^3, substantially as shown and described, and for the purpose specified.

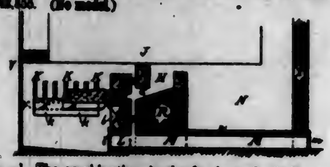
6. The combination of a partition-wall K, formed with an opening K', and a retort C, formed with the openings C', lugs C^3, and flanges C^3, said partition K closing the space between the retort and the furnace-walls, the fire-pan F, formed with the slotted standards f^4, a superheating-chamber G, the under side of which is solid and forms an abutment and in which the curved passage G' is formed, and the pipes D and D', the latter extending down through the retort C within the range of the fire and formed with the openings d^3, substantially as shown and described, and for the purpose specified.

482,146. MEAT-CUTTER.

Oliver D. Woodruff, Southington, Conn. Filed May 31, 1892. Serial No. 434,962. (No model.)

Claim.—1. In a meat-cutter, the combination of a case having a hopper for the introduction of the meat at one end, a spiral follower arranged within the case, the case near its delivery end constructed with internal spiral ribs and the follower with corresponding spiral ribs adapted to operate as cutters upon said spiral ribs within the case, and the spiral ribs on the follower forming grooves between them, the said grooves continued over the delivery end of the follower producing ribs between the grooves which form cutters, combined with a stationary perforated plate, against the inner surface of which the said cutters on the end of the plate will bear, and means for imparting rotation to said follower, substantially as described.

2. The combination of a case having a hopper for the introduction of meat at one end, the opposite end of the case flaring and constructed with spiral ribs upon its inside around said flaring portion, a spiral follower within said case and adapted to revolve therein, the follower extending through the flaring portion of the case and in that flaring portion of the case the follower constructed with a series of spiral ribs coacting with the ribs in the case as cutters, the ribs on the follower producing grooves between them, which grooves are continued over the end of the follower, thereby forming substantially radial cutters on the end of the follower, and a stationary perforated plate in the delivery end of the case, against the inner surface of which the said radial cutters on the follower are adapted to work, substantially as described.



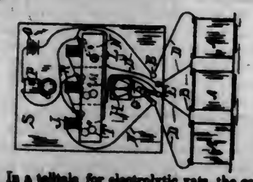
3. The combination of a case having a hopper at one end for the introduction of meat, a spiral follower within the said case, the interior of the case toward its delivery end constructed with spiral ribs upon its inside and the follower constructed with corresponding spiral ribs adapted to co-operate with the spiral ribs in the case as cutters and so as to produce a preliminary cut upon the meat passing through the case, the outer end of the follower of conical shape, the grooves between the said spiral cutting-ribs of the follower continued onto the said conical surface on the end of the follower and so as to form grooves therein, producing cutters on the said conical end of the follower, with a perforated plate outside the end of the follower and of an internal shape corresponding to the conical end of the follower, the said plate stationary and so that the cutters on the said conical end of the follower may work in close contact with the inner surface of said perforated plate, substantially as described.

4. The combination of the case A, having a hopper B for the introduction of the meat at one end, a spiral follower G, arranged longitudinally within the case and extending through the hopper end of the follower and provided with means for imparting revolution to the follower, the interior of the case toward its delivery end constructed with a series of spiral ribs, the follower upon its surface also constructed with a series of spiral ribs corresponding to the spiral ribs on

the interior of the case, the ribs on the follower being adapted to coact with the ribs of the case as preliminary cutters, the grooves formed by the said spiral ribs on the follower continued over onto the end of the follower and so as to produce substantially radial ribs therein to serve as cutters, a perforated plate outside the end of said follower and connected to the case so as to be held stationary against revolution with the follower, a bolt longitudinally through the perforated plate and follower, with a nut upon the opposite end of the follower, adapted through said bolt to draw the perforated plate against the end of the follower, substantially as described.

5. In a meat-cutter, the combination of a case having a hopper for the introduction of meat at one end, a spiral follower arranged longitudinally in the case and so as to revolve therein and adapted to force the meat introduced through the hopper toward the opposite end of the case, a stationary perforated plate on the delivery end of the case, and the follower constructed with radial cutters on the delivery end corresponding to and adapted to work against the inner surface of the perforated plate, the said cutters being made an integral part of the follower, substantially as and for the purpose described.

482,147. BOILER AND FURNACE SETTING. CLARENCE O. ABEY, Cleveland, Ohio. Filed Dec. 10, 1891. Renewed Aug. 12, 1892. Serial No. 442,855. (No model.)



Claim.—1. The combination, in the fire-box of a boiler or other furnace, of narrow ascending side pockets with a large lower connecting pocket whose axis is nearly parallel with the surface of the grate, with a duct at the back edge of the grate and near its level, with an arch or lintel directly over this duct that does not extend up to the boiler or roof of furnace, with a descending duct immediately behind this arch or lintel, with an ascending duct immediately below the descending duct, which is connected into a chamber at the rear underneath the rear combustion-chamber, this under chamber connecting with the air outside by means of a regulating-door, with a nearly horizontal duct just in the rear of the duct from the back edge of the grate, with a chamber at the back of this duct which opens only into this duct and at its upper back surface, with a wall between the descending duct and the last-named chamber, resting upon an arch or lintel over the rear horizontal duct and extending up tight to the boiler or roof of furnace.

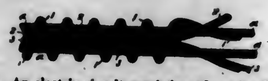
2. The combination, in the fire-box of a boiler or other furnace, of a duct from the back edge of the grate, with another duct intersecting the first duct and connecting at its top with the fire-chamber and at its bottom with a chamber connected with the outer air, with a wall over the first duct and in the rear of the second duct, which extends up tight to the boiler or roof of the furnace.

3. The combination, in the fire-box of a boiler or other furnace, of a bridge-wall running above the grate-level, with a duct at about the grate-level, with a damping-plate forming the floor of said duct, with a wall slightly in the rear of the bridge-wall, resting on an arch or lintel and continuing up tight to the boiler or roof of the furnace.

4. The combination, in the construction of the combustion-chambers of a boiler or other furnace, of two ducts from the fire-chamber, one above the other, with a duct passing from outside under the rear combustion-chamber, with a duct passing into the rear combustion-chamber, all four ducts meeting at a common point.

482,148. TELLTALE FOR ELECTROLYTIC REFINERIES. FRANCIS B. BADT, Chicago, Ill., assignor of two-thirds to Lester S. Ellis and A. M. Scarles, same place. Filed May 16, 1892. Serial No. 433,150. (No model.)

Claim.—1. In a telltale for electrolytic vats, the combination of a series of vats connected in series with a meter, conductors leading from the terminal of each vat, and a movable circuit-closer connected with the terminals of the meter and adapted to successively engage such conductors from the vats, so that the meter is successively placed in a local circuit with each vat without disturbing the circuit of the rest of the vats.



2. In a telltale for electrolytic vats, the combination of a series of vats coupled in series with a series of visual signaling devices, each in a normally-closed local circuit, including itself and one vat.

3. In a telltale for electrolytic vats, the combination of a series of vats coupled in series with a series of visual signaling devices, each in a normally-closed local circuit, including itself and one vat, and a meter, and a circuit-closer adapted to switch said meter successively into each of such local circuits, as desired.

4. In a telltale for electrolytic vats, the combination of a series of vats coupled in series with a series of visual signaling devices, each in a normally-closed local circuit, including itself and one vat, an audible signaling device adapted to be closed upon the operation of any visual device.

5. In a telltale for electrolytic vats, the combination of a series of vats coupled in series with a series of visual signaling devices, each in a normally-closed local circuit, including itself and one vat, an audible signaling device adapted to be closed upon the operation of any visual device, and a meter and a circuit-closer therefor adapted to successively cut said meter into each of such local circuits.

482,149. ELECTRICAL CIRCUIT AND CABLE. JOHN A. BARRETT, Brooklyn, N. Y., assignor to the Standard Underground Cable Company, Pittsburg, Pa. Filed Jan. 8, 1891. Serial No. 377,066. (No model.)

Claim.—1. An electric circuit consisting of a pair of naked conductors and a single mesh of cord, tape, or similar insulating material woven between and about said conductors, with a greater thickness of the woven insulating material between the conductors than about the same, substantially as described.

2. An electric circuit consisting of a pair of naked conductors and a single mesh of cord, tape, or similar insulating material woven between and about the conductors and constructed to form a flat-band circuit, with a greater thickness of the woven insulating material between than about the conductors, substantially as described.

3. An electric circuit consisting of a pair of naked conductors, one or more strands of cord, tape, or similar insulating material lying between the conductors, and one or more strands wound about the conductors and intermediate strand or strands and crossing the latter alternately on opposite sides, substantially as described.

4. An electric circuit consisting of a pair of naked conductors, one or more strands of cord, tape, or similar insulating material lying between the conductors, and one or more strands of similar material wound about the conductors and intermediate strand or strands and crossing the latter alternately on opposite sides, said strands being constructed and arranged to form a greater thickness of insulating material between than outside the conductors, substantially as described.

5. An electric circuit consisting of a pair of naked conductors, two strands of cord, tape, or similar insulating material lying between the conductors, and a single strand wound about the conductors and intermediate strands and crossing the latter alternately on opposite sides, substantially as described.

6. In an electric cable, the combination of a plurality of independent circuits, each circuit consisting of a pair of conductors woven in a single mesh of cord, tape, or other insulating material, with a greater thickness between the conductors than outside the same, substantially as described.

7. In an electric cable, the combination of a plurality of independent circuits, each circuit consisting of a pair of conductors woven in a single mesh of cord, tape, or other insulating material, with two strands between the conductors and one strand outside the same, substantially as described.

8. An electric cable consisting of a plurality of independent circuits, each circuit consisting of a pair of conductors woven into a flat band, with a greater thickness of insulating material between the conductors of the same circuit than between those of different circuits, substantially as described.

9. In an electric cable, the combination of a plurality of electric circuits, each circuit consisting of a pair of naked conductors insulated by being woven in a single mesh of cord, tape, or other insulating material, forming an air-containing serving, an envelope about each circuit preventing or retarding the passage of the sealing material, a protecting-sheath inclosing the enveloped circuits, and sealing material filling the space between the envelopes and sheath, substantially as described.

10. In an electric cable, the combination of a plurality of electric

circuits, each circuit consisting of a pair of conductors woven in a single mesh of cord, tape, or other insulating material, forming an air-containing serving, with a greater thickness of insulating material between than outside the conductors, an envelope about each circuit preventing or retarding the passage of the sealing material, a protecting-sheath inclosing the enveloped circuits, and sealing material filling the space between the envelopes and sheath, substantially as described.

11. In an electric cable, the combination of a plurality of electric circuits, each circuit consisting of a pair of conductors insulated by an air-containing serving, with a greater thickness of insulation between than outside the conductors, and an envelope about each circuit, substantially as described.

482,150. ELECTRIC CONDUCTOR. JOHN A. BARRETT, Brooklyn, N. Y., assignor to the Standard Underground Cable Company, Pittsburg, Pa. Filed Jan. 8, 1891. Serial No. 377,067. (No model.)

Claim.—1. An electric conductor or group of conductors having a covering of paper, cloth, or other flexible material provided with tucks extending transversely to the lines of flexure, substantially as described.

2. An electric conductor or group of conductors having a covering consisting of a strip of paper, cloth, or other flexible material wound about the conductor or group of conductors and provided with tucks extending transversely to the lines of flexure, substantially as described.

3. An electric conductor or group of conductors having a covering consisting of a strip of paper, cloth, or other flexible material wound spirally about the conductor or group of conductors and provided with tucks extending transversely to the lines of flexure, substantially as described.

4. An electric conductor or group of conductors having a covering consisting of a strip of paper, cloth, or other flexible material wound spirally about the conductor or group of conductors and provided with tucks extending transversely to the lines of flexure, the overlapping edges of the successive windings being gummed together, substantially as described.

5. An electric conductor or group of conductors surrounded by a spiral wrapping formed of the flexible strip *c*, having the longitudinal tuck 1, substantially as described.

6. An electric conductor or group of conductors surrounded by a spiral wrapping formed of the flexible strip *c*, having the longitudinal tuck 1 and the fold 4 parallel thereto, the sections formed by the tuck and fold overlapping, substantially as described.

7. An electric conductor or group of conductors surrounded by a spiral wrapping formed of the flexible strip *c*, having the longitudinal tuck 1 and the fold 4 parallel thereto, the sections formed by the tuck and fold overlapping and being gummed together, substantially as described.

8. A wrapping consisting of a strip of paper *c*, or other flexible material, provided with tucks extending transversely to the lines of flexure of the applied wrapping, substantially as described.

9. A spiral wrapping consisting of the flexible strip *c*, having the longitudinal tuck 1, substantially as described.

10. A spiral wrapping consisting of the flexible strip *c*, having the longitudinal tuck 1 and fold 4 parallel thereto, substantially as described.

11. A spiral wrapping consisting of the flexible strip *c*, having the longitudinal tuck 1 and fold 4 parallel thereto, forming comparatively wide sections 2 3, and narrow section 5, lying in a plane intermediate of the planes of the other two sections, substantially as described.

482,151. ELECTRIC CONDUCTOR. JOHN A. BARRETT, Brooklyn, N. Y., assignor to the Standard Underground Cable Company, Pittsburg, Pa. Filed July 17, 1891. Serial No. 399,796. (No model.)

Claim.—1. In an electric cable, the combination of a plurality of independent circuits, each circuit consisting of a pair of conductors formed into a single oblong strand, the distance between conductors of the same circuit being greater than that between conductors of adjacent circuits, substantially as described.

2. In an electric cable, the combination of a plurality of independent circuits, each circuit consisting of a pair of conductors formed into a single strand by a covering of paper or other insulating material applied about both conductors and secured to hold the conductors at a distance apart greater than the distance between conductors of adjacent circuits in the cable, substantially as described.

3. In an electric cable, the combination of a plurality of independent circuits, each circuit consisting of a pair of conductors formed into a single oblong strand by a covering of paper or other insulating material applied about both conductors and secured to hold the conductors at a distance apart greater than the distance between the conductors of adjacent circuits in the cable, substantially as described.

4. An electric cable consisting of an inclosing sheath and a plurality of independent circuits, each circuit consisting of a pair of conductors formed into a single oblong strand, the distance between conductors of the same circuit being greater than that between conductors of adjacent circuits, substantially as described.

5. An electric cable consisting of an inclosing sheath and a plurality of independent circuits, each circuit consisting of a pair of conductors formed into a single oblong strand by a covering of paper or other insulating material applied about both conductors and secured to hold the conductors at a distance apart greater than the distance between the conductors of adjacent circuits in the cable, substantially as described.

6. A plurality of conductors having a covering consisting of a strip formed of one or more layers of paper or other insulating material wrapped about and inclosing all the conductors and having its opposite sides secured together between the conductors to hold them in place, substantially as described.

7. A plurality of conductors having a covering of paper or other insulating material applied about the conductors and a binding strip or strips between the conductors, the covering and binding strip or strips being secured together between the conductors to hold them in place, substantially as described.

8. A plurality of conductors having a covering of paper or other insulating material applied about the conductors, and a binding strip or strips applied outside the wrapper between the conductors, the covering and binding strip or strips being secured together between the conductors to hold them in place, substantially as described.

9. A pair of conductors having a covering consisting of one or more strips of paper or other insulating material wrapped about both conductors and a binding strip or strips between the conductors, the wrapping and binding strip or strips being secured together between the conductors to hold them in place, substantially as described.

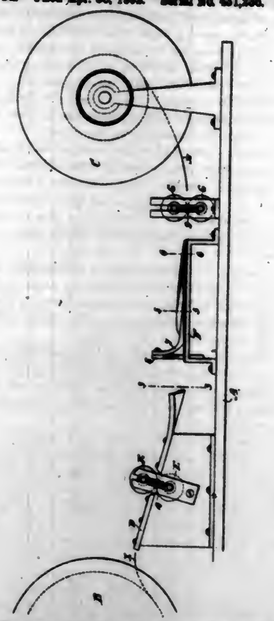
10. A pair of conductors having a covering consisting of one or more strips of paper or other insulating material applied straight and wrapped about both conductors with the edges overlapping between the conductors and having the plies secured together between the conductors to hold them in place, substantially as described.

11. A pair of conductors having a covering consisting of one or more strips of paper or other insulating material applied straight and wrapped about both conductors with the edges overlapping between the conductors and a binding strip or strips between the conductors, the wrapping and strip or strips being secured together between the conductors by sewing or gumming to hold them in place, substantially as described.

482,152. ELECTRIC CIRCUIT AND CABLE. JOHN A. BARRETT, Brooklyn, N. Y., assignor to the Standard Underground Cable Company, Pittsburg, Pa. Filed Aug. 28, 1891. Serial No. 403,963. (No model.)

Claim.—1. An anti-induction circuit consisting of a pair of flat conductors arranged edgewise with relation to each other, substantially as described.

2. A single-strand anti-induction electric circuit consisting of a pair of flat conductors held in position edgewise with relation to each other, substantially as described.



3. A single-strand anti-induction electric circuit consisting of a pair of flat conductors held in position edgewise with relation to each other by insulating material between and about the conductors, substantially as described.

4. An electric cable consisting of a group of flat conductors forming a plurality of anti-induction circuits and arranged with the conductors of the same circuits edgewise with relation to each other, substantially as described.

5. An electric cable consisting of a plurality of single-strand anti-induction circuits, each circuit consisting of a pair of flat insulated conductors held in position edgewise with relation to each other, substantially as described.

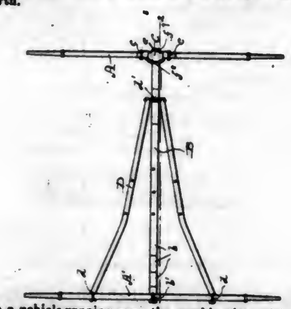
6. A group of flat conductors forming a plurality of anti-induction circuits and arranged with the conductors of the same circuits edgewise with relation to each other, substantially as described.

482,153. MACHINE FOR FOLDING TAPE. JOHN A. BARRETT, Brooklyn, N. Y., assignor to the Standard Underground Cable Company, Pittsburg, Pa. Filed Apr. 30, 1892. Serial No. 431,296. (No model.)

Claim.—1. The combination, with the external guide *a*, having one or more inwardly-curved wings 5 6, of internal guide *b*, over which said wings are curved, having one or more wings 9, curved outwardly over wings 5 6, substantially as described.

2. The combination, with external guide *a*, having one or more inwardly-curved wings 5 6, and internal guide *b*, over which said wings are curved, having one or more wings 9, curved outwardly over said wings 5 6, of guide D, having curved slot 2, through which the strip is led to the guides *a b*, substantially as described.

3. The combination, with the external guide *a*, having one or more inwardly-curved wings 5 6, and internal guide *b*, over which said wings are curved, having one or more wings 9, curved outwardly over said wings 5 6, of guide D, having curved slot 2, through which the strip is led to the guides *a b*, and marking-rolls E, by which the fold-lines are marked, substantially as described.



4. The combination, with the external guide *a*, having one or more inwardly-curved wings 5 6, and internal guide *b*, over which said wings are curved, having one or more wings 9, curved outwardly over said wings 5 6, of guide D, having curved slot 2, through which the strip is led to the guides *a b*, marking-rolls E, by which the fold lines are marked, and pressing-rolls G, substantially as described.

5. The combination, with reel B for the unfolded strip and driven winding-reel C, of guide D, having curved slot 2, marking-rolls E, by which the fold-lines are marked, external guide *a*, having one or more inwardly-curved wings 5 6, internal guide *b*, over which said wings are curved, having one or more wings 9, curved outwardly over wings 5 6, and pressing-rolls G between the guides and winding-reel, substantially as described.

482,154. VEHICLE RUNNING-GEAR. CHARLES S. BURNS, Racine, Wis. Filed Mar. 26, 1892. Serial No. 426,706. (No model.)

Claim.—1. In a running-gear, the combination, with the front and rear axles, of a spring-reach connecting said axles and having a flexible connection with the front one of said axles and side springs engaged with the rear axle upon opposite sides of the reach and connected together at their front ends by a transverse rod or bolt arranged to movably engage with the forward part of said spring-reach, substantially as set forth.

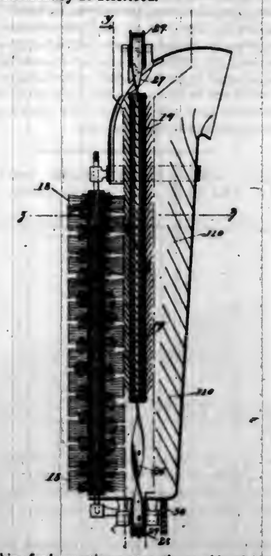
2. In a running-gear, the combination, with the front and rear axles, of a spring-reach engaged at its rear end with the rear axle and having a flexible connection at its front end with the front axle, and side springs engaged with the rear axle upon opposite sides of the reach, said springs being arranged to converge toward their forward ends, and a transverse rod or bolt connecting the forward ends of said side springs and arranged to rest in movable engagement with the upper surface of the forward portion of said spring-reach, substantially as set forth.

3. In a vehicle running-gear, the combination, with the front and rear axles, of a spring-reach comprising two or more leaves arranged one upon another, said spring-reach being connected rigidly with the rear axle and flexibly with the front axle, side springs each comprising one or more leaves and connected with the rear axle upon opposite sides of the reach and converging toward their front ends, and a transverse connection between said front ends adapted to rest in movable engagement with the forward part of said spring-reach, said spring-reach and said side springs being bent upwardly toward their central portions, so as to afford a support for the body of the vehicle above the body of the axles, substantially as set forth.

4. In a vehicle running-gear, the combination, with the front and rear axles, of a spring-reach composed of two or more leaves and rigidly connected at its rear end with the rear axle and flexibly connected at its forward end with the front axle, side springs engaged with said rear axle upon opposite sides of the reach and converging toward their forward ends, and a transverse rod or bolt connecting the forward ends of said springs and adapted to be arranged to rest in movable engagement with the upper surface of the forward part of the reach, substantially as set forth.

5. In a vehicle running-gear, the combination, with the front and rear axles, of a reach connecting the same and provided with a flat extension, a plate secured to the front axle and provided with a recess or depression adapted for the reception of said extension of the reach, and stops upon said extension adapted to engage with the front and rear sides of said plate, substantially as set forth.

6. In a vehicle running-gear, the combination, with the front and rear axles, of a reach connecting the same and provided at its forward end with a flat extension, a plate adapted to be secured upon the top of the front axle and provided with a recess for the reception of said extension of the reach, an angular projection on the forward side of said plate, an extension on the rear side of said plate constructed in the form of an arc of a circle, an upturned end on the said extension of the reach adapted for engagement with said angular projection, and a stop on said reach adapted for engagement with the extension on the rear of said plate, substantially as set forth.



7. In a vehicle running-gear, the combination, with the front and rear axles, of a spring-reach comprising two or more flat leaves, an extension on the front end of the lower leaf, a plate adapted for engagement upon the top of the front axle and provided with a recess for the reception of said extension and provided with an angular projection on its front side and with a projection on its rear side constructed in the form of an arc of a circle, and an upturned ear or stop on the front end of the extension of said lower leaf adapted for engagement with the angular projection on the front of said plate, and the second leaf of the reach being arranged to engage with said rearward projection on said plate, substantially as set forth.

482,155. TRANSMITTER FOR FIBROUS MATERIAL. GERARD BERKMAN, New York, N. Y. Filed Apr. 22, 1891. Serial No. 389,982. (No model.)

Claim.—1. In a transmitter for fibrous material, barbs projecting from the inclosing case inwardly and in the direction of transmission, in combination with one or more spirally-reciprocating actuators having barbs projecting outwardly and in the direction of transmission and means for actuating the same, substantially as described.

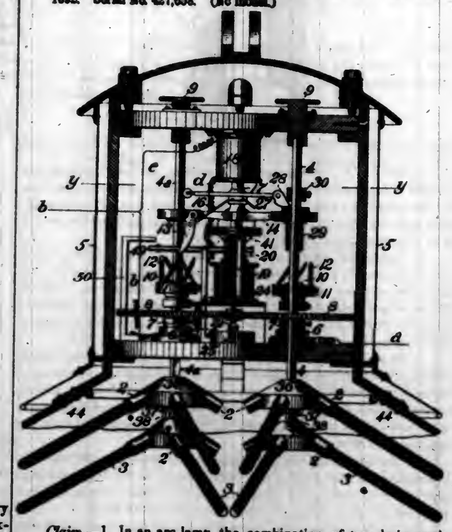
2. The machine for producing a spiral reciprocating motion, which consists of a driving sheave or wheel and means for rotating the same first in one direction and then in the other, in combination with an idle sheave or wheel and a twisted band passing around said wheels, substantially as described.

3. In a transmitter for fibrous material, the combination of a transmitting-channel and a spirally-reciprocating actuator provided with barbs projecting in the direction of transmission, partly exposed to the exterior of the channel, adapted to feed the material both laterally into and longitudinally through the said channel, with means for operating the same, substantially as described.

4. In a machine for harvesting cotton, the combination of a rotary brush or adjacent pair thereof for removing the cotton from the pickers, a transmitting-channel, and a spirally-reciprocating actuator provided with barbs projecting in the direction of transmission and adapted to catch the cotton from said brushes and carry the same through said channel with means for operating the same, substantially as described.

5. In a machine for harvesting cotton, the combination of rotary pickers, a transmitting-channel, two spirally-reciprocating actuators having barbs projecting on their adjacent sides in the direction of transmission, and two cylindrical brushes rotating toward the channel on their adjacent sides in contact with the actuators, adapted to strip the cotton from the pickers, said actuators adapted to catch the cotton from the brushes and feed it both laterally into and longitudinally through the said channel and mutually to clean each other, with means for operating the same, substantially as described.

482,156. COTTON-HARVESTER. GERARD BERKMAN, New York, N. Y. Original application filed Nov. 15, 1890, Serial No. 371,535. Divided and this application filed Apr. 22, 1891. Serial No. 389,934. (No model.)



Claim.—1. In a machine for harvesting cotton, two or more flexible shafts supported by the same elastic arm, each shaft being connected at one end to a separate rotating device J and at the other end to a separate picking device X', projecting from said arm, substantially as described.

2. In a machine for harvesting cotton, an elastic arm containing two or more flexible shafts X, in combination with the end piece *d*, having apertures through which project picking devices, substantially as described.

3. In a machine for harvesting cotton, the flexible arm consisting of a rigid tube N, terminating at its upper end in an elastic portion and at its lower end bearing a plurality of elastic tubular fingers, and flexible shafts terminating in pickers, supported thereby, substantially as described.

482,157. ELECTRIC-ARC LAMP. JOHN T. BIRCH, Pittsburg, assignor of one-half to William B. Henderson, Ingram, Pa. Filed Apr. 4, 1892. Serial No. 427,658. (No model.)

Claim.—1. In an arc lamp, the combination of two hubs, each provided with radially-arranged holders for carbon rods, a series of cam projections connected to the shafts carrying the hubs, and reciprocating dogs engaging said projections and thereby rotating the shafts and hubs, substantially as set forth.

2. In an arc lamp, the combination of two hubs, each provided with radially-arranged holders for carbon rods, a series of cam projections connected to the vertical shafts carrying the hubs, dogs operative by gravity and adapted to engage said projections, and a solenoid for raising the dogs, substantially as set forth.

3. In an arc lamp, the combination of two hubs, each provided with radially-arranged holders for the carbon rods, a series of cam projections connected to the vertical shafts carrying the hubs, dogs operative by gravity and adapted to engage said projections, a solenoid for raising the dogs, and means operative by an electric magnet for moving the hubs in a direction contrary to that imparted by the dogs, substantially as set forth.

4. In an arc lamp, the combination of two hubs, each provided with a series of radially-arranged holders for the carbon rods, a series of cam projections connected with the vertical shafts carrying the hubs, dogs operative by gravity and adapted to engage the cam projections, a solenoid for raising the dogs, and a switch movable with the dogs and operative to direct the current through the solenoid as the dogs approach the lower limit of the movement and to break the current through the solenoid as the dogs reach the upper limit of their movement, substantially as set forth.

5. In an arc lamp, the combination of two hubs, each provided with radially-arranged sockets for carbon rods, mechanism for rotating said hubs so as to bring the carbon rods into operative relation to each other successively, auxiliary hubs provided with radially-arranged sockets, and connections between the main and auxiliary hubs, whereby the auxiliary hubs may be rotated by the main hubs after the latter have made one revolution, substantially as set forth.

6. In an arc lamp, the combination of an electric magnet having a conducting-spool and included in the shunt-circuit of the lamp, an armature operative on an abnormal increase in the current through the magnet, and a contact-piece connected to the main circuit, substantially as set forth.

482,158. WARDROBE-BED. ADELBERT M. BRAINARD, Chicago, Ill. Filed Oct. 19, 1891. Serial No. 409,206. (No model.)

482,158.

Claim.—1. In combination with the casing, the bed-frame jointed thereto to turn upward and downward, the mattress-frame hinged to the bed-frame to swing inward and outward, and means for automatically and positively controlling this motion of the mattress-frame as it is carried up and down with the bed-frame.

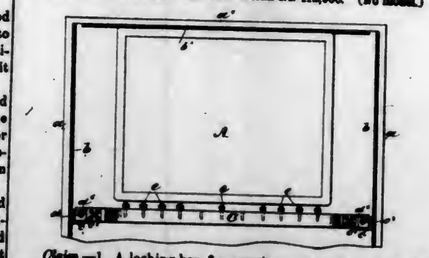
2. The casing and the bed-frame jointed thereto to turn upward and downward, in combination with the mattress-frame jointed to the bed-frame to move inward and outward at the head end and rails or guides whereon said end travels, whereby the motion of the mattress-frame in relation to the bed-frame is controlled and a balancing action of the parts secured.

3. In combination with the casing, the gravitating head-board thereto, the bed-frame sustained and guided, respectively, by the horizontally and the vertically movable pivots, the mattress-frame jointed thereto, the tracks whereon the mattress-frame is sustained during part of its movements, and supports F, whereon it is sustained during the remainder of its movements.

4. The casing and the bed-frame jointed thereto to fold therein, in combination with the mattress-frame hinged to the bed-frame and provided with rollers, the track whereon said rollers travel, and the fixed rollers whereon the mattress-frame pivots and slides.

5. In combination, the casing, the gravitating head-board, the bed-frame sustained by shifting pivots, the mattress-frame hinged to the bed-frame and having the shoulders or inclines, and the fixed rollers or bearings on which the mattress-frame bears at its free end.

482,159. WARDROBE-BEDSTEAD. ADELBERT M. BRAINARD, Chicago, Ill. Filed Oct. 19, 1891. Serial No. 409,211. (No model.)



Claim.—1. In a folding bed, the combination of the casing, the arms or levers jointed thereto to turn upward and downward, the bed-frame jointed to the levers and provided with rollers, the rails whereon the rollers travel, and connections through which the rails are elevated at one end as the bed is extended.

2. In a folding bed, the casing and the rising and falling head-board thereto, in combination with the lever jointed to the casing to turn upward and downward, the bed-frame jointed to the levers, the track-rails to sustain the end of the bed-frame, and the connection from the rails to the head-board, substantially as shown.

3. In a folding bed, a bed-frame mounted to turn upward and downward, in combination with track-rails against which the end of the bed-frame rides and connections between the head-frame and track-rails through which these rails are positively elevated to offer an increasing resistance as the bed-frame is turned downward.

4. The casing, the gravitating head-board, and the arms or levers having studs mounted in horizontal and vertical guides in the casing, in combination with the bed-frame pivoted to the arms, the pivoted rails arranged to sustain and guide the end of the bed-frame, and the connection between the head-board and rails.

482,160. LOCKING-BAR FOR CHASES. JOHN S. BROWN, Jersey City, N. J. Filed Nov. 24, 1891. Serial No. 412,990. (No model.)

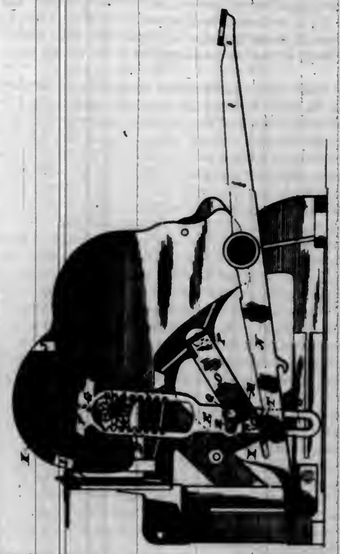
Claim.—1. A locking-bar for securing a chase in position on a press-bed, comprising a bar C, having locking-jaws *c* mounted one in each end of said bar, and eccentrics *d*, journaled rotatively in the bar, said eccentrics engaging apertures in the respective jaws, substantially as set forth.

2. The combination, with a press-bed having flanges at its sides, of a chase locking-bar extending transversely across the bed and resting thereon, said bar having jaws *c* mounted in its respective ends and each adapted to be driven outward in two directions by eccentrics, the said eccentrics mounted rotatively in the bar and engaging circular apertures in the respective jaws, as set forth.

3. A locking-bar for securing a chase in position on a press-bed, comprising a bar C, having pointed screws *e* set in its edge or face adjacent to the chase, a movable jaw *c*, mounted in each end and adapted to be protruded by an eccentric, and eccentrics mounted in the respective ends of the bar and engaging apertures in said jaws, substantially as set forth.

482,161. COMPLETE-STROKE MECHANISM FOR CASH-REGISTERS. THOMAS CARNEY, Dayton, Ohio, assignor to the National Cash Register Company, same place. Filed May 21, 1892. Serial No. 433,836. (No model.)

Claim.—1. The combination of a revoluble pinion, two reciprocating racks adapted to alternately engage the pinion, means for shifting the racks at the opposite ends of their strokes to disengage one rack from the pinion and engage the other with it, means for holding the racks in their shifted positions, a ratchet revoluble with the pinion, and a pawl co-operating with the ratchet, substantially as described.



2. The combination of a series of operating-keys, a movable bar common to all of the keys, to which bar the keys become attached when operated, a revoluble pinion, two reciprocating racks actuated by said movable bar and adapted to alternately engage the pinion, means for shifting the racks at the ends of their strokes to disengage one rack from the pinion and engage the other with it, means for holding the racks in their shifted positions, a ratchet revoluble with the pinion, and a pawl co-operating with the ratchet, substantially as and for the purpose described.

3. The combination of a series of operating-keys, a movable bar common to all of the keys, to which bar the keys become attached when operated, a revoluble pinion, two reciprocating racks actuated by said movable bar and adapted to alternately engage the pinion, means for shifting the racks at the ends of their strokes to disengage one rack from the pinion and engage the other with it, a projection moving with the racks and co-operating with a fixed guide-rib for holding the racks in their shifted positions, a ratchet revoluble with the pinion, and a pawl co-operating with the ratchet, substantially as and for the purpose described.

4. The combination of a series of operating-keys, a movable bar

common to all of said keys, a revoluble pinion, two reciprocating racks actuated by said movable bar and adapted to alternately engage the pinion, means for shifting the racks at the ends of their strokes to disengage one rack from the pinion and engage the other with it, and means for holding the racks in their shifted positions, whereby the successive operations of the keys will rotate the pinion in the same direction, substantially as described.

5. The combination of a series of operating-keys, a movable bar common to all of said keys, a revoluble pinion, two reciprocating racks actuated by said movable bar and adapted to alternately engage the pinion, means for shifting the racks at the ends of their strokes to disengage one rack from the pinion and engage the other with it, and a projection moving with the racks and co-operating with a fixed guide-rib to hold the racks in their shifted positions, substantially as described.

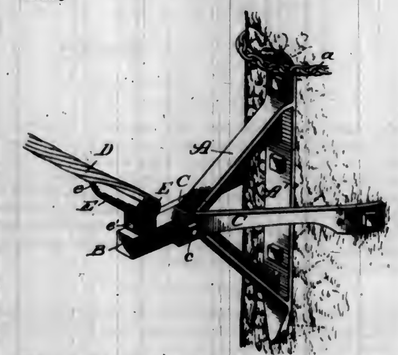
6. The combination of the reciprocating racks C D, interposed pinion B, ratchet U, moving with the pinion, pawl V, springs K L, rib H, and projection G, carried by the racks and co-operating with the rib H, substantially as described.

7. The combination of the revoluble shaft A, the pinion B, fast thereon, the reciprocating plate E, carrying the racks C D upon opposite sides of the pinion B, the cross-plate F, connecting the upper ends of the racks, the springs K L, co-operating with the plate F, the rib H, and the projection G on the plate F co-operating with the rib H, substantially as described.

8. The combination of the revoluble shaft A, the pinion B and ratchet U fast thereon, the pawl V, the reciprocating plate E, carrying the racks C D on opposite sides of the pinion, the plate F at the upper ends of the racks, the springs K L, the rib H, and the projection G on the plate F co-operating with the rib H, substantially as described.

9. The combination of the pinion B, the reciprocating plate E, carrying the racks C D on opposite sides of said pinion, the plate F at the upper ends of the racks, the springs K L, the rib H, the projection G on the plate F co-operating with the rib H, the key-levers N, and the vibrating cross bar or frame common thereto and connected to the plate E, substantially as described.

10. The combination of the pinion B, the ratchet U, moving therewith, the pawl V, the reciprocating plate E, carrying the racks C D on opposite sides of the pinion B, the plate F at the upper ends of the racks, the springs K L, the rib H, the projection G on the plate F co-operating with the rib H, the vibrating cross bar or frame, and the series of key-levers adapted to be coupled to said bar when displaced from normal position, substantially as described.



11. The combination of the revoluble shaft A, the pinion B, and ratchet U fast thereon, the pawl V, the reciprocating plate E, carrying the racks C D on opposite sides of the pinion B and provided at its lower end with the longitudinal slot S, embracing the stud T on the frame, the plate F at the upper ends of the racks, the springs K L, the rib H, the projection on the plate F co-operating with the rib H, the series of key-levers N, provided with hooks X, and the vibrating frame having the flange W co-operating with said hooks and provided, also, with a pin Q, engaging the transverse slot R in the plate E, substantially as described.

482,162. SAWBUCK. JOSEPH CHATTAWAY, Petoskey, Mich. Filed Feb. 10, 1892. Serial No. 420,990. (No model.)

Claim.—In combination with a sawbuck, a toothed dog pivoted to the cross-legs at or near the intersection thereof and extending vertically between them when in normal position and under spring tension, substantially as described.

482,163. HANGER OR SUPPORT FOR LOG-CARRIERS, &c. GEORGE W. COLE, Chicago, Ill. Filed Sept. 9, 1891. Serial No. 405,208. (No model.)

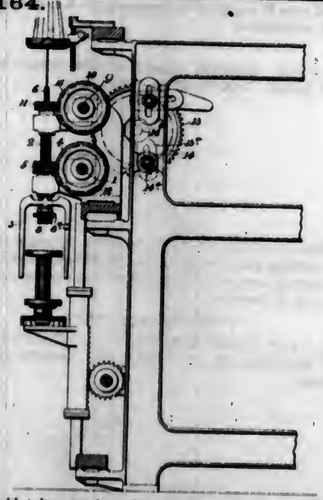
Claim.—1. A track-supporting hanger comprising a frame provided with an arm, a socket in such arm, and jaws adapted to engage with the track and provided with shanks fitting into such socket, substantially as described.

2. A track-supporting hanger comprising a frame having an extending arm, a socket in such arm, and jaws having shanks entering such socket, such jaws being clamped upon the track, the external curve of the jaws corresponding with the curve of the track, whereby the more even running of the vehicle is facilitated, substantially as described.

3. A track-supporting hanger for lumber-carriers, &c., comprising a triangular frame carrying an arm, a socket in such arm, and jaws supported in such socket and adapted to be clamped upon the track, such jaws being beveled at their ends to permit the wheels of the carriage to pass them without jar, substantially as described.

4. The combination of a triangular frame provided with an extending arm, a socket in such arm, jaws for engaging with the track, supported in such socket and provided with means for clamping them against the track, and side braces secured to the support and fastened to the frame to prevent any sidewise movement thereof, substantially as described.

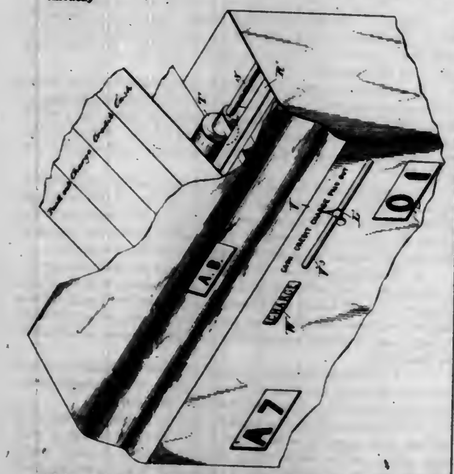
5. A track-supporting hanger provided with an extending arm, a socket in such arm, and jaws adapted to engage with the track, rotatably supported in such socket, substantially as described.



6. The combination of a track-supporting hanger provided with an arm, jaws engaging with the track and held in a socket in such arm, and a double load-carrying sheave traveling on such track, whereby the jar of passing one of the jaws is lessened and the load steadied, substantially as described.

482,164. TWISTING-FRAME. ARRAN COMBE, Belfast, Ireland. Filed June 30, 1891. Serial No. 397,804. (No model.)

Brief.—The fliers and the haul-pulleys of the twisting-frame are both driven from a main shaft by means of worm-gearing, between such shaft and the haul-pulleys there being an intermediate shaft mounted upon an adjustable bracket, whereby gear-wheels of varying diameters may be employed.



Claim.—In a twisting-frame, and in combination, a main shaft carrying worm-wheels, supporting-tubes, fliers carried thereby, worm-

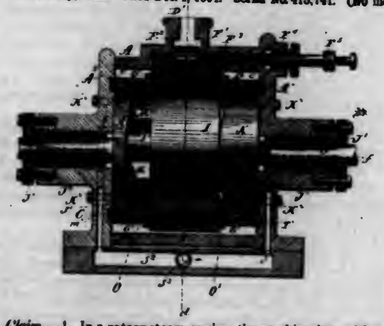
482,164.

wheels on said tubes gearing with the worms on the main shaft, a second shaft carrying worm-wheels, yarn-tubes carrying worm-wheels gearing with the worms on the second shaft, haul-pulleys driven by gearing from said yarn-tubes, and the means for communicating the motion from the shaft 1 to the shaft 9, including the gear-wheels 13 14 on the short shaft 14^a, gearing, respectively, with the gears on the shafts 1 and 9, and the bracket 14^b, carrying said shaft 14^a, said bracket being slotted and adjustable longitudinally and laterally on its holding-bolt, substantially as described.

482,165. CASH REGISTER, INDICATOR, AND RECORDER. Hugo Cook, Dayton, Ohio. Filed June 3, 1891. Serial No. 395,589. (No model.)

Claim.—1. In a cash register and indicator, the combination of a type wheel or carrier bearing upon its periphery a series of numbers representing different values, a second type wheel or carrier arranged beside the first type-wheel and bearing upon its periphery a series of type letters or characters, a driving mechanism for said wheels, capable of connection therewith and disconnection therefrom, and two series of keys co-operating with the driving mechanism to determine the extent of movement imparted by it to the type-wheels, one of said series of keys bearing numbers corresponding to those upon the first type-wheel and the other bearing letters or characters corresponding to those upon the second type-wheel, and a platen co-operating with the type-wheels, whereby at each operation of the machine both the amount of the sale and the letter or character designating the clerk who made it may be printed upon a paper strip or ticket interposed between the platen or type-wheels.

2. In a cash register and indicator, the combination of an indicator bearing a series of numbers representing different values, a type wheel or carrier bearing upon its periphery a corresponding series of type-numbers and moving in unison with the indicator to simultaneously bring to the indicating-point a given number on the indicator and to the printing-point a corresponding number upon the type-wheel, a second indicator bearing a series of letters or characters, a second type-wheel bearing upon its periphery corresponding type letters or characters and moving in unison with the indicator, a driving mechanism for said indicators and type wheels, capable of connection therewith and disconnection therefrom, two series of keys co operating with the driving mechanism to determine the extent of movement imparted by it to the indicator and type wheels, one series bearing numbers corresponding to those upon the first indicator and type wheel and the other series bearing letters or characters corresponding to those upon the second indicator and type wheel, and a platen co-operating with the type-wheels, substantially as and for the purpose described.



3. In a cash register and indicator, the combination of the indicator-wheels, the type-wheels moving in unison therewith and bearing corresponding type-numbers, the platen co-operating with the type-wheels, a paper-carriage laterally movable across the type-wheels, a record-strip carried thereby and divided into different longitudinal spaces, and an index indicating the different spaces or columns on the record-strip and co-operating with the laterally-movable paper-carriage to determine the position of the record-strip relative to the type-wheels, substantially as and for the purpose described.

4. In a cash register and indicator, the combination of the indicator-wheels, the type-wheels bearing corresponding type-numbers and movable in unison with the indicator-wheels, a platen co-operating with the type-wheels, a paper-carriage laterally movable across the type-wheels, a record-strip carried thereby and divided into different longitudinal spaces, an index corresponding to the different spaces or columns on the record-strip, and a handle or pointer movable with the paper-carriage over the index to determine the position of the record-strip relative to the type-wheels, substantially as and for the purpose described.

5. In a cash register and indicator, the combination of the type-wheels, the printer co-operating therewith, the paper-carriage laterally movable across the type-wheels, the record-strip carried thereby and divided into different longitudinal columns or spaces, the paper-carriage bearing the series of words referring to the different columns of the record-strip, and the casing being provided with an opening through which said words are separately visible when the paper-carriage is moved to different positions to bring the columns of the record-strip opposite the type-wheels.

6. In a cash register and indicator, the combination of the type-wheels, the printer co-operating therewith, the laterally-movable paper-carriage, the record-strip carried thereby and divided into different longitudinal columns or spaces, the paper-carriage bearing a series of words designating the different columns on the record-strip and separately visible through an opening in the casing when the paper-carriage is movable laterally to different positions to bring different columns of the record-strip opposite the type-wheels, and a pointer movable with the paper-carriage over an index designating the different columns on the record-strip.

482,166. ROTARY STEAM-ENGINE. William B. Coulter, Waterbury, Conn. Filed Dec. 1, 1891. Serial No. 413,741. (No model.)

Claim.—1. In a rotary steam-engine, the combination, with a cylinder, of a rotary piston-head located therein, two corresponding cam-heads located on opposite sides of the piston-head, having their operating-faces equidistant at opposite points from each other and each composed of corresponding continuously-pitched spirals merging into each other at their ends to form a continuous track, and one or more transversely-reciprocal pistons mounted in the said head and having their opposite ends engaged with the faces of the respective cam-heads, which are engaged at one or more points by the respective faces of the piston-head, so as to co-operate with the said piston or pistons in forming steam-chambers, substantially as described.

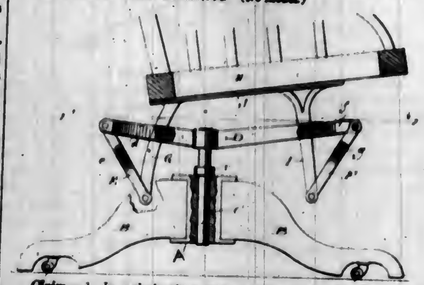
2. In a rotary steam-engine, the combination, with a cylinder having peripheral steam-inlet ports, of a rotary piston-head located therein and having steam-inlet ports arranged to coincide with those in the cylinder and entering its periphery and issuing from its sides, two corresponding cam-heads located on opposite sides of the piston-head and each having an exhaust-port opening out of its operating-face, and one or more transversely-reciprocal pistons mounted in the said head and having their opposite ends engaged with the faces of the respective cam-heads, which are engaged at one or more points by the respective faces of the piston-head, so as to co-operate therewith in forming steam-chambers, substantially as described.

3. In a rotary steam-engine, the combination, with a cylinder having one or more peripheral steam-inlet ports, of a rotary piston-head having steam-inlet ports entering its periphery and issuing from its sides, two corresponding cam-heads respectively located on opposite sides of the said head and having oppositely-winding operating-faces which are respectively equidistant at opposite points from each other, one or more transversely-reciprocal pistons mounted in the said head and having their opposite ends engaged with the faces of the respective cam-heads, which are respectively engaged at one or more points by the respective faces of the piston-head, so as to co-operate with the piston or pistons in forming steam-chambers, and exhaust-ports leading from the said chambers, substantially as described.

4. In a rotary steam-engine, the combination, with a cylinder having peripheral steam-inlet ports, of two cam-heads respectively located in the opposite ends of the said cylinder, having the opposite points in their operating-faces equidistant from each other and each having an exhaust-port and a large central opening, a piston-head located between the said heads, engaging with the highest points in the faces thereof, having heavy hubs which bear in the central openings of the said heads, and constructed with steam-inlet ports entering its periphery in position to coincide with the ports in the cylinder and issuing from its sides, and one or more transversely-reciprocal pistons mounted in the said head and having their opposite ends engaged with the faces of the respective cam-heads, substantially as described.

5. In a rotary steam-engine, the combination, with a cylinder having two or more peripheral inlet-ports and segmental ducts leading therefrom and following its inner periphery, of a piston-head having inlet-ports entering its periphery and arranged thereon to coincide with the said ports and ducts of the cylinder and issuing from its sides, two cam-heads respectively located at the ends of the cylinder and having irregular or winding operating-faces which are uniformly separated from each other, and one or more transversely-reciprocal pistons mounted in the said head and having their opposite ends engaged with the faces of the respective cam-heads, the highest points whereof are engaged by the respective faces of the piston-head, substantially as described.

6. In a rotary steam-engine, the combination, with a cylinder having segmental steam-ducts formed in the inner face of its periphery, of a rotary piston-head having steam-ports arranged to coincide with the said ducts, two cam-heads respectively located on opposite sides of the said head and having irregular or winding operating-faces which are equidistant at opposite points from each other, and one or more transversely-reciprocal pistons mounted in the said head and having their opposite ends engaged with the faces of the respective cam-heads, which are respectively engaged at one or more points by the respective faces of the piston-head, so as to co-operate with the pistons in forming steam-chambers, substantially as described.

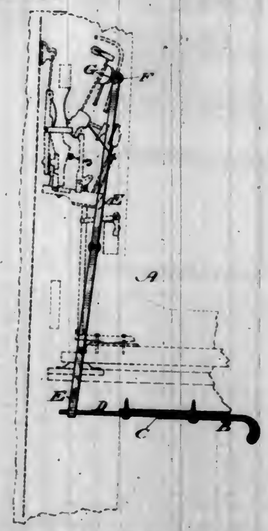


7. In a rotary steam-engine, a rotary piston-head having one or more deep transverse chambers formed in its periphery, a piston-holder set into each of said chambers, a piston mounted in each block piston-holder, and antifriction-pinions mounted in the block piston-holder on opposite sides of the piston, which is thereto furnished with racks, substantially as described.

8. In a rotary steam-engine, the combination, with a rotary piston-head having one or more deep transverse chambers formed in its periphery, of a two-part chambered piston-holder set into each of said chambers, a piston set into each holder and having its opposite faces provided with longitudinal racks, and pinions set into the holder on opposite sides of the piston, engaging with the racks thereof, and taking the strain of its operation upon their journals, substantially as described.

9. In a rotary steam-engine, the combination, with a cylinder having one or more peripheral inlet-ports, of a steam-chest surrounding the said cylinder, an annular cut-off located in the said chest encircling the cylinder and having inlet-ports coinciding with those in the cylinder, means for oscillating the cut-off to gage the amount of steam admitted to the cylinder, one or more pistons located in the cylinder, means for rotating and operating them, and exhaust-ports leading out of the said cylinder, substantially as described.

10. In a rotary steam-engine, the combination, with a cylinder having one or more inlet ports in its periphery, of a steam-chamber surrounding the said cylinder, an annular cut-off located in the said chamber encircling the cylinder, having peripheral ports coinciding with the ports therein and furnished with a rack, a pinion engaged with the said rack, means for operating the pinion to oscillate the cut-off on the cylinder, a rotary piston-head located in the cylinder, one or more pistons mounted in the said head, and exhaust-ports leading out of the cylinder, substantially as described.



482,167. CHAIR. Fred A. Dennett, Sheboygan, Wis. Filed Oct. 2, 1891. Serial No. 407,514. (No model.)

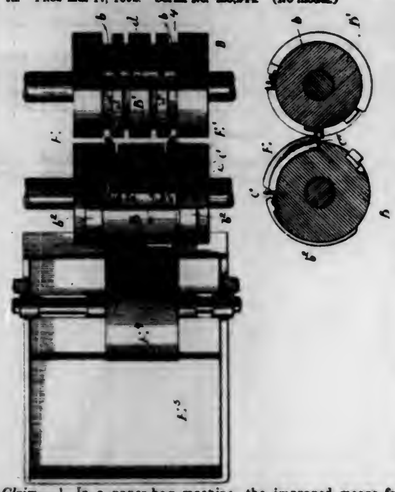
Claim.—1. In a chair, the combination, with a base having a central socket, of a single longitudinal support provided with a depending device that engages said socket, a seat having front and rear arms depending therefrom, and links pivotally connected to said support and arms, substantially as set forth.

2. In a chair, the combination of a stationary base, a horizontal support pivotally connected to the center of the base, a seat having front and rear arms depending from its under side, and links pivotally connected to said support and arms, substantially as set forth.

482,168. EXPRESSION-REGULATOR FOR PIANOS. Joseph Y. Brockenmiller, Jenkintown, Pa. Filed May 16, 1892. Serial No. 433,134. (No model.)

Claim.—1. An expression-regulator for a piano, consisting of a pivoted knee-piece and two pivoted levers adapted to be attached to the casing of the piano, said parts being combined substantially as described.

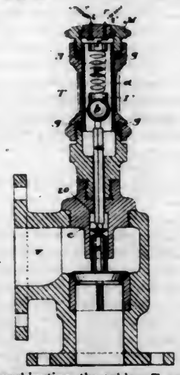
2. An expression-regulator for a piano, consisting of a knee-piece



adapted to be pivoted to the casing of a piano and having a roller journaled on one end, a pivoted lever having one end in contact with said roller, a vertically-pivoted lever within the piano-casing, having its lower end in contact with one end of said first-mentioned levers and its upper end adapted to contact with the hammer rest rail or head of the piano, said parts being combined substantially as described.

482,169. PORTABLE WAGON-LOADER. JAMES E. EVELETH, Salix, Iowa. Filed Mar. 18, 1892. Serial No. 425,461. (No model.)

Claim.—A portable wagon-loader comprising an axle and supporting-wheels, a loading-platform having a dumping-stop, a discharge-opening, and a chute at its upper end and a receiving-board hinged to its lower end, said platform comprising inclined side beams supported by risers from the axle, transverse joists and a flooring, uprights at the upper ends of said beams, a cross-brace and a stationary rod connecting the uprights, a shoveling device having a pivoted bail, and a hoist-rope secured to said bail and led through a block carried by the brace, whereby the shoveling device engages said stop to cause it to dump and the bail engages said rod to prevent the device falling through the opening, all substantially as described.

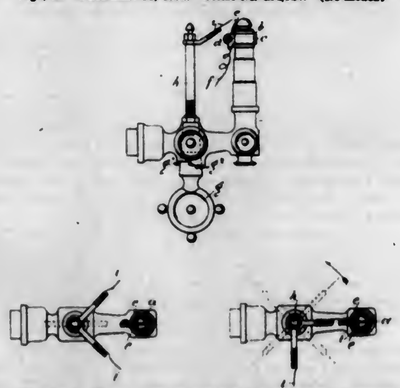


482,170. PAPER-BAG MACHINE. ALBERT C. GETTEN, Chicago, Ill. Filed Mar 17, 1892. Serial No. 425,344. (No model.)

Claim.—1. In a paper-bag machine, the improved means for creasing the bag-blank, which consists of a pair of rolls, one of which rolls is provided with two creasing-blades, one of said blades being adjustable around the periphery of the roll to enable it to be shifted with respect to the other blade and the other of which rolls is provided with two grooved creasing plates or channels, one of which is adjustable around the periphery of the roll to permit it to be shifted with respect to the other, whereby the distance between the creased lines of the bag may be varied as desired, substantially as described.

2. In a paper-bag machine, the improved means for creasing and pasting the bag-blank, which consists of a pair of rolls, one of which rolls is provided with paste-pads and with two creasing-blades, one of said blades being adjustable around the periphery of the roll to enable it to be shifted with respect to the other blade and the other of which rolls is provided with two grooved creasing plates or channels, one of which is adjustable around the periphery of the roll to permit it to be shifted with respect to the other, whereby the distance between the creased lines of the bag may be varied as desired, substantially as described.

482,171. FEED-INDICATOR FOR BOILERS. ANDRÉ GUASCO and ANGE CHUBB, Marseilles, France. Filed Oct. 8, 1891. Serial No. 408,113. (No model.) Patented in France July 7, 1890, No. 206,795; in Belgium Aug. 17, 1891, No. 95,723; in England Aug. 21, 1891, No. 14,128; in Germany Sept. 29, 1891, No. 65,429; in Italy Sept. 30, 1891, No. 30,427; in Spain Nov. 7, 1891, No. 12,506, and in Austria-Hungary Nov. 27, 1891, No. 38,823 and No. 68,465.



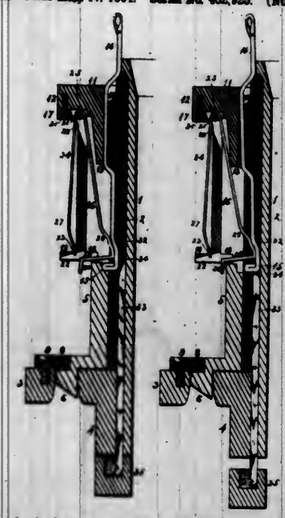
Claim.—1. In combination, the tubing T, screw-threaded at its lower end for attachment to its support, the insulating-cap M, closing the upper end of said tube, the terminals *t t'*, carried by the said cap, the valve *e* and its casing, the movable stem *a*, operated thereby, the movable contact I, and the spring K, intermediate of the contact, and the movable stem *a*, substantially as described.

2. In combination, the tubing T, having openings in its side, the valve *e*, with its casing, the movable stem *a*, carrying indicator *b*, the inner glass tube *d*, the terminals *t t'*, the contact I, connected with the stem *a*, and the means for supporting the terminals closing the end of the tube and holding the parts in place, consisting of the insulated cap M, substantially as described.

3. In combination, the valve with its stem, the indicator *b*, the contact I, the interposed spring between the contact and the indicator, and an electric circuit arranged to be opened and closed by the movable contact I, substantially as described.

4. In combination, the tubing T, the valve *e*, with its casing, the terminals *t t'*, the insulating-cap M therefor, the contact I, the movable stem *a*, connected therewith to move the same to the terminals, and the valve *e* on the lower end of the stem *a*, resting upon the stem of the valve *e*, substantially as described.

482,172. ELECTRICAL GAS-LIGHTER. JAMES E. HAMILTON, Chicago, Ill. Filed Mar. 11, 1892. Serial No. 424,527. (No model.)



Claim.—1. In an electric gas-lighting device, the combination, with a cock carrying a shaft parallel to the axis of said cock, provided with a pair of arms carrying reciprocating wipers moving in a horizontal plane, of an insulated spur near the slot of a gas-burner, substantially as specified.

2. In an electric gas-lighting device, the combination, with a gas-burner with insulated spurs on each side of the slot thereof, of a shaft on the end of the gas-cock parallel with its axis and revolving therewith, provided with an arm carrying a wiper adapted to make and break contact with said spurs, substantially as specified.

3. In an electric gas-lighting device, the combination, with a burner with insulated spurs on each side of the slot thereof, of a cock with a shaft on its end axial and revolving therewith, provided with a pair of arms carrying wipers adapted to make and break contact with said spurs, substantially as specified.

4. In an electric gas-lighting device, the combination, with a gas-cock adapted to make the usual half-revolution, surmounted by a shaft axial and revolving therewith, and provided with arms carrying wipers, of a burner and insulated spurs on each side of its slot, to operate substantially as specified.

482,178. KNITTING-MACHINE. HOWARD E. HARBAUGH, Rockford, Ill. Filed Aug. 17, 1891. Serial No. 402,925. (No model.)

Claim.—1. A knitting-machine provided with needle-grooves, needles located therein, a needle-operating cam, two sections provided with means adapted to hold the fashioning-needles in action or allow them to become inactive, the sections having movements independent of each other in the lengthwise direction of the needles.

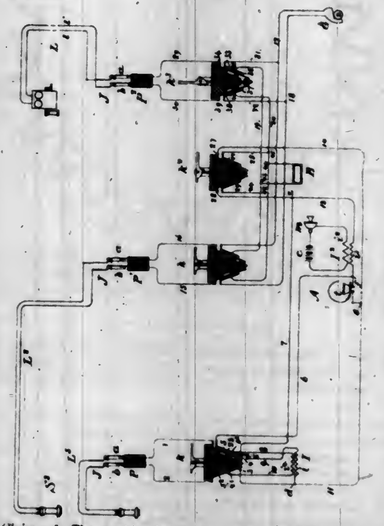
2. A knitting-machine provided with a needle-cylinder having needle-grooves, needles located therein, a needle-operating cam, two sections provided with means adapted to hold the fashioning-needles in engagement with the cam or allow them to become inactive, the sections having movements independent of each other in the lengthwise direction of the needle-cylinder.

3. A knitting-machine provided with a needle-cylinder having needles-grooves, needles located therein, a needle-operating cam, two series of arms for holding the fashioning-needles in engagement with the cam, the series having a movement independent of each other in the lengthwise direction of the needle-cylinder.

4. A knitting-machine provided with needle-grooves, needles located therein, a needle-operating cam, three series of arms for holding the needles in engagement with the cam, two series for the fashioning-needles and other series for the remaining needles, which are thrown in and out of action, the series of arms for the fashioning-needles having a movement independent of the remaining series.

5. A knitting-machine provided with needle-grooves, needles located therein, a needle-operating cam, and three sections provided with arms for holding the needles in engagement with the cam, two of the sections for the fashioning-needles, the arms of which are of different lengths, and the arms of the remaining section which operate upon the front needles being of equal length.

6. A knitting-machine provided with needle-grooves, needles located therein, a needle-operating cam, three sections provided with arms for holding the needles in engagement with the cam, two of the sections for the fashioning-needles and the remaining section for the front needles, the arms of each of the sections located and moving in the lengthwise direction of the needle-grooves, and means for moving the sections, the arms of which operate upon the fashioning-needles.



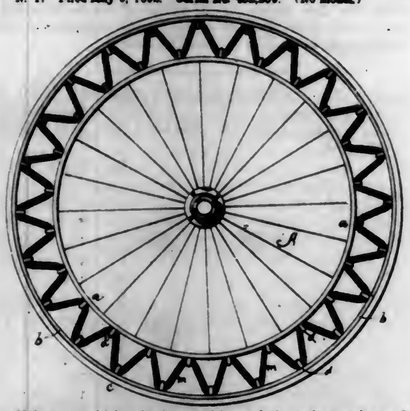
7. A knitting-machine provided with needle-grooves, needles located therein, a needle-operating cam, two sections provided with arms extending therefrom of different lengths and located in the needle-grooves for the purpose of holding the needles in action or allowing them to become inactive.

8. A knitting-machine provided with needle-grooves, needles located therein, a needle-operating cam, two sections provided with arms extending therefrom and located in the needle-grooves and having their upper ends beveled, each section provided with a toothed rack, and dogs for engaging the teeth of the racks for alternately raising or lowering them.

9. A knitting-machine provided with needle-grooves, needles located therein, a needle-operating cam, springs for holding the needles out of action, a suitable frame, one end of the springs held by the frame and the other end of each located in a needle-groove in contact with the needle thereof.

10. In a knitting-machine, the combination of a needle-cylinder provided with needle-grooves, a needle-operating cam, a cylinder surrounding the needle-cylinder, provided with grooves conforming to the needle-grooves, springs held in place in the grooves of the outside cylinder, each having one end stationary and the other end in contact with a needle, and each provided with a projection by which the springs can be removed to release the needles.

482,174. TELEPHONE-EXCHANGE APPARATUS. ANGUS S. HIBBARD, New York, N. Y., assignor to the American Telephone and Telegraph Company, of New York. Filed June 2, 1892. Serial No. 435,279. (No model.)



Claim.—1. The combination, with a series of telephone service-circuits, an order-circuit, an operator's receiving-telephone, and a circuit-changer controlling the connection of said telephone with the said service-circuit, of a repeating-coil having one of its windings connected with the order-circuit and an independent loop extending from the terminals of the said receiving-telephone and formed into a closed circuit with the other winding of the said repeating-coil, substantially as described.

2. The combination, with a series of telephone service-circuits, an order-circuit, operators' receiving and transmitting telephones, and a circuit-changer controlling the connection of said telephones with the said service-circuits, of two independent loop-circuits, one including the receiving-telephone only, and the other including the transmitter also, a repeating induction-coil, and an auxiliary circuit-changer or switch-key controlling the relations of the terminals of the said two loops, the repeating-coil, and the order circuit and adapted in one position to connect one winding of the said coil with the order-circuit and to form the other winding thereof with the receiving-telephone loop into a closed circuit and in a second position to disconnect the said repeating-coil from the said two circuits and to close the order-circuit through the said second loop containing the said receiving and transmitting telephones, substantially as described.

3. The combination, substantially as hereinbefore described, of a series of telephone service-circuits, flexible link conductors terminating in plug-connectors for uniting any two such circuits, an operator's receiving and transmitting telephone, and a listening-key interposed between the said telephone outfit and the said link conductors and

adapted to connect the said telephones therewith and disconnect them therefrom, with an order-circuit, a repeating-coil, a local circuit including the said receiving-telephone, a second and normally-open local circuit including the secondary helix of the transmitter induction-coil as well as the receiver, and a circuit-changing switch interposed between the terminals of the said local circuits and the order-circuit and so constructed and connected that when placed in one position the order-circuit is closed through one helix of the repeating-coil and the receiving-telephone local circuit through the other, the second local circuit remaining open, and so that when placed in a second position the circuits of the repeating-coil are both opened, while the local circuit, which includes both transmitter and receiver, is connected directly with the order-circuit, substantially as described.

482,175. VEHICLE-WHEEL. GEORGE HOLLAFOLLA, Syracuse N. Y. Filed May 9, 1892. Serial No. 432,239. (No model.)

Claim.—A vehicle-wheel comprising a hub, spokes, and two felloes substantially parallel to each other, connected together by a band of elastic material strung through loops arranged alternately upon the two felloes.

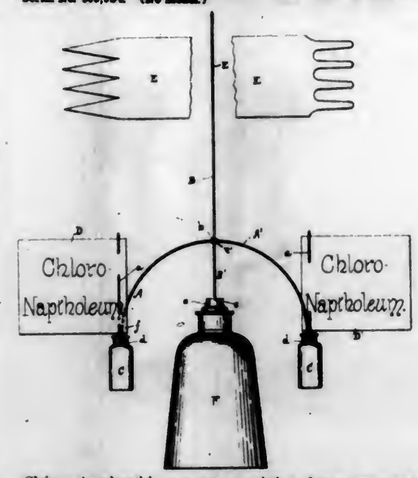
482,176. COMPOSITION OF MATTER. PHILIP H. HOLMES, Gardiner, Me., assignor to the Holmes Fibre-Graphite Manufacturing Company, Chicago, Ill. Filed Jan. 2, 1892. Serial No. 416,855. (No specimens.)

Claim.—1. A composition of matter consisting of plumbago, carbonized fiber, and a binder, substantially as specified.

2. A composition of matter consisting of plumbago combined with structural and deposited carbon, substantially as described.

3. The process herein described of making a plumbago and carbon compound, said process consisting, essentially, in, first, mixing plumbago and fiber; second, subjecting the mass to pressure; third, drying the mass; fourth, immersing it in oil, and, finally, baking the mass to carbonize the oil and fiber, substantially as set forth.

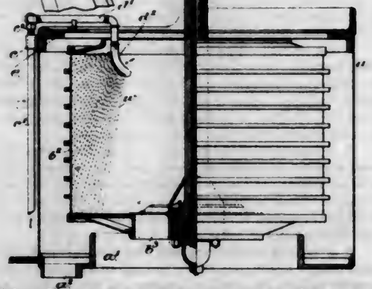
482,177. ELECTRICAL CONDUCTOR. PHILIP H. HOLMES, Gardiner, Me., assignor to the Holmes Fibre-Graphite Manufacturing Company, Chicago, Ill. Filed Jan. 2, 1892. Serial No. 416,858. (No model.)



Claim.—1. An electric conductor composed of particles of plumbago disposed in strata which lie in planes parallel with the direction of the current.

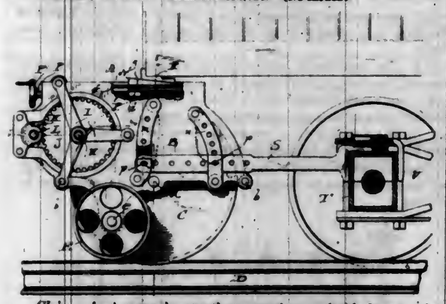
2. An electric conductor composed of particles of electric-conducting carbon and divided fiber disposed in strata which lie in planes parallel with the direction of the current.

3. An electric conductor composed of particles of electric-conducting carbon united by an oil-binder and disposed in strata which lie in planes parallel with the direction of the current.



4. An electric commutator-brush composed of particles of conducting-carbon, such as plumbago, disposed in strata, which lie in planes parallel with the direction of the current, and are thus presented on end to the commutator when the brush is in use, substantially as described.

482,178. ADVERTISING DEVICE. WILLIAM R. IRISH, Cleveland, Ohio, assignor to Robert S. West, same place. Filed Oct. 26, 1891. Serial No. 409,994. (No model.)



Claim.—An advertising apparatus consisting of two or more packages suspended by two or more wires A A', said wires being attached to an upright wire B, having a pivotal bearing, in combination with the wings D D', pivotally connected to the wires *a a*, said wings causing the apparatus to turn on its pivotal bearing by reason of air-currents striking against the same, substantially as and for the purpose set forth.

482,179. APPARATUS FOR WASHING SUGAR. RICHARD P. JOHNSON, Boston, Mass. Filed May 9, 1892. Serial No. 432,333. (No model.)

Claim.—The combination, with the curb and basket of a centrifugal machine, of a water-supply pipe, as *c'*, a branch pipe provided with a perforated shoe, and a valve or cock to automatically effect the discharge of water through the shoe when the latter is placed in position within the basket and to shut off the supply when withdrawn, the shape of the shoe being that of a curved tube perforated on its convex side to enable it to discharge water from the upper to the lower part of the basket, substantially as described.

482,180. MANUAL MOTOR. MARTIN JOHNSON, Milwaukee, Wis. Filed May 11, 1892. Serial No. 432,635. (No model.)

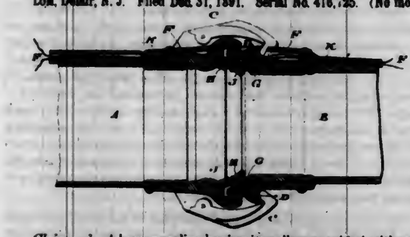
Claim.—1. A manual motor that comprises a suitable frame, a single-track wheel having its axle supported by the frame, an actuating mechanism in gear with the wheel, and suitable means for detachably connecting said frame with a railway-car, substantially as set forth.

2. A manual motor that comprises a suitable frame, a track-wheel having its axle supported by the frame, an actuating mechanism for the wheel, suitable means for detachably connecting said frame with a car, and surface-wheels supported on the aforesaid frame eccentric to the track-wheel, substantially as set forth.

3. A manual motor that comprises a suitable frame, a track-wheel having its axle supported by the frame, an actuating mechanism for the wheel, a wedge-block longitudinally adjustable in said frame, a step loose on the wedge-block, and a suitable bar carried by the aforesaid frame for connection with a car axle box, substantially as set forth.

4. A manual motor that comprises a suitable frame, a single-track wheel having its axle supported by the frame, an actuating mechanism in gear with the wheel, and a car-connecting bar capable of positive vertical and angular adjustments on said frame, substantially as set forth.

5. A manual motor that comprises a suitable frame, a single-track wheel having its axle supported by the frame, an actuating mechanism in gear with the wheel, a car-connecting bar, and a car-connecting hook at right angles to the bar, said bar and hook being carried by said frame, substantially as set forth.



6. A manual motor that comprises a suitable frame, a single-track wheel having its axle supported by the frame, an actuating mechanism in gear with the wheel, and a car-connecting bar carried by the frame and having the outer end thereof in the form of a clamp provided with a longitudinally-adjustable section, substantially as set forth.

7. A manual motor that comprises a suitable frame, a track-wheel having its axle supported by the frame, an actuating mechanism for the wheel, a wedge-block loose in the frame and provided with a screw-threaded sleeve, a screw-rod engaging the sleeve, a step loose on the wedge-block, and suitable means for connecting said frame with a car, substantially as set forth.

8. A manual motor comprising a suitable frame, a track-wheel and surface wheels connected to the frame, a train of gearing controlling the track-wheel, a wedge-block longitudinally adjustable in said frame, a step loose on the wedge-block, and a car-connecting bar adjustable to various elevations and angles on the aforesaid frame, substantially as set forth.

9. A manual motor comprising a suitable frame, a track-wheel and surface wheels connected to the frame, a train of gearing controlling the track-wheel, a wedge-block longitudinally adjustable in said frame, a step loose on the wedge-block, a car-connecting bar, and a car-connecting hook at right angles to the bar, said bar and hook being carried by the aforesaid frame, substantially as set forth.

482,181. ELECTRIC CONNECTOR FOR HOSE. CHARLES F. KELLOM, Deinir, N. J. Filed Dec. 31, 1891. Serial No. 416,725. (No model.)

Claim.—1. A hose-coupling having its collars provided with tubes on their sides and electric wires in said tubes and having a segmental ring adapted to contact with said wires, substantially as described.

2. A hose-coupling having one of its collars provided with a gasket and the other collar provided with fingers, a segmental ring seated on said gasket, adapted to contact with said fingers, and electric wires connected with said ring and fingers, said parts being combined substantially as described.

3. A hose-coupling having one of its collars provided with a gasket adapted to extend between it and the other collar, a ring on said collar, and fingers or points on the other collar, said parts being combined substantially as described.

4. A hose-coupling having each of its collars provided with a contact-piece, one of the pieces being secured to packing, which forms a water-tight joint for the coupling, substantially as described.

482,182. PNEUMATIC TIRE. CHARLES M. LUNGREN, Bayonne, N. J. Filed Sept. 16, 1891. Serial No. 405,831. (No model.)

Claim.—1. The combination, in a vehicle-tire, of a wheel-rim and a surrounding flexible envelope adapted to be distended to shape by compressed air, the wheel-rim partly filling the space inclosed by the inflated envelope and adapted to form a supporting center for this envelope when relieved of its compressed air, substantially as described.

2. The combination, in a vehicle-tire, of a wheel-rim and a surrounding flexible envelope adapted to be distended to shape by compressed air, the envelope being non-expansible at its outer part and expansible at its inner part and the wheel-rim being arranged to form a supporting center for the flexible envelope when it is relieved of its compressed air, substantially as described.

3. The combination, in a vehicle-tire, of a wheel-rim and a surrounding flexible envelope adapted to be distended to shape by compressed air, the wheel-rim consisting of a metal channel provided with a tubular or solid ring of elastic material and arranged to form a supporting center for the flexible envelope when it is relieved of its compressed air, substantially as specified.

4. A vehicle-tire consisting of an envelope or strip of flexible material adapted to be distended to shape by compressed air, said strip or envelope being non-expansible at the part which bears upon the ground and expansible at the part near the wheel-rim, substantially as specified.

5. A vehicle-tire consisting of a strip of flexible material provided with enlarged edges, said strip of material being non-expansible at its central portion and expansible at the parts between this central portion and the enlarged edge, substantially as specified.

6. A vehicle-tire having the following elements in combination: first, a band or strip of flexible material provided with enlarged edges; second, a wheel-rim provided with channels at its edges, said channels being adapted to receive the enlarged edges of the tire, but being large enough to allow these to be freely withdrawn, and, third, retaining rings or strips adapted to hold the enlarged edges of the tire in the rim-channels by acting as wedge-pieces, substantially as specified.

7. In a vehicle-tire, the combination of a wheel-rim provided with a central abutment, a tire consisting of a band or strip of flexible material provided with enlarged edges, and wedge-rings adapted to hold the enlarged edges of the tire in the channels between the central abutment and the edges of the rim, substantially as shown and described.

482,183. WATER CIRCULATOR AND PURIFIER FOR STEAM-BOILERS. JAMES MACDONALD, Los Angeles, Cal., assignor of one-half to Mary MacDonald, same place. Filed July 7, 1891. Serial No. 398,650. (No model.)

Claim.—1. The water-purifier set forth, comprising the combination of the boiler, a purifier-tank devoid of impurity-retaining diaphragms between its ingress and egress pipes, the hot-water pipe leading from the boiler and arranged to discharge horizontally into the lower part of the purifier-tank at one side and above the bottom thereof, the cold-water injector arranged coaxial with the horizontal discharge member of the hot-water pipe, with its discharge-orifice immediately outside of the tank, as set forth, and the purified-water pipe leading from the tank to the boiler and having its mouth arranged in the side wall of the tank, near the top of the tank, on the side thereof opposite the ingress or discharge orifice of the hot and cold water pipe.

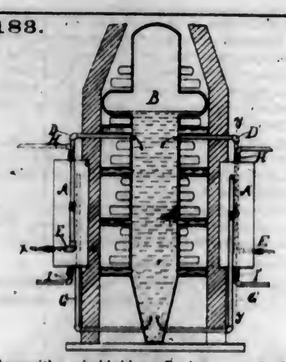
2. The combination of a suitable boiler, an unobstructed tank pro-

482,183.

integrating-blades situated below the roll and acting in conjunction therewith on the stock as it passes through the lower passage and upper disintegrating-blades acting in conjunction with the blades on the stock as it passes through the upper passage, substantially as set forth.

3. The combination of the casing, a central disintegrating-roll therein, the horizontal mid-feather on each side of the roll, forming upper and lower passages, one or both of the outer ends of the mid-feather being at an angle, substantially as described.

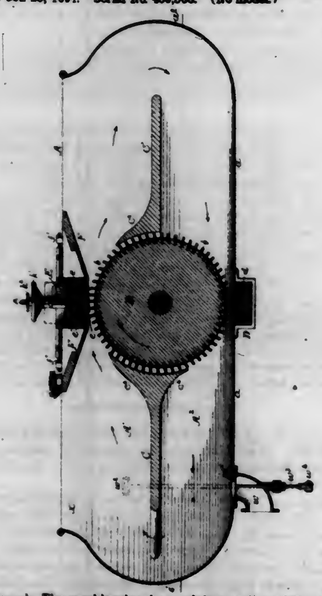
4. The combination of the casing, a central mid-feather forming two passages, and a disintegrating-roll mounted in the casing and pro-



tained in said box, and frames on each side of the knife-box, the lower portion of each frame being beveled toward the knives, so as to guide the stock thereunder, substantially as described.

14. The combination of the casing, disintegrating-roll, the upper disintegrating-knives situated above the roll, a box for said knives, frames on each side of the box, having inclined portions, said frames being adjustable upon the casing, and set-screws for adjusting said frames and locking each frame in the adjusted position, substantially as described.

said table, and the compressor cord or rope, substantially as described.

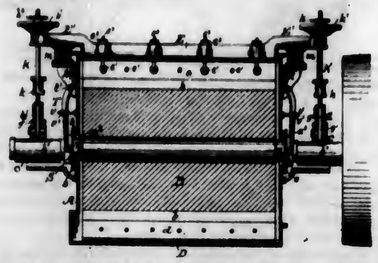


482,187. VALVE. GEORGE R. MOORE, Springfield, Mass. Filed Nov. 7, 1891. Serial No. 411,189. (No model.)

482,183.

vided at its base with a suitable blow-off, a hot-water pipe leading from the boiler below the water-line to the lower part of the tank at such a point above the bottom thereof as to allow a settling-chamber therebeneath, a feed-water injector arranged with its discharge-orifice coaxial with the hot-water pipe and close to the mouth thereof, (that is to say, within three or four inches thereof,) so that the injected cold water is caused to enter the purifier-tank incased in a sheath of hot water and the impurities released at the instant of change of temperature will fall into the settling chamber or basin, and a purified-water pipe leading from the tank at a point near the top thereof opposite the mouth of the hot-water pipe to the boiler at or near the bottom thereof, the whole being so arranged that there are no obstructions which will impede the passage of the water or retain any deposit or impurities within the tank between the inlet at the bottom and the outlet at the top, whereby the water is instantly and uniformly changed in temperature and the current immediately flows in an upward oblique direction through the purifier, thus giving perfect freedom for the impurities to fall out of the current and deposit at a point from which they can readily be removed.

482,184. PULP-ENGINE. GUYON MILLER, Downingtown, Pa. Filed Oct. 23, 1891. Serial No. 409,583. (No model.)



Claim.—1. The combination, in a pulping-engine, of the tank, the disintegrating roll B, and partitions C C, one on each side of the roll, forming the mid-feather which separates the tank into upper and lower passages, with upper disintegrating-blades directly above the roll and acting in conjunction therewith, substantially as described.

2. The combination of a casing, the disintegrating-roll, and the mid-feather forming upper and lower passages in the casing with disintegrating-blades situated below the roll and acting in conjunction therewith on the stock as it passes through the lower passage and upper disintegrating-blades acting in conjunction with the blades on the stock as it passes through the upper passage, substantially as set forth.

3. The combination of the casing, a central disintegrating-roll therein, the horizontal mid-feather on each side of the roll, forming upper and lower passages, one or both of the outer ends of the mid-feather being at an angle, substantially as described.

4. The combination of the casing, a central mid-feather forming two passages, and a disintegrating-roll mounted in the casing and projecting into each passage with disintegrating-blades in each passage, acting on the stock in conjunction with the roll, substantially as described.

5. The combination of the casing, the mid-feather, the fixed lower blades, the vertically-movable roll, the vertically-movable upper blades, and mechanism, substantially as described, whereby the carrier of the upper blades is connected to the roll, so that when the roll is raised the upper blades will be raised, substantially as described.

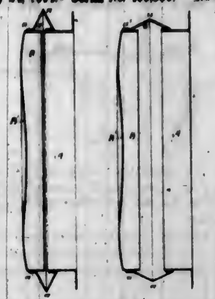
6. The combination of the casing, the mid-feather separating the casing into upper and lower passages, a roll extending into both passages, fixed lower blades, movable upper blades, boxes for the trunnions of the roll, levers connected to said boxes, levers connected to the upper blade-carrier, said levers being connected together, and mechanism for raising and lowering the rolls and blades, substantially as described.

7. The combination of the casing, the mid-feather, a disintegrating-roll, bearings for the journals of said roll, the fixed lower blades, the vertically-movable upper blades, a lever on each side of the casing, locked to the bearings for the roll, a lever on each side of the casing, connected to the upper blade-carrier, connections between the roll-levers and the blade-levers, vertical screw-rods connected to said levers, nuts on said screw-rods having gear-teeth in the periphery, a transverse shaft, and worms on said transverse shaft gearing with the teeth of the said nuts, substantially as described.

8. The combination, in a pulping-engine, of the upper blade-casing, blades therein, filling-pieces between said blades, transverse securing-pins for the said blades, and eyebolts through which the pins pass, said bolts passing up through the box, with nuts adapted to said bolts, substantially as described.

9. The combination, in a pulping-engine, of the casing, the upper blades, box therefor mounted in said casing, and a disintegrating-roll connected to the box with springs or their equivalents situated between the casing and the box, said springs tending to raise the blade-box, substantially as described.

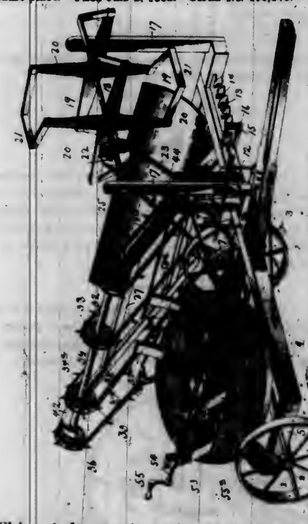
10. The combination of the casing, disintegrating-roll, vertical adjusting-rods connected to the bearings of said roll, adapted to guideways on the casing, threaded worm-wheels on the bars, a transverse shaft, worms on the shaft, engaging with the worm-wheels, and bearings for said shaft mounted on the upright rods and resting on the guides therefor, so that any accidental raising of the roll will not disengage the gearing, but merely raise the bearings of the transverse shaft, substantially as described.



11. The combination of the casing, the disintegrating-roller, bearings therefor, levers connected to said bearings, upper disintegrating-blades, carrier therefor, levers connected to said carrier, and connections between the roll-levers and the blade-levers, the fulcrum of the blade-lever being at a greater distance from its weight than the fulcrum of the roll-lever, whereby when the roll is raised the blades will be moved a greater extent than the roll, substantially as described.

12. The combination of the casing, openings in the side of said casing, a disintegrating-roll, the trunnions of said roll extending through the openings in said casing, flanged rings adapted to said trunnions, pivoted levers adapted to bear against said rings, and bolts for holding the levers against the ring with annular packing between each ring and the casing, substantially as described.

13. The combination, in a pulping-engine, of the casing, the disintegrating-roll, the upper knife-box situated above the roll, knives contained in said box, and frames on each side of the knife-box, the lower portion of each frame being beveled toward the knives, so as to guide the stock thereunder, substantially as described.

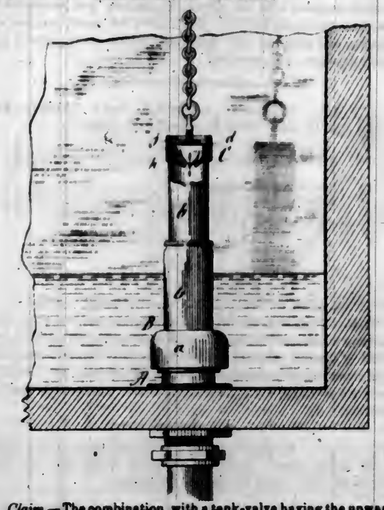


14. The combination of the casing, disintegrating-roll, the upper disintegrating-knives situated above the roll, a box for said knives, frames on each side of the box, having inclined portions, said frames being adjustable upon the casing, and set-screws for adjusting said frames and locking each frame in the adjusted position, substantially as described.

482,185. METER-DIAPHRAGM. WILLIAM N. MILSTED, New York, N. Y. Filed July 24, 1891. Serial No. 400,539. (No model.)

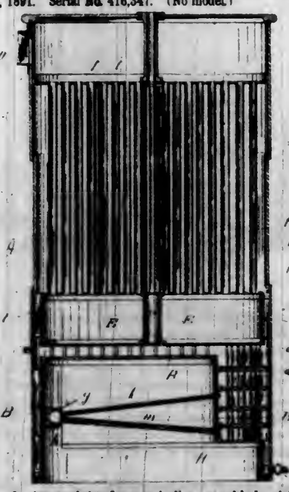
Claim.—The combination of the fixed and movable portions of the diaphragm with the flexible portion inclosing the triangular space, the lines being so proportioned that the area of the space will be the same when the diaphragm is fully expanded and fully contracted, substantially as specified.

482,186. CORN-HARVESTER. HAMON MORRISON, Morantown, Kans., assignor of one-half to Greenleaf W. Campbell and John H. Vaughn, same place. Filed Jan. 2, 1892. Serial No. 416,873. (No model.)



Claim.—1. In a corn-harvesting machine, the combination, with the elevator, of the binder-table located underneath the upper end thereof, the upwardly-extending curved arms or jaws secured to said table, the shaft journaled in said jaws, and a compressor cord or rope secured to said shaft, substantially as described.

2. In a corn-harvesting machine, the combination, with the elevator, of the binder-table made in two parts hinged together, the lever secured to one of said parts, the upwardly-extending curved arms or jaws, the shaft journaled therein, and a compressor cord or rope secured to said shaft, substantially as described.



3. In a corn-harvesting machine, the combination, with the elevator, of the rotatable binder-table made in two parts hinged together, the lever secured to one of said parts, the upwardly-extending curved arms or jaws, the shaft journaled therein, the staple secured to the said table, and the compressor cord or rope, substantially as described.

482,187. VALVE. GEORGE B. MOORE, Springfield, Mass. Filed Nov. 7, 1891. Serial No. 411,189. (No model.)

Claim.—The combination, with a tank-valve having the upwardly-extended and upwardly-opening tubular member adapted for communication with the valve-seat opening, of a muffle or diaphragm composed of resilient material, as rubber, having slits within its borders leaving members at either side which have their edges normally together, whereby said passage will be usually practically closed, but whereby downward air-suctions or overflowage of water passing through said passage from its top will insure a suitably-corresponding opening of the passage, substantially as described.

482,188. FURNACE-BOILER. EDWARD B. PARKHURST, Woburn, assignor to the Complete Combustion Company, Boston, Mass. Filed Dec. 28, 1891. Serial No. 416,347. (No model.)

Claim.—1. An upright furnace-boiler provided with a center chamber located above the crown-sheet and larger in transverse area than the fire-chamber, a series of flue-pipes connecting the combustion-chamber with said center chamber and traversing the water-space between the sides of the fire-chamber shell and the boiler-shell, and another series of flue-pipes traversing the water-space above said center chamber and connecting said center chamber with the smoke-chamber and uptake, substantially as shown and described.

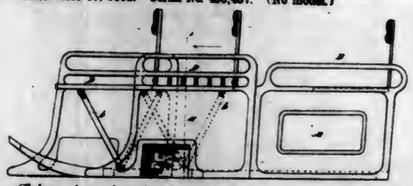
2. An upright downdraft furnace-boiler provided with a water-grate and having a center chamber located above the crown-sheet of larger transverse area than the fire-chamber, a series of flue-pipes traversing the water-space around the fire-chamber and connecting said center chamber with the combustion chamber, and another series of flue-pipes traversing the water-space above the center chamber and connecting said chamber with the smoke-chamber and uptake, substantially as shown and described.

482,189. CARRIAGE. AUGUSTUS N. PARRY, Amesbury, Mass. Filed June 13, 1892. Serial No. 436,437. (No model.)

ing the rope under tension through an upright furnace, in which it is subjected to a softening heat, and exposing the rope to a blast of air or a spray of water as it emerges from the furnace, substantially as described.

6. The combination of the furnace, the upright chamber therein through which the rope to be heated is passed, a delivery-drum and a receiving-drum for the rope, and a water-spraying device situated between the furnace and the receiving-drum through which water can be forced against the rope, substantially as described.

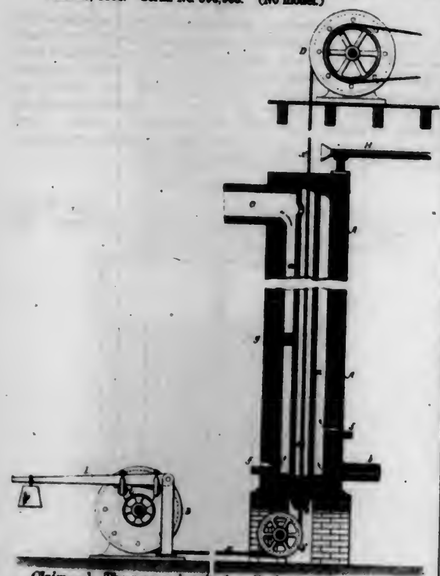
482,191. EYEGLASS-HOLDER. ERNEST C. PERKINS, Geneva, N. Y. Filed May 2, 1892. Serial No. 431,449. (No model.)



482,193.

2. The combination, with the cotton-opener and lifting-apron from which cotton is delivered to the opener, of an intermediate revolving cage and means whereby the cotton is delivered from the lifting-apron to the cage and from the cage to the opener, substantially as herein set forth.

482,195. LUBRICATING-HUB. FREDERICK W. RANDOLPH, Raynor, Va. Filed Dec. 17, 1891. Serial No. 415,389. (No model.)



2. An upright downdraft furnace-boiler provided with a water-grate and having a center chamber located above the crown-sheet of larger transverse area than the fire-chamber, a series of flue-pipes traversing the water-space around the fire-chamber and connecting said center chamber with the combustion chamber, and another series of flue-pipes traversing the water-space above the center chamber and connecting said chamber with the smoke-chamber and uptake, substantially as shown and described.

482,189. CARRIAGE. AUGUSTUS N. PARRY, Amesbury, Mass. Filed June 13, 1892. Serial No. 436,437. (No model.)

Claim.—A carriage having a wheel-house to admit the cut under of the front wheels and the front seat or seats having attached thereto a section of the side panel formed to correspond with the wheel-house and provided with jumping-irons upon which said seat may be moved forward and rearward while maintaining a level position, substantially as specified.

482,190. PROCESS OF AND APPARATUS FOR MANUFACTURING WIRE ROPE. AUGUST F. W. PARTE, Philadelphia, Pa. Filed June 20, 1891. Serial No. 396,963. (No model.)

Claim.—1. The process herein described of equalizing the tension and compacting the strands of a wire rope, said process consisting in subjecting the rope to the action of heat while under strain and while maintained in an upright position, substantially as described.

2. The process of equalizing the tension and compacting the strands of a wire rope, said process consisting in subjecting the rope to the action of transmitted heat while said rope is under strain, is maintained in an upright position, and is protected from a flow of air, substantially as described.

3. In an apparatus for heating wire rope, the combination of a furnace, an upright fire-proof tube therein through which the rope to be heated is passed, and mechanism for feeding said rope through the furnace and for imparting tension to the rope, substantially as described.

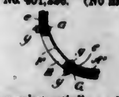
4. The combination of the upright furnace, the upright fireproof tube therein, inlets and outlets for the passage of the rope to be heated, and a box containing granular material, through which the rope passes into the tube, substantially as described.

5. The process of tempering ropes of steel wire, consisting in passing the rope under tension through an upright furnace, in which it is subjected to a softening heat, and exposing the rope to a blast of air or a spray of water as it emerges from the furnace, substantially as described.

6. The combination of the furnace, the upright chamber therein through which the rope to be heated is passed, a delivery-drum and a receiving-drum for the rope, and a water-spraying device situated between the furnace and the receiving-drum through which water can be forced against the rope, substantially as described.

482,191. EYEGLASS-HOLDER. ERNEST C. PERKINS, Geneva, N. Y. Filed May 2, 1892. Serial No. 431,449. (No model.)

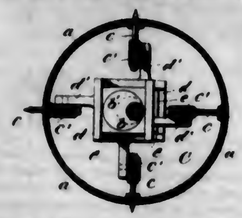
Claim.—1. The combination, with the rigid body and the inner slots therein and the glass-frames mounted thereon, of the levers pivoted in said slots, the guards thereon, and the springs connected to said levers and body.



2. The combination, with the slotted body and the finger-levers pivoted thereto, of springs connected thereto and provided with slots in their outer ends and means to adjustably connect said ends to the body.

3. An eyeglass comprising a rigid body, glass-frames adjustably mounted thereon, finger-levers pivoted in said body, nose-guards mounted upon said levers, and springs connected to said levers and adjustably connected to said body, in combination, as set forth.

4. The combination, with the rigid body, of the levers pivoted thereon and projecting above it and the nose-guards mounted adjustably upon the lower ends of said levers.

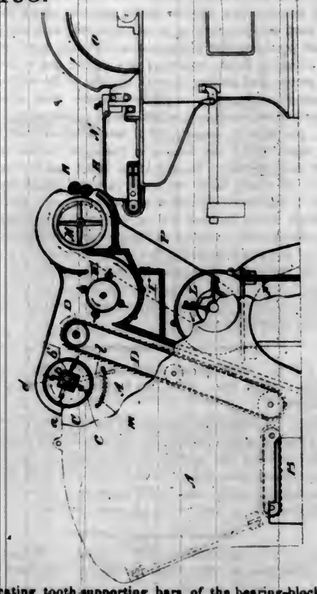


5. The combination, with the rigid body, of the levers pivoted thereon and projecting above it, and the nose-guards mounted adjustably upon said levers, springs connected to said levers and body, and means to vary their tension.

482,192. RICE-SCOURER. SQUIRE A. PICKETT, Crowley, La. Filed July 30, 1891. Serial No. 401,296. (No model.)

Claim.—In a machine substantially as described, the combination of the casing having an opening E and grooved or recessed at *e* along the edges of said opening, the wire-netting fitted over the opening E and inserted at its edges in the groove or recess *e*, the strips fitted in the groove or recess, and the fastening-bolts for such strips, all substantially as and for the purposes set forth.

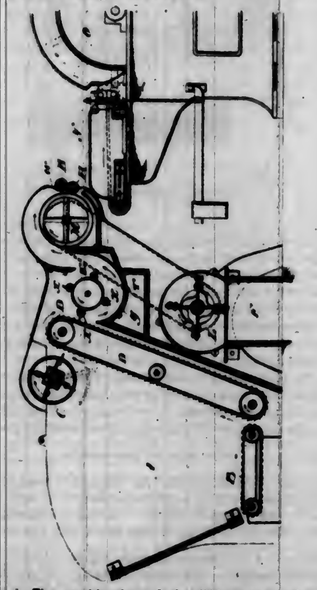
482,193. FEEDING MECHANISM FOR MACHINERY FOR OPENING, CLEANING, AND PREPARING COTTON. JAMES C. POTTER, Pawtucket, R. I., assignor to the Potter & Atherton Machine Company, same place. Filed June 29, 1892. Serial No. 438,444. (No model.)



Claim.—1. The combination of the doffer-cylinder, the doffer-teeth, the tooth-supporting bars, the saddles, their sliding blocks, and the stationary eccentrics on which said blocks are mounted, substantially as and for the purpose set forth.

2. The combination, with the lifting-apron, of the doffer-cylinder, the doffer-teeth, the tooth-supporting bars, the saddles, the sliding blocks, the eccentrics on which said blocks are mounted, and the eccentric-carrying shaft adjustable in its bearings, as and for the purposes hereinbefore set forth.

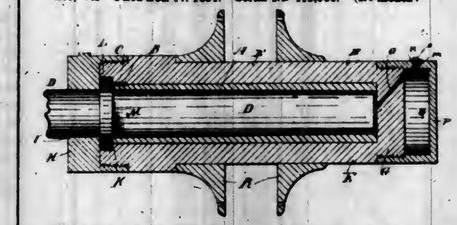
3. The combination, with the doffer-cylinder, the doffer-teeth, and



482,193.

the reciprocating tooth-supporting bars, of the bearing-blocks swiveled to the ends of the bars and fitting in radial guide-grooves in the cylinder-heads, substantially as and for the purposes hereinbefore set forth.

482,194. FEEDING MECHANISM FOR MACHINERY FOR OPENING AND PREPARING COTTON. JAMES C. POTTER, Pawtucket, R. I., assignor to the Potter & Atherton Machine Company, same place. Filed June 29, 1892. Serial No. 438,445. (No model.)

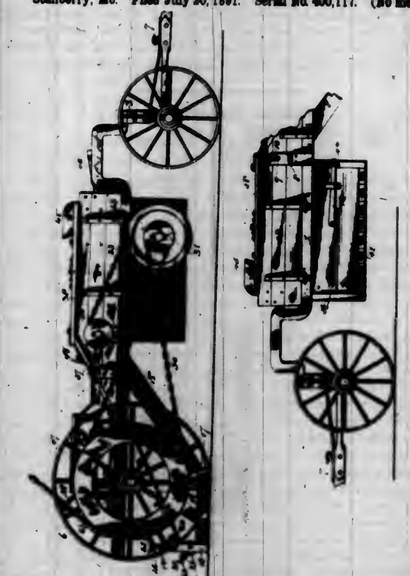


Brief.—The invention resides in the interposition of a condensing-cylinder or revolving cage between the opening mechanism and the lifting-apron for feeding cotton thereto.

Claim.—1. The combination of the lifting-apron, the beater-clearer, the revolving cage, and the stripper-rolls, substantially as herein set forth.

2. The combination, with the cotton-opener and lifting-apron from which cotton is delivered to the opener, of an intermediate revolving cage and means whereby the cotton is delivered from the lifting-apron to the cage and from the cage to the opener, substantially as herein set forth.

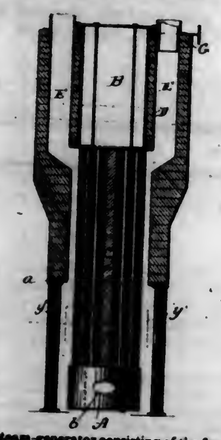
482,195. LUBRICATING-HUB. FREDERICK W. RANDOLPH, Raynor, Va. Filed Dec. 17, 1891. Serial No. 415,389. (No model.)



Claim.—1. The combination, with a vehicle-axle, of a lubricating-hub having an open rear end and a solid front end formed in the same piece, the said solid end having an oil-channel extending from its outer edge diagonally through to the inside center thereof and of the front cap secured to the solid end to form an oil-cup, substantially as shown and described.

2. In a self-oiling axle-hub, the combination, with the horizontal portion and the front end formed in the same piece, having an oil-channel extending diagonally therethrough, of the front cap attached to and surrounding the said end, so as to form an oil-cup between the said front end and the cap, with the rear cap adapted to confine the axle to the hub and the spoke-flanges shrunk upon the said horizontal portion, substantially as shown and described.

3. In a self-oiling axle-hub, the front solid end provided with an oil-channel and the front cap secured to the said solid end to form an oil-cup between the said cap and the solid end, combined with the cylinder A and means, substantially such as described, for holding the cylinder in the hub and up to the inner face of the solid end, whereby the said cylinder is continually oiled, as set forth.

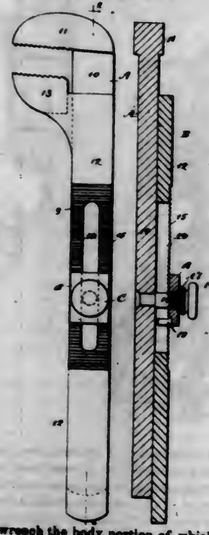


482,196. STREET-SWEEPING MACHINE. SERENO H. RATHBURN, Stanberry, Mo. Filed July 30, 1891. Serial No. 400,117. (No model.)

Claim.—In a street-sweeping machine, the combination, with the frame and supporting-wheels, the conveyer, and means for operating the same, of the dust-receptacle having an opening at its rear end to receive the upper end of the conveyer, a hinged side door, and the bottom consisting of a series of removable transverse bars having their outer ends cut away or recessed, forming shoulders against which the

door abutting when closed and locked, whereby removal of said bars is prevented, substantially as described.

482,197. STEAM-BOILER AND BOILER-FURNACE. SEBASTIAN RUMMEL, Sharon, Pa. Filed Apr. 26, 1892. Serial No. 430,764. (No model.)



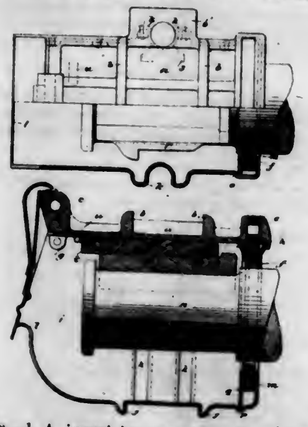
Claim.—1. A steam-generator consisting of the flue or boiler space provided with a steam and mud drum and flues, said space being formed by suitable brickwork, a series of columns, and a metal ring interposed between the columns and the brickwork, substantially as described.

2. In combination, a furnace made up of brickwork, columns supporting said brickwork, a mud-drum located within the space inclosed by the columns, and brickwork between the columns, substantially as described.

3. In combination with the boiler-space, a mud-drum located below the line of the heat-opening, a series of flues extending therefrom and connected with the steam-drum, and a central partition-wall extending from the mud-drum to the bottom of the steam-drum, substantially as described.

4. In combination with a mud-drum and steam-drum and intermediate flues, a contracted space through which the tubes pass, an exit-flue from said space passing around the steam-drum, and dampers located in the upper ends of said flues, substantially as described.

482,198. WRENCH. JOHN RYAN, New York, N. Y. Filed July 13, 1892. Serial No. 439,887. (No model.)



Claim.—1. A wrench the body portion of which consists of two sections, a fixed and a sliding section, the fixed section comprising a shank and an upper jaw, and the sliding section a shank held to slide upon the fixed section, carrying at its upper end the lower jaw of the wrench and provided with a longitudinal slot and teeth around said slot, and a locking device consisting of a pin turning in the shank of the fixed section and passing through the slot of the sliding section, and a toothed locking-plate engaging with the teeth of the sliding section and carried by the pin, substantially as described.

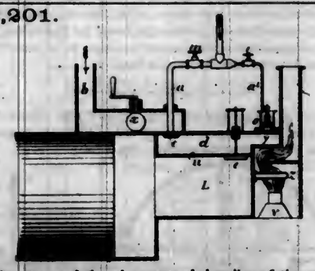
2. A pipe-wrench constructed in two body-sections, each comprising a shank and a jaw formed at the upper portion thereof, the upper jaw being formed at the top of its shank and the lower jaw at the side of its shank below the upper jaw, the shank carrying the lower jaw being provided with a slot and the outer surface of the slotted shank being toothed, and a locking device consisting of a toothed locking-plate engaging with the toothed surface of the shank of the lower jaw and provided with a threaded aperture, a pin loosely mounted in the unslotted shank and passed through the slot in the sliding shank and through the aperture in the locking-plate, that portion of the pin being threaded, and means for turning the pin, substantially as shown and described.

482,199. PROCESS OF FINISHING LEATHER. JOHN SANSENBACHER, Canfield, Ohio. Filed May 7, 1892. Serial No. 432,182. (No specimens.)

Claim.—The process for finishing leather, consisting of heating the same in a stuffing-wheel, adding the above-described heated stuffing compound, rotating the stuffing-wheel containing the leather and heated compound, removing the leather and stoning the leather while warm, cooling the leather, and finally applying a heated stuffing compound, substantially as and for the purpose specified.

482,200. CAR-JOURNAL BOX. CHARLES T. SCHORR, Allegheny, Pa. Filed Mar. 28, 1892. Serial No. 426,736. (No model.)

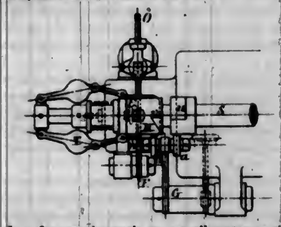
Claim.—1. A journal-box comprising an independently-constructed top of suitable material and formation, combined with a body of wrought metal, such as pressed steel, made separate from the top and composed of sides, bottom, a rear wall, and a front lip made integral and fitted and secured to such top, substantially as described.



2. A journal-box comprising a top having a groove in its under side and downwardly-projecting lugs, combined with a body struck up from wrought metal, having its edges fitted in said grooves and fastened to said lugs, substantially as described.

3. In a journal-box, a wrought-metal body provided with lateral shoulders *o* and a bottom groove *p*, combined with a partition-plate *q*, fitted therein, to separate off or form in the rear of the box a compartment for the reception of the dust-guard, substantially as described.

482,201. OIL-MOTOR ENGINE. HERMANN SCHUHM, Cologne-Deutz, Germany, assignor to the Gas-Motoren-Fabrik-Deutz, same place. Filed Feb. 27, 1892. Serial No. 423,087. (No model.) Patented in Belgium Jan. 7, 1892, No. 97,835, and in Italy Feb. 3, 1892, LXI, 92.



Claim.—In a petroleum or oil motor engine, the combination, with a vaporizing-chamber on the explosion-chamber of the engine, of an automatic valve *e*, which closes auxiliary air and oil supply passages *q* and *r*, a stop-cock *m* for closing the ordinary oil-supply pipe *a*, a valve for closing the ordinary air-supply passage *b*, an auxiliary oil-supply

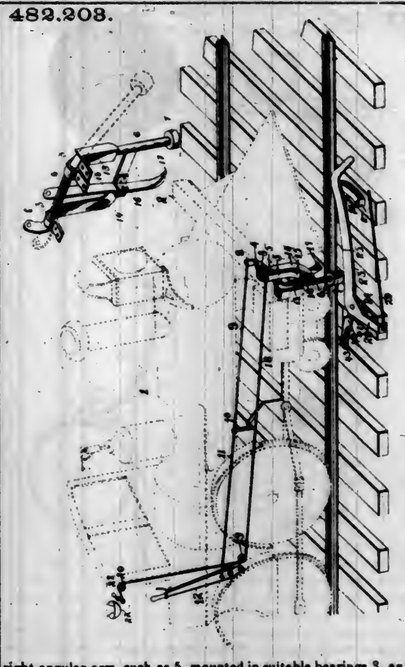
482,201.

pipe *a'*, with stop-cock *i*, and an extended wall *y* of the vaporizing-chamber heated by a lamp, so that for starting the engine the valves *m* and *x* are closed while valve *i* is opened, so as to admit oil and air through the valve *e* to the heated part *y* of the vaporizing-chamber, and thus form a heated explosive charge that passes through valve *e* into the explosion-chamber, substantially as described.

482,202. GAS OR OIL MOTOR ENGINE. HERMANN SCHUHM, Cologne-Deutz, Germany, assignor to the Gas-Motoren-Fabrik-Deutz, same place. Filed Mar. 7, 1892. Serial No. 424,055. (No model.) Patented in Belgium Feb. 27, 1892, No. 96,539; in Italy Mar. 19, 1892, LXI, 384, and in Spain Mar. 26, 1892, No. 12,074.

Claim.—In a four-stroke cycle gas or oil motor engine, the combination, with the ordinary cam, such as *u*, for opening the discharge-valve during the expelling-stroke, of two cams, such as *v* and *w*, that are controlled by the engine-governor, of which the one cam *v*, which is formed with a sloping face on its following side, so as to have a variable dwell, is also made to act upon the discharge-valve so as to hold it open for a longer or shorter space of time during the first part of the suction-stroke, while the second cam *w*, which is formed with a sloping face on the leading side, acts upon the inlet valve or valves for the explosive charge of the cylinder, also with a variable dwell, so as to open this or these as soon as the before-mentioned cam allows the discharge-valve to close and to hold it or them open until the end of the suction-stroke, substantially as described.

482,203. AUTOMATIC SIGNAL DEVICE FOR RAILROADS. BYRON SHOEMAKER and JUDSON SHOEMAKER, St. Louis, Mo. Filed Jan. 6, 1892. Serial No. 417,184. (No model.) Patented in Canada Feb. 12, 1892, No. 33,263.



Claim.—1. In an automatic signaling device for railroads, the combination, with the locomotive, of a rocking arm comprising a horizontal bearing portion and a vertical portion projecting normally downwardly at the side of the locomotive, and means connecting said rocking arm with the locomotive reversing-lever, whereby said arm is actuated by the latter, substantially as and for the purpose set forth.

2. In an automatic signaling device for railroads, the combination, with a locomotive, of a rocking arm mounted thereon and comprising a downwardly-projecting member, mechanism for connecting said arm with the locomotive reversing-lever, and a local alarm-lever carried by said arm and adapted to be simultaneously thrown out of operation therewith, substantially as and for the purpose set forth.

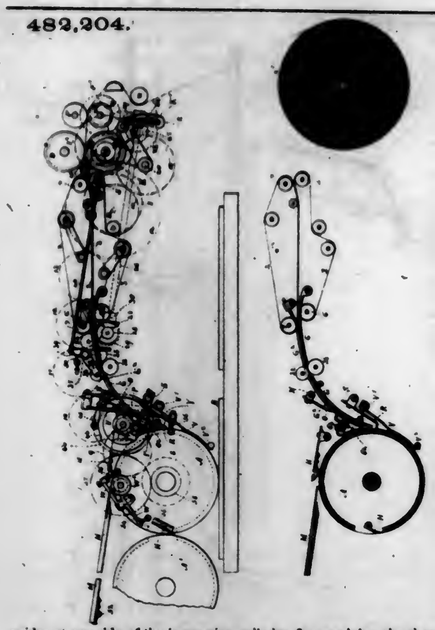
3. An automatic signal device for railroads, consisting of an arm 5, suitably mounted in bearings and adapted to be attached to the front of the locomotive, a friction-wheel 7, carried by said arm, a curved brace 14, also secured to said arm, a lever 15, movably secured to said brace, having a wedge-shaped lower end 17, a rope or cord 18, attached to the upper end of said lever, leading to and connected to an alarm in the cab of the locomotive, a rod attached to the said arm 5 and connected to the reversing-lever on the locomotive, levers secured to the cross-ties and adapted to be moved by the said roller, and suitable wires leading to and connected with a shaft for operating or elevating an arm, substantially as described.

4. An automatic signal device for railroads, consisting of a

482,208.

right-angular arm, such as 5, mounted in suitable bearings 3, an arm, such as 8, attached to or formed with the arm 5, a rod 9, movably attached to the said arm 8 and also attached to the lever 10, for operating the link upon the locomotive, a second rod, such as 11, attached to the said arm 10 and also to the reversing-lever 12 upon the locomotive, a brace, such as 14, a lever, such as 15, movably secured to said brace, having a wedge-shaped lower end 17, a cord or rope, such as 18, attached to the upper end of said lever and passed over suitable rollers and also attached to the clapper 21 of the gong 32 for sounding an alarm, and a system of levers arranged to one side of the track-rails for operating or rotating suitable shafts, such as 40, substantially as described.

482,204. PRINTING-PRESS. WALTER SCOTT, Plainfield, N. J. Filed Sept. 11, 1891. Serial No. 405,269. (No model.)



Claim.—1. The combination, in a two-revolution perfecting-press having two impression-cylinders, of feeding, cutting, and forwarding mechanism for supplying sheets from a roll, and a curved and downwardly-inclined table or guides at the downwardly-moving side of the impression-cylinder, whereby the sheets are passed to the impression-cylinder directly from the curved surface, substantially as set forth.

2. The combination, with the impression-cylinder of a printing-press, of a feed-board for hand-feed above the impression-cylinder, means for supplying and cutting sheets automatically, a table or guides at one side of the impression-cylinder, over which the automatically-supplied sheets pass downwardly to the impression-cylinder, and forwarding-rolls for regulating the passage of the sheet over the said guides or table to the impression-cylinder, substantially as set forth.

3. The combination, with the impression-cylinder of a printing-press, of a feed-board for hand-feed above the impression-cylinder, feed-rolls and changeable gearing for varying the length of sheet supplied, cutters for perforating or separating the sheets, a table or guides at one side of the impression-cylinder, over which the automatically-supplied sheets pass downwardly to the impression-cylinder, and forwarding-rolls for regulating the passage of the sheets over said guides or table to the impression-cylinder, substantially as set forth.

4. The combination, with an impression-cylinder and its grippers of a printing-press, of forwarding belts or rolls, cutters for perforating or separating the web, feed-rolls and changeable gearing for varying the speed of the feed-rolls and the length of paper fed in for each sheet, eccentric gears or their equivalents for giving to the cutters or perforators a speed corresponding, or nearly so, to that of the paper at the time such paper is cut or perforated, gearing connecting the feed-rolls, and forwarding-rolls, whereby the latter are caused to move at the same or nearly the same speed as the sheets of paper, and a table or

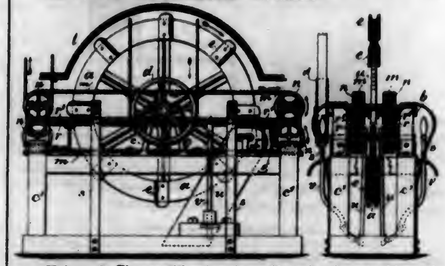
482,204.

guides at one side of the impression-cylinder for supplying the sheets in a downward direction to such impression-cylinder, substantially as set forth.

5. The combination, with the impression-cylinder and its grippers, of a feed-board and gages adapted to sheets supplied by hand, a table or guides extending from the impression-cylinder at one side thereof, automatic feeding and cutting mechanism for supplying sheets from a roll of paper, and changeable mechanism for operating the grippers to take the sheet as the same is fed by hand or automatically, substantially as set forth.

6. The combination, in a two-revolution perfecting-press having two impression-cylinders, of feeding, cutting, and forwarding mechanism for supplying the sheet from a roll, a curved and downwardly-inclined table or guides at the downwardly-moving side of the impression-cylinder, and a feed-board at the upper part of the same impression-cylinder, substantially as set forth.

7. The combination, with the impression-cylinder and its grippers, of an inclined table or guides at the downwardly-moving side of the impression-cylinder, a forwarding-roll for moving the paper down the inclined table or guides, fingers acting upon the paper to steady the same and to check its movement down the table, and mechanism for bringing the fingers and forwarding-roll into action, substantially as set forth.



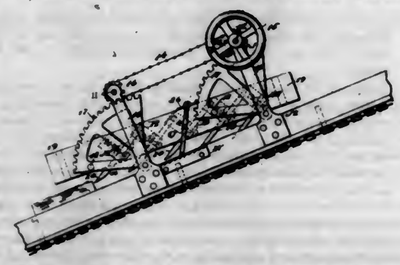
8. The combination, with the impression-cylinder and the automatic feeding mechanism, of a downwardly-inclined and curved table or guides for pressing the sheet in a curved condition against the downwardly-moving side of the impression-cylinder to be taken by the grippers thereof, substantially as set forth.

9. The combination, with the impression-cylinder and grippers of a printing-press, of a table or guides extending out from one side of such impression-cylinder, forwarding tapes or belts and their rollers, feed-rolls, and cutting or perforating cylinders, changeable gearing for varying the speed of the feed-rolls, gearing connecting the feed-rolls and the rolls for the belts for driving the latter at the same or nearly the same speed as the feed-rolls, a pair of forwarding-rolls, and mechanism, substantially as specified, receiving its motion in harmony with one of the cutting-cylinders for bringing the forwarding-rolls into action in harmony with the cutting devices, substantially as set forth.

10. The combination, with the impression cylinder and its grippers, of a downwardly-inclined table or guides at the downwardly-moving side of the impression-cylinder, feeding and cutting mechanism, the gages R for the advancing end of the sheet, contiguous to the impression-cylinder, fingers acting against the paper to steady the same upon the table, and mechanism for moving the fingers and the gages, substantially as set forth.

11. The combination, in a printing-press, with the revolving impression-cylinder and its grippers, of a feed-board for hand-fed above the impression-cylinder, automatic mechanism for supplying sheets, and a downwardly-inclined table or guides at the downwardly-moving side of the impression-cylinder and over which the automatically-supplied sheets pass, substantially as set forth.

482,205. MACHINE FOR PREPARING FIBER. HAROLD SERRELL, New York, N. Y., administrator of Isidoro Villamor, deceased. Filed Jan. 18, 1892. Serial No. 418,202. (No model.)



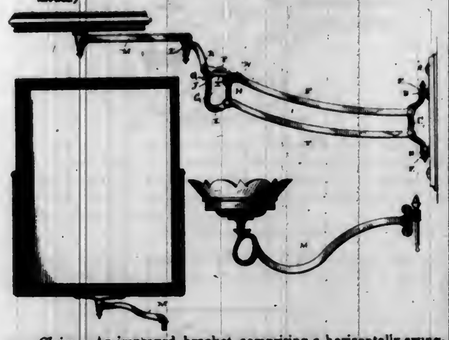
Claim.—1. The combination, in a fiber-cleaning machine, of a revolving wheel having radial or nearly radial knives or scrapers secured to the face of the same, a presser-board pivoted near the upper end thereof where the bank of fiber is supplied, said board being inclined in the direction of the scraping action, so that the fiber is spread out as scraped by the knives, and a lever for moving the lower end of the presser-board toward the scraping-wheel, substantially as specified.

2. The combination, in a fiber-cleaning machine, with a revolving wheel having knives or scrapers, of a scraping-board over which the fibers are drawn as they are cleaned, the feeding and holding belts that receive the leaves between the straight portions thereof and hold such leaves at one end while the other ends are being cleaned, substantially as specified.

3. The combination, in a fiber-cleaning machine, with a revolving wheel having knives or scrapers, of a scraping-board over which the fibers are drawn as they are cleaned, the feeding and holding belts between which the leaves are supplied and by which they are held at at one end while the other ends are being cleaned, and mechanism, substantially as set forth, for applying pressure to the straight portions of said belts to cause them to grip the fiber firmly, substantially as specified.

4. The combination, in a fiber-cleaning machine having a revolving wheel and scrapers, of a scraping-board over which the fibers are drawn as they are cleaned, feeding and holding belts, and yielding supports between which such belts pass for retaining the fibers that are supplied between the chain as they are cleaned, substantially as specified.

482,206. PLANER FOR ICE-ELEVATORS. WILLIAM H. M. SMITH, Brooklyn, N. Y. Filed Dec. 22, 1891. Serial No. 415,853. (No model.)



Claim.—1. In an ice-planer, the combination, with an elevator, of a planer-body held at an inclination above the elevator and provided with several series of knives one in rear of the other, the knives of the several series being in alignment, means for adjusting the inclination of the planer-body, and means for locking it in the position to which it has been adjusted, substantially as described.

2. In an ice-planer, the combination, with supports, of segmental racks pivoted to said supports, a planer-body secured to the said racks, pinions meshing with said racks, and means for operating the pinions, substantially as described.

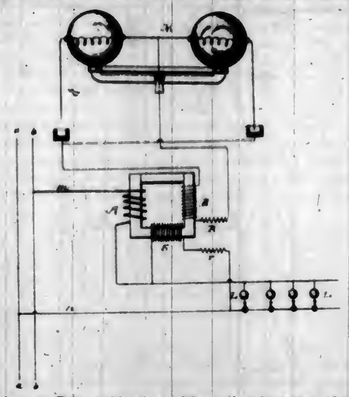
3. In an ice-planer, the combination, with supports, of segmental racks pivoted to said supports, a planer-body secured to the racks, pinions meshing with the racks, sprocket-wheels on the shafts of the pinions, chain belts passing over the sprocket-wheels, and a crank on one of the pinion-shafts, substantially as described.

4. In an ice-planer, the combination, with an elevator, of pivoted segmental racks, a planer-body secured to the racks, pinions meshing with said racks, means for operating the pinions, racks secured to the elevator, and pawls pivoted to the planer-body and engaging the racks on the elevator, substantially as described.

482,207. ADJUSTABLE SWINGING BRACKET. NELSON R. STREETER, Groton, N. Y. Filed Jan. 26, 1892. Serial No. 419,219. (No model.)

Claim.—An improved bracket comprising a horizontally-swinging head, parallel arms pivoted at their inner ends one above the other to swing vertically, a combined hand-piece and support consisting of an inner and outer vertical portion, upper and lower horizontal portions connecting the ends of the vertical portions, and a supporting-arm extending upward and outward therefrom, the outer ends of said arms pivoted to the said inner vertical portion, the upper arm having serrations above and inside of its pivotal point, a pawl pivoted at the upper outer corner of the said hand-piece and in a plane above the pivotal point of the upper arm, the inner end of the pawl extending inside of the pivotal point of the said arm, whereby the said hand-piece must be raised before the pawl can be released, the said outer vertical portion forming a hand-piece, and a depending handle upon the outer end of the pawl, whereby it is convenient to be operated by the thumb, substantially as specified.

482,208. CHARM OR LOCKET. AUGUST L. TETAZ and LEOPOLD C. HACHEN, Chicago, Ill. Filed May 20, 1892. Serial No. 433,666. (No model.)



Claim.—1. The combination, with two hemispherical shells divided by a meridian plane and provided with polar projections also divided by said meridian plane, of a hinged joint connecting the two parts of one of said projections and a locking device connecting the parts of the other of said divided polar projections, substantially as specified.

2. The combination, with two hemispherical shells divided by a meridian plane and provided with a long and a short polar projection, whereof the latter is entirely divided by said meridian and whereof said other projection is only partly divided by said plane and cut transversely to said meridional cut, of a thread and nut on said latter projection, substantially as specified.

3. The combination, with two hemispherical shells representing the earth, having raised portions to represent land, whereof the remaining depressed portions represent water and which are filled with blue enamel, and each provided on its interior with images in relief, of divided polar projections, whereof one is provided with a hinge-joint and the other with a locking device adapted to connect the parts of said divided polar projection, substantially as specified.

482,209. INDUCTION-COIL FOR ELECTRIC METERS. ELIHU THOMSON, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Mar. 5, 1889. Serial No. 301,910. (No model.)

Claim.—1. The combination, with an electric meter, of coils or conductors tending to help one another and placed, respectively, in derivation to the work and in circuit with the work and a third coil or conductor inductively related to the other two and supplying the current which causes the operation of the meter, as and for the purpose described.

2. The combination, on the same iron core, of three coils, one of few turns carrying current in direct proportion to the current to be measured, a second carrying current in derivation to the work and tending to help the first, and a third connected to a separate circuit and being the seat of currents induced by the other two for operating upon the meter.

3. The combination, substantially as described, of three coils inductively related to one another and connected, respectively, as described, one into the main circuit with the work, a second into a derived circuit around the work and adapted to help the first, and a third into the the circuit with an electric meter for measuring the current consumed in the work.

4. The combination, substantially as described, of a meter-circuit, a main-circuit coil in inductive relation to the same and in series with the work, and a helping high-resistance circuit in a branch around the work at the point of consumption and also in inductive relation to the meter-circuit, as and for the purpose described.

5. The combination, with constant-potential mains feeding a translating device or devices requiring a variable amount of energy, of a coil or conductor in the circuit through which the energy consumed passes, a helping coil or conductor of practically constant effect, and a separate meter-circuit in inductive relation to the first two, as and for the purpose described.

482,210. MACHINE FOR TAPER-TURNING. WILLIAM W. TUCKER, Hartford, Conn. Filed July 13, 1891. Serial No. 399,432. (No model.)

Claim.—1. In a taper-turning mechanism, the combination, with the lathe-spindle and with a fixture-stock arranged to move parallel with the axis of said spindle, of the spring-actuated slide in said stock and fitted to carry one end of the piece to be turned, the cutter-slide mounted on the fixture-stock crosswise to the line of movement thereof, and a guide-block inclined to the line of movement of the fixture and engaging the cutter-slide, whereby the cutter is moved laterally of the fixture during the longitudinal movement thereof, substantially as described.

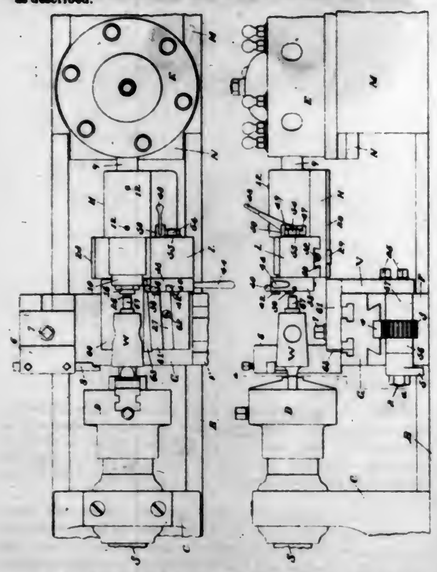
2. In a taper-turning mechanism, the combination, with the fixed stock having the sleeve 10, of the slide in said sleeve fitted to support the piece to be turned, the spring actuating said slide, and a stop limiting the outward movement of the slide, substantially as described.

3. In a taper-turning mechanism, the combination, with the fixed stock constructed, substantially as described, for carrying the work-supporting slide, of the cutter-carrying slide L, the cutter-holder shiftably supported, substantially as described, on said slide and provided with two cutters, and a holder-lock for locking said holder in successive positions, substantially as described.

4. In a taper-turning mechanism, the combination, with the fixed stock carried by the carret and constructed, substantially as described, to carry the guide-slide, of the guide-slide, the cutter-slide, the spring normally moving said cutter-slide to bring the cutter toward the piece to be turned, a stop limiting said movement, and a guide-bracket having two guide-grooves, one parallel to the longitudinal line of move-

ment of the fixture and engaging the fixed stock and the other inclined to said line of movement and engaging the cutter-slide, substantially as described.

482,211.



482,213. PROCESS OF REDUCING UNSMELTED ORES. JACOB T. WAINWRIGHT, Chicago, Ill. Filed Feb. 28, 1891. Serial No. 383,188. (No model.)

shaft and having its opposite end secured to the remaining seat-section, substantially as specified.

4. In a combined walking-stick and seat, the combination, with the lower base-supports and the upwardly-diverging seat-supporting standards provided with opposite semicircular grooves longitudinally disposed, one of which is provided at its lower end with a cavity, of the brace pivoted in the lower end of one of the grooves and at its free end adapted to take into the cavity, substantially as specified.

5. In a combined walking-stick and seat, the combination, with the three leg-standards pivoted together, one of which is slightly longer than the remaining two and terminates at its lower end in a

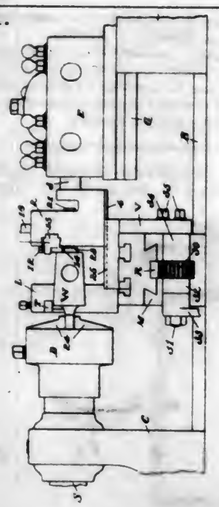
ment of the fixture and engaging the fixed stock and the other inclined to said line of movement and engaging the cutter-slide, substantially as described.

5. In a taper-turning mechanism of the class specified, the combination, with the fixed stock and with the cutter-slide movable crosswise of said stock, of the rotatable cutter-holder mounted on said slide, two cutters mounted in said holder, means for separately adjusting said cutters, a holder-locking bolt carried in the slide and engaging the holder, and means for withdrawing said bolt, substantially as described.

6. The combination, with a cutter-holder, substantially as described, of the cutters 36 and 40, means clamping said cutters in place, means, substantially as described, for adjusting said cutter 36, the screw 43, and the intermediate thrust-rod passing to one side of the cutter 36 and engaging the cutter 40 for adjusting the same, substantially as described.

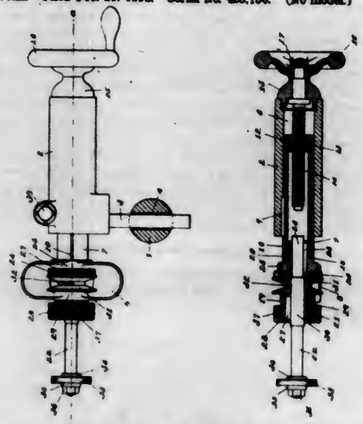
7. In a taper-turning mechanism, the combination, with a fixture, substantially as described, of the fixed guide-block 60, fitted to engage the guide 28 of said fixture, and the adjustable guide-block 61, fitted to engage the cutter-slide of the fixture, and a pattern-wedge controlling the position of the adjustable guide-block, substantially as described

8. The combination, with the fixed stock H, having the hollow shank 9, of the forwardly-projecting sleeve 10, the slide 13, having the hollow stem 18, the spring 17, outside of said stem and extending within the hollow shank 9, and a rod, substantially as described, limiting the forward movement of the slide and extending into said hollow stem, substantially as described.



482,211. MACHINE FOR MILLING PLUG-VALVES. WILLIAM W. TUCKER, Hartford, Conn. Filed July 13, 1891. Serial No. 399,483. (No model.)

Claim.—1. The combination, with a suitable holder or stock having a guide for the piece to be milled, of the cutter-slide fitted to move crosswise of said guide at one side thereof, a cutter fixed on said slide slightly inclined to the line of movement thereof, and means actuating the slide, substantially as set forth.

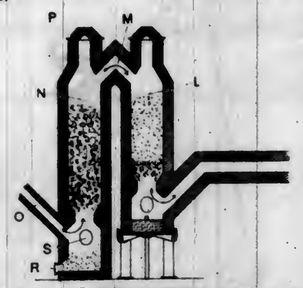


2. The combination, with a holder or stock substantially as described, of the removable guide-bushing, the cutter-slide, the cutter set inclined on said slide, means for adjusting the cutter on the cutter-slide, a shaft geared to the cutter-slide and journaled in said holder, and means for revolving the shaft by hand, substantially as set forth.

3. The combination, with the spindle-chuck and turret of a turret-lathe, of the guide-bracket having the guide-slot therein, the milling-tool holder fixed in the turret and having the guide constructed to enter and slide in said guide-slot and constructed, substantially as described, to support the piece to be milled, a sliding cutter carried by said holder, and means for actuating said cutter in a direction crosswise to said guide-slot, all substantially as set forth.

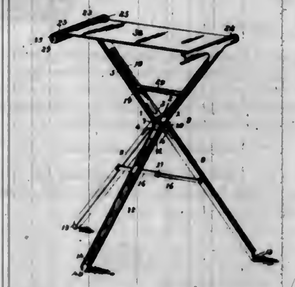
482,211.

482,212. GRINDING-FIXTURE. WILLIAM W. TUCKER, Hartford, Conn. Filed Feb. 29, 1892. Serial No. 423,156. (No model.)



Claim.—1. In a fixture of the class specified, the combination, with a holder and with a carrier, substantially as described, having a tubular stem fitted to slide in the holder, the bore of said stem at the forward end thereof being tapered substantially as described, of the spindle, the adjustable outer bearing for the spindle, the adjustable inner bearing 20, fitting in the tapered portion of said bore, and means, substantially as described, for adjusting said bearing 20 within the tubular stem, substantially as set forth.

2. In a fixture of the class specified, the combination, with the holder and with the sliding spindle-carrier having the hollow stem 7 fitted to slide in the holder, of the spindle, the conical bearing 20, having its larger end within the bore of the stem, the nut 24, engaging the smaller end of said bearing for adjusting the same, the removable carrier-actuating nut 12, and a screw engaging the nut 12 for sliding the spindle-carrier, whereby the carrier may be actuated and on removal of the nut 12 the bearing 20 may be removed through the tubular stem of said carrier, substantially as described.



3. In a fixture of the class specified, the combination, with the carrier 8, having the hubs 29 and 25, and the tubular stem 7, fitted to receive a tapered bearing, of the bearings 21 and 20, fitting within said hubs, respectively, the spindle supported in said bearings, the driving-wheel fixed on the spindle, the nut 24 for adjusting the bearing 20, the ring 28 for adjusting the bearing 21, and means for supporting and actuating the carrier, substantially as shown and described.

482,213. PROCESS OF REDUCING UNSMELTED ORES. JACOB T. WAINWRIGHT, Chicago, Ill. Filed Feb. 23, 1891. Serial No. 382,188. (No model.)

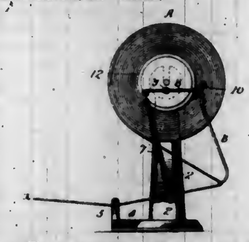
Claim.—In the art of reducing unsmelted or partly-smelted ore, the improved method of operation, which consists in generating gases at successionally-increasing temperature, passing these gases downward through ore, and maintaining this ore in an unreplenished condition, substantially as set forth.

482,214. COMBINED CANE AND STOOL. CHARLES WALLIS and ROBERT MADER, Bay City, Mich. Filed Apr. 23, 1892. Serial No. 430,387. (No model.)

Claim.—1. In a combined walking-stick and seat, the opposite diverging and folding standards terminating at their upper ends in hollow handle-sections forming seat-supports, one of said handle-sections being provided with end walls having central bearings and one of the end walls being provided with a countersunk polygonal recess, a shaft journaled in the bearings, a head or knob mounted for reciprocation on the shaft and having at its inner side a polygonal boss designed to fit the recess, a spring for normally maintaining said boss in the recess, means for locking the boss out of engagement with the recess, and a seat secured to the shaft, adapted to be wound thereon and having its opposite end secured to the opposite handle-section, substantially as specified.

2. In a combined walking-stick and seat, the opposite diverging and folding standards terminating at their upper ends in hollow handle-sections forming seat-supports, one of said handle-sections being provided with end walls, one of which has an angular cavity, and each of said end walls having bearings, a shaft journaled in the bearings and extending beyond that end wall having the cavity, a knob mounted non-rotatably upon the extended end of the shaft and adapted for reciprocation, a projection on the inner side of the knob for engaging the cavity, means for locking the knob out of engagement with the cavity, and a flexible seat wound upon the shaft and connected at its opposite end to the opposite seat-section, substantially as specified.

3. In a combined walking-stick and seat, the combination, with the upwardly-diverging seat-standards terminating in the semi-cylindrical hollow seat-sections, one of which is provided with opposite heads having bearings, the head at one end having a countersunk polygonal recess surrounding its bearing, of a shaft mounted in the bearing and extending beyond the polygonal recess, a knob mounted non-rotatably upon the extended end of the shaft and provided at its inner side with a surrounding annular boss adapted to fit the recess and at its front side with a circular recess in which the end of the shaft terminates in a head, a coiled spring mounted on the shaft between the inner end of the recess of the knob and the head of the shaft, an L-shaped recess formed in the front face of the knob at one side of the shaft, an L-shaped pin mounted therein and adapted to be projected into the path of the shaft, and a flexible seat secured to the shaft and having its opposite end secured to the remaining seat-section, substantially as specified.

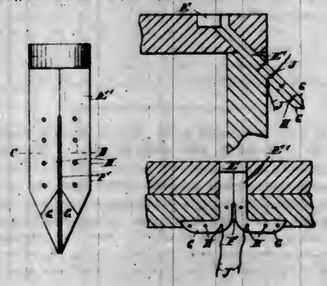


4. In a combined walking-stick and seat, the combination, with the lower base-supports and the upwardly-diverging seat-supporting standards provided with opposite semicircular grooves longitudinally disposed, one of which is provided at its lower end with a cavity, of the brace pivoted in the lower end of one of the grooves and at its free end adapted to take into the cavity, substantially as specified.

5. In a combined walking-stick and seat, the combination, with the three leg-standards pivoted together, one of which is slightly longer than the remaining two and terminates at its lower end in a lower cylindrical portion, of a ring mounted on the cylindrical end of the lower standard and provided at one side with a recess or cut-away portion adapted to be brought opposite the lower ends of the remaining standards, whereby they may be liberated, substantially as specified.

6. In a combined walking-stick and seat, the combination, with the two leg-standards 8, quadrant-shaped in cross-section, and the semicylindrical leg-standard 12, hinged together at their upper ends, and the latter standard being provided with a lower cylindrical end slightly reduced, of a ferrule and a ring mounted above the ferrule on the cylindrical end and provided with a cut-away side or upper edge, substantially as specified.

7. In a combined walking-stick and seat, the metal sections crossed and terminating in upper and lower sockets, the upper sockets being semicylindrical and the lower sockets quadrant-shaped, a metal block, a pivot-pin passed through the same, and a semicylindrical socket hinged to the lower end of the block, seat standards mounted in the upper sockets, a seat supported thereon, and leg-standards located in the lower sockets, and means for locking the legs together, substantially as specified.



482,215. THREAD-CONTROLLING DEVICE FOR SEWING-MACHINES. SIMON W. WARDWELL, Jr., Boston, Mass. Filed Feb. 26, 1892. Serial No. 422,921. (Model.)

Claim.—1. The combination, with the sewing-machine and with the thread take-up thereof, of a spool or cop containing the thread, substantially frictionless bearings for the said spool, a movable controller having a bearing for the thread between the spool and the take-up and supported to move in one direction under the draft upon the thread, and means for positively swinging the controller in the opposite direction and causing it to draw the thread from the spool, substantially as set forth.

2. The combination, in a thread-controlling device, of a spool or cop, substantially frictionless bearings therefor, a swinging controlling-arm having a bearing for the thread and supported to move in one direction under the draft of the thread, and a spring arranged to swing the arm in the other direction and cause it to draw the thread from the spool, as set forth.

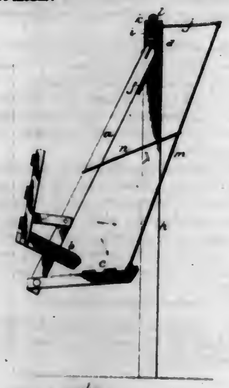
482,216. SEALING DEVICE. LUDWIG WURSBURG, London, England. Filed Dec. 2, 1891. Serial No. 413,816. (No model.) Patented in England June 6, 1891, No. 9,633.

Claim.—1. As an improved article of manufacture, the nail for use in sealing boxes, &c., the same having a split shank whose lower portion is provided with one or more transverse apertures adapted to receive a sealing wire or cord, as shown and described.

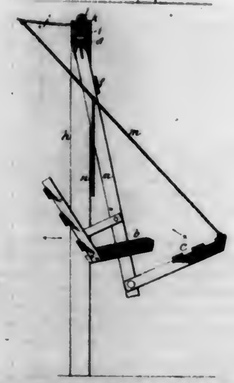
2. The combination of two or more flanged nails having the lower ends of their shanks split and perforated, as described, with cords or their equivalents connecting the perforated portions of adjacent nails, substantially as described.

482,217. SWING. CORNELIUS CLARK ALEXANDER and ISAAC ZOOK ALEXANDER, Hartford City, Ind.; said Isaac Zook Alexander assignor to William J. Alexander, same place. Filed Feb. 4, 1892. Serial No. 420,340. (No model.)

482,218.



482,220. TRAIN-ORDER CATCHER. EDWARD C. BARNEY, New Bloomfield, Pa. Filed Mar. 1, 1892. Serial No. 423,363. (No model.)



482,222. COMBINATION-LOCK. GEORGE L. BARNEY, Indianapolis, Ind. Filed Apr. 29, 1892. Serial No. 431,175. (No model.)

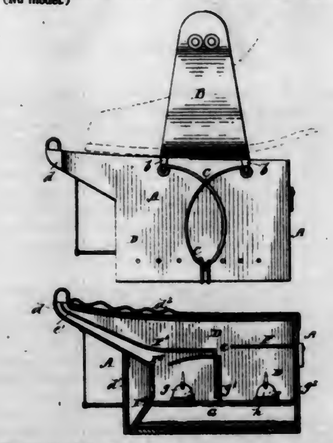
Claim.—1. As an improved article of manufacture, the nail for use in sealing boxes, &c., the same having a split shank whose lower portion is provided with one or more transverse apertures adapted to receive a sealing wire or cord, as shown and described.

2. The combination of two or more flanged nails having the lower ends of their shanks split and perforated, as described, with cords or their equivalents connecting the perforated portions of adjacent nails, substantially as described.

482,217. SWING. CORNELIUS CLARK ALEXANDER and ISAAC ZOOK ALEXANDER, Hartford City, Ind.; said Isaac Zook Alexander assignor to William J. Alexander, same place. Filed Feb. 4, 1892. Serial No. 420,340. (No model.)

Claim.—1. In a swing, the combination, with the suspending-bars and the foot-rest pivoted thereto, of an overhead spring-arm having a fixed relation to the swing and a flexible connection with the free end of the foot-rest, for the purpose stated.

2. In a swing, the combination, with the suspending-bars and a pivoted foot-rest, of an overhead spring-arm, a clamp-holder therefor, whereby said arm may be secured in fixed position to the front or to the rear of the swing, and a flexible connection for said spring-arm and the foot-rest, for the purpose stated.

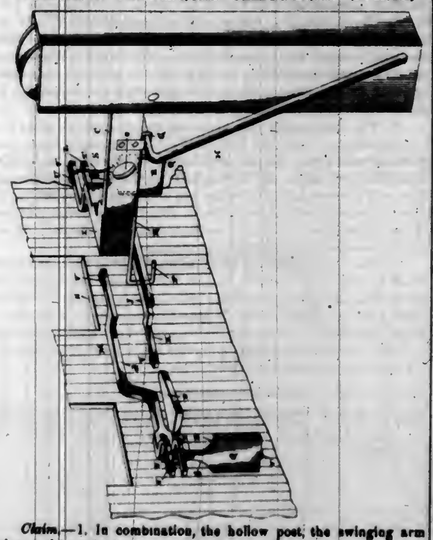


3. In a swing, the combination, with the fixed pintle-brackets *c e* and the seat-suspending bars having eyes *d d* for engaging said pintle-brackets, of a latch-bar *f*, pivoted at one end to one of said suspension bars and standing across and engaging the other of said suspension-bars, whereby to secure said suspension-bars and permit their removal from said pintle-brackets, substantially as described.

482,218. SWINGING GATE. MARTIN ANDERSON, Henderson Station, Ill. Filed Apr. 26, 1892. Serial No. 430,515. (No model.)

Claim.—The combination of a swinging gate having its inner end bar extended vertically and provided at the upper end with a horizontal bar disposed at an angle to the gate, the inclined supporting-bars arranged at each side of the gate and extending upward and outward, the operating-ropes arranged in pairs and extending in opposite directions from the gate, each pair having its outer ends supported by an inclined bar and having its inner ends secured to the horizontal bar at opposite ends thereof, the pivoted latch-bar mounted on the gate and provided at its inner end with a weight, and the latch-ropes arranged in pairs at each side of the gate and having their lower ends secured to the latch-bar and their upper ends attached to the operating-ropes, substantially as described.

482,219. COMBINED STIRRUP-LANTERN AND FOOT-WARMER. THOMAS F. BAIRD, Gasburg, Va. Filed May 2, 1892. Serial No. 431,516. (No model.)



Claim.—1. The combination of a riding-stirrup, a lantern-case, and a removable reservoir-lamp having two burners, and a vertical partition between the said burners, whereby the combined stirrup-lantern and foot-warmer can be used alternately as a lantern or foot-warmer, or as a foot-warmer and lantern at the same time, substantially as described.

2. The combination of a riding-stirrup, a lantern-case formed with a forwardly-extending chimney portion upon which the foot of the rider is adapted to rest, and a removable reservoir-lamp having two burners and a vertical partition between the burners, the front surface of the said partition being silvered or polished to form a reflector, substantially as described.

3. The combination of a riding-stirrup, a lantern-case roughened on its top surface and formed with a forward-extending foot-support which serves as a conductor for the heat, suitable guards on said case, and a removable reservoir, substantially as described.

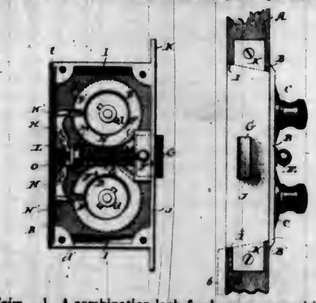
482,220. TRAIN-ORDER CATCHER. EDWARD C. BARNETT, New Bloomfield, Pa. Filed Mar. 1, 1892. Serial No. 423,363. (No model.)

Claim.—1. In combination, the hollow post, the swinging arm fulcrumed in a slot in the post, a weight in the post attached to the inner end of the arm, a longitudinally-movable catch carried by the arm and arranged to engage a stationary means secured to the post to hold the arm depressed, said catch adapted to be forced in by a passing car to release the catch, and a longitudinally-arranged receiving and delivering bar on the outer end of the arm, substantially as described.

2. A receiving and delivering device comprising a horizontally-disposed bar provided with a single receiving-finger at one end and two parallel separated delivering-prongs at the outer end, arranged in the same vertical plane and in such a manner that an order-holder supported thereon will be held against lateral swinging or displacement, and the receiving-finger of a corresponding bar will pass between said prongs, substantially as set forth.

3. A delivery device comprising a post, an arm pivoted thereto, a means for moving the arm vertically at its outer end, an endwise-moving rod which has its outer end extending beyond the end of the arm, the inner end of the rod forming a catch, means to be engaged by said catch to hold the arm, a projection upon the car to move the rod endwise, and a delivery-bar, substantially as specified.

4. In combination, a post, a swinging arm carried thereby, and a horizontally-disposed receiving and delivering bar on the outer end of said arm, provided with a single receiving-finger at one end and a pair of separated parallel delivering-prongs at the other end, arranged in the same vertical plane, the lower prong serving as a guide or guard to hold the ring of the holder against swinging, substantially as shown and described.



482,221. HANDLE-HOLDER FOR BRUSHES, &c. WILLIAM R. BARNETT and BENNET R. CHALK, Mount Washington, Md. Filed Mar. 24, 1892. Serial No. 426,312. (No model.)

Claim.—1. The improved handle-holder herein described, comprising the two separated sockets, the handle-section pivoted at its lower end between the said sockets and provided above said pivot with oppositely-projected lugs arranged to project in the adjustments of the handle into their respective sockets, and securing devices for holding the said lugs in their sockets, substantially as set forth.

2. The improved handle-holder herein described, consisting of the joint-plate having a central seat and provided on opposite sides of such seat with sockets C, the side plates C' of which are perforated, one perforation of each pair being threaded, the handle-section pivoted at its lower end in the seat of the joint-plate and provided above said pivot with oppositely-projected perforated lugs fitting in their respective sockets C in the different adjustments of the handle-piece, and the screw-pin by which to retain the said lugs in their sockets, substantially as set forth.

482,222. COMBINATION-LOCK. GEORGE L. BARNEY, Indianapolis, Ind. Filed Apr. 29, 1892. Serial No. 431,175. (No model.)

Claim.—1. A combination-lock for drawers, comprising the face-plate carrying the dial and the beveled sides, the face-plate extending beyond the beveled sides, substantially as described.

2. The combination-lock for drawers, comprising the face-plate, the beveled sides, the face-plate extending beyond the beveled sides, and the top plate having the extensions K, substantially as described.

3. The combination, with a drawer having a portion cut away on a bevel, of the lock having beveled sides and a face-plate carrying the dial the edges of which extend beyond the bevel sides and fitting the beveled cut-away portion in the drawer, substantially as described.

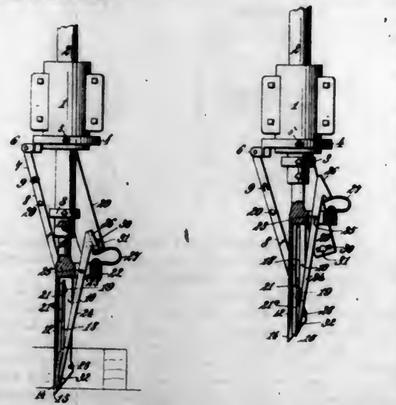
4. In a permutation lock, the combination, with the disks, each provided with a notch, of the sliding plate, a bolt operated by the sliding plate, and the dogs arranged at the rear of the sliding plate and adapted to enter the notches in the disk, substantially as described.

5. In a permutation-lock, the combination, with the disk having saw-tooth edges and a notch in each disk, of the slide-plate carrying the latch and the pivoted dogs arranged at the rear of the slide-plate and adapted to enter the notches in the disk, substantially as described.

6. In a permutation-lock, the combination, with the disk, of the slide-plate carrying the latch and having an upward-turned rear end, of the pivoted dogs bearing on said upward end and a spring for retaining them in position, substantially as described.

7. In a permutation-lock for drawers, the combination, with the face-plate having the disks, an operating-stud on the outside of the face, the disks mounted on the rear of the face, having saw-tooth edges, and a notch in the edges, a slide-plate carrying a latch and mounted on the rear of the face-plate, the dogs at the rear of the slide-plate, a top plate having an opening for the bolt, and the lateral extension K and the sides of the lock being beveled, substantially as described.

482,223. VENT-CLOSURE. JOHN L. BARTELS, Jr., Milwaukee, Wis. Filed Mar. 17, 1891. Serial No. 385,430. (No model.)



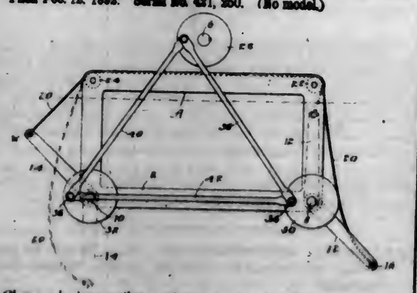
Claim.—The securing device for closures of vents, &c., the same consisting of a strip of sheet metal provided near its ends with punched openings, the stock removed by the punch forming annular flanges about the openings, and the tacks consisting of a shank and head, the former being provided between its point and the head with an annular groove receiving the flanges and forming a space between the head and the plate for a tack drawing tool, said shank being tapered from the groove to the point and forming at the top of the groove a shoulder of greater width than the shank at the bottom of the groove to direct the flanges into the grooves, substantially as described.

482,224. MORTISING-MACHINE. LOUIS A. BELMONT and ALFRED C. CLOAD, New Orleans, La. Filed Feb. 15, 1892. Serial No. 421,632. (No model.)

Claim.—1. An attachment for mortising-machines, consisting of a recessed chisel, a plunger attachment having one end pivotally at-

tached to a rigid support on the machine, a cross-head lying in the recess in the chisel, to which the lower end of the plunger attachment is pivotally connected, a clearer carried by said cross-head, and a spring-actuated snapper-bar having a cam-plate adapted to engage a cam-pin on the downward stroke of the chisel, substantially as described.

2. In a mortising-machine, the combination, with a cutter or chisel having a longitudinal recess or channel, of a snapper-bar pivotally mounted upon said chisel and having its point lying in the lower end of the recess therein, means for automatically vibrating said snapper-bar to pack the detached chip or core, and a clearer traversing the slot or channel as the chisel is withdrawn from the mortise, substantially as described.



3. In a mortising-machine, the combination, with a reciprocating chisel having a longitudinal channel or recess, of a snapper-bar having its point lying in the lower end of the slot or channel and capable of a limited vibration therein and means for automatically forcing said point inward in said channel to compact the chips therein, substantially as described.

4. In a mortising-machine, the combination, with the chisel-mandrel and with a box within which said mandrel moves, of a cutter or chisel mounted in the mandrel and having a longitudinal channel open upon the front edge and extending nearly to the back of the cutter, a cross-head lying in said channel between the side pieces of the chisel, a plunger attachment hinged to a ring mounted on the box and having parallel arms between which lies the chisel, said arms engaged by pins on the cross-head, a snapper-bar pivoted on a bracket projecting from the front of the cutter or chisel, the lower end of said snapper-bar lying in the channel of the chisel, a cam-pin supported by an arm rigid on a bracket dropped from the ring and lying in the path of a cam-plate on the descending snapper-bar, and a clearer attached to the cross-head, substantially as described.

5. The combination, with a chisel having a longitudinal channel inclosed on both sides and in rear, the sides being beveled downwardly and rearwardly to form inclined cutting-edges, of a chip-clearer located in the said channel and serving to eject the chips on the upstroke of the chisel, substantially as described.

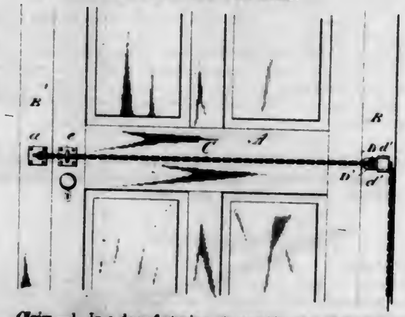
482,225. PROPELLER. WALTER R. BOHRAM, St. Paul, Minn., Filed Feb. 12, 1892. Serial No. 421,260. (No model.)

Claim.—1. A propeller consisting of a pair of similar cranks driven at equal speed with alternating movements and a flexible web running over suitable supports above said cranks and having its ends connected, respectively, to their pins, combined and adapted to be operated substantially as described.

2. The combination, with a boat and its driving-shaft, of a pair of similar parallel crank-shafts so connected to said driving-shaft as to be driven thereby with alternate movements, a flexible web having its ends connected, respectively, to the crank-pins of said crank-shafts, and idler-drums journaled above said crank-shafts and supporting the slack of said web, substantially as described.

3. The combination, with a boat and its driving-shaft, of the two-part rectangular frame, the crank-shafts journaled in said frame, each provided with a pair of crank-arms connected by a cross-bar or common crank pin, means for driving said crank-shafts simultaneously from said driving-shaft, the flexible web having its ends secured to the pins or cross-bars of said crank-shafts, and the idler-drums journaled in said frame above said crank-shafts and carrying the slack of said web, substantially as described.

4. The combination, with the driving-shaft 6, of the crank-shafts 8 and 10, each provided with a crank-disk at each end, pitmen connecting said crank-disks with said driving-shaft, the crank-arms carried by said shafts 8 and 10, the cross-bars connecting said arms together, the flexible web having its ends attached to said cross-bars, and the idler-drums journaled above said shafts 8 and 10 and supporting said web, substantially as described.

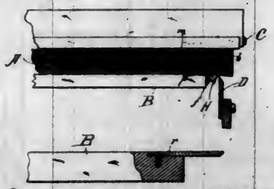


482,226. CULTIVATOR-TOOTH. MALVIN J. CHENEY and HERMAN BENCH, Taylor, Iowa. Filed Apr. 27, 1892. Serial No. 430,830. (No model.)

Claim.—1. The herein-described improved cultivator-tooth having an approximately diamond-shaped point and an arm or wing extending from one side and bent or curved over said point to near a line with the opposite side of the tooth-shank and having a forward sharpened edge, as set forth.

2. The herein-described improved cultivator-tooth, having a shank provided with right-angular slots in the outer end, a diamond-shaped point, and a curved arm or wing extending from one side of said point upward and across its face, and having a forward sharpened edge, as set forth.

482,227. DOOR-CHECK. WILLIAM J. CONNER, Labette, Kans. Filed May 26, 1892. Serial No. 434,508. (No model.)



Claim.—1. In a door-fastening, the combination of the fixtures a and D, rigidly secured to the door-frame on each side of the door, a chain permanently attached to one of the fixtures and adapted to be engaged by a pawl carried by the other fixture, substantially as shown, and for the purpose set forth.

2. In a door-fastening, the combination of a chain C, rigidly secured to one side of the door-frame and provided at its free end with a needle or bar *e*, a pawl secured to the opposite side of the frame, said pawl having a reduced end which engages with said chain, substantially as shown.

3. The combination, in a door-fastening, of a chain permanently secured to the door-frame, an eye or loop carried by the door, through which the chain passes, and a fixture D, secured to the opposite side of the door-frame, the chain being adapted to be engaged by said fixture, substantially as shown, and for the purpose set forth.

4. The combination, in a door-fastener, of a chain rigidly secured to the door-frame and adapted to engage with an eye carried by the door, a spring-actuated pawl attached to the opposite side of the door-frame, the pawl having a reduced end which may pass through a link of the chain and engage with the bed-plate of the fixture which carries the pawl, substantially as shown.

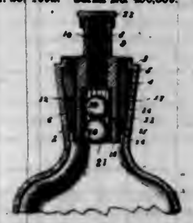
482,228. PAPER-CUTTING MACHINE. ROBERT D. CRAWFORD, East Pepperell, Mass. Filed Sept. 18, 1891. Serial No. 406,068. (No model.)

Claim.—1. In a paper-cutting machine, a bed provided with a depressible projection at its cutting-edge, substantially as and for the purpose set forth.

2. In a paper-cutting machine, a bed, in combination with a spring-tensioned bar secured at an edge thereof between said bed and the cutter-knife and having a face normally flush with the face of said bed, substantially as described.

3. In a paper-cutting machine, a spring-pushed bar angular in cross-section and hinged by an edge to an edge of the paper-bed of said machine, a face of said bar being normally flush with the face of said bed, substantially as and for the purpose set forth.

4. The bed B, in combination with the bar H, hinged thereto, and the spring *f*, interposed between said bed and bar, substantially as described.



482,229. BRACELET. LOUIS CREMONESI, New York, N. Y. Filed May 16, 1892. Serial No. 433,129. (No model.)

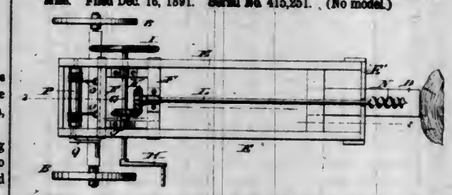
Claim.—1. A bracelet or similar ornament comprising an endless spring formed into a series of open loops and limiting-links held in the loops, the links having widened and oppositely-extending free ends, substantially as described.

2. A bracelet or similar ornament comprising an endless spring formed into a series of open loops and links held to span every two loops, the links being doubled around the loops and having widened and inwardly-curved free ends, substantially as described.

482,230. BOTTLE AND STOPPER. HENRY CRIMMEL, Fostoria, Ohio. Filed Apr. 23, 1892. Serial No. 430,359. (No model.)

Claim.—1. The herein-described stopper adapted to interlock with the neck of a bottle, the same consisting of a truncated cork having a central bore, a tube mounted therein and provided near its outer end with a smaller or reduced bore and at its lower end with an expanded bore, each of its bores being provided with grooves respectively differential in depth, said tube terminating at its lower end in a reduced opening, and a ball mounted in the lower end of the bore and adapted to close the opening, substantially as specified.

2. The herein-described stopper adapted to interlock with the neck of a bottle, the same consisting of a truncated cork having a central bore, a metal tube located in the bore and provided at its upper end with an expanded bore having a reduced bore and at its lower end with a reduced valve-seat, and a valve adapted to cover the seat when the stopper is in a vertical position, substantially as specified.



3. The combination, with the vessel having a tapered neck, the mouth of which is provided with an annular shoulder, of a stopper consisting of a cork having an upper annular shoulder forced into the neck and engaging the shoulder, said cork being provided with a bore, a metal tube snugly fitting the bore, said tube terminating at its upper end in a reduced opening and at its lower end in a reduced valve seat or opening, and a valve mounted over the lower reduced opening, substantially as specified.

4. The combination, with a vessel having a tapered neck terminating in a reduced annular shoulder, of a cork tapered to fit the neck and having an upper reduced end forming a shoulder for engaging that of the neck, a metal tube mounted in the cork and extending below the end of the same, said tube being provided with an upwardly-opening valve, and a ring mounted on the lower end of the tube and having prongs embracing the exterior of the cork and terminating at the shoulder thereof, substantially as specified.

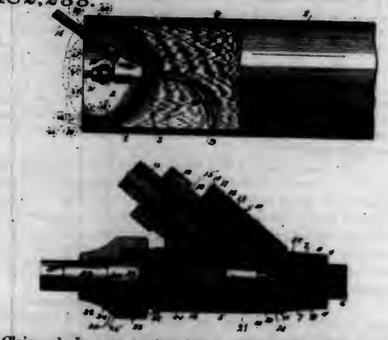
5. The combination, with the vessel having the tapered neck and annular shoulder at the upper end of the same, of the tapered cork fitting the neck and having an annular shoulder engaging that of the neck, a tube mounted in the cork and comprising a lower bore and an upper reduced bore, said bores having their walls corrugated, a cap having a central opening threaded on the lower end of the tube, and a ball mounted in the large bore of the tube and adapted to close the opening in the tube, substantially as specified.

6. The combination, with the vessel having the tapered neck provided with the annular shoulder, of the tapered cork fitting the neck and provided with an external shoulder engaging that of the neck, a metal tube mounted in the cork, extending below the same, exteriorly threaded at its lower end, and having an upper and a lower bore, each of which is grooved longitudinally, the upper bore being smaller than the lower bore, a metal ring mounted on the lower end of the tube and provided with a series of upwardly-disposed cork-embracing prongs terminating at the shoulder of the cork, a perforated cap threaded on the lower end of the tube, a pair of balls mounted in the large bore of the tube and loosely fitting the same, a washer interposed between the lower end of the cork and ring, and an annular boss located upon the upper end of the tube and extending over the upper end of the cork, substantially as specified.

482,231. BORING-MACHINE. JONATHAN W. DAY, Crystal Springs, Miss. Filed Dec. 16, 1891. Serial No. 415,251. (No model.)

Claim.—The improved stump-boring machine composed of the truck-frame having supporting rear wheels and front legs, the slotted ways E E, mounted in inclined position on said frame, and the stop-board D, projecting from their lower end, the frame F, sliding in the ways, the crank-shaft G, passing through them and carrying the gear J centrally and the balance-wheel on one end, the auger L, mounted in the frame F and having miter-gear K, and means for adjusting the auger-carrying frame and its attachments, as shown and described.

482,232. WATCHMAKER'S TWEEZERS. CHARLES W. DELANEY, Hammond, Ind. Filed Dec. 15, 1891. Serial No. 415,171. (No model.)



Claim.—1. A watchmaker's or jeweler's tool comprising the gripping-legs, the inwardly-projecting lips having a notch or groove in their inner edges, and the pins located underneath one of the lips and adapted to project under the opposite lip, substantially as described.

2. A watchmaker's or jeweler's tool comprising the gripping-legs having the grooves upon their inner faces, the inwardly-projecting lips with a notch or groove on their inner edges, and the pins located underneath one of said lips and adapted to project under the opposite lip, substantially as described.

482,233. AMMONIA DIFFER-VALVE. JACOB DREYFOUSS, St. Louis, Mo., assignor to the National Ammonia Company, same place. Filed Apr. 18, 1892. Serial No. 429,675. (No model.)

482,233.

Claim.—1. In an ammonia-valve, the combination of the gas-cylinder, the branched valve-joint, the bearer head for the valve-joint, the valve-stem in said joint, and the arc-curved dipper-pipe 6, extending from the bearer-head to the side of the cylinder, substantially as described.

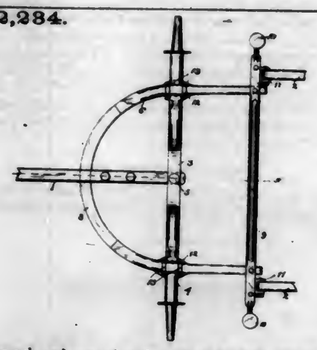
2. In an ammonia-valve, the combination of the gas-cylinder having the concave valve bearer-head, the integral forked branched valve-joint screw-seated in said head, one of the forks of said joint provided with the main horizontal screw-threaded bore 10 and the other fork provided with the angle-bore 12 and the enlarged screw-perforate bore 13, the screw valve-stem that works in said screw-bore 10, and the compression supply-pipe that engages in said screw-perforate bore 13, substantially as described.

3. In an ammonia-valve, the combination of the integral forked branched valve-joint provided with the main screw-threaded valve-bore 10, the screw-threaded valve-stem 23, having the shoulder 30, the elongated neck 29, the wrench-seat 31, the smooth reduced extension 25, the secondary reduced extension 26, the valve-shoulder 28 between said extensions, the soft-metal gasket 20, against which said valve-shoulder presses to produce a gas-tight seat, and the bevel end 27 of said valve-stem, substantially as described.

4. In an ammonia valve, the combination of the integral forked branched valve-joint provided with the fork 37, the main screw-threaded valve-bore 10, and the peripheral screw 32, the screw valve-stem that works in said bore, the soft-metal gasket against which said valve closes, the rubber gasket 35, and the jam-nut 34, having the jam-shoulder 36 and the perforate screw 33, substantially as described.

5. In an ammonia-valve, the combination of the integral forked branched valve-joint having the fork 37, provided with the screw-threaded bore 10, the valve-screw-threaded stem 23, the soft-metal gasket against which said valve closes, the said hunchback joint also provided with the angle-bore 12, that connects with the valve-bore 10, the enlarged screw-perforate bore 13, and the gasket-shoulder bore 14, the rubber gasket 17, the screw-attached compressor supply-pipe 15, and the jam-nut 16, having the round stem 19, the progressive butt-end of which jams against said rubber gasket 17, substantially as described.

6. In an ammonia-valve, the combination of the gas-cylinder 1, the concave valve bearer-head 2, having the perforate center screw-threaded seat 3, the integral branched valve-joint 5, having the screw-threaded nozzle 4, and the valve and compressor supply-bores, the valve-stem in said valve-bore, the concave head of said gas-cylinder having the inwardly-curved lip 39, and the cover 41, having the inwardly-projecting lugs 40 and 42, and the bolt 44, whose head and screw-nut hold said cover to the concave valve-head of said cylinder, substantially as described.



482,234. VEHICLE RUNNING-GEAR. EGBERT DENNIS, Rochester, N. Y., assignor of one-half to George Hoyer, same place. Filed Apr. 4, 1892. Serial No. 427,943. (No model.)

Claim.—1. The combination, with the reach and axle, of the combined hounds and slides having the semicircular part beneath the reach, the ends extending forward of the axle, the clips for the connection of the thills on said ends, and the step connected thereto, substantially as described.

2. The combination, with the reach and axle, of the combined hounds and slide having the semicircular part beneath the reach and the ends extending forward of the axle, the cross-bar connecting said ends, the clips for the thills thereon, and the step secured to the end of said bar, substantially as described.

3. The combination, with the reach and axle, of the combined hounds and slide having the semicircular part beneath the reach and the ends extending forward of the axle, of the plates 12, passing beneath the axle and secured at the ends to the slide, and the clips connecting said plates to the slide on opposite sides of the axle, substantially as described.

482,284.

482,285. LOCOMOTIVE ASH-PAN. JOHN W. KADE, Dallas, Tex. Filed Mar. 29, 1892. Serial No. 426,965. (No model.)

Claim.—1. A locomotive ash-pan having a rear draft-opening, an air-drum inclosing said draft-opening and open at its lower end, and a regulating-damper working within said air-drum over said draft-opening, substantially as set forth.

2. A locomotive ash-pan having a rear draft-opening, an enlarged air-drum inclosing said draft-opening and provided with an opening below the rear wall of the ash-pan, and a regulating-damper working within said air-drum and over said draft-opening, substantially as set forth.

3. A locomotive ash-pan provided with a rear draft-opening, an air-drum inclosing said draft-opening and provided with a curved lip projecting below and in front of the rear wall of the ash-pan, and a regulating-damper working within said air-drum and over said draft-opening, substantially as set forth.

4. The combination, with the ash-pan having front and rear draft-openings, of draft-regulating doors working over said openings, means for controlling said doors, and an air-drum inclosing the rear draft-opening and draft-door working thereover, substantially as set forth.

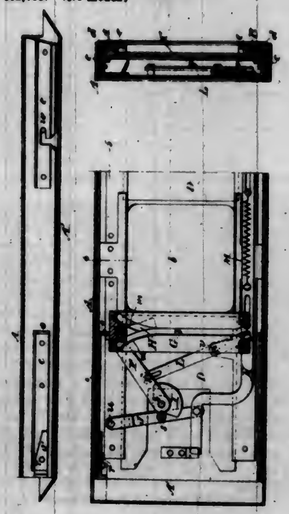
5. The combination, with the locomotive ash-pan having draft-openings at each end and a series of damping slats or leaves adapted to be closed in a line below said openings, of crank-arms connected with said slats or leaves, a single connecting-rod pivotally connected to the ends of said crank-arms, a vertical bracket-arm projecting from the front end of said ash-pan, a locking-bracket secured to the opposite ends of the ash-pan, an oscillating lever pivoted near its center to said bracket-arm, a connecting-link loosely connected to one end of said connecting-rod and to the lower end of said lever, and a horizontal operating-rod connected to the upper end of said lever and provided in its under side, near the handle thereof, with a series of locking-notches adapted to engage said locking-bracket, substantially as set forth.

482,286. STEAM-BLOWER. AUGUSTUS FLETCHER, Minersville, Pa. Filed Nov. 2, 1891. Serial No. 410,569. (Model.)

Claim.—1. A steam-blower consisting of an annular pipe containing passages through its walls for the escape of the steam, the direction of said passage being laterally and inwardly oblique to the axis of the blower, substantially as described.

2. A steam-blower consisting of a frusto-conical nozzle and an annular steam-pipe located in the large end of said nozzle, said pipe having a series of small holes arranged to give the jets of steam issuing therefrom a direction both laterally and inwardly oblique, substantially as described.

3. A steam-blower consisting of a nozzle and a steam-pipe delivering jets of steam into said nozzle in a direction laterally oblique to the axis of the nozzle, whereby the steam is caused to form a vortex, substantially as described.

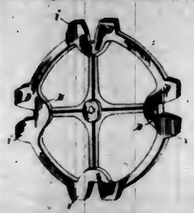


482,287. NAME-PLATE FOR MONUMENTS, SIGNS, &c. REINHOLD H. FOLLENIUS, St. Louis, Mo. Filed Feb. 3, 1892. Serial No. 420,716. (No model.)

Claim.—1. The combination, with the monument, wall, or object to be marked, of the bed-frame 1, the glass tablet 5, the said tablet having the countersinks 7 and 8 and the frosted margin 12 in and adjoining said countersinks and the remainder of said tablet clear of color and frosting, the colored and frosted glass name-plate 9, having the inscription and its surrounding field, respectively, colored and frosted, the said name-plate seated in said countersink 7, and the back reflector-plate seated in the countersink 8, substantially as described.

2. The combination, with the monument, wall, or object to be marked, of the bed-frame, the glass tablet 5, said tablet provided with the countersinks 7 and 8 and the frosted margin 12 in and adjoining said countersinks and the remainder of said tablet being clear of color and frosting, the colored and frosted glass name-plate 9, having the inscription and its surrounding field, respectively, colored and frosted, the said name-plate seated in said countersink 7, the back reflector-plate seated in said countersink 8, the waterproof cement ring 13, and the air chamber or inclosure 14, that constitutes a non-conductor of dampness and frost, substantially as described.

482,288. ATTACHMENT FOR STEREOPTICONS, MAGIC LANTERNS, &c. HORACE W. FOSCH, Newburg, N. Y. Filed Nov. 23, 1891. Serial No. 412,709. (No model.)



Claim.—1. In a slide-changing and light-eclipsing carrier adapted for insertion in the slide-receiver of the lantern, the combination of a slide adapted for carrying lantern-transparencies, a shutter for closing the aperture of the lantern, and mechanism connected with the slide carrier and shutter, substantially as described, for moving the slide-carrier while holding the shutter closed and then opening the shutter while the slide-carrier is stationary, the cycle of operations being effected by a single movement of the operating-lever in one direction.

2. In an attachment for magic lanterns and other like optical instruments, the combination of the tubular case A A', having opposite front and rear openings *b b* in its sides, the sliding divided shutter or shutter-sections D D, the outside crank E, with its spindle *i*, the inner crank F on said spindle, the cam I, the arm or lever J, adapted to be actuated by said cam in one direction, the sliding frame K, the reverse arms or levers L L, connecting said sliding frame with the shutter-sections, and the spring M, controlling the opening of the shutter, substantially as specified.

3. In an attachment for magic lanterns and other like optical instruments, substantially as specified, the combination, with the tubular case A A', having opposite exposing-openings in its front and rear sides, of the sliding double transparency-carrier B, having double exposing-openings *g g* arranged side by side, the outer crank E, with its attached spindle *i*, and inner crank F, having an outer stud or roller *k*, the upright or piece G, attached to the transparency-carrier, having an upright groove *l*, with reversely-curved end branches *m m*, the switch H, the fixed stop *o*, and movable stop *o'*, essentially as described.

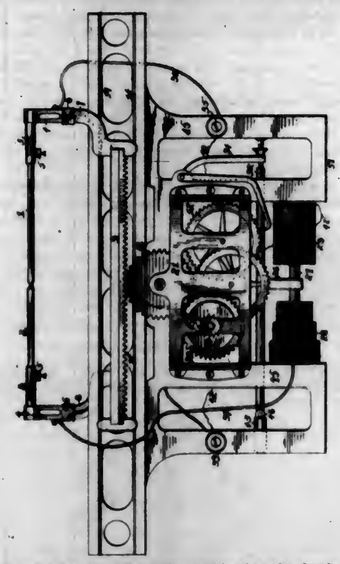
482,289. SPROCKET-CABLE ELEVATOR. MICHAEL GARLAND, Bay City, Mich. Filed Apr. 18, 1892. Serial No. 429,510. (No model.)

Claim.—1. A combined rope and sprocket wheel having some of the spaces between the pairs or sets of sprockets or teeth gapped or cut out, as specified, and having the rest of such spaces ungrooved circumferentially of the wheel to seat the sprocketed rope which may be run on such wheel, substantially as and for the purposes described.

2. The combination, with a combined rope and sprocket wheel having gaps *m* between some of the pairs of sprockets and having its periphery ungrooved at all points except immediately at either side of where the said gaps are formed, of a cable arranged to run on the ungrooved periphery of said wheel and provided with sprocket-like devices which engage with said gaps, all substantially as and for the purposes hereinbefore set forth.

482,240. ELECTRIC-ARC LAMP. JAMES R. GASTON, Sparta, Ill., assignor to the Gaston Electrical Manufacturing Company, same place. Filed May 31, 1892. Serial No. 435,000. (No model.)

Claim.—1. In an electric-arc lamp, the improved carbon-carrying sliding frame comprising the horizontal body portion provided with a rack 11 upon its under edge, guiding devices, as 12, projecting from one face adjacent its ends, and an outwardly-diverging arm 7, provided at its outer terminal with a socket 6, substantially as and for the purpose set forth.



2. In an electric-arc lamp, the improved carbon-carrying frame comprising the horizontal body portion provided with a rack 16 upon its upper edge, guiding devices, as 12, projecting from one face adjacent its ends, an outwardly-diverging arm 8, provided at its outer terminal with a socket 6, and a vertical arm 17, secured to the end of the body portion which is opposite that to which said outwardly-diverging arm is connected, substantially as and for the purpose set forth.

3. In an arc lamp, the frame-plate having opposite guiding-tracks 14 projecting from opposite sides of said frame-plate and the tracks projecting from one side of said frame-plate in the same plane with those which project from the opposite side of the frame-plate, substantially as and for the purpose set forth.

4. In an arc lamp, the frame-plate having opposite guiding-tracks 14 projecting from opposite sides of said frame-plate and the tracks on one side of the frame-plate located parallel with the tracks on the opposite sides of said frame, substantially as and for the purpose set forth.

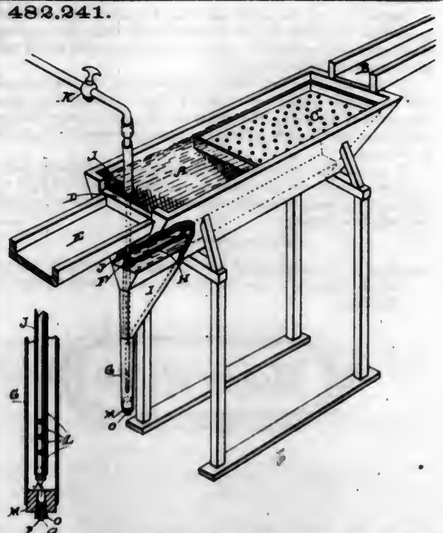
5. The improved frame for arc lamps, comprising the horizon-

tally-extending base-plate 31, adapted to support the lamp mechanism, the vertical plate 15, rising from said base-plate at a right angle thereto, and the tracks 14, located one pair on the front and one pair on the rear side of said vertical plate, the upper track of each pair extending horizontally in the same plane and all located parallel to each other and to said base-plate, substantially as and for the purpose set forth.

6. In a positive-feed arc lamp, the combination of a clutch-wheel having a series of teeth arranged with attenuated outer extremities and a projection having an attenuated extremity adapted to engage said teeth and turn said wheel in either direction, substantially as and for the purpose set forth.

7. In a positive-feed arc lamp, a clock-train having a high-speed wheel, as 52, in combination with the combined detent and brake-shoe 50, constructed and arranged to engage the teeth of said wheel simultaneously as a detent and a brake-shoe, substantially as and for the purpose set forth.

8. In an arc lamp, the improved carbon-holding arm comprising a shank 4, formed integral with the sliding frame, a pair of clamping-jaws 56, formed integral with the upper end of said shank, the tubular socket 3, removably located between said jaws and having a suitable carbon-clamp, and a screw, as 57, for causing said jaws to bind upon said tubular socket, substantially as and for the purpose set forth.

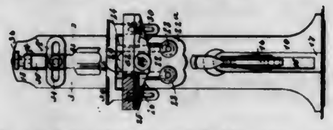


482,241. SEPARATING SAND AND SLIMES. GEORGE GATES, Jackson, Cal. Filed Jan. 5, 1892. Serial No. 417,061. (No model.)

Claim.—1. In an apparatus for separating slimes from heavy coarse particles, a tank with a narrow bottom and a narrow opening therein, an inclined triangular channel, the upper edge of which connects with the slot, an approximately vertical receiving-pipe into which the lower angle of the channel discharges, a pipe through which water is delivered into the lower part of the receiving-pipe, and a discharge-opening in the bottom of the receiving-pipe, through which the heavy particles escape, while the lighter particles are carried upward to the tank and overflow by the water, substantially as herein described.

2. In an apparatus for separating slimes from heavy coarse particles, a settling-tank with a slotted inclined discharge-channel and a pipe into which the channel delivers its contents, a removable stopper at the bottom of the pipe, having a central hole, and a second stopper fitting the hole, and a discharge-opening through this stopper with a bushing of hard material to prevent wear, substantially as herein described.

3. An apparatus for separating sand and slimes, consisting of a tank having inclined sides, a tray with a flat perforated bottom situated in the upper part near the receiving end of the tank, a sluice through which the material is delivered into the tray to pass through the bottom, a depressed overflow-opening at the upper part of the discharge end, through which the slimes escape, a vertical opening from the bottom, an inclined slot and channel extending from said opening toward the center of the tank, whereby the heavier particles are caused to pass gradually into the channel and discharge from its lower angle,



482,241.

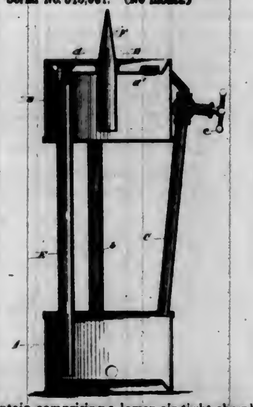
the water-pipe J, and a vertical receiving and separating pipe, substantially as herein described.

4. An apparatus for separating slimes and sand, consisting of the tank with inclined sides, the perforated receiving-tray at the upper end, the overflow-opening at the discharge end, a passage extending vertically down from the bottom near the discharge end, a slot in the bottom of the tank, and an inclined channel connecting with the slotted opening and pipe, as shown, stoppers fitted to the lower end of the pipe with a central discharge-hole, and a supplemental water-pipe of smaller diameter extending down into the main pipe, having perforations around its lower end, whereby the water is delivered into the pipe to agitate and separate the slimes and sand, substantially as herein described.

482,242. MORTISING-MACHINE. ERIK J. GRYVOLD, Eagle Mills, Mich. Filed Aug. 19, 1891. Serial No. 403,092. (No model.)

Claim.—1. The combination, with the frame A, provided on its rear side with vertical ways 11, and vertical slots 14 22, extending through the frame from front to rear, the cross-head 12, sliding in said ways and having a rod 19, extending downward through a suitable guide 20, a spring encircling the rod and bearing at its lower end on said guide, the treadle-lever pivotally connected with the cross-head, and a tool-carrying arm projecting from the cross-head through the upper slot 14, of the adjustable work-table on the front of the frame and set-screws extending through the lower slots and supporting the table, substantially as set forth.

2. The combination, with the vertically-slotted frame, of the table 22, comprising a vertical member 22^a, having set-screws extending through said slots, the open horizontal dovetail member 22^b, the bed-plate 25, having a dovetail recess receiving said member 22^b and an opening 27, a swiveled screw 28, connecting the bed-plate and member 22^b to adjust the bed-plate toward and from the frame, and the vertically-sliding clamp 30, having depending slotted members bolted to the bed-plate, and the bed-block 32, secured upon the bed-plate and having an opening registering with the opening 27, substantially as set forth.



3. In an implement of the character described, the combination, with the tool-carrier, an adjustable table, a mechanism, substantially as described, for moving the carrier to and from the table, a bed-plate located upon the table, provided with a recess in one edge, forming at said edge a tongue, and a gage adjustable upon the bed-plate, of blades adjustably connected with the tool-carrier, adjustable to and from each other, and held at angles one to another, as and for the purpose specified.

482,243. SHAFT-TUG. JOSEPH L. GREGORY, Washington, Mo. Filed Apr. 1, 1892. Serial No. 427,417. (No model.)

Claim.—An improved shaft-tug consisting of the metallic sections A A', having coincident flanges a' a', extending entirely around the inner edges thereof, whereby to form a groove B, a packing-ring C, held in such groove and projected beyond the inner edges thereof, each of such sections having coincident laterally-extending lugs a^5 a^6 a^7, connected to form guide-loops a^4, and means for securing such sections together, substantially as and for the purpose described.

482,244. FOUNTAIN. GEORGE C. GRISIER, Jefferson, Iowa. Filed June 26, 1889. Serial No. 315,661. (No model.)

Claim.—A fountain comprising a lower air-tight chamber having an air-compressor connecting with its top, a valve located between the chamber and the source of pressure, an upper air-tight chamber having a basin-like top provided with an opening communicating with the latter reservoir, an escape-pipe opening into the bottom of the basin portion and connecting with and extending to within a short distance of the bottom of the lower chamber, an air-pipe connecting with the top of the lower chamber and entering the upper chamber near its top, a valve carried by the latter pipe, a jet-nozzle extending from near the bottom to without the upper reservoir, and plugs or stoppers for closing the opening in the escape-pipe and in the basin, substantially as described.

482,245. WRENCH. JACOB H. GUILEY and JAMES E. WRIGHT, Saginaw, Mich. Filed Apr. 7, 1892. Serial No. 428,109. (No model.)

Claim.—1. As an article of manufacture, a pipe-wrench consisting of a bar provided at one end with a fixed jaw and having a rack arranged at one side of said jaw, a slidable sleeve fitted on and adapted to move longitudinally of the bar, and a toothed gripping-wheel carried by said sleeve and having the teeth on its periphery meshing directly with the rack on the bar or shank, substantially as described.

2. A pipe-wrench consisting of a shank or bar provided with a rigid jaw at one end and having a rack arranged at one side of said jaw, a sliding sleeve fitted on the bar and adapted to move longitudinally thereon, and a gripping-wheel carried by said sleeve and provided on its periphery with a series of teeth which mesh directly with the rack on the bar, the outer faces of said teeth being serrated or roughened, substantially as described.

3. In a pipe-wrench, the combination of a shank or bar provided at one end with a stationary jaw and having a rack arranged at one side of said jaw, a sleeve fitted on said bar and provided at one end

482,245.

with extending flanges, a gripping-wheel mounted on a shaft which is journaled in said flanges and having on its periphery a series of teeth which mesh with the rack, a coiled spring arranged in a recess or socket in the bar below the rack thereon, connections between said sliding sleeve and coiled spring, and a face arm or plate attached to the sleeve and arranged over the socket or recess in the bar, substantially as described.

482,246. SHUTTER-FASTENER. EDWARD W. HAGER, St. Louis, Mo. Filed Feb. 29, 1892. Serial No. 423,261. (No model.)

Claim.—As an improved article of manufacture, a shutter attachment comprising a deflecting housing of an inverted-U-shaped form, made in a single piece of metal and provided in its parallel side walls with apertures, and a catch provided at its inner end with outwardly-projecting journals engaging said apertures, said catch being located entirely within the walls of said housing and provided at its rear end with a rearwardly-extending integrally-formed limiting-stop arranged to engage the wall of the housing C at a predetermined point, substantially as and for the purpose set forth.

482,247. ELEVATOR. STEDMAN H. HALE, Chicago, Ill. Filed June 29, 1891. Serial No. 397,835. (No model.)

Claim.—1. The combination, in an elevator and with the car, counter-balance connected by a cable with the car, and motor-engine and connections, of a supplemental counter-balance in the form of a flexible weight or chain connected at one end to a fixed elevated support and at the other with a vertically-moving part of the apparatus, substantially as set forth.

2. The combination, with the cage, counter-balance, vertical engine, and multiplying gears and flexible suspensories, of one or more flexible weights or chains connected each with an elevated support at one end and at the other with a vertically-moving part of the apparatus, substantially as set forth.

3. The combination, with the car of an elevator, of one or more flexible weights or chains, each connected at one end with a fixed elevated support and at the other with the car, substantially as described.

482,247.

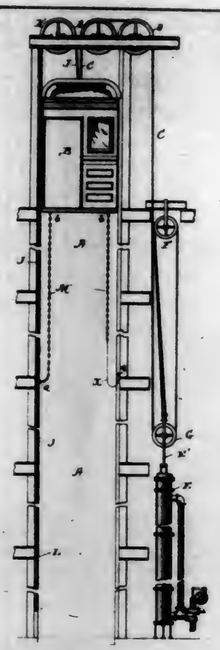
482,249. LUBRICANT. DEFIANCE HARRIS, Ionia, Mich. Filed May 11, 1892. Serial No. 432,602. (No specimens.)

Claim.—1. The herein-described lubricant, comprising silica, alumina, iron, plumbago, castor-oil, and mineral oil, combined in or about the proportions specified.

2. An electrical conducting semi-fluid lubricant for dynamo-electric machines or motors, consisting of alumina, plumbago, silica, and iron, combined with a suitable lubricating-oil forming a vehicle, as and for the purpose described.

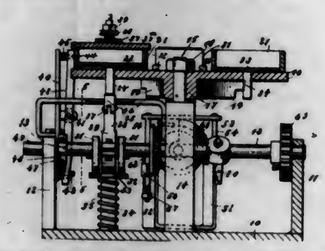
482,250. SAW SET AND GAGE. [illegible]

---



3. In a watchman's time-check, the combination, with a printing-wheel, an inking-ribbon, and paper-reels, of a spring-pressed printing-bar to be operated by the watchman, a platen moved in and out of the path of the printing-bar, and mechanism between the printing-bar and one of the paper-reels for operating the said reel from the printing-bar, substantially as described.

4. In a watchman's time-check, the combination of the ratchet-wheel E, carrying characters representing the hours of the day, the electro-magnetic wheel-operating device consisting of the electro-magnet F, the spring-pressed armature-lever *j*, provided with the arm *m*



any surplus of clay from the mold in which the clay has been partially pressed and mechanism for actuating the molds, plungers, and scraper, substantially as described.

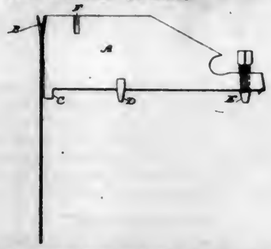
4. In a brick or tile machine, the combination of a series of traveling molds having movable false bottoms or press-blocks, mechanism for feeding clay into said molds, a depending vertically-movable plunger for pressing the contents of the molds while their press-blocks are at rest, vertically-movable and oppositely-arranged upper and lower plungers for closing the top of a mold and moving its press-block upward to re-press the mold contents, and mechanism for

482,247.

482,248. BRICK-MACHINE. HOWARD HARLAN, Renovo, Pa., assignor to himself and George R. McCrea, same place. Filed Mar. 5, 1892. Serial No. 423,862. (No model.)

Claim.—1. The combination, with the turn-table having a series of molds provided with plungers, the stems of which extend down through the table, projections on the under side of the table, a latch for locking the table, and a cover under which the molds are successively brought, of a transverse shaft beneath the table, provided with an arm to strike said projections and move the table intermittently, an eccentric also on said shaft to actuate the plungers as they are brought over it, a cam also on said shaft to release the latch, and a vertical slide to act on the mold-plungers and cause them to discharge the molded article, and a counter-shaft from which said slide is actuated and geared to the main shaft, substantially as set forth.

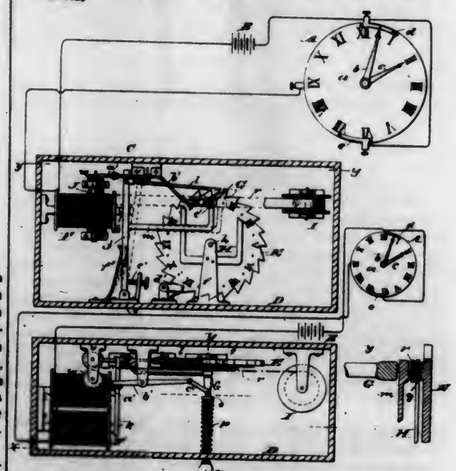
2. The combination, with the turn-table, its molds, and bottom plungers, of a transverse shaft having an eccentric 30 and a vertical plunger-operating slide 25, actuated therefrom, a cam 31, parallel with the eccentric, posts 34 34, extending above the table, springs 35 on the lower ends thereof, the vertical frame sliding on said posts and resting on the springs, the top cross-bar 37 of the frame crossing the table and provided with a mold-cover 37ª and the lower cross-bar 32 being acted on by the cam 31, and an arm on the drive-shaft for rotating the table, substantially as set forth.



3. The combination, with the revolvable tables carrying brick-molds and having compressing and ejecting mechanism for the molds, of flanges produced on the under side of the table, a revolving driving-shaft extending horizontally beneath the table, and an arm secured to the shaft and adapted to engage the flanges, substantially as described.

482,249. LUBRICANT. DEGATUR HARMON, Ionia, Mich. Filed May 11, 1892. Serial No. 432,908. (No specimens.)

Claim.—1. The herein-described lubricant, comprising silica, alumina, iron, plumbago, castor-oil, and mineral oil, combined in or about the proportions specified.



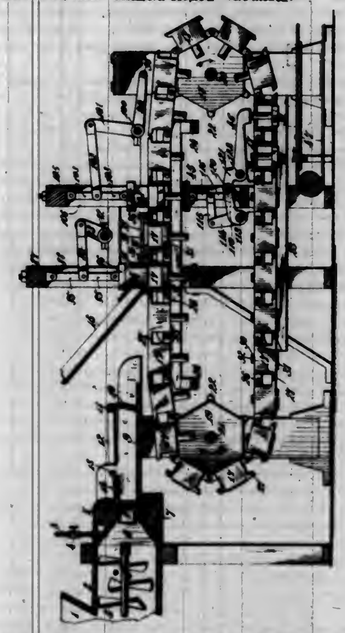
2. An electrical conducting semi-fluid lubricant for dynamo-electric machines or motors, consisting of alumina, plumbago, silica, and iron, combined with a suitable lubricating-oil forming a vehicle, as and for the purpose described.

482,250. SAW SET AND GAGE. CHARLES F. HEATH, Durham, Cal., assignor of one-half to William M. Taylor, same place. Filed May 29, 1891. Serial No. 394,542. (No model.)

Claim.—A saw set and gage consisting of the block of metal having the inclined face at one end serving as an anvil upon which the saw-tooth is set, the projection or lug C, extending crosswise the block at one end, the independent separated legs D at the sides of the block and outside of the plane of its walls, and the adjustable screw E, passing through the block, so that its point, the ends of the lug, and the two legs D will be in contact with the side of the saw-blade and the point of the tooth when the latter is properly set, substantially as herein described.

482,251. WATCHMAN'S ELECTRIC TIME-RECORDER. EMANUEL R. HEYNER, Leon, Mex. Filed Mar. 2, 1892. Serial No. 423,496. (No model.)

Claim.—1. In a watchman's time-check, the combination, with a clock and an electrical device connected therewith, of a printing-wheel operated by the electrical device and having its characters on one side, an ink-ribbon in front of the printing-wheel, a strip of paper in front of the ink-ribbon, a printing-bar to be operated by the watchman, and a platen moved in and out of the path of the printing-bar by the electrical device, substantially as described.



2. In a watchman's time-check, the combination, with a clock and an electrical device connected therewith, of a printing-wheel operated by the electrical device and having its characters on one side, an ink-ribbon in front of the printing-wheel, paper-reels mounted to allow the paper to pass in front of the ink-ribbon, a printing-bar to be operated by the watchman, a platen moved in and out of the path of the printing-bar by the electrical device, and means for rotating one of the paper-reels from the printing-bar, substantially as described.

3. In a watchman's time-check, the combination, with a printing-wheel, an inking-ribbon, and paper-reels, of a spring-pressed printing-bar to be operated by the watchman, a platen moved in and out of the path of the printing-bar, and mechanism between the printing-bar and one of the paper-reels for operating the said reel from the printing-bar, substantially as described.

4. In a watchman's time-check, the combination of the ratchet-wheel E, carrying characters representing the hours of the day, the electro-magnetic wheel-operating device consisting of the electro-magnet F, the spring-pressed armature-lever j, provided with the arm m and pawl l, adapted to engage the ratchet-wheel, the spring-pressed printing-bar G, arranged to press upon the arm m, and the electric generator and circuit-closer, substantially as specified.

5. The combination, with the time printing mechanism, of the reel I, carrying the paper strip r, the reel J for receiving the paper strip, the ratchet-wheel w, the lever b', the spring-pressed pawl a', the link c', and the printing-bar G, substantially as specified.

482,252. BRICK-MACHINE. GEORGE T. JACOBS, Washington, D. C. Filed Oct. 29, 1891. Serial No. 410,234. (No model.)

Claim.—1. In a brick or tile machine, the combination, with a series of pivotally-connected molds, of movable press-blocks located in and forming false bottoms for said molds and having on their under sides projections that extend through openings in the mold-bottoms, a depending plunger for pressing the material in the mold while the press-block in said mold is at rest, oppositely-arranged upper and lower plungers so constructed that while the upper plunger closes the top of a mold the lower ones move the press-block upward to re-press the mold contents, and means for actuating the plungers and for moving the molds forward when the plungers are withdrawn, substantially as described.

2. In a brick or tile machine, the combination, with a series of traveling molds and movable press-blocks located in and forming false bottoms for said molds and having on their under sides projections that extend through openings in the mold-bottoms, of a vertically-movable plunger located above the molds for pressing the material in a mold while its press-block is at rest, oppositely-arranged upper and lower plungers located above and below the molds in such a manner that while the upper plunger closes the top of a mold the lower ones move the press-block vertically to re-press the mold contents, an ejector for discharging the mold contents, and mechanism for actuating the molds, plungers, and ejector, substantially as described.

3. In a brick or tile machine, the combination, with a series of pivotally-connected traveling molds and separate plungers for pressing and re-pressing the mold contents, of a laterally-reciprocating scraper located intermediate the pressing and re-pressing plungers to remove any surplus of clay from the mold in which the clay has been partially pressed and mechanism for actuating the molds, plungers, and scraper, substantially as described.

4. In a brick or tile machine, the combination of a series of traveling molds having movable false bottoms or press-blocks, mechanism for feeding clay into said molds, a depending vertically-movable plunger for pressing the contents of the molds while their press-blocks are at rest, vertically-movable and oppositely-arranged upper and lower plungers for closing the top of a mold and moving its press-block upward to re-press the mold contents, and mechanism for moving said molds and plungers intermittingly, substantially as described.

5. In a brick or tile machine, the combination of a tempering-box having feed-rollers in its exit end, a trough to receive the strip of clay from between said rollers, a horizontal guide-board supported across the trough above and in front of the exit-space between the rollers to prevent the clay strip from being carried upward as it passes out from the rollers, and a knife for cutting the strip of clay into blocks, substantially as described.

6. In a brick or tile machine, the combination of a series of traveling molds having movable false bottoms or press-blocks located therein, mechanism for feeding clay into said molds, a depending plunger for pressing the contents of a mold while its press-block is at rest, oppositely-arranged upper and lower plungers for closing the top of a mold and actuating its press-block to re-press the mold contents, a laterally-movable scraper located intermediate the pressing and re-pressing plungers, an ejector for discharging the pressed and re-pressed contents of the molds, and mechanism for intermittingly moving the molds, plungers, scraper, and ejector, substantially as described.

7. In a brick or tile machine, the combination of a tempering-box provided with feed devices, a series of traveling molds, a trough intermediate said tempering-box and molds, a horizontal guide supported across the trough above and in front of the exit end of the tempering-box to hold the strip of clay down onto the trough, and a vertically-movable knife to cut the clay into blocks for the molds, substantially as described.

8. In a brick or tile machine, the combination of the tempering-box 2, the trough 9 for receiving a strip of tempered clay from said box, the intermediate horizontal and vertical feed-rollers 7 and 8, having their shafts provided with miter-gears 72, the ratchet-wheel 71 on the shaft of one of the horizontal feed-rollers, the arm 68, loosely mounted on said roller-shaft and provided with a pawl 70 and a pin 67, and the reciprocating bar 63, having a slotted lug engaged with said pin, whereby the feed-rolls are intermittingly actuated, substantially as described.

9. In a brick or tile machine, the combination of a series of traveling molds, a trough 9 for supporting a strip of clay, devices for feeding the clay along the trough toward the molds, a vertically-movable knife 10, arms 12, that carry said knife, a rock-shaft 13, to which said arms are secured, an inclined arm or cam 75, mounted on the rock-shaft and provided with the lug 76, and the reciprocating bar 63, having a tappet 74 engaged with said cam, whereby the knife 10 is actuated intermittingly, substantially as described.

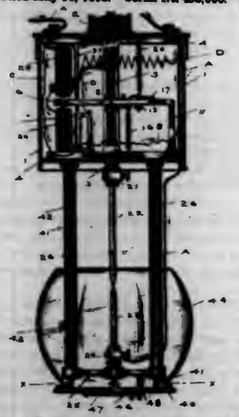
10. In a brick or tile machine, the combination of a series of traveling molds 17, provided with movable false bottoms or press-blocks 31, the depending vertically-movable plunger 35, having a cross-head 86, provided at its ends with guides 90, the uprights 88, having vertical grooves 89 to receive said guides, the cross-beam 87, the toggles 85, the rock-shaft 82, having upward-projecting arms 83 and a downward-projecting arm 81, the levers 84, connecting the arms 83 and toggles 85, and the reciprocating arm or bar 77, having a loose connection with the rock-shaft arm 81, whereby the plunger 35 is actuated, substantially as described.

11. In a brick or tile machine, the combination, with a series of traveling molds 17, of a laterally-reciprocating knife or scraper 38, located above said molds, a cross-head 37, to which said knife is secured, the guide-rails 36, the rod 39, the pivoted lever 93, engaged with said rod and having a tail end 92, and the traverse-bar 60, provided with pins or strikers 91 to impinge on the tail end 92 of the lever 93, and thereby actuate the knife or scraper, substantially as described.

12. In a brick or tile machine, the combination, with a series of traveling molds 17, having movable bottoms or press-blocks 31, located therein, of the upper plunger 41, having a cross-head 104, provided at its ends with guides 106, the uprights 106, having vertical grooves 107 to receive said guides, the cross-beam 105, the toggles 103, the rock-shaft 100, having arms 101, the levers 102, connecting said arms and toggles, the rotary gear 51, provided with a cam-groove 97, the arm 99, mounted on the rock-shaft 100 and having a pin or roller engaged in said cam-groove, whereby the plunger 41 is intermittingly actuated to close the top of a mold, and mechanism for raising the press-block 31 in the mold when the top of said mold is closed, substantially as described.

13. In a brick or tile machine, the combination, with a series of traveling molds 17, having movable false bottoms or press-blocks 31

located therein and provided on their under sides with studs 42, that enter openings 43 in the mold-bottoms, of a vertically-movable cross-head 45, provided with vertically-projecting plungers 44 to bear on the studs 42 and force a press-block 31 upward in a mold, the uprights 106, having vertical grooves to receive guides on the ends of said cross-head, the cross-beam 118, the toggles 116, the rock-shaft 113, having arms 114, the levers 115, connecting said arms and toggles, the arm 112, mounted on the rock-shaft 113, the traverse-bar 60, provided with a bracket 109, having a loose connection with said rock-shaft arm, and an upper depending plunger 41 for closing the top of a mold when the press-block 31 located therein is actuated, substantially as described.



14. In a brick or tile machine, the combination, with a series of pivotally-connected traveling molds 17, having movable false bottoms or press-blocks 31, provided with stems 30, projecting through the mold-bottoms, of an ejector 46, adapted to be brought in contact with the stem of a press-block in an inverted mold to eject a brick therefrom, a shaft 122, on which said ejector is mounted, the rock-shaft 113, having an arm 119, loosely connected with the tail end of said ejector, and means for actuating said rock-shaft, substantially as described.

15. In a brick or tile machine, the combination of a series of pivotally-connected traveling molds 17, having vertically-movable false bottoms or press-blocks 31, provided with stems 30, that project through the mold-bottom, a pivotally-supported and intermittingly-actuated ejector 46, adapted to be brought in contact with the stem of a press-block in an inverted mold to eject a brick therefrom, and a conveyer 47 to receive and carry away the discharged bricks, substantially as described.

16. In a brick or tile machine, the combination, with a series of pivotally-connected traveling molds 17, of the polygonal wheels 18 and 19, on which the chain of molds is mounted, the shaft 20 of the wheels 18, the spur-gear 52 on said shaft, the shaft 49, having a mutilated gear 51, adapted to mesh at intervals with the spur-gear 52, and thereby actuate the wheels 18 and 19 and molds 17 intermittingly, the cam 57 on the shaft 49, the pivoted and bifurcated or slotted lever 56, engaged with and actuated by said cam, and the lever-arm 54, having a pawl 53, adapted to engage with and intermittingly lock and release the gear 52, substantially as described.

17. In a brick or tile machine, the combination of a series of pivotally-connected traveling molds 17, intermittingly-rotating polygonal wheels 18 and 19, on which the chain of molds is mounted, a depending vertically-movable plunger 35 for pressing the clay in an upright mold, oppositely-arranged upper and lower plungers 41 and 44 for re-pressing the clay in the upright molds, press-blocks 31, located in said molds and adapted to be acted on by the lower plungers 44 of the re-pressing mechanism, the rotary shaft 49, provided with cams or eccentrics, and connections from said cams or eccentrics to intermittingly actuate the pressing and re-pressing plungers, substantially as described.

482,253. ELECTRIC-ARC LAMP. JESSE F. KESTER, Terre Haute, Ind., assignor to the Kester Arc Lamp and Manufacturing Company, Chicago, Ill. Filed May 11, 1892. Serial No. 432,680. (No model.)

Claim.—1. In an electric-arc lamp, a clutch mechanism consisting of a friction-block to contact with or grip the carbon holder or rod, such friction-block set in the arms of the collar surrounding the carbon holder or rod, such collar set within a centrally-pivoted yoke, all set within a single armature-frame, which is pivoted at one point, a trip-arm attached to such friction-block and releasing the same by operation with such armature-frame, and an armature set in such frame and between two non-differentially-wound electro-magnets, one above and one below such armature, to control such armature and operate such armature-frame and clutch mechanism, substantially as shown and described.

2. In an electric-arc lamp, a clutch mechanism carried in a frame pivoted at one end to a single bracket, the opposite end provided with two arms, an armature held in place by such arms, and non-differentially-wound electro-magnets in line with and on each side of such armature, one magnet set in the main circuit and the other in the shunt-circuit, whereby through the magnetizing of such magnets the armature-frame is actuated and the clutch is operated to feed the upper-carbon holder, substantially as shown and described.

3. In an electric-arc lamp, a clutch mechanism carried in a frame, one end pivoted to a bracket, an armature on the opposite end, electro-magnets in line with and on either side of such armature, their same poles together, a bracket secured to one of the arms of the framework, such bracket provided near its end with two projections, one above and the other below such pivoted armature-frame, and set-screws passing through such projections, adapted to contact with such armature-frame as it rises or falls to limit the upward and downward movement of the same, one of such magnets set in the main circuit and the other in a shunt-circuit, whereby the current passing through such magnets operates to move the armature-frame and its clutch mechanism, and thereby feed the upper-carbon holder, substantially as shown and described.

4. In an electric-arc lamp, a clutch mechanism consisting of a pivoted frame, a yoke centrally pivoted within such frame, its arms rigidly mounted on the ends of a pin, a collar surrounding the carbon-holder, having arms loosely mounted on such pin, a friction-block having a beveled face adapted to contact with the side of the carbon-holder and rigidly mounted on the pin, and electrical means for actuating the armature-frame, whereby the clutch mechanism is adapted to feed the upper-carbon holder, substantially as described.

5. In an electric-arc lamp, a clutch mechanism within an armature-frame pivoted at one end and having an armature in the opposite end, the clutch mechanism consisting of a yoke centrally pivoted in the armature-frame, its arms rigidly mounted on a pin, a collar fitting about and adapted to loosely contact with the upper-carbon holder, its arms loosely mounted on such yoke-pin, a friction-block rigidly mounted on the yoke-pin between the arms of the collar and adapted to engage frictionally with the carbon rod, an arm formed on the friction-block to limit its downward movement, a spring secured to the under side of the friction-block and to the lamp framework, an adjustable spring secured to the top of the armature-frame, its opposite end secured to the lamp-frame, and electrical means for actuating the armature-frame through its armature, whereby the upper-carbon holder and rod are fed through the friction-clutch mechanism, substantially as shown and described.

6. In an electric-arc lamp, an automatic cut-out mechanism consisting of a thermostat so placed as to be acted upon by the heating of the shunt-magnet coil and a resistance-coil whereby such thermostat, should the carbon rod stick or be broken or burned out, will cut the lamp out of the main circuit and cut in the resistance-coil, substantially as shown and described.

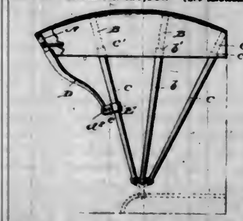
7. In an electric-arc lamp, a framework carrying therein a friction-clutch adapted to contact with and feed the upper-carbon rod and holder to such lamp, one end of such framework pivoted to a bracket, and an armature formed in the opposite end, adjustable stops for limiting the movement of such frame, electro-magnets having laminated cores set one above and one below such armature, one of such magnets set in the main circuit and the other in a shunt-circuit, and a thermostat and a resistance-coil set in the shunt-circuit, the thermostat operated on by the shunt-magnet to cut in the main circuit into a resistance-coil when the circuit through the carbons is broken, substantially as shown and described.

8. In an electric-arc lamp, a pair of carbon-holders, a clutch carried in a pivoted frame, an armature in such frame actuated by electro-magnets, one set on each side, one of such magnets set in the main circuit and the other in a shunt-circuit, a thermostat consisting of a welded strip of steel and brass mounted on a base and insulated therefrom, a bracket on such base having a contact-piece and insulated therefrom, a wire connecting such contact-piece with the base, and a wire leading from such bracket to the resistance-coil, such thermostat and resistance-coil set in a shunt-circuit, whereby upon the breaking of the circuit through the carbons and the heating of the shunt-magnet the thermostat will contact with and be held against its contacting piece, thereby throwing the main circuit into the resistance-coil until the current is cut off from the lamp, substantially as shown and described.

9. In an electric-arc lamp, a thermostat consisting of a welded strip of steel and brass set in a vertical line with a shunt-magnet, such thermostat secured to a base-plate and insulated therefrom, a bracket formed on such plate having at its top a contact-piece, such piece insulated from such bracket and connected with the same by a wire adapted to be heated by the electric current, and a shunt-circuit from

the main-line wires, connected at one end to the thermostat and its opposite end connected to the bracket and to a resistance-coil, whereby when the circuit through the carbons is broken the heat of the shunt-magnet will force the thermostat to contact with its contact-piece, thereby throwing the main-line current into the resistance-coil, the resistance of which is equal to the arc, substantially as shown and described.

10. In combination, a thermostat consisting of a welded flexible strip of steel and brass secured at its lower end to a base-plate and insulated therefrom, such thermostat in close proximity with a shunt-magnet, a bracket having on its upper end a contact-piece which is insulated therefrom, and a wire adapted to be heated by the electric current, connected to such contact-piece and to the base, such thermostat set in a circuit of its own, one end connected to the thermostat and the other to its bracket, such thermostat adapted to contact with its contact-piece when heated by the shunt-magnet and be retained in contact by the heat of the wire connecting the contact-piece with the base, substantially as shown and described.

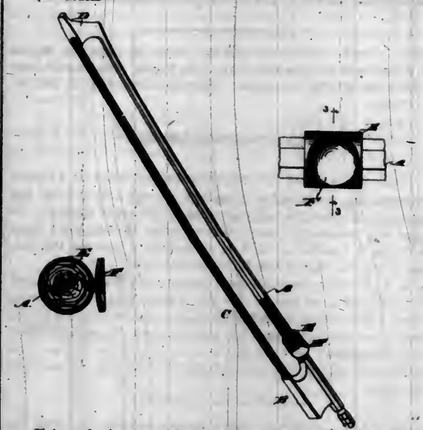


11. In an electric-arc lamp, in combination with the framework of such lamp having two hollow vertical arms connected at their lower ends by a cross-piece therefrom as a holder for the lower carbon, a globe-holder consisting of a plate with vertical rods mounted thereon, such rods adapted to work within the vertical arms of the lamp-frame, one of such rods having a groove therein which does not extend to either end of such rod, such groove adapted to engage with a pin through one of the lamp-arms, and a lug formed on the cross-piece of the lamp-frame, adapted to engage with a latch on the bottom of the globe-holder for locking such globe-holder to the main frame of the lamp, substantially as shown and described.

12. In an electric-arc lamp, a lower-carbon holder mounted on a cross-piece connecting the hollow arms of the framework of the lamp, a globe-holder formed of a plate upon which the globe rests, two rods formed on the top of such plate, adapted to work in the hollow arms of the lamp-frame, one of such rods having an elongated notch therein and adapted to engage with a pin through one of the arms of the lamp-frame, an opening through the bottom of the globe-holding plate, a pivoted door or latch adapted to close such opening, a lug or pawl formed on the cross-piece of the lamp-frame and adapted to pass through such base-plate of the globe holder, and the pivoted door or latch of the base-plate, adapted to engage with the notch in such lug and thereby support the globe-holder in position, substantially as shown and described.

13. In an electric-arc lamp, a framework consisting of two hollow vertical arms secured to the casing of the lamp and connected at their lower ends by a cross-piece carrying thereon a holder for the lower carbon, and a globe-carrier consisting of a plate having vertical rods mounted on the upper side, such rods adapted to work within the vertical arms of the lamp-frame, such rods having elongated notches therein adapted to engage with set-screws through the lamp-arms, whereby such globe-holder is held in position when raised or drawn down, substantially as shown and described.

14. In an electric-arc lamp, a globe-holder having in its base-plate an opening, a pivoted door or latch adapted to close such opening, a lug projecting from the lamp-frame, adapted to pass through such base-plate of the globe-holder, and the pivoted door or latch of the base-plate, adapted to engage with the notch in such lug and thereby support the globe-holder, substantially as described.



482,254. CARRIAGE-TOP. SALEM E. KIKBOLT, Jackson, Tenn. Filed Apr. 14, 1892. Serial No. 429,147. (No model.)

Claim.—1. In a carriage-top, the front bow, the compound curved supports for said bow having the sockets in their upper ends to receive the bow, and adjustable clamps on the adjacent bow-supports to receive the inner ends of the front-bow supports, substantially as described.

2. In a carriage-top, the combination, with the bows and supports therefor, of the clamps adjustably secured on the supports for one of the bows and the compound curved front-bow supports pivotally secured to said clamps and having sockets in their upper ends which receive the extremities of the front bow, substantially as described.

482,255. BOW FOR STRINGED MUSICAL INSTRUMENTS. EMIL A. KRETSCHMER, Horicon, Wis. Filed May 21, 1892. Serial No. 433,842. (No model.)

Claim.—1. An attachment for bows for stringed instruments, comprising a slide and a screw extending through the slide to secure it in proper position on the bow and provided with a concave head forming a thumb-piece, substantially as set forth.

2. The combination, with the bow, of the slide mounted on the bow-staff and having a transverse threaded aperture and a screw extending through the aperture into contact with the bow-staff and provided with a head having a concave outer face to receive the end of the thumb, substantially as set forth.

482,256. TOOL-HANDLE. ALBERT LANDON and LOUIS MARTEL, Rutland, Vt. Filed Feb. 9, 1892. Serial No. 420,924. (No model.)

Claim.—1. The combination, with an interiorly-chambered tool-handle provided with a pivoted cover, of tools located in the handle and a latch fulcrumed within the handle the head of which is adapted for engagement with the lid or cover and provided with an outwardly-extending wing adapted likewise for engagement with the outer portion of the lid or cover, substantially as shown and described.

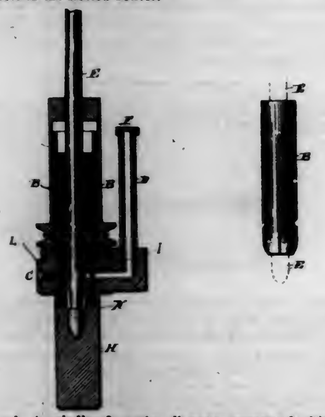
2. The combination, with a tool-handle provided with a chambered interior and a pivoted lid or cover having an opening therein, of tools pivoted in the handle and a latch likewise pivoted in the handle and of angular construction, one member being provided with a head adapted to pass through a slot in the lid or cover, the opposite member extending outward for engagement with the outer end portion of the cover, the inner end of the said latch being provided with feet adapted for engagement with and as a rest for the tools when wholly contained within the handle, as and for the purpose specified.

3. The combination, with a tool-handle provided with an interior chamber open at one end and closed at one side by a pivoted cover, of tools pivoted within the handle near its open end, the shanks of which are provided with shoulders upon one edge and a lock or latch of angular formation, likewise pivoted within the chamber of the handle, the head portion of which latch is adapted for locking engagement with the lid or cover, the horizontal member being provided with an extension adapted for engagement with the outer or free end of the lid or cover, the vertical member being likewise provided at its inner end with feet adapted for engagement with and as a support for the tools when located wholly within the handle, as and for the purpose specified.

482,257. SPIRAL HAIR OR OTHER PIN. JOHN T. LARKIN, Halifax, Canada. Filed Feb. 15, 1892. Serial No. 421,593. (No model.)

Claim.—A hair or jewelry pin consisting of a body portion of helical or spiral form and provided with a swiveled or rotatable head, substantially as described, and for the purpose specified.

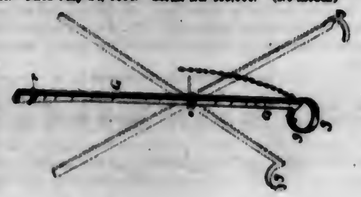
482,258. COVER FOR BOXES. VICTOR A. LEHUCHER, MELINA A. LEHUCHER, and ADRIEN MATHIEU, Paris, France. Filed June 28, 1892. Serial No. 438,326. (No model.) Patented in France Feb. 20, 1892, No. 219,560.



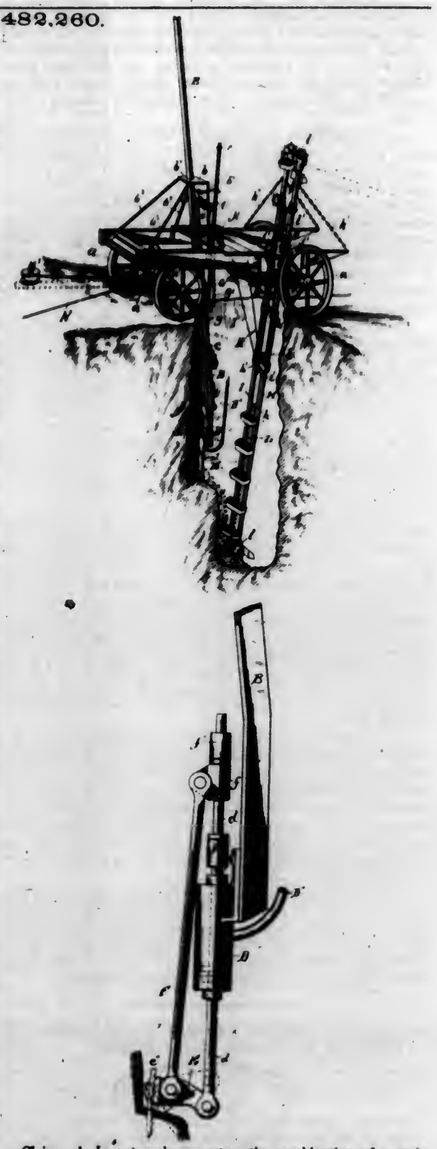
Claim.—1. A cover for preserve-boxes, consisting of a flanged sheet-metal ring *a*, adapted to be secured to a box, a sheet-metal ring *d*, having its outer annular edge attached to the upper surface of the flanged ring between the inner and outer edges thereof, and a transparent disk *b*, confined air-tight at its periphery between the inner edges of the two rings, substantially as described.

2. A cover for preserve-boxes, consisting of a flanged sheet-metal ring *a*, adapted to be secured to a box, a sheet-metal ring *d*, having its outer annular edge soldered to the upper surface of the flanged ring between the inner and outer edges thereof, and a transparent disk *b*, having its periphery provided with an annular packing-ring *c* and confined air-tight between the inner edges of the two rings, substantially as described.

482,259. SPINDLE. JOSEPH LOSEHEN, Pottsville, Pa. Filed Feb. 26, 1892. Serial No. 422,943. (No model.)



Brief.—To afford effective lubrication of the spindle it is made tapering but terminating in a conical bearing which provides a shoulder, the lubricant being supplied at the reduced diameter of the spindle through a hole in the slotted bolster.



Claim.—1. A spindle of varying diameter supported within the bolster and gradually tapering toward a shoulder and terminating in a conically-shaped step-bearing, in combination with the casing L, having the step H, the bolster B within the casing, and an oil-cup having a supply-tube leading to the spindle at its reduced diameter through an opening in the bolster, substantially as described.

2. The casing L, having step H, in combination with the bolster B within the casing and slotted at its lower extremity, the spindle supported within the bolster, gradually tapering toward a shoulder and terminating in a conically-shaped step-bearing, and an oil-cup having a supply-tube leading to the spindle at its reduced diameter through an opening in the bolster, substantially as described.

482,260. TRENCH-EXCAVATOR. ARTHUR J. MASON, Kansas City, Mo. Filed July 24, 1891. Serial No. 400,606. (No model.)

482,260.

Claim.—1. In a trench-excavator, the combination of a main frame, a plate supported above said frame, an angular beam carrying the pick, arranged to move vertically in said plate, and the tongs adapted to grasp said beam and adjust it laterally, so that the pick will operate in the desired position, substantially as described.

2. In a trench-excavator, the combination of the main frame, an angularly-slotted plate supported over the front portion of said frame, an angular beam adapted to move vertically in said plate, the pick, and mechanism for operating the same on the lower end of said beam, a windlass arranged below the plate on the supports therefor and having a weighted arm, a rope attached to said windlass and the lower end of the beam to adjust the same vertically, and the tongs fulcrumed on the frame to move the beam laterally, substantially as described.

3. In a trench-excavator, the combination of a main frame, the rods in the front part of said frame, an angularly-slotted plate supported on the rods, and the pick carrying beam adapted to move vertically in said plate and fitting loosely in the slot to permit the lower end of the beam to be adjusted laterally, substantially as described.

4. In a trench-excavator, the combination of a main frame, the rods secured in the front portion of said frame and converging to their upper ends, the angularly-slotted plate mounted on said rods, the pick-carrying beam adapted to move vertically in said plate, and the tongs fulcrumed on the main frame, adapted to grasp the main beam and adjust it laterally, substantially as described.

5. In a trench-excavator, the main frame, the pick-beam loosely mounted thereon, and the tongs having their lower ends curved and extending at right angles to the handles thereof, said tongs being fulcrumed to the main beam at their pivotal point, substantially as described.

6. In a trench-excavator, the combination of a main frame, the pick-beam mounted on said main frame, the pick mechanism, the tongs fulcrumed in the frame, and the chain supporting said tongs, substantially as described.

7. In a trench-excavator, the combination of the main frame, the beam loosely supported on said frame, the cylinder secured to the lower end of the beam, the piston-rod, the pick, and connections intermediate of the pick and piston rod to operate the former, substantially as described.

8. In a trench-excavator, the combination of the pick-beam, the cylinder, the piston-rod extending through said cylinder, and the link pivotally secured to the lower end of the piston-rod and carrying a pick-point, substantially as described, for the purpose set forth.

9. In a trench-excavator, the combination of the pick-beam, the cylinder, the piston-rod extending through the cylinder, the link pivotally secured to the lower end of said piston-rod and carrying the pick-points, the rod pivotally secured to said link between the pick-points and the piston-rod and having its upper end loosely connected to the upper end of the piston-rod, and the abutments on said piston-rod, as and for the purpose set forth.

10. In a trench-excavator, the combination of the pick-beam, the cylinder, the piston-rod extending through the cylinder, the link on the lower end of the piston-rod, the clamping-plates on said link, the pick-points, the rod pivotally secured to said link and connected to the upper end of the piston, and the abutments, substantially as described.

11. In a trench-excavator, the piston-rod, the link pivotally secured thereon at its lower end, the transverse plate on the front of said link, the movable plate adapted to be clamped tightly to the transverse plate, the recesses in said plates, and the picks, substantially as described.

12. In a trench-excavator, the piston-rod, the link pivotally secured thereon at its lower end and carrying the binding-plates, the picks, and a screw passing through said plates and securing the picks firmly between them, substantially as described.

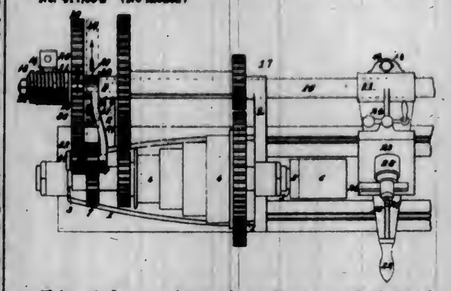
13. In a trench-excavator, the elevator comprising the movable sections, each section consisting of two parallel tubes adapted to telescope into the tubes of the section next above, the transverse pieces connecting the lower ends of each pair of tubes, and means for suspending said elevator on the machine, substantially as described.

14. In a trench excavator, the elevator composed of the sections adapted to telescope one within the other, the ropes connecting the lower end of one section with the main frame and with the lower end of the next adjacent section, whereby each section may be independently adjusted, and the bucket-chain, substantially as described.

15. In a trench-excavator, the elevator consisting of the sections of parallel tubes, each section being adapted to telescope in the one next above, the ropes connecting the lower ends of two adjacent sections, the bucket-chain, and the suspension device loosely secured on the rear axle of the machine, substantially as described.

16. In a trench-excavator, the frame, the elevator, and the suspension device consisting of the collar loosely secured on the rear axle of the machine and the plate swiveled to said collar and having the sleeves on the outer ends thereof, through which pass the tubes forming the elevator, substantially as described.

17. In a trench-excavator, the frame, the collar fitted loosely on the rear axle of the machine, the plate swiveled to said collar and having the sleeves in which the tubes of the elevator pass, the suspension devices, the elevator, and the rope connecting the suspension device with the lower end of the upper section of the elevator and adapted to elevate the same, substantially as described.



18. In a trench-excavator, the frame mounted on wheels and adapted to straddle the trench, the pick-beam loosely secured above the frame, the pick and mechanism for operating the same, carried by the beam, the elevator loosely secured on the rear axle of the machine, and the bucket-chain, both pick-beam and elevator being capable of a vertical and lateral adjustment to bring the latter in proper position beneath the pick, substantially as described.

19. In a trench-excavator, the frame, the pick-beam loosely secured in the forward part of the frame and capable of vertical adjustment, the pick and mechanism for operating the same, carried by the beam, the elevator composed of the telescopical sections, said elevator being loosely secured on the rear axle of the machine, the bucket-chain, and means for adjusting the pick-beam and elevator, substantially as described.

20. In a trench-excavator, the frame, a pick-beam loosely secured in the front portion of said frame and having a vertical and lateral adjustment, the pick and mechanism for operating the same, carried by said beam, the elevator loosely secured on the rear axle and adapted to be adjusted laterally thereon, the bucket-chain operating on said elevator, and means for adjusting the pick and elevator, substantially as described.

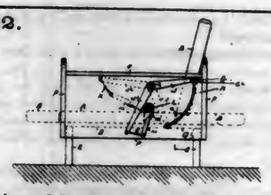
21. In a trench-excavator, the pick-beam made of angle-iron loosely fitted in an angularly-slotted plate to enable the lower end of the pick-beam to be swung in any direction, substantially as described.

482,261. REVERSING ATTACHMENT FOR SCREW-CUTTING LATHES. JOHN J. MERRING, St. Louis, Mo. Filed Jan. 13, 1890. Serial No. 417,884. (No model.)

Claim.—1. In a reversing attachment for screw-cutting lathes, the combination of the leader gear-wheel 10 and screw guide-hob 11, the elongated bearing-rod 8, on which said leader-wheel and hob are laterally adjustable, the drive-pinion 7, the mandrel of the lathe on which said drive-pinion is mounted, the hanger-bar 29, the journal 31, that projects from said hanger-bar, the tube-bearing 30, that mounts to said bar, and the broad intervening reversing-pinion 32, that is mounted on said journal 31 and effects a reversing movement of said leader-wheel to that of its normal drive, substantially as described.

2. In a reversing attachment for screw-cutting lathes, the combination of the elongated bearing-rod 8, the leader gear-wheel 10, and screw guide-hob 11, laterally adjustable on said rod, the back gear-frame in which said rod is mounted, the drive-pinion 7, mounted on the mandrel that carries the cone-pulleys, the hanger-bar 29, having the mounting tube-bearing 30, the journal 31, that projects from said hanger-bar, the broad intervening reversing-pinion 32, mounted on said journal, the perforate angle-arm 34, that projects from said hanger-bar, and the set-screw 36, that secures said angle-arm to the back gear-frame, substantially as described.

3. In a reversing attachment for screw-cutting lathes, the combination of the laterally-adjustable leader gear-wheel and screw guide-hob, the drive-pinion Y, the attachable hanger-bar 29, carrying the journal 31, the broad intervening reversing-pinion 32, mounted on said journal, said hanger-bar provided with the slit-opening 38, the perforate lugs 39, and the set-screw 40, that tightens the mounting bearings of said hanger-arm, substantially as described.



4. In a reversing attachment for screw-cutting lathes, the combination of the laterally-adjustable leader gear-wheel 10 and screw guide-hob 11, the drive-pinion 7, the attachable hanger-bar 29, the intervening broad reversing-pinion 32, carried by said attachable hanger-bar, the guide-screw 13 on the periphery of said hob 11, the leader-die 14, that works in said screw, the guide-arm 19, the chaser-bar 16, the chaser-tool 15, the die-holder turret 25, the die-cutter 26, the set-screw that holds said cutter, the chuck 5 on the mandrel, and the blank 6, held by said chuck while said cutter effects its respective right and left hand screw cuts, substantially as described.

5. In a reversing attachment for screw-cutting lathes, the combination of the reversing-pinion 32, the interchangeable leader gear-wheel 10, and the hanger-bar that carries said pinion, the screw guide-hob 11, and drive-pinion 7, substantially as set forth.

482,262. SOFA-BED. JAMES P. MILLER, Boston, Mass. Filed May 10, 1892. Serial No. 432,504. (No model.)

Claim.—In a sofa-bed of the character described, the combination, with the back and opposite arm-frames, of bolts G, held on said back-frame at its opposite ends, carrying slots H in said arm-frames, receiving said bolts G, angular levers J J^3, fulcrumed on said arm-frames and concentric with said slots H and by their arms J engaging said bolts G, coiled springs L at one end rigidly held on said arm-frames, and chains K, joining the free end of said springs L and the arms J^3

482,262.

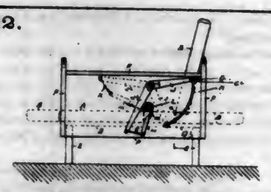
of said angular levers J J^3, substantially as described, for the purposes specified.

and provided with a platform beneath the supply-hopper, a slide carrying a scale, a portion of which is visible from the outside of the box-body, a weight held to slide upon the scale-beam, and a connection between the scale-carrying slide and the scale-beam weight, as and for the purpose set forth.

5. In a device of the character described, the combination, with a scale-beam and a device for supplying material to a vessel supported by the scale-beam, of a dial having movement past a sight-opening, a weight held to slide upon the scale-beam, and a connection between the dial and the beam, whereby when the dial is moved the weight will also be moved, as and for the purpose set forth.

6. A machine of the character described, comprising a box hav-

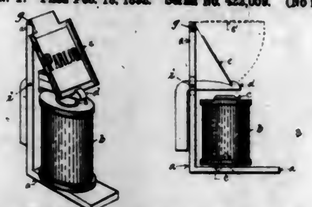
hooks, detachably connected therewith at one end and at the other end secured to the casing, substantially as set forth.



2. In a folding bed, the combination, with a casing and a bed pivoted in said casing, of springs connected with the casing at its base, and also connected with the head portion of the bed, and spring-pressed levers fulcrumed in the base of the casing, said levers having bearings upon extensions at the sides of the bed, as and for the purpose specified.

3. The combination, with a casing and a bed pivoted therein, of springs secured at one end in the base portion of the casing and adjustably attached to the under portion of the bed at the head, projections formed at the sides of the bed, at the head, back of the pivot of

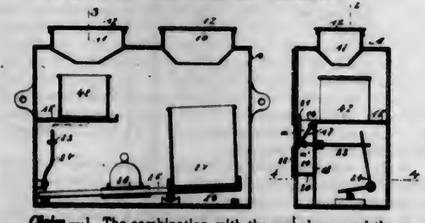
bottom rolls provided with a fixed ring *e*, which carry dies on their peripheries, the loose dies H, having a letter or design formed thereon, the securing-rings F, provided with beveled faces which hold the dies in position, and the adjusting-screws *f*, by which the securing-rings are held, substantially as described.



6. In apparatus for producing or impressing upon sheets of ductile metal lettering, figuring, or design in relief, the combination, with the framing A, the shafts G, which carry the rolls, and the top and bottom rolls D and E, upon the peripheries of which the dies are mounted and each provided with a ring *e*, with beveled faces, of the dies H, having a letter or design formed thereon, the loose movable

482,262.

of said angular levers J J², substantially as described, for the purposes specified.



482,268. ELECTRIC ANNUNCIATOR. ERASTUS D. MOORE, New York, N. Y. Filed Feb. 18, 1892. Serial No. 422,069. (No model.)

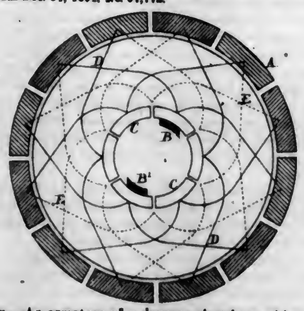
Claim.—1. The combination of the frame *a*, the helix *b*, the magnet-core *c*, the armature *d*, the indicator-plate *e*, the spring *f*, pivotally mounted, as at *g*, and the pivot carrying the armature, all arranged and operating substantially as and for the purpose set forth.

2. The combination of a frame having a slot therein and two projecting arms, a core mounted in a position approximately parallel with said slot, the armature *d*, pivotally mounted in the slot, an indicator-plate pivoted between the arms of the frame and engaging the armature, and a spring, as at *f*, adapted to throw the indicator-plate away from the armature when the armature releases the plate, substantially as set forth.

482,264. MILK-RECEIVER. SILAS J. MORGAN, La Grange, Ill. Filed Apr. 4, 1892. Serial No. 427,622. (No model.)

Claim.—1. The combination, with the scale-beam and the receptacle-platform carried thereby, of a ticket-delivery mechanism connected with the scale-beam and operated thereby when the receptacle receives the proper quantity, substantially as set forth.

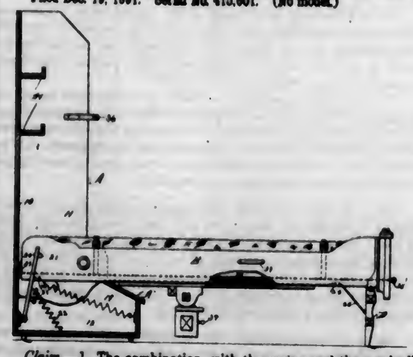
2. In a device of the character described, the combination, with the box-body provided with a hopper leading into the interior and a sub-compartment having an opening at one end and a damper pivoted at the opposite end of the sub-compartment, which damper is capable of extending across the compartment, of a trip-lever, a connection between the trip-lever and the damper, and a scale-beam one end o which is adapted for engagement with the trip-lever, which beam is also provided with a platform located beneath the hopper, the platform being adapted to receive a vessel, substantially as shown and described.



3. In a device of the character described, the combination, with a box-body and a feed apparatus leading into the body, the said body being provided with a sub-compartment and a damper pivoted in the compartment, of a trip-lever, a connection between the trip lever and the damper, a scale-beam fulcrumed within the box-body, one end of the beam being adapted for engagement with the trip-lever, the said beam being also provided with a platform located beneath the feed apparatus, a weight adjustably placed upon the beam, and a slide carrying a scale connected with the adjustable weight, whereby the said weight may be moved in such a manner as to regulate the weighing capacity of the scale, substantially as shown and described.

4. In a device of the character described, the combination, with a casing provided with a supply-hopper, a ticket-receiving compartment having a drop-bottom, and a trip-lever connected with the drop-bottom, of a scale-beam adapted for engagement with the trip-lever and provided with a platform beneath the supply-hopper, a slide carrying a scale, a portion of which is visible from the outside of the box-body, a weight held to slide upon the scale-beam, and a connection between the scale-carrying slide and the scale-beam weight, as and for the purpose set forth.

5. In a device of the character described, the combination, with a scale-beam and a device for supplying material to a vessel supported by the scale-beam, of a dial having movement past a sight-opening, a weight held to slide upon the scale-beam, and a connection between the dial and the beam, whereby when the dial is moved the weight will also be moved, as and for the purpose set forth.

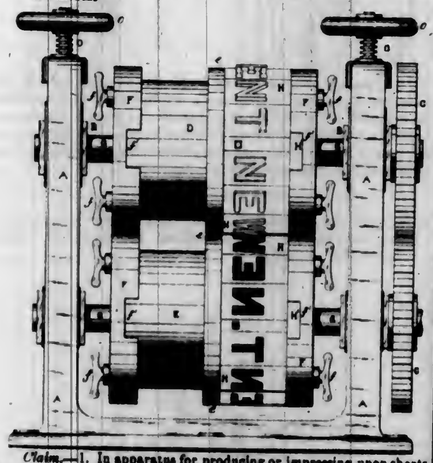


6. A machine of the character described, comprising a box having an inlet-opening at its top and two doors on one side, a scale-beam in the box, provided with a receptacle-platform adjacent to one door and below the said inlet-opening, a sliding weight on the beam, a dial having a movement past an opening in the box and connected with the weight, and a handle on the dial, projecting adjacent to one of said door-openings, a ticket-delivering mechanism connected with the scale-beam and operated thereby, a passage leading downward to said mechanism from the other of said two doors, and a locking mechanism to simultaneously lock both of the said doors after the operator has placed a receptacle on the platform, dropped a ticket in the passage, and adjusted the dial by means of said handle, substantially as set forth.

482,265. ARMATURE FOR DYNAMO-ELECTRIC MACHINES. JOHN NEBEL, Charlton, assignor to the Siemens Brothers & Co., Limited, Westminster, England. Filed Nov. 11, 1891. Serial No. 411,596. (No model.) Patented in Germany Feb. 22, 1891, No. 61,059; in England Nov. 30, 1891, No. 20,340; in France Dec. 24, 1891, No. 304,633, and in Belgium Dec. 31, 1891, No. 97,772.

Claim.—An armature of a dynamo-electric machine, having its conducting-bars, not less than eight in number, divided into two, three, or *n* sections and this number increased or diminished by adding or subtracting 2, 4, or 2*n*—2, each bar of the number so determined being connected, not to that opposite to it, but to the second, third, or *n*th before the opposite, and each brush touching two, three, or *n* commutator-segments, of which there are half as many as there are bars, substantially as and for the purpose set forth.

482,266. FOLDING BED. WILLIAM S. NEVINS, Terre Haute, Ind. Filed Dec. 19, 1891. Serial No. 415,601. (No model.)



Claim.—1. The combination, with the casing and the vertically-swinging bed having side projections in rear of its pivots, of levers hinged at their rear ends to the casing and crossing the said projections, a series of hooks on each lever, and a spring for each series of hooks, detachably connected therewith at one end and at the other end secured to the casing, substantially as set forth.

2. In a folding bed, the combination, with a casing and a bed pivoted in said casing, of springs connected with the casing at its base, and also connected with the head portion of the bed, and spring-pressed levers fulcrumed in the base of the casing, said levers having bearings upon extensions at the sides of the bed, as and for the purpose specified.

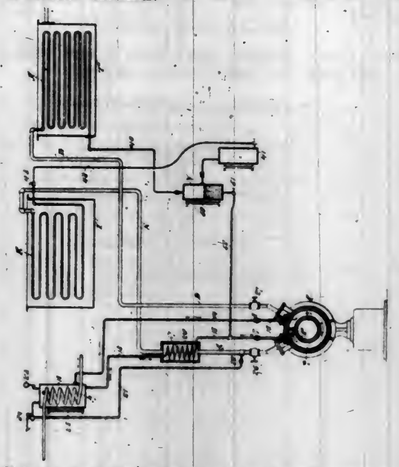
3. The combination, with a casing and a bed pivoted therein, of springs secured at one end in the base portion of the casing and adjustably attached to the under portion of the bed at the head, projections formed at the sides of the bed, at the head, back of the pivot of the bed, levers fulcrumed in the rear of the base and having constant bearing upon the projections of the bed, and springs secured to the base of the casing and adjustably connected with the levers, as and for the purpose specified.

4. In a folding bed, the combination, with a casing, a bed pivoted therein and removable therefrom, springs attached to the base of the casing and to the head portion of the bed back of its pivot, and spring-pressed levers fulcrumed in the base and having constant bearing upon projections formed at the sides of the bed, of a latch carried by the bed and adapted for engagement with a keeper on the casing, a trip device connected with the latch, handles secured to the sides of the bed, latches attached to the sides of the casing and adapted for engagement with the handles, all combined to operate substantially as and for the purpose set forth.

482,267. APPARATUS FOR PRODUCING LETTERING, &c., IN RELIEF ON SHEETS OF DUCTILE METAL. JOHN M. NEWTON, Stalybridge, England, assignor of five-twelfths to John Edward Gimson and Arthur Newton, same place. Filed Nov. 3, 1891. Serial No. 410,766. (No model.)

Claim.—1. In apparatus for producing or impressing upon sheets of ductile metal lettering, figuring, or design in relief, the combination, with the rolls, of dies H, each in the form of a segment cut from a cylinder, having a letter or design formed thereon, and the securing-rings F, each cap shaped to fit over the end of the roll and provided with beveled faces which secure the dies on the roll, substantially as described.

2. In apparatus for producing or impressing upon sheets of ductile metal lettering, figuring, or design in relief, the combination, with a roll provided with a ring *e*, having beveled faces, of the dies H, having letters, figures, or designs thereon, substantially as and for the purpose described.



3. In apparatus for producing or impressing upon sheets of ductile metal lettering, figuring, or design in relief, the combination, with a roll provided with a ring *e*, of the movable cap-shaped rings F, which fit over the ends of the rolls, and the adjustable screws *f*, by which the rings are clamped, substantially as described.

4. In apparatus for impressing or producing upon sheets of ductile metal lettering, figuring, or design in relief, the combination, with the roll provided with a stationary ring *e* and dies H, of the movable rings F, provided with a recess *f'*, and the loose key-segment H', substantially as described.

5. In apparatus for producing or impressing upon sheets of ductile metal lettering, figuring, or design in relief, the combination of the framing A, the shafts G, to which the rolls are affixed, the top and bottom rolls provided with a fixed ring *e*, which carry dies on their peripheries, the loose dies H, having a letter or design formed thereon, the securing-rings F, provided with beveled faces which hold the dies in position, and the adjusting-screws *f*, by which the securing-rings are held, substantially as described.

6. In apparatus for producing or impressing upon sheets of ductile metal lettering, figuring, or design in relief, the combination, with the framing A, the shafts G, which carry the rolls, and the top and bottom rolls D and E, upon the peripheries of which the dies are mounted and each provided with a ring *e*, with beveled faces, of the dies H, having a letter or design formed thereon, the loose movable securing-rings F, provided with beveled faces which hold the dies in position and formed with a recess *f'*, through which the dies are inserted, the loose key-segments H', which fill the recesses *f'*, and the adjusting-screws *f*, which maintain the securing-rings in position, substantially as described.

482,268. REFRIGERATING APPARATUS. CARLETON W. MASON and CHARLES H. LEINERT, New York, N. Y. Filed Oct. 3, 1891. Serial No. 407,603. (No model.)

Claim.—1. In a refrigerating apparatus, the combination of a piston-chamber in a gas-compressor for the reception of a circulating sealing lubricant and the circulatory system of ascending and descending columns of lubricating or sealing liquid communicating therewith, which columns of liquid are propelled by the alternate expansion and contraction due to the heat of compression in said chamber and the lower temperature above, substantially as described.

2. The combination, with the cylinder of a gas-compressor and its piston, the latter provided with an annular chamber between its bearing ends, within which the lubricating or sealing liquid may circulate and be subjected to the heat of compression, of a reservoir connected with said chamber for supplying a body of the liquid thereto and means for cooling said liquid, through which chamber the liquid is circulated by the changing specific gravity due to the said heat and cooling, substantially as described.

3. The combination, with the cylinder of a gas-compressor and its piston, the latter provided with an annular chamber intermediate between its bearing ends, of induction and eduction pipes connecting such chamber with a lubricating or sealing liquid reservoir and without communication with the pressure side, substantially as described.

4. In a gas-compressor, the combination, with a piston provided with an annular chamber intermediate between its bearing ends and having a longitudinal cut-off or dividing-wall, of induction and eduction pipes leading to said chamber on opposite sides of said cut-off, substantially as described.

5. In a gas-compressor, the combination, with a piston provided with a chamber intermediate between its bearing ends and having a longitudinal cut-off, of induction and eduction passages through the body of the compressor-cylinder communicating with said chamber on opposite sides of the cut-off, pipes connecting said passages with a lubricating or sealing liquid reservoir, and a cooler operating to reduce the temperature of the liquid prior to its introduction into said chamber, substantially as described.

6. In a refrigerating apparatus, the combination, with a compressor-piston provided with a chamber within which the lubricating or sealing liquid is circulated without communication with the pressure

side, of induction and eduction pipes connecting such chamber with a lubricating or sealing liquid reservoir, said induction-pipe having a coil which is within a chamber through which the expanded gas passes in returning to the compressor, substantially as described.

7. In a refrigerating apparatus, the combination, with a compressor-piston provided with a chamber for the circulation of the lubricating or sealing liquid, induction and eduction pipes connected therewith and with a lubricating or sealing liquid reservoir, of a pipe connecting said reservoir with the low-pressure side of the apparatus and provided with an adjustable valve whereby gas that may have leaked into said reservoir will be automatically discharged when it has attained a predetermined pressure, substantially as described.

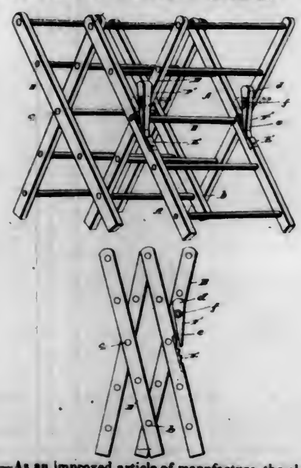
8. A refrigerating apparatus consisting of a compressor-piston

482,270.

cavity and adapted to receive the fruit, and a central slot and opening through which the knife passes when the carrier reaches it and through which the pit is ejected when forced from the fruit, substantially as herein described.

2. In a fruit-pitting machine, a framework having a rotary shaft with sprocket-wheels fixed thereto journaled at one end, a crank-shaft with a sprocket-wheel fixed thereto, a chain passing from said sprocket-wheel to a second sprocket-wheel upon the first-named shaft, treadles and connecting-rods uniting them with the cranks, whereby motion is transmitted to the shafts, a stationary shaft fixed at the opposite end of the top of the machine, having loosely-revolving sprocket-wheels

ate projecting points N⁶, and the central projecting spurs Q, substantially as herein described.



482,273. MACHINE FOR OPENING AND PREPARING COTTON. JAMES C. POTTER, Pawtucket, R. I., assignor to the Potter & Atherton Machine Company, same place. Filed June 29, 1892. Serial No. 438,446. (No model.)

side, of induction and eduction pipes connecting such chamber with a lubricating or sealing liquid reservoir, said induction-pipe having a coil which is within a chamber through which the expanded gas passes in returning to the compressor, substantially as described.

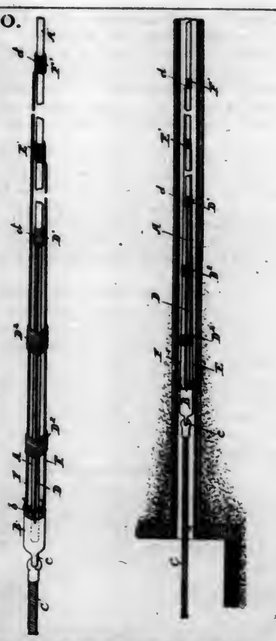
7. In a refrigerating apparatus, the combination, with a compressor-piston provided with a chamber for the circulation of the lubricating or sealing liquid, induction and eduction pipes connected therewith and with a lubricating or sealing liquid reservoir, of a pipe connecting said reservoir with the low-pressure side of the apparatus and provided with an adjustable valve whereby gas that may have leaked into said reservoir will be automatically discharged when it has attained a predetermined pressure, substantially as described.

8. A refrigerating apparatus consisting of a compressor whose piston is provided with a chamber for the lubricating or sealing liquid independent of the chamber or passages for the gas, a condenser to which the compressed gas is directly conveyed, an expansion-coil in which the gas is vaporized and from which it is directly conveyed to the suction side of the compressor, a drip-tank for separating such gas or oil as may combine from slight leakage in long use, and a storage-reservoir for the liquefied gas, which drip-tank and storage-reservoir are located between the condenser and expanding-coil, substantially as described.

482,269. CLOTHES-DRIER. GEORGE W. HORTH, Clarkes, Oreg. Filed May 10, 1892. Serial No. 432,497. (No model.)

Claim.—As an improved article of manufacture, the clothes-rack described, consisting, essentially, of the vertically-oblique bars A and B, pivotally connected together, and the cross bars or rounds connecting said vertically-oblique bars, the toothed plates secured to the outer sides of two of the bars A below their pivotal points, and the pawls F, constructed as shown and pivoted to two of the bars B at a suitable distance from their upper enlarged ends and out of their longitudinal centers to serve in locking the frame, substantially as and for the purposes specified.

482,270. MEANS FOR DRAWING CABLES INTO CONDUITS. THOMAS F. O'CONNOR, New York, N. Y., and JOSEPH W. MABEE, Pittsburg, Pa., assignors to the Standard Underground Cable Company, Pittsburg, Pa. Filed Jan. 6, 1892. Serial No. 417,304. (No model.)



Claim.—1. The means, substantially as hereinbefore set forth, for introducing cables into conduits or ducts, which consists, essentially, of a draw-rope provided with a cap for the reception of the end of the cable and having connected thereto a series of wires, the ends of which are secured to the cable, as and for the purposes set forth.

2. As a means for introducing cables into conduits or ducts and preventing undue strain thereof, the combination of a series of draw-wires connected to the cable at different points along its length, substantially as described.

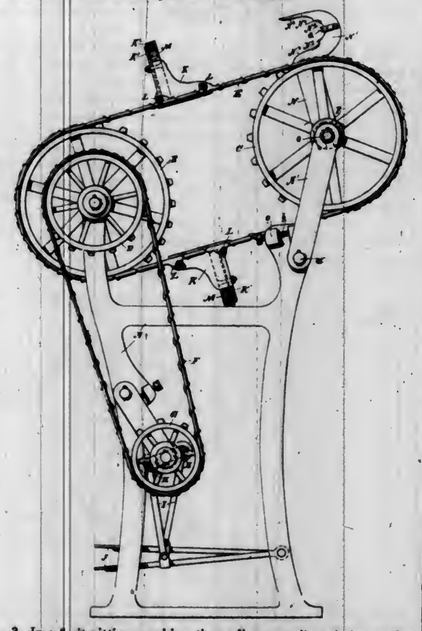
3. As a means for introducing cables into conduits or ducts, the combination of a draw-rope having a cap for the reception of the free end of the cable and a series of wires connected to the cap and to the cable at different points along its length, substantially as described.

4. As a means for introducing cables into conduits or ducts, the combination of a series of draw-wires connected to the cable at different points, each draw-wire being slightly shorter than the section of the cable to which it is attached, substantially as described.

482,270.

5. As a means for introducing cables into conduits or ducts, the combination of a draw-rope having a cap provided with a recess for the reception of the free end of the cable, and a series of draw-wires attached to the cap and having their free ends securely attached to the cable at different points and intermediate loose wrappings for the cable and draw-wires, substantially as described.

482,271. ATTACHMENT FOR VELOCIPEDES. GEORGE OPENSHAW and CHARLES A. CARR, Bury, England. Filed Oct. 10, 1891. Serial No. 408,398. (No model.)

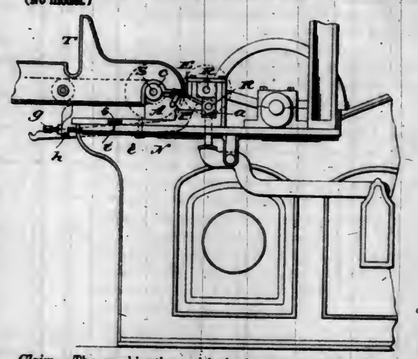


Claim.—The combination, with a bicycle or other velocipede, of a hook E, secured thereto, a strap or belt to surround the body of the rider, the ends of which strap or belt terminate in front of the rider, a straddle C, to which the ends of the strap or belt are adjustably attached, and a ring secured to the breeches-strap and adapted to be connected to the hook on the vehicle, substantially as described.

482,272. FRUIT-PITTING MACHINE. FRANK C. PHILIPS, Healdsburg, Cal. Filed May 6, 1892. Serial No. 432,053. (No model.)

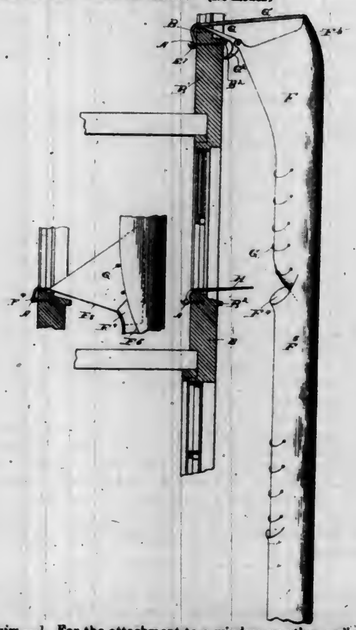
Claim.—1. In a fruit-pitting machine, the framework having a horizontal stationary shaft fixed at one end of the top with sprocket-wheels revolving loosely thereon and a central radially-fixed sickle-shaped knife projecting from the shaft intermediate between the sprocket-wheels, a rotary shaft journaled at the opposite end of the frame and means for communicating motion thereto, sprocket-wheels fixed upon said shaft, chains passing around these sprocket-wheels and those upon the fixed shaft, parallel with each other, fruit-carriers with their opposite sides fixed between the two chains, having a concavity and adapted to receive the fruit, and a central slot and opening through which the knife passes when the carrier reaches it and through which the pit is ejected when forced from the fruit, substantially as herein described.

2. In a fruit-pitting machine, a framework having a rotary shaft with sprocket-wheels fixed thereto journaled at one end, a crank-shaft with a sprocket-wheel fixed thereto, a chain passing from said sprocket-wheel to a second sprocket-wheel upon the first-named shaft, treadles and connecting-rods uniting them with the cranks, whereby motion is transmitted to the shafts, a stationary shaft fixed at the opposite end of the top of the machine, having loosely-revolving sprocket-wheels upon it at equal distances apart with those upon the first-mentioned shaft, independent chains passing around said sprocket-wheels, parallel with each other, and carriers consisting of boxes having an open front, closed back and sides, and a central slot passing through the bottom and back, means whereby said carriers are secured between the chains and movable therewith, elastic cup-shaped back pieces and bottom pieces fitted into the carriers to receive the fruit, having slots made therein, and a central opening in the concavity of the back piece for the ejection of the pit, in combination with a knife having a shank fixed centrally to the stationary shaft, extending radially outward therefrom, and having the concave cutting-edge with the centrally-projecting spurs, whereby the fruit is first cut around the pit as it is brought against the knife and the pit is forced out through the back of the carrier, substantially as herein described.



3. In a fruit-pitting machine, the endless traveling chains passing around sprocket-wheels parallel with each other, carriers fixed between the chains and movable therewith, having a slotted bottom and back, the elastic cup-shaped receiving-plates or holders upon the bottoms of the carriers, and the slotted concaved backs having the central opening for the ejection of the pit, said backs being adjustable in the back of the outer case by means of slots and screw-bolts to fit them to different sizes of fruit, substantially as herein described.

4. In a fruit-pitting machine, the rotary and stationary shafts, sprocket-wheels mounted thereon, endless parallel chains passing around the wheels, with carriers secured between and movable with them, a stationary radial knife extending outward from the fixed shaft to intercept and divide the fruit brought to it by the carriers, and a two-part framework on which the sprocket-wheel shafts are mounted, said framework being adjustably united, so that the tension of the chain is maintained, substantially as herein described.



5. In a fruit-pitting machine, the rotary and stationary shafts, sprocket-wheels mounted thereon, endless parallel chains passing around the wheels, with carriers secured between and movable with them, in combination with a stationary radial knife having the shank secured to the stationary shaft and having the outer sickle-shaped end with the independent curved cutting-edges N^2 N^3, the intermediate projecting points N^4, and the central projecting spurs Q, substantially as herein described.

482,273. MACHINE FOR OPENING AND PREPARING COTTON. JAMES C. POTTER, Pawtucket, R. I., assignor to the Potter & Atherton Machine Company, same place. Filed June 29, 1892. Serial No. 438,446. (No model.)

Claim.—The combination, with the beater, the feed-rolls, evener devices, and feed-apron, of a stand secured to and adjustable upon the frame and carrying said feed-rolls, evener devices, and feed-apron, whereby the feed-rolls and the other parts with which they are in operative relation may as a whole be adjusted toward and away from the beater, substantially as and for the purposes hereinbefore set forth.

482,274. FIRE-ESCAPE. JAMES PRIDE, London, England. Filed Apr. 16, 1891. Serial No. 389,198. (No model.)

Claim.—1. For the attachment to a window or other wall-opening of a fire-escape, the combination, with the ladder, of a frame G G', having feet G^2, substantially as and for the purpose described.

2. In a fire-escape, the combination, with a folding frame pivotally supported, as described, of the casing or framework carried by said folding frame, to which the chute is directly attached and serving to hold the mouth of the chute open and to contain the chute when not in use, substantially as shown and described.

3. The combination, with a fire-escape chute or tube having intermediate openings by which entrance to the chute may be secured,

of loops or rungs upon the outside of the chute and also upon the flap, substantially as and for the purpose described, and illustrated in Fig. 3 of the accompanying drawings.

4. In a fire-escape, the combination, with the chute or tube having one or more intermediate openings by which entrance to the chute may be had, of an apron secured to the chute at each of these entrances and extending a suitable distance up the sides of the chute, having hooks or other means of attachment for securing it in place, substantially as described.

5. In a fire-escape, the combination, with a tube or chute, of fork-ended rungs secured to its vertical edges, substantially as described, and illustrated in the accompanying drawings.

6. In a fire-escape, the combination, with a tube or chute having

suitable bearing and running over the top of said chain, and spring g^3, impinging against the bearing of said wheel g' and bearing said wheel down against said sprocket-chain, keeping it taut, substantially as shown and described, and for the purposes set forth.

4. An armillary sphere carried by a pivoted arm moving over a scale representing latitude and provided with a weighted horizon-disk and with movable declination-quadrants pivoted at the poles, substantially as described.

5. In an armillary sphere carried by a pivoted arm moving over a scale representing latitude, a circle representing the ecliptic arranged to be turned about its own center and also around the equator-circle and means for supporting the same, substantially as described.

6. In an armillary sphere carried by a pivoted arm moving over a scale representing latitude, the combination of circles representing, respectively, the equator, the meridian, and the ecliptic, a weighted

482,280.

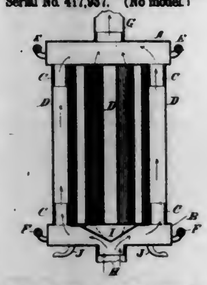
of loops or rungs upon the outside of the chute and also upon the flap, substantially as and for the purpose described, and illustrated in Fig. 3 of the accompanying drawings.

4. In a fire-escape, the combination, with the chute or tube having one or more intermediate openings by which entrance to the chute may be had, of an apron secured to the chute at each of these entrances and extending a suitable distance up the sides of the chute, having hooks or other means of attachment for securing it in place, substantially as described.

5. In a fire-escape, the combination, with a tube or chute, of fork-ended rungs secured to its vertical edges, substantially as described, and illustrated in the accompanying drawings.

6. In a fire-escape, the combination, with a tube or chute having its edges folded over cores, of fork-ended rungs secured to it by rivets passing through the forked ends of folded edges and cores, substantially as described, and illustrated in the accompanying drawings.

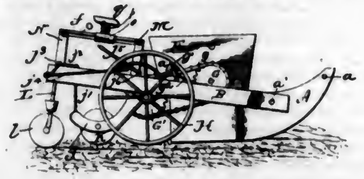
7. For attachment to a window or door or other wall-opening, the combination, with a purchase-bar, of a platform which may be connected to it by hooks which admit of its removal from the bar only when the platform is in an inoperative position.



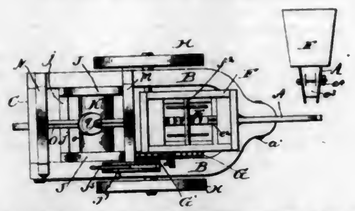
8. In a fire-escape, the combination, with the folding frame having the pivoted hooks at the rear side, of the purchase-bar, to which the folding frame is pivotally connected by said hooks, substantially as and for the purpose set forth.

482,275. SWINGING BED FOR INFANTS. BERTHA B. ROACH, Upper Alton, Ill. Filed Dec. 8, 1891. Serial No. 414,377. (No model.)

Claim.—As an improvement in swinging beds for infants, the combination, with a flexible hammock and a bed disposed therein, of head and foot boards 14, of greater height than said bed and adapted, when applied, to retain the sides of the hammock in vertical position above the bed, whereby guards for the latter are formed, substantially as and for the purpose set forth.

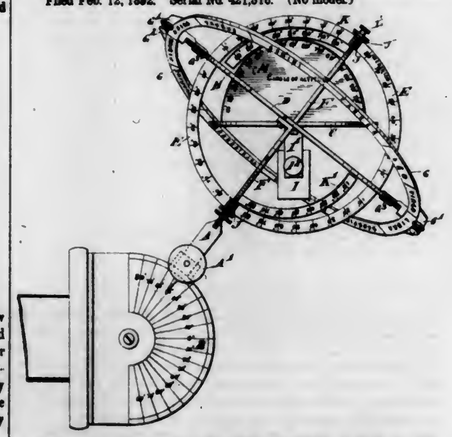


482,276. HEATING-DRUM. JACOB SEITHER, Keokuk, Iowa. Filed Jan. 13, 1892. Serial No. 417,937. (No model.)



Claim.—In a heating-drum, the combination of a pair of hollow heads or terminals, short sections of pipe or tubing connected to and communicating with each of the heads, a similar number of flues for connecting the heads, fitting over the short sections of tubing, a conical heat deflector located in the center of the lower head and directly over the inlet-pipe, whereby the heat is equally distributed among the flues, and inlet and outlet pipes connected to each head, substantially as described.

482,277. COTTON-PLANTER. PETER P. SIMPSON, Henderson, assignor of one-half to William J. Arnett, Mountain Home, Ark. Filed Feb. 4, 1892. Serial No. 420,267. (No model.)



Claim.—1. The combination, with the frame B, of runner A, pivoted in the front end of said frame, widening at its rear end to receive the periphery of the feeder, hopper F, secured to the upper part and rear end of said runner, feed-wheel E, and stirrer f^3, journaled in said hopper, slotted feed-regulator c^6, borne in the front end of said hopper, adjustable plate c^5, pivoted in the rear end of said runner, sprocket-wheel G', borne on the axle of the wheels of the planter, sprocket-wheel G, secured on the end of the axle of the feeder E, sprocket-chain g, passing around said wheels, sprocket-wheel g', journaled in a suitable bearing and running over the top of said chain, and spring g^5, impinging against the bearing of said wheel g' and bearing said wheel down against said sprocket-chain, keeping it taut, substantially as shown and described, and for the purposes set forth.

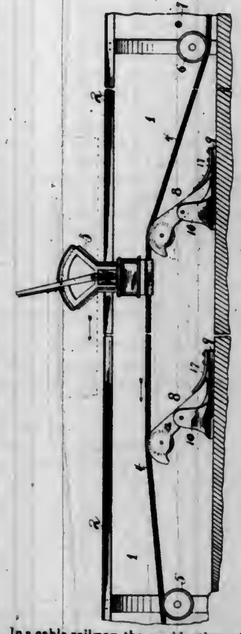
2. In a cotton-seed planter, the combination of the side pieces B, borne on an axle and wheels, runner A, pivoted between the front ends of said side pieces and provided with means for raising its rear end from the ground, hopper F, secured to the upper edges and rear end of said runner and provided with means for working the seed into the furrow below, roller K, journaled between arms J and provided with means for raising said roller from the ground, caster-wheel l, journaled in the lower forked end of rod L, rod L, pivoted in the rear cross-beam C, braces M and N, secured to said side pieces B, rod O, rigidly secured to the apex of said braces, and sliding seat q, working on said rod, said braces, rod, and seat being in the rear of the axle and wheels of said planter, substantially as shown and described, and for the purposes set forth.

482,278. ARMILLARY SPHERE. JOHN S. SLATER, Calcutta, India. Filed Feb. 12, 1892. Serial No. 421,316. (No model.)

Claim.—1. An armillary sphere for illustrating motions of celestial bodies, carried by a pivoted arm moving in a vertical plane over a scale graduated to represent latitude, substantially as described.

2. In an armillary sphere for representing motions of celestial bodies, a pivoted weighted disk that represents the sensible horizon and is adapted to remain in a horizontal attitude in all positions of the armillary sphere and an adjustable circle of altitude carried by said weighted disk, substantially as described.

3. An armillary sphere for illustrating motions of celestial bodies, carried by a pivoted arm moving in a vertical plane over a scale graduated to represent latitude and provided with a pivoted weighted disk representing the sensible horizon, the said disk assuming a horizontal position in all positions of the armillary sphere, substantially as described.



4. An armillary sphere carried by a pivoted arm moving over a scale representing latitude and provided with a weighted horizon-disk and with movable declination-quadrants pivoted at the poles, substantially as described.

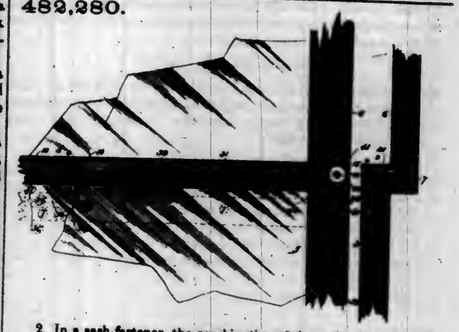
5. In an armillary sphere carried by a pivoted arm moving over a scale representing latitude, a circle representing the ecliptic arranged to be turned about its own center and also around the equator-circle and means for supporting the same, substantially as described.

6. In an armillary sphere carried by a pivoted arm moving over a scale representing latitude, the combination of circles representing, respectively, the equator, the meridian, and the ecliptic, a weighted horizon-disk, and movable declination-quadrants pivoted at the poles, substantially as described.

7. In an armillary sphere, the combination, with circles D, E, F, and G, disk C, weight I, scale M, and quadrants K K', of the arm A, moving over scale B and having a clamp A' for fixing it in any desired position on said scale, substantially as described.

482,279. AUTOMATIC GIPSY FOR CABLE RAILWAYS. ANDREW J. SMITH, St. Louis, Mo., assignor of one-half to Theodore H. Wurmb, same place. Filed Oct. 24, 1891. Serial No. 409,653. (No model.)

Claim.—1. In a cable railway, the combination, with the cable and its carrying-sheaves normally below the path of the grip, of gipsies arranged in juxtaposition with a crossing cable and adapted to normally hold a straight determinate length of the first-mentioned cable elevated in the path of the grip, substantially as set forth.



2. In a cable railway, the combination, with the cable, of yielding gipsies arranged to normally hold a determinate length of said cable above the normal height and in the normal path of the grip jaws carried by the car, whereby cars may take the cable without stopping or slacking speed at any point within said determinate length so elevated, substantially as set forth.

3. The combination of two yielding supports S, situated a determinate distance apart in a cable-conduit and constructed to yieldingly hold a determinate length of cable elevated above its normal line of travel and in a line in the path of the grip-jaws, substantially as specified.

482,280. AUTOMATIC SASH-FASTENER. GEORGE SOLARI, St. Louis, Mo. Filed Apr. 5, 1892. Serial No. 427,912. (No model.)

Claim.—1. In a sash-fastener, the combination of the spring-lock that fastens together the meeting-rails of the sash, the captor-cord that captivates the spring-bolt of said lock in its disengaged position, and the pivoted captor quadrant-plate that holds said cords, substantially as described.

482,280.

2. In a sash-fastener, the combination of the spring-lock that fastens together the meeting-rails of the sash, the captor-cord 31, the pivoted captor quadrant-plate 58, connected by said cord to the bolt of said lock, the ratchet-teeth 65 on said quadrant-plate, and the spring-pawl 66, that engages in said ratchet and maintains the stress of said quadrant-plate on said cord, substantially as described.

3. In a sash-fastener, the combination of the spring-lock that fastens together the meeting-rails of the sash, the captor-cord 31, the pivoted captor quadrant-plate 58, the ratchet-teeth on said captor-plate, the spring-pawl that engages in said teeth, and the automatic trip-bolt 75, that trips said pawl out of engagement with said ratchet, substantially as described.
